In February or March, 1904, the Rajah Auto-Supply Company (which had bought the spark-plug business of the Torbensen Co.), began putting on the market the Rajah plug (Complainant's Exhibit 5).

In August, 1904, the Olds Motor Works of Detroit, per a Mr. Whittemore, notified the Torbensen concern that they controlled Letters Patent 612,701, and that the Torbensen Co. was infringing the Canfield patent. Neither the Torbensen nor Rajah companies ceased manufacture (D. R. 62 and 63), nor was suit begun.

It will be observed that this notice did not come from a poor inventor or his executor, but from automobile manufacturers.

Mezger's plug (Complaint's Exhibit 1) has been on the market since about 1902. (Mezger obtained a patent in 1902, D. R. 78, 305.)

The plug, Complainant's Exhibit 6, has been on the market since about 1902.

Other alleged infringing plugs have been on the market since about 1906, 1907 or 1908.

This very complainant has had a plug (Mosler Spitfire) on the market since 1902 or 1903, and that plug (if he is right now) infringed the Canfield patent.

Many other plugs have been on the market which possibly have infringed this patent, if complainant is right.

Nowhere does it appear that the slightest effort has been made to stop the alleged infringing, unless it be the sending of the letter on behalf of the Olds Works, and that went no further.

The Association Patents Company owned this patent from 1906 until it was assigned to complainant in 1909. There is nothing to show that Associated Patents Company manufactured or marketed spark-plugs made under the Canfield patent.

I gather from the record (C. R. 496) that Association Patents Company is some sort of a corporation that deals in patents and licenses, and I find that complainant company was desirous, among other things, "of acquiring all damages and profits recoverable by said Association Patents Company from any and every party for any and every infringement of said 'letters patent' and each of them and all claims and demands for damages and profits." (C. R. 500-501.)

It is stated in complainant's brief (page 1):

Although it does not appear on the record, in so many words, that John Lurie is a nominal defendant and that the defenes of this suit is carried on by manufacturers of the infringing spark plugs, that such is the fact is a natural inference and one that will not be disputed, for among the spark plugs, the sale of which by John Lurie is complained of in the Bill of Complaint, are the spark plugs of certain well known manufacturers in the United States, and the defendant has been represented throughout the proceedings in this case, prior to the final hearing, by no less than three able counsel who are not associated in business and who happen to represent regularly two of these manufacturers of the alleged infringing spark plugs.

I presume this statement is correct and that defendant's counsel will not contravert it.

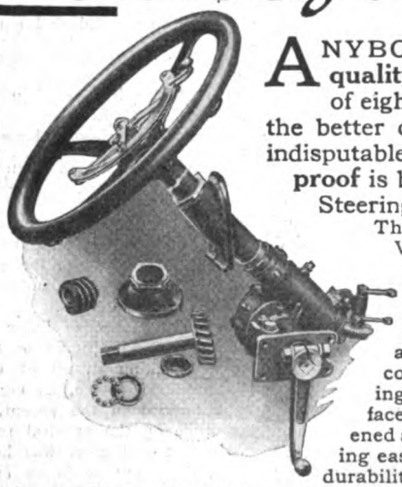
The suit, thus, is really against the manufacturers, but whether against them or not, defendant and others have been notoriously selling these goods to a large extent for a number of years. (D. R. 79).

Here then we have a situation where nothing was done by the patentee or his assigns for eleven years, while others risked their money in putting on the market an improved and very important device in an industry which has developed by leaps and bounds and which has revolutionized travel for utility and pleasure. While the public has been getting the benefit of the use of the devices and of competition between manufacturers, the assignees of this patent have sat supinely by, not even bringing one suit against any one of many open alleged infringers.

Then comes along an ex-infringer (on its own theory) who has bought the rights under this and another patent, and asks a court of equity to fill its treasury with license fees and damage money.

It is no excuse that complainant obtained its title only in 1909. Its claim is affected by the laches and the want of equity of its assignors.

The defense of laches is not tested by time alone. Lapse of time may be well explained, but, on the other hand, even a comparatively short time may constitute laches when the conduct of the slothful is such as to induce others, in good faith, to expend money and take the risks of enterprise.



I think this defendant and the manufacturers of the goods in question, have acted in good faith, in the belief that the patent was of no, or, in any event, doubtful validity, and they were justified in that belief by the inertia of the assignees of this patent, which non-action was strongly suggestive of lack of confidence in the validity of the patent. The court would go a long distance to protect the inventor who is ahead of his times and who, unable to interest capital, finds that some one has stolen the fruits of his genius.

But that is not this case.

This case calls rather within the principles stated by Judge Coxe in Richardson v. Osborne, 82 Fed. Rep., 95 (affirmed 93 Fed. Rep., 828).

The patent is sustained within the limits here indicated, and it is held that there is no infringement. The bill is dismissed with costs.

Warner Quality
Steering Gears

ANYBODY can claim quality—but a record of eight years use on the better class of cars is indisputable proof. That proof is back of Warner Steering Gears.

The prime features of Warner Gears are: accessibility; complete interchangeability; use of eccentric sleeves; adjustable angle of column; large bearing and contact surfaces specially hardened and ground, assuring ease of motion and durability.

The Warner line includes a wide range in both pleasure and commercial types.

We guarantee dependable deliveries.

Get acquainted with Warner Quality—make it another selling argument.

We modify our designs to meet your detail requirements, or build on approved designs on seasons quantity specifications.

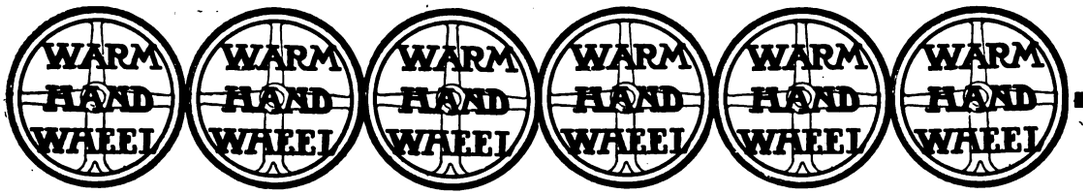
Have You Closed Up in Your Territory Yet for the

WARM HAND WHEEL



Not only will the Warm Hand Wheel make money for the dealer who sells it as a purely sales proposition, but every man who sells an automobile owes it to himself to boost hard for the Warm Hand Wheel—for the reason that every Warm Hand Wheel sold enables the car owner to get more months of service out of his car with comfort than he has ever been able to obtain before.

The Warm Hand Wheel, which may be attached to any car, and which operates either by storage battery or lighting or charging outfit, retails for $15.00 with a good liberal dealers' discount. The Warm Hand Wheel enables the driver of the car to drive in the cold days and nights with light gloves or without gloves without discomfiture. It keeps his hands warm, and makes him comfortable. Not only is the Warm Hand Wheel a necessity in Winter, but during the cold, chilly nights in the Fall and Spring it should be on every car.

Do not wait until after all the choice territory is taken. Get into the game today, and tell us what you can do for us in return for the agency.

SPRINGFIELD METAL BODIES

¶ Springfield Metal Bodies in combination with Springfield Convertible Tops, shown here, embody every item of beauty in design, convenience, quality and finish, that mark them distinctly different and better.

¶ The Convertible Tops, made over our own exclusive designs can be raised in short order, by opening the doors, unbuttoning the pads and raising the hinged glass in the rear panel. No bows across the doorways—no view obstruction by frames and rods. Through their beauty and simplicity they emphasize the awkward, inconvenient qualities of ordinary types.

¶ Springfield Convertible Tops are built for Springfield Metal Bodies only. They can not be attached to any other body.

Digitized by Google

¶ Dealers who anticipate the wants of the supercritical car buyer will appreciate this combination and specify it, for it stands that these tops and bodies make a good car still better—and that they increase the quality argument for the cheaper car. As specifications they offer a strong selling argument for both manufacturer and dealer.

¶ Study these illustrations. They are faithful pictures of Springfield products, made in a factory equipped to turn out bodies and tops in every size and style. Then send for complete details of construction.

"The Horn that's Made for the Discriminating"

TUTO HORN

THE TWO TONE HORN

More Than An Emergency Horn.

BEFORE the advent of the TUTO horn there was actual need for a separate one-tone-loud-emergency-signal as a supplement to the bulb horn.

¶ The fact that these electric horns have but one loud note, makes it out of the question to use the same constantly for regular service.

¶ Thus, this single-note loud electric horn does not displace the bulb horn, merely supplements it, and requires that two methods of operation be employed, that of working the bulb and the pressing of the button.

¶ In the case of a close range emergency, there is not sufficient time to go from the bulb to the button, so that this combination of two horns promotes confusion.

¶ On the other hand, the TUTO horn, does all of the signalling of the car in the most simple manner and with one horn mechanism and one operating button—a slight pressure of the latter gives the low service signal which is effective 90% of the time and which completely displaces the bulb horn; a full pressure on the same button instantly causes the loud emergency signal to sound, and no thought or movement of the hand is necessary.

¶ In fact, the going from the service to the emergency note of the TUTO horn is automatic, as the spasmodic gripping of the steering wheel (upon which the button is mounted) will force the finger, which is already on the button for the low note, clear down.

¶ This is quicker than thought and has cleared many a TUTO-equipped car from tight places where serious or fatal accidents were imminent.

¶ There is no time to play with two signal controls in the case of an emergency, such as the going from a bulb to a button. This requires concentration of thought and subsequent action.

¶ It is better to do your thinking now and get the TUTO horn on your car. It is a complete signalling system, not merely an emergency signal.

Pullman

When You Sell Your Full Allotment —You Are Happy

IN our advertising to the TRADE we have purposely omitted detail specifications, equipment, material, comparisons, etc. We do not believe that GOOD DEALERS are closed that way.

Some manufacturers building from 10,000 cars up have from one to three thousand DEALERS—whereas the PULLMAN COMPANY will build but 1,500 cars for 1913, and we cannot possibly consider over 100 DEALERS. Our present DEALERS will take 1,000 PULLMANS—leaving but 500 for new territory.

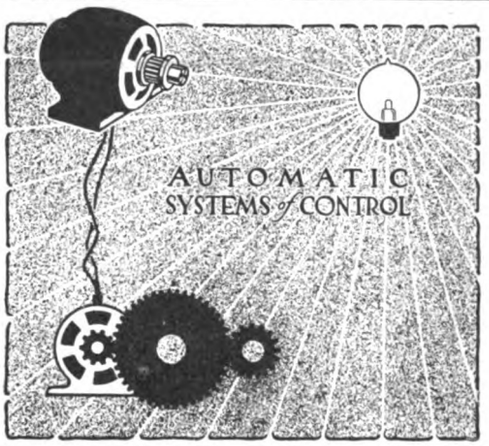
As a Possible Pullman Dealer You Should Be Interested

We recently closed with an AGENT in a new territory—new for PULLMAN CARS—although we have been forced to refuse "applications" from this particular territory three straight years. The dealer was sure he could sell fifteen cars—we allotted him that amount, and the fifteen were sold almost in advance—Pullman buyers waiting—and in a new territory.

Pretty good evidence of the PULLMAN SALES MAKING MACHINERY. It means more to the DEALER than double the ordinary DEALERS' DISCOUNT.

Some dealers sell as high as fifty cars a year and show little or no profit, and it isn't because of his discounts or the demand. Briefly, it's lost energy, haphazard selling methods, individual effort, etc.

WE REDUCE THE PULLMAN AGENTS' selling "overhead" to a point where competition ceases to exist. We select your possible purchaser in advance, get you in touch, and practically "cinch" the sale.



IF YOUR TERRITORY IS OPEN, WE CAN INTEREST YOU, BUT ACT QUICKLY. Wherever introduced PULLMAN cars dominate the territory.

WARD LEONARD

Lighting - Starting

We paved the way

Two decades of unqualified success

Twenty years ago we were leaders in electric lighting appliances. We were pioneers then, but today the Ward Leonard Automatic Dynamo Lighting System stands forth as the most finished product of its kind.

A brief resume of some of the Ward Leonard achievements will serve to show why "Ward Leonard" is but another word for superiority in electric lighting systems.

Ward Leonard was the first to install an electric lighting system on railroads.

Ward Leonard evolved an electric elevator control system licensed to the Otis Elevator Company.

A Ward Leonard System of control is used to operate the turrets and heavy ordnance in the U. S. Navy.

Nearly all the modern steel rolling mills in the world are operated by Ward Leonard Systems of control.

The Ward Leonard railway system for trunk line electrification was adopted by the State Railways of Switzerland and is known as the Ward Leonard-Oerlikon System.

A matter of electrical control

The problem of dynamo lighting systems is nothing more than the automatic control of a dynamo and storage batteries.

For twenty years the Ward Leonard Company have manufactured dynamo controlling rheostats and storage battery controlling rheostats. The Ward Leonard Company have always been

Digitized by Google

and are still the largest manufacturers of this apparatus.

More than one hundred patents have been issued under the Ward Leonard name.

What the Ward Leonard System accomplishes

The Ward Leonard Automatic Dynamo System keeps the storage batteries fully charged at all times, supplies the starting current, lights all the lamps, and supplies the energy for operating the electric horn. This system gives faultless service at a minimum price, is absolutely reliable and entirely foolproof.

Automatic control is necessary

But the distinctive feature of the Ward Leonard System lies in the perfection of its automatic control. No matter what speed the engine may attain, the charging amperes from the dynamo will remain between fixed limits because of the automatic action of an electrically operated switch. This automatic electric control is perfect. It is not based on mechanical control as are other systems. This is just the reason for Ward Leonard supremacy—it cannot go wrong.

The marvelous and substantial growth of the automobile industry has guaranteed the permanence of Ward Leonard supremacy because automobile manufacturers realize the need of a perfect lighting and starting system.

The system of the future must have the approval of the electrical engineer

The popular demand for lighting and starting devices has forced many engineers to adopt half-heartedly systems that would bridge them over; but the public demands efficient and reliable service, and the systems selected in the future will have to stand the test of true engineering design.

The Ward Leonard Automatic Dynamo System has won the endorsement of leading automobile engineers because—

First, a fool proof system

1. It has every essential feature of a real electric lighting plant without a single extra device or a single complicated part. In short it supplies electric energy for any electric requirement on a car.

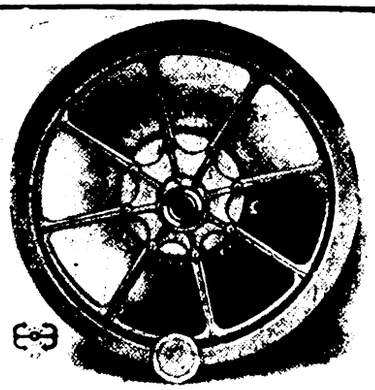
Second, a switch does the trick

2. The Ward Leonard System is automatically perfect. An electrically operated switch automatically controls the number of charging amperes regardless of the motor's speed. Nothing mechanical about it. It's purely automatic, and it never fails.

Third, it needs no attention

3. The Ward Leonard System has no centrifugal governor, no friction drive, no compression rheostats or dash-pots and no ventilating fan. Just an electric switch that opens and closes. Simplicity itself.

The simplicity of the Ward Leonard System is the fundamental reason for its durability. There is nothing about it to get out of order, nothing to worry the motorist. You simply operate from your seat the switches necessary to light and start the car.



The Ward Leonard Lighting and Starting System will be the ultimate equipment of the car that is built for lasting service.

SHELDON STEEL WHEEL

"Guaranteed to Outlast a Score of Cars"

SHELDON Axle Co., after months of close study of the perplexing wheel problem, presents here for the consideration of manufacturers and dealers—the SHELDON Steel Wheel.

We have analyzed every possibility—what a wheel ought to be and what it frequently is not. In the final analysis we now come to the trade with the announcement in effect that we have perfected a wheel which has absolutely overcome every weak point extant in wooden and wire wheels.

This wheel is of much lighter construction than the wooden wheel, owing to more economic disposition of material. It is unbreakable under the most extraordinary shocks, even withstanding most terrific side wipe tests under which a wire wheel would crumple up or a wooden wheel break. It is unaffected by time, moisture and every condition of heat and cold. In brief, the SHELDON Steel Wheel is indestructible.

This steel wheel increases the life of tires on a very high percentage basis, due to the superior resiliency, light weight at the periphery of the wheel, and the rapid radiation of frictional heat which keeps the tire cool under all conditions.

In the concrete analysis the SHELDON Steel Wheel lasts as long as the frame of the car, weighs less than the wooden wheel and saves tires—and while prices range somewhat higher than on wooden wheels, it remains that the quality added to the car so equipped will give an amount of prestige not possible with cars with wooden wheels.

These basic facts are plain and unconvertible, and engineers, purchasing agents and dealers should get the detailed information covering this most remarkable car refinement.

Knox

MARTIN TRACTOR

Maximum Carrying Capacity
Minimum First Cost
Minimum Maintenance
Minimum Turning Radius

What It Is

Not a Theory But a Proven Success in a Year's Gruelling Work. Many in Successful Operation. 5 to 10 Ton Capacity. Full Details Explained in Tractor Catalog. Send Today.

A motor unit that may be attached to any heavy vehicle designed to be drawn by horses; the combination making a five-wheeled motor-drawn vehicle.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE COST OF RUBBER TIRES. Wagons have been doing good work for many years on steel tires and there is no reason why they will not continue to do so when drawn by the tractor; the heaviest part of the load is always carried on steel tires.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE VIBRATION ON STIFF SPRINGS. All working parts of the tractor are carried on springs as resilient as those of a pleasure car.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO SUDDEN STARTING OR STOPPING OF HEAVY LOADS. The cushioning of the shock between the engine and the load is one of the most important advantages gained, (fully explained in catalog).

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO NEGLECT ON ACCOUNT OF INACCESSIBILITY OF PARTS—all parts of the tractor being more accessible than on a touring car.

IT SAVES HEAVY MAINTENANCE CHARGES due to frame twist. The tractor accommodates itself to all road unevenness.

The single front wheel can be turned at 80 degrees angle, enabling the driver to back to any position or turn completely around in a narrow street.

Send for further information and prices

The New Atwater Kent Ignition System

With Automatic SPARK ADVANCE

Of extreme interest to every motorist

THE Automatic Spark Advance feature of the Type "K" Atwater Kent System is a long stride forward in ignition practice.

With this device, the control of the spark timing is entirely automatic (although the hand lever can be used if desired). This means that the spark is always properly timed to get the greatest possible power from the motor at any speed from three to seventy miles per hour.

No human mind can follow accurately the speed variations in an automobile motor and accordingly regulate the spark setting to get the best results.

The automatic spark control of the Atwater Kent System is more than human in its performance—it is sensitive to the slightest variation in speed—immediate in its response and positive in its action. The operator can forget his spark lever, knowing that his spark is being better regulated than he can do it himself.

The increased safety due to the automatic retarding of the spark for starting is alone more than sufficient to commend it to the modern motorist.

The Type "K" System is especially adapted for use in conjunction with lighting and starting equipment, or as sole ignition in place of the high-tension magneto. We regard it as being fully up to the high standard of merit for which Atwater Kent equipment is known.

Interesting Booklet D and detailed information sent upon request.

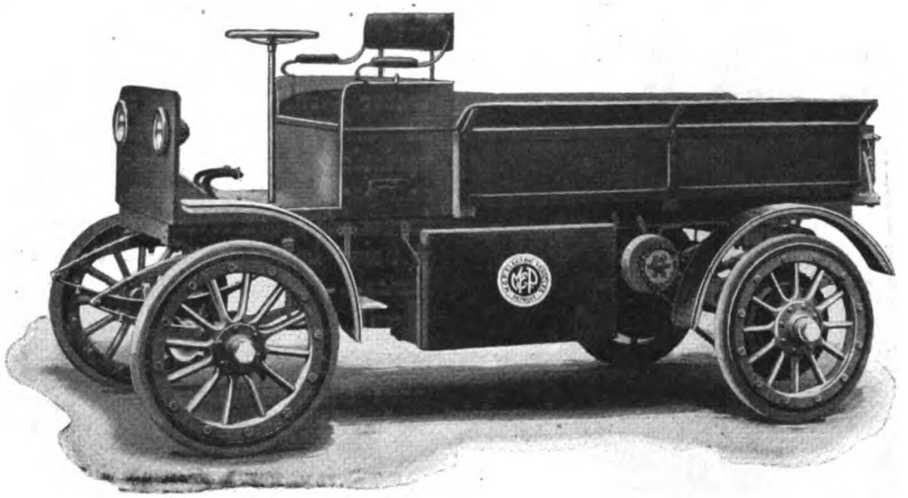
Quality M & P Price

M & P ELECTRIC VEHICLE DETROIT

A 1000 Pound Electric Truck



We Are Pioneers in the Production of a High-Grade Electric Truck at a Popular Price.

We built the "M & P" before we decided its selling price. We built it over designs which eliminated every point of weakness characterizing the average electric truck.

In the matter of materials no expense was spared; our specifications called for grades of steel and other metals higher than those ever contemplated by the average manufacturer.

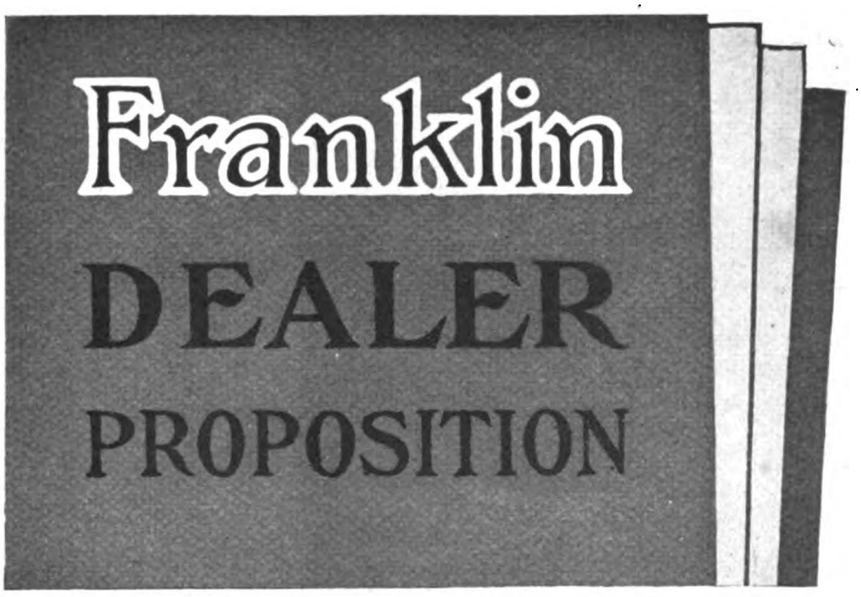
We knew that in order to create popular demand we would have to place the prices within range of the masses we desired to serve. But we sought quality and efficiency first.

The result is before you in the M & P One Thousand Pound Electric Truck, which from tires to top embodies every point of excellence found in much higher priced trucks—also other improvements in design and construction never appearing in competitive vehicles.

Meets the Popular Demand

Now, the best thing about the M & P, Mr. Dealer, is that you can sell it to the rank and file of retail Dealers who, at this time, are using the semi-obsolete, expensive horse-drawn vehicle for transportation purposes.

You can tell your prospective customers (with our assurance back of every word) that the "M & P" will reduce his transportation expenses hundreds of dollars yearly—that it will give more service, more efficiency, more mileage at lowest cost.



Don't Overlook This

Your share of the transaction is liberal and our proposition is bound to get your attention if you are a red-blooded, live-wire Dealer.

PRICES: Stripped $1450. Express Body $1500. Enclosed Body $1600... Write for our proposition.

M & P ELECTRIC VEHICLE CO., Franklin and Dubois Sts., Detroit, Mich.

Send This Dealer Application

No matter what cars you *now* handle—get the Franklin Dealer Proposition. Franklin is now the third largest selling high priced car, and gaining rapidly on second.

Franklin cars are easy to sell because they (1) use less gasoline, averaging 20% to 35% more mileage per gallon; (2) use less oil, averaging 400 to 600 miles per gallon, without smoke; (3) use fewer tires, averaging 8,967 miles per set, the 1911 record; (4) travel faster in the long run, owners thinking little of making 200, 250 and 300 miles and more per day, without fatigue; (5) ride easier, bowling along so smoothly and comfortably, without jolt or jar, that driver and occupants do not realize that they are steadily traveling 30, 35, and 40 miles per hour; (6) and wear longer than other cars, many Franklin cars giving their owners continuous satisfactory service for 5, 6, 7 and 8 years.

We will send full particulars of the Franklin Dealer Proposition to any automobile dealer, garage owner or automobile owners financially capable and with the business experience to become a successful dealer, provided he will mail us this "dealer application" immediately.

The sending of this application does not obligate the sender or us. It is merely a convenient way to get at the facts.

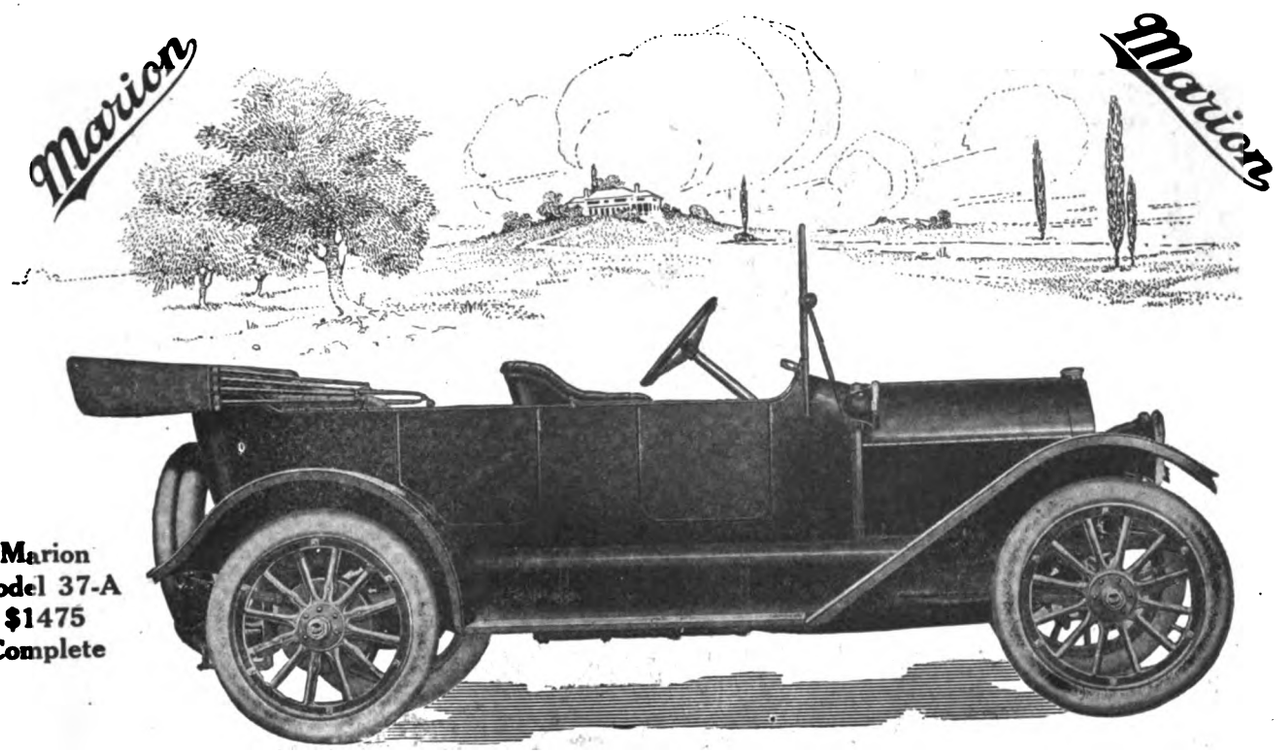
A Load Well Borne



FLOATING ON ONE BEARING the rear wheel of many a car carries the modern motorist swiftly, smoothly and surely to his destination. Semi and full floating axles, each in turn, have enjoyed popularity. These types have been described in print so much of late that finally the one word—floating—has seemed the "open sesame" to all advantages.

GREAT IS THE GAIN when linked to this same floating principle is employed the more modern construction embodying but a single bearing. Efficiency, durability, economy and quietness of operation are points that may be mentioned in its favor; and axle shafts can readily be withdrawn for taking out the differential gears when that is necessary.

USE THIS WITH HYATT bearing and no better axle can be built today. The load is carried on a line not a point as in ball bearings. Close to one hundred thousand cars will this year, in floating axles, profit by Hyatt flexibility, strength, and ease of lubrication, efficiency and silence.

Hyatt Roller Bearing Co.

Marion
Model 37-A
$1475
Complete

Here Is A Car Built to Meet Your Conditions

MARION motor cars are built with the definite idea of their giving satisfactory service to every class of motorists. They are luxurious and refined as well as sturdy, staunch and strong.

More Marion cars are in the hands of experienced motorists, who know the value of good cars, than of any other people because they meet every road condition.

Backed by ten years of success this newest and best Marion is a car on which you can not go wrong. It is the most improved car of the season—the talk of automobilists this fall. It is the largest, most completely equipped, luxurious and powerful car anywhere near $1500.

THE "proof of the pudding is in the eating." This car shows for itself. Look at it. Measure it. Feel of it. Ride in it.

You can boast of owning a Marion car. Its style and beauty give it distinction. Its strength and stability make it absolutely dependable. Marion owners are always touring.

It is a large five-passenger car with deep upholstering. Lots of width, lots of breadth. It is finished either in a rich Brewster green or deep wine color. Long wheel base and springs of flexible imported steel make it ride with exceptional ease. It has a quiet, flexible, economcial motor, 30-40 horsepower.

Everything You Need in a Motor Car

Disco Self-Starter
Prest-O-Lite Tank
Warner Speedometer
Nickel-Plated Trimmings
Concealed Tool Boxes
Center Control
Q. D. Demountable Rims, One Extra
Mohair Top, Boot, Storm Curtains
Brewster Green or Deep Wine Color
Deep Upholstering
Dynamo Electric Lighting System
80-Hour Storage Battery
Foot Rest, Robe Rail
Ventilating Plate-Glass Windshields
Tools, Tire Irons, Kit

Taken from any standpoint there is no other moderate priced car which offers you so much for your money. We urge you to see the Marion 37-A or send to us immediately for illustrated literature.

To bona fide automobile dealers we offer the fairest sales agreement ever written. Ask about it without delay.

The EISEMANN

Coincidentally, with our occupancy of a factory three times as large as that just vacated, we beg to announce to the trade and to the automobile public, the making and marketing of a new Eisemann product.

The Type E. B. High Tension System

With Separate Transformer Coil

This new Eisemann dual system is brought out to meet the constantly increasing demand for an ignition system that is low in cost, yet high in efficiency—and at the same time fully up to the standard of excellence inherent in all Eisemann products.

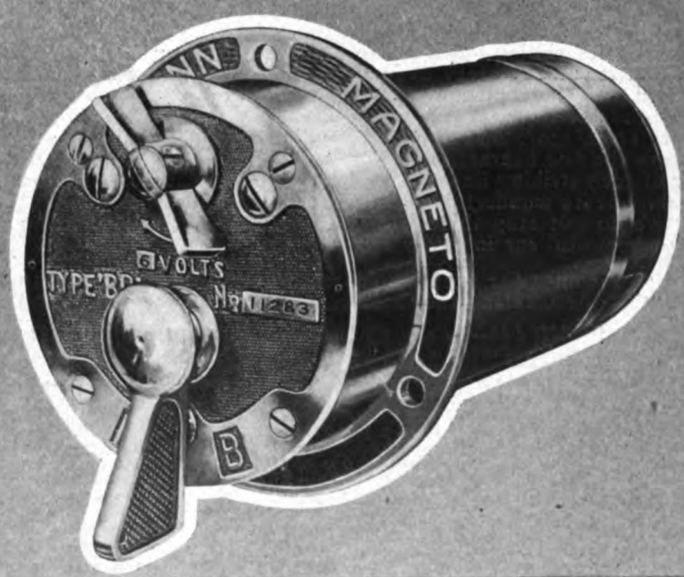
This system consists of a magneto in which only the primary current is generated and a separate transformer coil, in which the current is stepped up to its high tension.

Digitized by Google

MAGNETO

This type E. B. high tension system is remarkably compact, simple and durable as well as high in efficiency. The coil, in which is included a switch and a mechanical device for starting "on the spark," is placed through the dash as is the case with the coils of all of our other systems. The make and break mechanism can be entirely removed without the use of any tool whatsoever —a point of remarkable advantage and merit.

This new system is simply an addition to our other successful models and systems and with greatly increased facilities both in the making and marketing of our products we shall continue our past successes laying special stress on the type E. M. direct high tension magneto and all of the various models equipped with our automatic spark control.



The Eisemann Magneto Company

Oakland

"The Car with a Conscience"

Model 42 Oakland — $1600

The Squarest Automobile "Ad" Ever Printed

This is, without question, the squarest automobile advertisement ever printed.

It marks an epoch in the advertising of automobiles.

It's the new way. It's the right way.

It's going to be the way of those who dare—of those who know they are in the right—of those who know they are supreme—of those whose position is safe—whose claims will stand the most searching examination.

It's going to be the Oakland way—because we dare—because our position is safe.

Listen to this new way of convincing you of the merits of Oakland cars:

The Oakland is the first of the new era in motor car construction.

It represents the **best** and **certain** of the old and the **safe** and **beautiful** of the new. To appreciate the full significance of this statement you must see 1913 Oaklands.

There are hundreds and more of five-passenger, four-cylinder cars—all similar in appearance—and there is the Oakland model of the same description but a car so different, so beautiful, so individual, that if you say every five-passenger, four-cylinder car made you would pick the Oakland as **the car** of the group.

A bold assertion but a true one.

There are a score or more of six-cylinder models but none of them have the fine characteristics of the Oakland Greyhound—6-60—a car of such striking lines that you gaze at it in sheer admiration and marvel at its wonderful symmetry and graceful appearance.

But we do not stop there. We are not satisfied in producing the most beautiful car in the world.

We give you beauty you cannot see—beauty you cannot feel—we give you beauty of construction for the Oakland is as true inside mechanically as it is true outside artistically.

We give you a car that is mechanically right, for Oakland construction stands for maximum mechanical efficiency.

We give you unit power construction—the motor, clutch and transmission on one line, because this method gives you increased power, the minimum of friction and straight line drive.

We give you maximum accessibility, which you must have in order to give the car proper attention after you own it and drive it.

We give you a double drop frame because this construction gives the car a low center of gravity, keeping the machine on the road better. It makes the car safer to handle at high rates of speed and improves the riding qualities generally. The side swaying of the body is reduced to the minimum because the car "hugs the ground," and the danger of skidding is almost done away with.

We give you aluminum steps instead of wooden running boards, because this construction eliminates the use of a number of thin metal parts subject to noise. Have Oakland salesmen enumerate the many advantages incorporated.

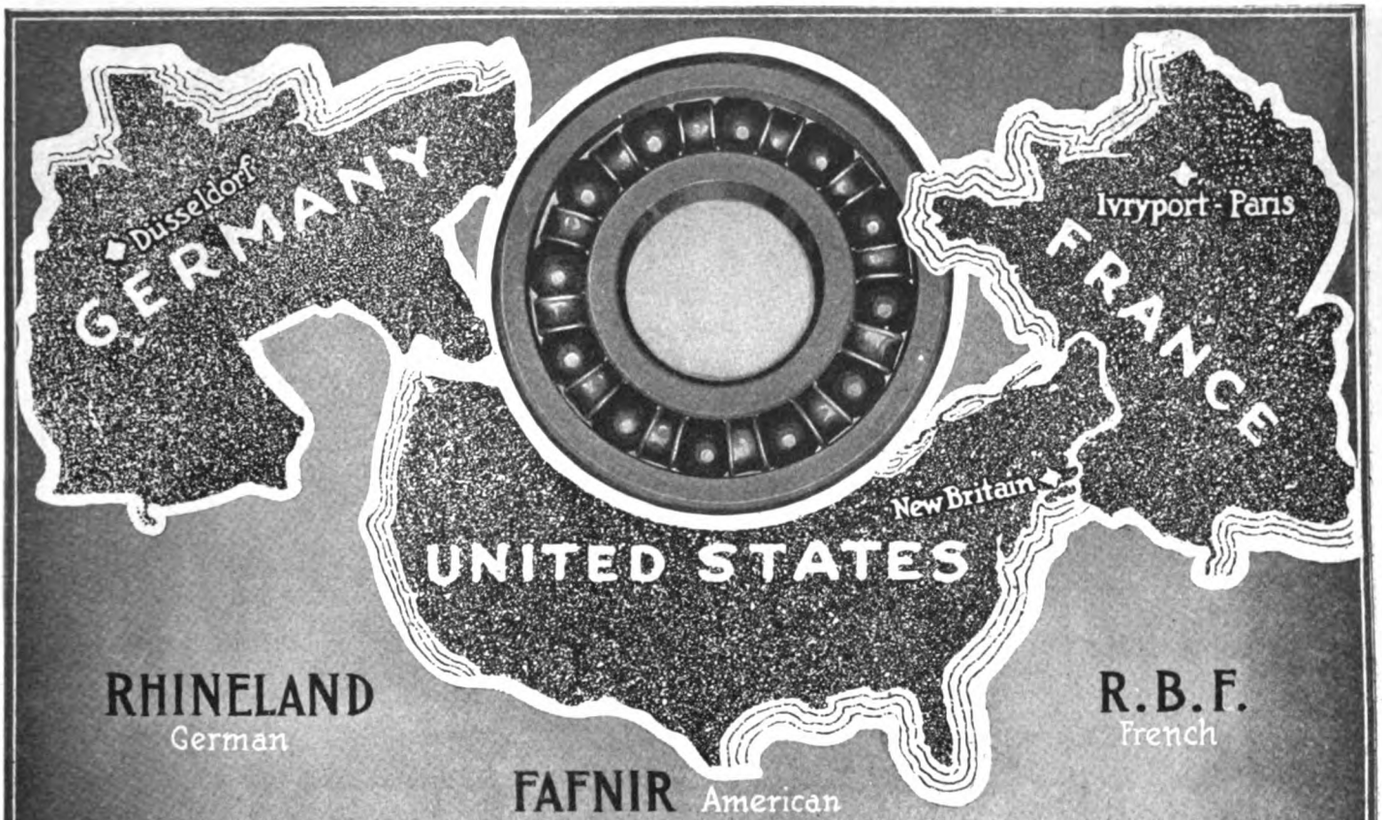
In the matter of detail, comfort and convenience, the Oakland is modern, for there has been incorporated the best of the scientific progress made to date in automobile construction.

The Oakland is equipped with an efficient electric lighting system and a positive self starter. Gasoline tank is carried at the rear, making it very convenient for filling. There is a gasoline gauge on the tank.

There is an oil sight feed on the dash. The starter valve is on the dash. Everything is in a convenient position for use.

And now comes the squarest sentence ever printed in an automobile advertisement: Make all the comparisons you want, and if you do not think the Oakland the most beautiful car in the world, and the equal, mechanically, of any car made, you need not buy it.

THE GREYHOUND 6-60—the new Oakland Six-Cylinder Chassis has a wheelbase of 130 inches, double drop frame, unit power plant, cone clutch, sliding gear transmission, full floating rear axle, demountable rims, German silver radiator "V" shaped, 10-inch upholstering, full nickel trimmings and equipped with electric lighting and ignition system and a self starter. There will be mounted on this chassis, four, five and seven passenger bodies, and a raceabout for two. Price of all models $2400.00. Model 45 seven passenger Limousine; wheelbase 120 inches, unit power plant, selective sliding gear transmission, cone clutch, Bosch magneto. $3000.00.



MODEL 42 CHASSIS, 116-inch wheelbase, double drop frame, unit power plant, cone clutch, sliding gear transmission, full floating rear axle, demountable rims, German silver radiator "V" shaped, 10-inch upholstering, full nickel trimmings, and equipped with electric lighting and ignition system, and a self starter. There will be mounted on this chassis a five-passenger body and the famous Sociable Roadster (three-passenger single seat). Price of all models $1600.00. There will also be built a smart four-passenger coupe on this chassis to sell at $2500.00.

MODEL 40 CHASSIS, five-passenger touring car; 114-inch wheelbase, single drop frame, unit power plant, selective sliding gear transmission, cone clutch, demountable rims, full nickel trimmings, and equipped with a self starter, at $1450.00.

MODEL 35 CHASSIS, five-passenger touring car, wheelbase 112 inches, motor 3½ x 5 unit power plant, "V" shaped, vertical tube radiator, 32 x 3½ tires, demountable rims, gasoline capacity 15 gallons, Remy ignition, electric lights, with storage battery, nickel trimmings, $1075.00. We are also building on this chassis a three-passenger Sociable Roadster, at $1000.00.

The Right Foundation for a Motor Truck

Axles—front and rear—form the foundation on which the whole superstructure of the truck depends.

A motor truck is a commercial car and therefore must be dependable.

Dependable axles are fundamentally necessary to the dependable motor truck.

TIMKEN-DETROIT
AXLE EQUIPMENT FOR TRUCKS

In Timken-Detroit design every factor of motor-trucking service is considered—by engineers who have specialized on truck equipment since the days of the first commercial car.

By engineers whose experience covers every phase of truck axle equipment in every kind of a commercial vehicle from light delivery wagon to ten-ton truck.

By men who know what the engineers of a large number of truck builders (Timken-Detroit customers) have discovered in the actual use, first of other equipments, then of Timken Equipment, under every possible condition of truck service.

By engineers who study foreign practice as well as that of our own country.

Built Right, Too

Timken-Detroit Commercial Axle Equipment is built by an efficient organization of men who are specialists in axle production. By men who know every kink in axle manufacture from long experience and study—experience and study that goes back of the automobile age to the horse age.

Men whose heart is in the work—whose sole ideal is building the best possible axles.

Are Standing the Test of Use

Timken ability in designing and integrity in manufacturing commercial truck axle equipment are demonstrated by efficient service under the trucks of an overwhelming majority of the leading truck builders of the country.

The list of truck builders using Timken-Detroit equipment is an unanswerable argument for their quality and serviceability.

Write for a copy of the list—Bulletin 49

The Timken-Detroit Axle Company

Detroit, Michigan, U. S. A.

The only axle manufacturer licensed to make axles equipped with the famous Timken Roller Bearings

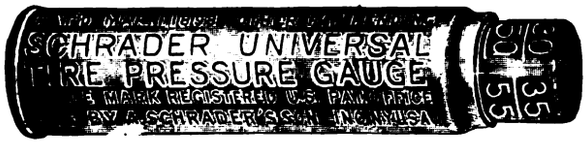
Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure



He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

Price $1.00 Each
Ready for Delivery Now

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers and the dealers, or

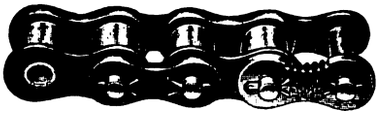
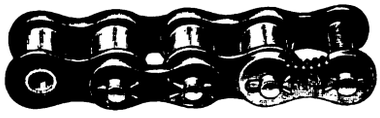
WHITNEY

The Most Practical Chain for Motor Trucks

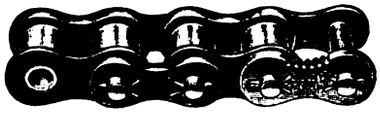
Because the "Whitney" Cotter Detachable Chain can be easily separated at any link and lengthened, shortened, or repaired without the use of any special tool. This is of great advantage to truck builders, owners and drivers.

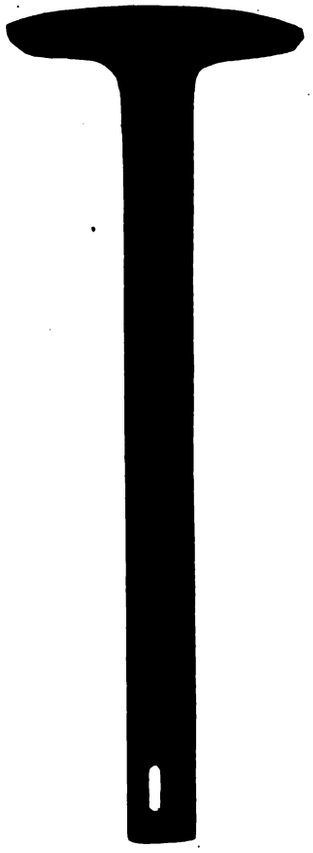


"Whitney" Chains are used by the leaders because they are strong, accurate, dependable and above all long lived. They are made right and they're made from the right kind of material, thus giving highest efficiency. When making replacements insist on a "Whitney" and get acquainted with its merits.



"Whitney" Chains Are Built for Strains





THE WHITNEY MFG. CO., Hartford, Conn.

THINK THIS OVER

very carefully and read it twice, if necessary.

Is there any part of an automobile engine, or any other gas engine, that is more important to its efficiency than a Valve?

Your engine leaves the factory running smoothly and sweetly—tuned up to its highest power. Perhaps the valves pit—warp—go out of shape—fail to hold compression. Then the power diminishes, and what can be more aggravating to the driver, who has known the fullness of the pulling power of his motor, than to have it grow less and less?

You cannot slight this part by putting in an inferior product—valves that will give trouble, or even break from inexperience in their manufacture—valves of unsuitable material, not suitably heat treated.

Too much is at stake, and a slight extra cost at the outset, which is the exception, may save you many times over a probable later expense.

This Company, with the experience of many years as a guarantee, will furnish you with properly made valves, of the materials best adapted to your requirements.

Not only QUALITY, but efficient SERVICE is a factor—surely there is a satisfaction in getting the kind of work you want—when you want it.

The Motor Lamps with Distinctive Features

There are no other motor lamps on the market with the advantages of Solar Lamps. Solars are always exclusive in style and in quality. They are the strongest lamps as well as the most effective.

In no other lamps can you obtain the Solar Special Short Focus Lead Glass Lens Mirror Reflector—the patented system of double ray light projection which gives two distinct fields of light for town and country use—or the new and exclusive black finish with a metallic lustre which is unaffected by heat or moisture. All of these features are exclusively "Solar."

Do not equip your car or specify equipment to the maker until you have seen all of the Solar advantages. See Solars at any live dealer's or write for the catalog.

Solars are made in all styles for oil, electricity, gas and in combinations.

THE DAYTON AUTO TRUCK CO. - DAYTON, OHIO

INTERLOCK INNER TIRES
Stop Tire Troubles

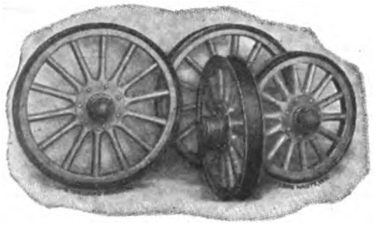
The one weak point of the automobile is that you cannot depend on the tires. Thousands of motorists have solved their tire problem by discarding inner shoes, reliners, fillers and other makeshifts and equipping their tires with **Interlock Inner Tires.**

Interlocks are complete inner tires (not inner shoes) placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They double the mileage of new tires and add 1,000 to 5,000 miles to old ones—save half your tire expense—and make tires trouble proof.

Dealers and Motorists—Investigate Interlocks

Don't delay—write now for booklets, data, prices, testimonials of users, road tests, etc. Mention size and kind of tires you use.

DOUBLE FABRIC TIRE CO., 600 W. 9th Street, Auburn, Indiana



Drop Hammer Forgings

JEFFERY-DEWITT CO.
DETROIT, MICH.

VISIBLE GAP SPARK PLUG
TELLS ITS OWN STORY

Through the window in the porcelain of the plug—**outside** the motor—you can instantly tell if the plug is firing correctly. You can see the spark jump the gap in the central electrode at any time—the darkest night shows it up clearest.

It Simplifies the Trouble Hunt by Half

If there is a spark in the window, but proper ignition fails, you know the points are fouled. In that case, just turn the knurled micrometer nut at the top of the plug with the fingers and separate the visible points still more. This increases the intensity of the spark, breaks down all oil or carbon deposits between the points and automatically cleans them in a jiffy.

And if there is no spark in the window, you know you must look to coil, batteries or magneto for your trouble.

You Don't Have to Take the J. D. Plug Out of the Motor

By this micrometer nut you can adjust each plug so as to give maximum sparking efficiency.

One Glance Through the Window Tells All

You need a set of these plugs in your motor. Send for a set now, enclosing price and size wanted (**or tell make of car**), and we will forward them at once, prepaid. Our rigid guarantee of positive satisfaction or your money back goes with every plug.

You Are the Judge in This Trial

We make millions of spark plugs a year—that's our only business. We import the clays for our heat-defying porcelain, and use the best material on the market.

Yet the Price of the J. D. Visible Gap Spark Plug Is Only $1.00

Perhaps you would like our free book on Ignition. It contains a mine of useful information. A card brings it.

DEALERS

Are the Cars You Represent R.I.V. Equipped?

Ball Bearings, in general, must measure up to certain fixed standards of strength and accuracy. That's admitted, but there is wide range of difference between the ultra good bearings and the one in which Quality is sacrificed for unwarranted profit.

R.I.V. Ball Bearings incorporate out-of-ordinary refinements of design and especially "compounded" steel—both uniting to give frictionless, noiseless wear, no matter how trying the strain or how long the service.

Car manufacturers who aim to supply the greatest degree of service and efficiency use R.I.V. Bearings.

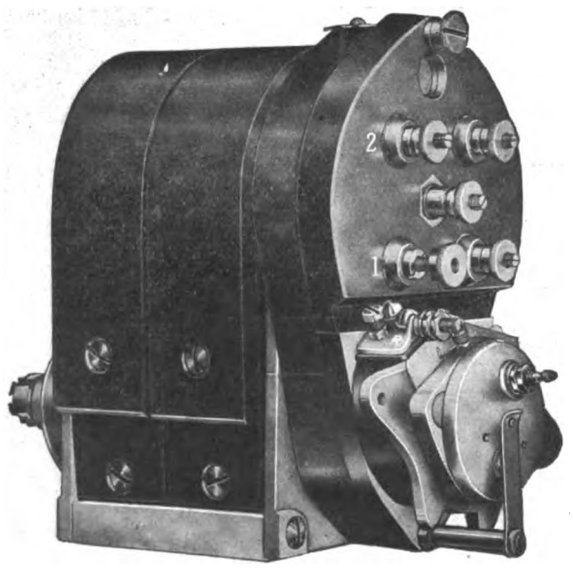
EISEMANN

¶ In the type E-M Eisemann high tension dual ignition system, particular attention has been paid to accessibility and to making it as nearly fool-proof as possible.

¶ A separate contact breaker is used for the battery as well as for the magneto. The breaker box is of the most advanced type. All vulnerable parts are applied individually for each circuit. In other words, only such parts are used in common with the battery and magneto as are not subject to accident and wear.



¶ The type E-M Eisemann magneto may be entirely looked over in a minute's time and both breakers may be inspected while the magneto is in operation.

High-priced feature No. 2

When an auto wheel hits a rut the frame must bend. Most popular priced makers try to hold the motor and transmission rigid by a *number* of arms. Overland motors are suspended at but three points. This method absolutely prevents disalignment. Otherwise, crank or gear cases bend and throw the engine bearings out. Disalignment prevents proper lubrication. It works general havoc with motor and transmission.

Experiment for yourself with three and four legged stools.

This is just one of the high priced features in the Overland at $985. A catalogue for the asking tells you of the many others. Please address Dept. 50.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, November 7, 1912 No. 7

WILL RENT CARBURETTERS INSTEAD OF SELLING THEM

Triple Action Company's Unusual Arrangement Built Around Gasolene Saving Effected—Fees Up to $100 a Month.

Renting carburetters, not selling them outright, is the rather remarkable business of the Triple Action Carburetter Co., of New York City, which recently was incorporated under New York laws with authorized capital of $200,000, which, according to the letterhead of the company, is "fully paid in." Mathias Weiwoda is president and general manager of the company "for the American Continent, England, Germany and France," and Frederick Hodschar is secretary-treasurer.

The company is located on the third floor of an unpretentious loft building at 718-722 East 11th street, but for some reason or other it will give no information concerning the internal construction of its carburetter. It is willing, though, that it be known that the device has "no needle valve or easy obstructed spray hole" and that it uses only a dry gas. It is not backward, however, in stating that the T. A. C. carburetter uses from 50 to 100 per cent. less gasolene than "any other carburetter in the world."

The quarters of the company are not large, which is not true of the rental fees which it exacts. Originally, it fixed a monthly rental fee equal to 50 per cent. of the quantity of gasolene saved by the use of its carburetter, the minimum fees being $25 per month for carburetters with 1¼-inch outlets, $50 for carburetters with 1½-inch to 2-inch outlets and $100 per month for 2½-inch to 3-inch outlets. On second thought, however, these figures were made arbitrary.

The rental fees are sufficiently large to make the manufacturers of carburetters who sell their productions outright wrinkle their brows. For its purpose, the Triple Action Carburetter Co. employs a rental contract which is very similar to those used by manufacturers of taximeters. It gives them the right to enter the lessee's premises at any time to make tests or for the purpose of removing the carburetter, and to do other similar things.

Cincinnatians Enter Toledo Company.

Dr. C. L. Bonifield, of Cincinnati, vice-president of the American Automobile Association, and president of the Ohio State Automobile Association, finally has entered the trade. He has been elected president of the National Cement & Rubber Co., of Toledo, O., which just has undergone reorganization. Gustave W. Drach, a Cincinnati architect, also has acquired an interest in the company, of which he has become secretary and treasurer. L. D. Finn, who has been identified with the enterprise for several years, will remain in the capacity of general manager.

Offers Discounts to Share Buyers.

The Federal Motor Supply Co., of Cincinnati, which recently was incorporated under the laws of Ohio, with an authorized capital of $250,000, is offering for public subscription its 8 per cent. cumulative preferred shares, par value $50 each. As a bonus purchasers are given one share of common stock with each three shares of preferred. They also are promised "special discounts" on all goods which they may purchase from the company.

Morgan Truck Files its Schedules.

Schedules filed by the Morgan Motor Truck Co., of Worcester, Mass., which was petitioned into bankruptcy on October 3, discloses liabilities of $76,020, of which $75,488 is unsecured. The assets are placed at $14,477, of which $203 is represented by cash on hand, $494 in bank, $1,000 in machinery and tools, $1,250 in vehicles and $4,500 in open accounts.

KENNY EVOLVES A SOLUTION OF THE USED CAR PROBLEM

He Rebuilt Cars in a Fanciful Factory, Collected Deposits and Then Disappeared—Short Campaign That Paid Handsomely.

Solving the used car problem may appear difficult, but at least one man has solved it to his satisfaction and in a manner that netted him a clean profit of $8,000 or $10,000 in seven weeks. He is, or pretended to be, Edward S. Kenny, and until October 25 last he did business as the Automobile Sales Agency in the Astor Theater Building, 1531 Broadway, New York City. Kenny's own story of how he solved the problem is not narrated, because Motor World has not been able to find him. The same may be said for the Post Office authorities and a host of people who unknowingly helped Kenny's "solution."

Six feet in height, bland and persuasive, he claimed to have been a baseball player a score of years ago and to have hailed originally from the West; rumor also has it that this same commodious section of the United States is his present abiding place. However that may be, he rented an office in the Astor Theater Building about two months ago and prepared to do business as a used car trader. Two stenographers were employed at first, but the flood of mail from the rural West soon necessitated the addition of a third girl. Kenny printed letter heads using the telephone number of the firm next door, despite protests against this course of procedure.

He claimed to have a car-rebuilding plant in Pontiac, Mich., and is said to have advertised extensively in newspapers throughout the West that he had rebuilt cars to sell, that these cars were in first-class condition and, although not the most up-to-date models, they would give excellent service; also he offered choice of colors and

Digitized by Google

trimmings, but one condition is said to have been that the purchaser make a deposit of one-third the total price. Deposits and letters began to pour in, according to those who were in position to see, but no one has been found who ever knew of the trader selling a car or having one in his possession.

Business boomed for seven weeks. One day after this lapse of time a man who had not dealt with Kenny but who knew of his suddenly acquired big business accused the trader of being a "crook." Kenny did not deny it very emphatically, and on a Friday two weeks ago left the office, saying he was going to Rochester. He did not return, and a telegram was sent to him, but he is not known to have received it.

A week ago a Motor World man went to the office of the Automobile Sales Agency and found two of the office girls ensconced behind a big desk, not very busily engaged. To inquiries as to Kenny's whereabouts they were ignorant, and as to the personnel of the company they said he was vice-president, which, in fact, was the title that appeared on his business card.

"Who's the president?" was asked.

"That's what we'd like to know," both exclaimed at once.

They advised the Motor World man to "come back in a week," but inside the week the girls decided that sitting at home was more comfortable than sitting on hard office chairs, or sought work elsewhere. The office now is empty, except for a few pieces of furniture.

That the business had every appearance of legality and trustworthiness was indicated by Kenny's answer to a man who wired from the West for the "best cash discount." Instead of inducing a cash payment by the offer of a substantial discount, Kenny wired, "Best cash discount two per cent."

In addition to representing that he had a rebuilding factory in Pontiac, Mich., Kenny told one inquirer that the head of Montgomery Ward & Co., the Chicago mail order house, was interested in his business and stated that the unnamed president of his "company" owned a building on Michigan avenue. Outside of his office, Kenny is said to have used the alias "Connors" or "O'Connor."

Death Claims One of Cramp Family.

Samuel A. Cramp, son of William Cramp, founder of the William Cramp & Sons Ship and Engine Building Co., of Philadelphia, died at his home in that city on Sunday last, 3rd inst. He was 79 years of age. At one time president of the company, Mr. Cramp retired from active business about 15 years ago and since has been engaged largely in philanthropic work.

AMERICAN TIRE EXCELLENCE REASON FOR EXPORT GROWTH

Small Promise for an American Tire Factory Abroad, However, Says De Lisser—Influence of "Polite Graft" Far Reaching.

Horace De Lisser, chairman of the board of directors of the Ajax-Grieb Rubber Co., is one man who is not surprised at the substantial growth of American tire exports.

"Do I think that American tires are better than those made abroad?" he said, repeating a question that had been asked him when the subject was being discussed. "I don't think so; I know it!" he added positively.

As De Lisser only recently returned from a close range investigation of foreign conditions, his opinion is worth something. When he went abroad, De Lisser had in mind the establishment of one or more Ajax tire factories in Europe, and, although his visit was due largely to inducements which had been held out by several of the more prominent automobile manufacturers, he found the prevailing conditions such as to discourage endeavors along the manufacturing line.

"They sell tires very much as they sell butter and eggs," he stated, "and the system of polite graft is so extensive as to have become almost a recognized feature of the business. It is not merely the chauffeur who seeks his 'bit' but friends and relatives often must be taken care of, while in the sale of cars, even knights, dukes and barons are not above offering their influence for hire and collecting graft when a sale is made. They know practically nothing of tire guarantees on the other side, and if a car owner obtains 2,000 miles from a tire he considers, or is told to consider, himself fortunate. Prices also are at sixes and sevens and, although their actual proportions differ little, the prices of tires in inch sizes are so much higher than figures that prevail for millimeter sizes as to be almost un-understandable."

Sues Garageman for Repaired Car.

Because of differences which arose between them, and because the garage owner would not deliver the car when it was demanded, Brown's Garage, in Fairfield, Conn., has been made the defendant in a suit brought by F. H. Wells, not merely to recover the Buick car which he had left in Brown's establishment, but for $300 which he claims he would have made had he been able to obtain possession of this piece of property.

Three months ago the car was badly damaged through an accident. It was taken to Brown's Garage for repair. When the owner called for it, trouble arose and delivery was refused. Meanwhile, Wells alleges that he had an opportunity to dispose of the car, but as Brown refused to relinquish it the sale fell through, which, according to Wells, lost to him the sum of $300.

Channon's Tire Grip Appeal Argued.

The appeal of the H. Channon Co., alleged to infringe the Parsons patent, No. 723,299, owned by the Weed Chain Tire Grip Co., was argued Friday last, 1st inst., in the United States Circuit Court of Appeals in Chicago; the District Court on April 25 of this year granted the Weed company a preliminary injunction against the Channon company and a reversal of this ruling is sought on the grounds that the lower court erred in so deciding, a plea commonly made in seeking relief of this nature.

The Channon company manufactured the Gripwell and Roughshod grips, which are of the anchored type, and in the court hearings the anchored feature of the product is made an important point, the contention of the defense being that the fastening of the chains so that they cannot creep as does the Weed chain removes their infringing feature.

Judgments Pile up Against Courtney.

Although several judgments in which the name of Courtney appears and in some of which the Courtney Tire & Rubber Co., of New York City, is named as debtor, have been filed recently in the New York county clerk's office, most of them are directed at William J. Courtney himself. One against the tire company, for paper of about $200 value which was not met on time, was satisfied, but there are at least several unsatisfied against Courtney. One for $3,000 is held by Thomas A. Desmond, a crude rubber importer, who accepted a note as payment for goods. Others, for some $300, are for rent of an apartment at 542 West 112th street, New York City, the agents, Albert E. Gibbs and Charles W. Kirby, being the creditors.

Garagemen to Manufacture Trucks.

The Empire Automobile Co., which operates a large and well equipped garage in Glens Falls, N. Y., has leased the remainder of the building at 45-47 Warren street, in that city, a portion of which it heretofore has occupied, and in which the manufacture of trucks will be carried on in a limited way. The owners of the company, Frank M. Starbuck and Daniel H. Cowles, already have built several trucks which are in use in Glens Falls, and therefore do not lack experience.

KLINE HEADQUARTERS TO BE REMOVED TO RICHMOND

Removal from Pennsylvania Already Well Under Way—Imposing Factory Erected in Virginia Capital by Virginia Capitalists.

Virginia capital, which last year was invested in the Kline Motor Car Corporation finally has brought about the removal of that company from York, Pa., to Richmond, Va. At the time the Virginians acquired an interest in the Kline corporation, it was stated that plants probably would be maintained in both York and Richmond, but it now transpires that so far as manufacturing operations and the conduct of its business affairs are concerned Richmond, Va., will be the Kline headquarters. The plant in York will not be wholly abandoned, but instead of being a factory it will be continued merely as a service station and salesroom.

The removal of the Kline machinery and other factory equipment has been in progress for some time, and so soon as the transfer is completed James A. Kline, general manager, and other officials of the company, as well as a large number of employes, will follow the machinery and take up their abode in the Virginia capital.

The factory in the latter city has been completed at a cost of more than $100,000 and, as the accompanying illustration serves to show, it is an imposing structure. It is formed of two parallel wings, connected at one end by a larger wing, in front of which and connected with it being a two and one-half story office building of the Colonial type. The main structure is of brick with white stone trimmings and cement floors. Each of the wings is 600 x 60 feet, the building connecting the two main wings being 30 x 60 feet. Within the court, between the two main factory structures, are the tracks of the Seaboard Air Line, which implies that the Kline corporation will be well situated both to receive and despatch goods. The new plant will afford a capacity of 2,000 Kline cars a year.

FACTORY IN RICHMOND, VA., ERECTED FOR OCCUPANCY OF KLINE MOTOR CAR CORPORATION

Schebler Not Wholly Lost to Wheeler.

Although he has retired from active participation in the affairs of the Wheeler & Schebler Co., as stated in Motor World last week, George M. Schebler still will serve as its consulting engineer and will, after his return from an extended vacation, be within call of his former partner, F. H. Wheeler. The company's name will remain unchanged and Wheeler's name will continue on his office door, as it is expected that he will be around the factory more or less when in Indianapolis.

Start-Lite to Remove to Michigan.

The Start-Lite Co., maker of the lamp lighting device of that name, is preparing to remove from Chicago to Muskegon, Mich., where it will establish itself in the former Henry motor car factory. It is expected that the removal will be completed about December 1st.

Stevens Succumbs to an Operation.

Following an operation, Frank M. Stevens, head of Stevens & Co., New York, who handle several important automobile accounts, died at his home in Rutherford, N. J., on Monday, October 28th. He was 53 years of age and is survived by his widow and two children.

COURT DECLINES TO DRAW COLOR LINE FOR TAXICABS

Ends Fight of New York's Biggest Operator for Distinctive Color, Even Though 'Tis Yellow—Victory for Independents.

"It is too well settled to require extended discussion that anyone may monopolize a particular color," is the language in which Judge Greenbaum, in the Supreme Court for New York County, on Monday, 4th inst., made decision in the fight of the Yellow Taxicab Co. to pre-empt yellow for its own purposes. Previously the Yellow Taxicab Co., which is the largest operator of those vehicles in New York City, and whose cabs are distinguished by a bright yellow color, styled Bristol orange, had obtained preliminary injunctions against a large number of independent operators and seemed in a fair way of monopolizing the color at stake. In his opinion, however, Judge Greenbaum states that the company was not entitled to a preliminary injunction, and in refusing to make the injunction permanent during the continuation of the case, he of course disposes of the temporary restraining order. His decision was rendered in the case of the Yellow Taxicab Co. vs. the City Taxicab Co., but six other similar cases were disposed of at the same time, his opinion applying to all. It is as follows:

"Plaintiff seeks to enjoin pendente lite the defendant as well as six other defendants in separate suits 'from maintaining and operating for hire taxicabs on the streets of New York so long as said taxicabs shall

Digitized by Google

be painted or decorated a bright yellow color, which is more technically described as "Bristol orange," or in imitation thereof, which said color is applied on cabs, and the wheels painted the same yellow hereinbefore mentioned, and the spokes thereof striped with black and the bolt heads in the wheels painted black.' The complaint in each case is a printed form identical in language, saving only in the insertion in typewriting of a given number which the particular defendant displays upon his car.

"The plaintiff claims to have built up at great expense a successful business and acquired a large patronage by a carefully supervised system of operating its cabs, and that the distinctive yellow coloring of taxicabs as above described with spokes 'striped with black and bolt heads in the wheels painted black' was 'a well defined departure from the coloring of other taxicabs' in use prior to April, 1909, the time when the plaintiff's predecessor in title organized a corporation for the operation of taxicabs, which were and are known and advertised as 'Yellow Taxi' or 'The Yellow Taxicab.'

"A temporary injunction was obtained in each case upon the complaint and printed affidavits, identical in every respect excepting only that in the supporting affidavit of one Brazier there is a difference in the number of the cab of the given defendant, typewritten in a blank space reserved for that purpose. Brazier's affidavit is the only one which attempts to connect the defendant in each case with the alleged acts of unfair competition or infringement of plaintiff's alleged rights in the exclusive use of the yellow taxicab above described. He alleges in his uniform printed affidavit respecting each defendant as follows: 'That I am familiar with the cab operated by the defendant. . . . That I have seen this taxicab operated in and about the streets of New York, and I have followed it and watched it for the purpose of seeing the methods employed by the driver to get passengers. I have frequently seen the driver of the defendant's cab standing near the curb, as near as he could get to the line of yellow taxicabs operated by the plaintiff company, with his door open, calling "First car out," and I have seen passengers go to his car remarking, "This is a yellow taxi," or words to that effect, and the defendant has refrained from telling them their mistake and has by his language in substance led them to believe that he was operating a "yellow taxicab." . . . The car operated by the defendant so closely resembles the cars of the plaintiff company that it is not easily distinguishable from the cars operated by the plaintiff company and so closely resembles the cars of the plaintiff company that the public is deceived and misled.'

"Each defendant positively denies that he represented by act or word his cab as a yellow taxicab of the plaintiff, or did or said anything to mislead anyone using his cab in believing that it was the cab of the plaintiff. The acts complained of are twofold: First, that the defendant's cab so closely resembles the cabs of the plaintiff in its coloring as not to be easily distinguishable therefrom, whereby the public is deceived and misled, and, secondly, that the defendants are guilty of unfair competition in deceiving the public by the manner in which they solicit patronage. There is not a scintilla of evidence from which the court may draw its conclusions of fact as to the way the defendants' cabs are painted, the concluding paragraph of Brazier's affidavit being the only allegation bearing thereon.

"It is thus apparent that the moving papers are totally deficient in a most essential particular. But as the counsel for the defendants conceded upon the argument that the cabs of their clients were painted in a yellow color and in that respect were similar to the cabs of the plaintiff, I will briefly touch upon this feature of the case. The defendants deny that plaintiff and its predecessors were the first to adopt the use of yellow colored taxicabs as described by plaintiff, and allege that such yellow colored cabs have been in operation to a considerable extent before the plaintiff or its predecessors engaged in the business of operating taxicabs. But aside from the issue of prior use, it is clear from the plaintiff's presentation of the case that the broad claim is made to the exclusive right to use taxicabs for hire having a yellow covered body and chassis.

"It is too well settled to require extended discussion that no one may monopolize a particular color. The only cases in which the courts have recognized the exclusive right to a color are those in which the particular color was employed in combination with other characteristics, which taken together presented a new and distinctive feature from that used by others engaged in a like business (Ohio Baking Co. v. Nat. Biscuit Co., 127 Fed. Rep., 116, 121; Diamond Match Co. v. Saginaw Match Co., 142 Fed. Rep., 727, 728). As was aptly said in the Diamond Match Co. case (supra): 'The primary colors, even adding black and white, are but few. If two of these colors can be appropriated for one brand of tipped matches, it will not take long to appropriate the rest.' It follows that plaintiff was not entitled to the temporary injunction, which must be vacated, and that the motion for an injunction pendente lite must be denied."

Hayes Offering of Preferred Stock.

In order to retire a large part of its floating indebtedness, and to furnish additional capital to handle its increased business, the Hayes Mfg. Co., of Detroit, is offering for public subscription $100,000 of its 7 per cent. cumulative preferred stock, which represents the unsold portion of a total issue of $250,000. The offer brings out that during the past four years the company's net profits have averaged $75,000 and that the business in sight for 1913 amounts to $1,500,000, on which it is estimated a profit of $150,000 will be earned. The total assets of the company, which is one of the largest manufacturers of sheet metal automobile parts, are four times in excess of the amount of the preferred stock.

Weidley Heads Indiana Engineers.

George A. Weidley, chief engineer of the Premier Motor Mfg. Co., was elected president of the Indiana Division of the Society of Automobile Engineers at the annual meeting in Indianapolis on Friday last, 1st inst. Chester S. Ricker, chief engineer of the Henderson Motor Car Co., was chosen treasurer, and H. W. Deupree, of the Remy Electric Co., secretary.

During the evening the subjects of ignition and engine starters was generally discussed, point being given to the discussion by the presence of E. V. Hartford, of the Hartford Suspension Co., who explained in detail the operation and the idea behind the electric starter of which he is the inventor. M. Raginel, of the Ignition Starter Co., also dealt with the subject, reading a paper which treated starters of the various types.

To Girdle Globe for General Motors.

L. W. Place, who has had experience with both the Buick and Olds companies, has been appointed foreign representative of the General Motors Co. He already has his plans well in hand, having sailed from Vancouver, B. C., on October 30, for Sydney, Australia, which will be his first stopping place. He will be absent about 18 months, during which time he will visit every country of promise on the eastern hemisphere.

Canadians Take on Buffalo Electrics.

The Universal Electrical Economy Co., Ltd., of Montreal, Can., has secured the agency for Buffalo electrics for all that portion of the Dominion lying east of Windsor, Ont. At the present time, the Universal company maintains salesrooms and service stations in both Montreal and Toronto.

To Enlarge Federal Motor Works.

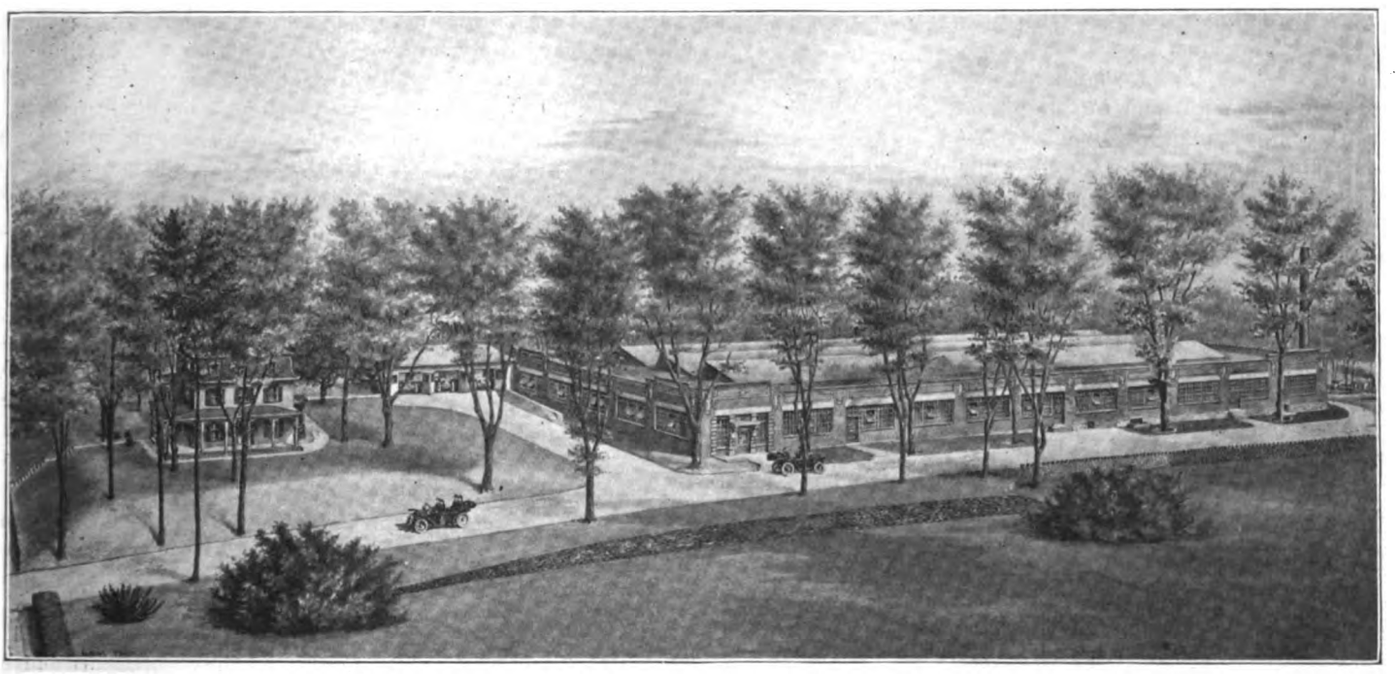
The Federal Motor Works, of Indianapolis, which is owned by John N. Willys, is making ready to enlarge its plant. The addition will be a one-story structure, of sawtooth construction, 50 x 450 feet.

Digitized by Google

The Week's Incorporations

Washington, Pa.—Croton Motor Car Co., under Pennsylvania laws, with $300,000 capital; to manufacture motor cars.

Cleveland, Ohio—Perrine Mfg. Co., under Ohio laws, with $10,000 capital; to deal in motor cars. Corporators—R. A. Wilbur and others.



Akron, Ohio—Akron Welding Co., under deal in lubricants. Corporators—John M. Madole, Lewis Madole, Leo B. Davis.

Roanoke, Va.—Southern Motor News Corp., under Virginia laws, with $15,000 capital; to publish motor car statistics. Corporators—J. M. Stevens and others.

Moline, Ill.—Williams McLean Garage Co., under Illinois laws, with $3,000 capital; ital; to operate a garage. Corporators—Henry E. Paige, Louis E. Smith, Charles H. Buell.

Ahstabula, Ohio—Owen Rubber Co., under Ohio laws, with $10,000 capital; to manufacture rubber goods. Corporators—Thomas J. Owen, F. M. Henry, Frank A. Owen.

NEW HOME OF THE ATWATER KENT MFG. WORKS IN PHILADELPHIA, PA.

The building, which is a single-story concrete and steel structure, measures 200 x 125 feet and affords 25,000 square feet of floor space; seventy-five per cent. of the wall area is given over to windows. The plant is located on the main line of the P. & R. R. R., near Wayne Junction.

Ohio laws, with $10,000 capital; to manufacture automobile parts. Corporators—Milton N. Smith and others.

Cleveland, Ohio—Owners Oil & Grease Co., under Ohio laws, with $10,000 capital; to manufacture lubricants. Corporators—James V. O'Donnell and others.

Ludlow, Mass.—Stens Mfg. Co., under Massachustts laws, with $200,000 capital; to manufacture motor car tires. Corporators—Ashley R. Reucher and others.

Seattle, Wash.—University Garage Co., under Washington laws, with $25,000 capital; to operate a garage. Corporators—Charles M. Betterton, C. M. Shannon.

Evanston, Ill.—Pennsylvania Oil Co., under Illinois laws, with $2,500 capital; to to operate a garage. Corporators—C. H. Williams, W. R. McLean, A. G. Abraham.

Boston, Mass.—A. W. Cox & Co., under Massachusetts laws, with $10,000 capital; to operate a garage. Corporators—Arthur W. Cox, Charles B. Baldwin, Nelson B. Todd.

Chicago, Ill.—Electric Motor Chair Co., under Illinois laws, with $50,000 capital; to manufacture motor vehicles. Corporators—C. B. Crysler, J. G. Bennett, C. B. Traver.

Dover, Del.—Perfect Tire Sales Co., under Delaware laws, with $45,000 capital; to deal in motor car tires. Corporators—F. R. Hansell, G. H. B. Martin, S. C. Seymour.

Amherst, Mass.—Amherst Garage Co., under Massachusetts laws, with $15,000 cap-

Troy, N. Y.—Auto Salvage Corporation, under New York laws, with $2,000 capital; to deal in motor cars. Corporators—Michael Kennedy, Theodore P. Lowe, Mark F. Nichols.

Munice, Ind.—Props-Brooker Motor Co., under Indiana laws, with $4,000 capital; to deal in motor cars. Corporators—J. Cooper Props, George J. Brooker, Oliver P. Dunn, Jennie Brooker.

Chicago, Ill.—National Oil and Gas Generators Co., under Illinois laws, with $5,000 capital; to manufacture carburetters. Corporators—Walter D. Hawk, Sam S. Helmes, George E. Diersen.

Cleveland, Ohio—Lozier Sales Co., under Ohio laws, with $30,000 capital; to deal

Digitized by Google

in motor cars. Corporators—W. H. Miller, A. G. Weaver, W. D. Anderson, V. C. Erman, J. M. Brown.

Boston, Mass.—Eliot Motor Car Co., under Massachusetts laws, with $250,000 capital; to deal in motor cars. Corporators—Moses H. Libbey, Roscoe G. Houston, William D. Wallace.

East Orange, N. J.—Funger Motor Trucking Co., under New Jersey laws, with $100,000 capital; to operate a motor delivery. Corporators—M. G. Funger, A. J. Grosso, D. L. Horton.

Ft. Wayne, Ind.—Eureka Garage Co., under Indiana laws, with $10,000 capital; to operate a garage. Corporators—E. C. Smith, C. J. Buhr, T. B. Adams, A. C. Hobrock, H. D. Alderman.

Clearmont, Mo.—Clearmont Motor Co., under Missouri laws, with $5,000 capital; to deal in motor cars. Corporators—Guy C. Cleary, Willard G. Carpenter, Bert R. Reynolds, Fred C. Newton.

Augusta, Me.—Goodyear Tire & Rubber Co. of South America, under Maine laws, with $3,000,000 capital; to manufacture and deal in motor car tires, etc. Corporator—E. M. Leafitt, Winthrop.

Lima, Ohio—Glenmore Lubricant Co., under Ohio laws, with $17,500 capital; to deal in lubricants. Corporators—John W. Glenn, Don C. Henderson, B. A. Crites, W. M. Scott, W. L. Nepille.

Cleveland, Ohio.—Perrine Mfg. Co., under Ohio laws, with $10,000 capital; to deal in motor cars. Corporators—H. A. Wilbur, Charles D. Wichner, H. A. Burton, Benjamin A. Gage, A. D. Dole.

Albany, N. Y.—Albany Motor Racing Association, Inc., under New York laws, with $1,000 capital; to promote motor car races. Corporators—John D. Keeler, Rufus P. Keeler, Samuel H. Shaw.

New York, N. Y.—Cathedral Park Garage, Inc., under New York laws, with $1,000 capital; to operate a garage. Corporators—Morris Klein, Katie Klein, Samuel Klein, all of 101 West 114th street.

Albany, N. Y.—Carbone Co., under New York laws, with $200,000 capital; to manufacture tires. Corporators—W. E. Greene, 100 Reade street, New York City; G. C. Leonard and W. G. Van Loon, Albany.

Pittsfield, Mass.—J. & B. Mfg. Co., under Massachusetts laws, with $25,000 capital; to manufacture ignition and other automobile appliances. Corporators—Edward S. Jacobson, Floyd A. Knight, John J. Whittlesey.

Asbury Park, N. J.—National Automobile Owners' Association, under New Jersey laws, with $25,000 capital; to deal in motor cars and accessories. Corporators—Arnold M. Huslsart, William F. Pattison, David W. Edwards.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve To Place Many Workers In New Places—Few Leave the Industry.

J. G. Budd has resigned as manager of the Victor Motor Truck Co., of Buffalo, to become sales manager of the Sanford Motor Truck Co., of Syracuse, N. Y.

After seven years' service, Thomas J. Hay has resigned the management of the Ford Motor Co.'s Chicago branch. He has been succeeded by D. E. Keith, previously the Ford manager in Indianapolis.

Macolm B. Richardson has been appointed district manager for the Franklin Automobile Co., with headquarters in Atlanta, Ga. He is an old Franklin man, but latterly has been connected with the Remy Magneto Co.

Albert Engelhardt, vice-president and secretary of the Universal Truck Co. of New York, has resigned those offices. He, however, will remain in the trade, having secured the Metropolitan agency for Stegeman trucks.

C. L. Morgan, former manager of the electric division of the General Motors Truck Co., has resigned that office to become identified with the St. Louis Billing Machine Co. He will establish headquarters in New York.

L. A. Austin has been appointed sales manager for the Mais Motor Truck Co., of Indianapolis. Previously he was sales and advertising manager of the Rutenber Motor Co., which offices he resigned to engage in the truck business.

Morton H. Luce has resigned the management of the Velie branch in Chicago to join the sales staff of the Marion Motor Car Co., of Indianapolis. He will become its eastern sales manager, with headquarters in New York City.

Stanley H. Keller, formerly New York State salesman for the United States Tire Co. out of the Buffalo branch, has been appointed manager of the new United States Tire branch which recently was opened in Rochester, N. Y.

Charles D. Smith has been promoted to the post of production manager of the Winton Motor Carriage Co., of Cleveland. Walter H. Doddridge succeeds to the management of the Winton service department, which for some time past was filled by Smith.

The General Motors Truck Co. having discontinued its advertising department, F. W. Kurtz, of course, has relinquished his post as director of advertising. Hereafter each of the General Motors subsidiaries will maintain its own advertising and publicity department.

J. W. Hobbs, manager of the Goodyear Tire & Rubber Co.'s Buffalo branch, has been promoted to the management of the more important branch in New York City, to which the Buffalo establishment hereafter will be subsidiary. Hobbs succeeds J. B. Maus, resigned.

To succeed Robert E. Fulton, who has been promoted to the post of assistant sales manager, David C. Fenner has been appointed manager of the International Motor Co.'s New York branch. C. W. Stratford, consulting engineer of the company, also has been promoted to the post of chief engineer.

Because of ill health, H. E. Schonacker has resigned the general management of the Marvel Carbureter Co., of Flint Mich., and will remove to the western part of the country. When he is definitely located, it is probable that he will set up in the automobile business as an agent or manufacturers' representative.

Fred A. Harris, former middle west supervisor of the United States Motor Co., has been appointed assistant general manager of the Hupp Motor Car Co., of Detroit. Temporarily that office has been filled by Harry Fosdick, who remains with the Hupp company but who will assume the title of director of sales, which is more in keeping with the class of work he has in hand.

Furthering its policy of having "men on the ground," R. E. Dennison has been appointed district manager of the Stewart Motor Corporation, of Buffalo; he will establish headquarters in Chicago and will have charge of Illinois, Missouri and eastern Iowa. W. T. Butler also has been appointed a Stewart district manager but with headquarters in Buffalo. He will control New York State and northern Pennsylvania.

Bosch Engineer to Visit Europe.

Victor W. Kliesrath, chief engineer of the Bosch Magneto Co., of New York, is booked to sail to Europe to-day. He will make the rounds of most of the European automobile factories and, incidentally, visit both the London and Paris shows.

Regal Export Chief Again Goes Abroad.

R. M. Lockwood, head of the Regal Motor Car Co.'s foreign department, sailed on Saturday last, 2nd inst., for a business tour of Great Britain and the Continent. He, of course, will be in attendance at both the London and Paris shows.

In the RETAIL WORLD

Warde L. Mack, of South Bend, Ind., has become a dealer; he has the Franklin line.

The Eckberg & Place Garage Co., of Fall River, Mass., has entered the selling field; it will stock Franklins.

W. J. Johnson, in Martinez, Cal., is building a new garage on property adjoining his present location.

A four-story garage and office building is being erected on 10th street, Des Moines, Ia., by The Herring Co.

V. L. Prazak and A. C. Fajman have secured a site upon which they will build a garage in Howells, S. D.

W. F. Gullick, of Onawa, Ia., has purchased a garage in Sloan, in the same state; he will deal in Overlands.

Spencer Wright has leased a new garage which is being erected in Oneonta, N. Y. Elvin Easton is the owner.

Thomas Vreeland has purchased the People's Garage in South Bend, Ind. He already has taken possession.

Clyde Waters has purchased a garage in Jefferson, Tex. He also conducts an agency in Perry, in the same state.

Fred Damp and Fred Tillisch have let the contract for a garage in Walnut Grove, Minn. It will be 44 x 60 feet.

Edgar S. Harrington, proprietor of the Milford (Del.) Garage, is about to erect a new building for his business.

J. H. Hileman of Waterloo, Ia., is opening salesrooms at 310 West Park avenue; he will represent the Haynes.

The Elyria (O.) Auto Sales Co., which rerently was organized, has let the contract for its garage and salesrooms.

The Highland (Cal.) Garage has been purchased by A. A. True and N. Levering; they will add a machine shop.

E. L. Clauss & Son have opened a garage in Hollywood, Cal., at 6450 Selma avenue; it is styled Baker Garage.

Bruno Seibel, a well-known racing driver on the Pacific Coast, has opened a garage at 773-9 3rd street, San Diego, Cal.

F. A. Hoyt and H. M. Garretson will soon establish a garage in Lansing, Ia. They have the Overland agency.

John Bertelson of Litchfield, Minn., plans to enter the selling field in Valley City, N. D. He will form a copartnership.

J. L. Bell and Ralph Wilson have entered the garage trade in Salt Lake City; their place of business is on State street.

E. H. Knoop of Chicago has let the contract for a garage to be erected at 666 Sheridan road; the approximate cost is $5,000.

Permission has been granted to Frank L. Roberts to build a garage at 1595 Massachusetts avenue, Bainbridge, Mass.

J. B. Thompson of Louisville, Ky., has secured authority to build a brick garage at 3d and A streets; it will cost $3,000.

John Christensen & Co., of Galveston, Tex., are about to build new salesrooms on Tremont street; they will cost $20,000.

Marshall Miller of Freeport, Ill., has taken over the garage and selling business formerly conducted by John Rosenstiel.

Dr. H. G. Gross and G. F. Pease have entered the supply field in Eureka, Cal. The firm style is Humbol Auto Supply Co.

Waterland & Andrews are building a garage at 6th street and Broadway, Chico, Cal. It will represent an expenditure of $10,000.

The Heilbron Rubber Co. has opened up on East Union street, in Pasadena, Cal. Miller and Gibraltar tires will be stocked.

W. L. Hicks, trading as Hicks Auto Supply Co., has engaged in business in Nashville, Tenn. He is located at 804 Broadway.

The Pioneer Commercial Co., dealer in trucks and sight-seeing cars in Los Angeles, Cal., is to build new quarters on Alameda street.

S. E. Raub has secured permission to erect a garage at 3024 North Meridian street, Indianapolis. The cost is estimated at $3,000.

A. M. Belina of Owatonna, Minn., has sold his garage business to George Klemmer; Belina was the first garageman in his town.

The Sperl Garage, in New Ulm, Minn., has been purchased by Edward Larson and John Nagel; the firm name will be Larson Auto Co.

Glenn A. Calkins has taken over the Ford agency in Riverside, Cal. He also has opened a garage and salesrooms at 446-48 8th street.

The Green Motor Car Co., of Newark, N. J., plans to erect a one-story garage, 60 x 50 feet, at 9-13 Bleecker street; it will cost $6,000.

W. Matthal has had plans prepared for a garage which he will have built at 2533 Prospect street, Kansas City, Mo. It will cost $4,000.

The Pullman Taxicab Co., of Philadelphia, Pa., will build a three-story garage, 74 x 86 feet, at 1542 Wood street; it is to cost $45,000.

Frank Fosha and L. P. Larson have opened a garage in Green Bay, Wis., at 206-7 Washington street; the style is Washington Garage.

I. C. Golden of Nevada, Ia., has purchased from J. R. Davidson the Hudson and Krit agencies; he will display his lines at Post Bros.' Garage.

O. R. Fuller of Los Angeles, Cal., is to build a two-story garage at 719 North Alameda street; the specifications name $20,000 as the cost.

A. V. Rothwell has bought the Koch Garage, at South Ashley and Madison streets, Ann Arbor, Mich. He is the Buick dealer in that city.

Charles McKenzie and Frank Cockburn have purchased the Milton (Ore.) Garage from George and Bert Miller; the consideration was $2,000.

The Greenleaf Automobile Co., of Waterville, Kan., has purchased the Thomas agency in that town; A. C. Geffert is the Greenleaf manager.

A garage is being built at 13th street and Grand avenue, Milwaukee, Wis., for the W. E. Allen Co. It will represent an expenditure of $15,000.

The Star Garage, in Mishawaka, Ind., has been sold by W. M. Stark of Elkhart to Robert Harvey. Harvey also operates the Harvey Auto Livery.

H. Penner and W. D. Angel, of Milwaukee, Wis., plan to build a garage on Oakland avenue, between Folsom place and Newberry boulevard.

R. S. Keeves of Oregon, Mo., has sold his interest in the J. H. Keeves Automobile Co. to his son, John H. Keeves; the consideration was $6,200.

Albert E. Whitney, of Elmira, N. Y., has bought the building formerly occupied by the Empire Mobile Car Sign Co., and will open a garage therein.

Digitized by Google

Webster City, Ia., is to become possessed of a new garage. It will be erected by Hanson & Tyler, who will expend $30,000 in its construction.

Central Garage Co., Inc., is a new entry into the garage field in Nashville, Tenn. It has opened up at 124-32 Third avenue. H. A. Williams is president.

P. B. Christian, Elmer Farmer and Ernest Loel are to open a garage in Waverly, O. The same location previously was occupied by Ehrman & Gordon.

The Omaha (Neb.) Taxi Co. has bought out the business and equipment of the Paxton Taxi Co. The deal carries rights to the stand in front of the Paxton Hotel.

Jay Livingston and William L. Crosson have purchased the Hiatt & Reader Garage in Hastings, Neb. The firm style will be Livingston & Crosson; they have the Krit agency.

James Morris, for some time manager of the Chalmers repair shop for the Union Supply Co., of Toledo, O., has entered business for himself; he has opened up a repair business at 109-11 11th street.

Warren L. Seeley, for three and one-halt years secretary of the St. Paul (Minn.) Commercial Club, has resigned to enter the automobile business; he is associated with M. J. Osborn, St. Paul distributor of White and Detroit electrics.

The recently organized Owl Garage, at 2313 Hennepin avenue, Minneapolis, Minn., has taken the Agency for Woods electric cars; a service station has been opened at Hennepin avenue and 24th street. Fred H. Day and Harry J. Murphy constitute the organization.

The Albany (N. Y.) branch of the Franklin Automobile Co. has been sold to Clarence G. Heck, who will continue it as a dealer; Heck was manager of the branch for several months past and has been connected with the company in other capacities for several years.

The Central Garage & Supply Co., of Toronto, Ont., is erecting a seven-story concrete building at Shepherd and Temperance streets, wherein it will handle the sale of Abbott-Detroit cars; the structure will cost $150,000 and will have 255 linear feet of display windows on the ground floor. T. S. Blues is president and Thomas Enright, secretary and treasurer.

Reversing the usual order of things, the Dodge Motor Vehicle Co., of Cambridge, Mass., which heretofore has handled gasolene cars, has relinquished them wholly in order to devote itself to the sale of Buffalo electrics, for which it has secured the agency for six counties in Massachusetts. The Dodge company already has two immense garages — one in Cambridge, the other in Boston—and shortly will open a salesroom near the corner of Boylston and Gloucester streets, in the latter city.

Abbott Motor Car Co. of Cleveland is the style under which a new Abbott-Detroit agency has been established in that Ohio city; it has a territory of several miles radius and has temporary quarters at 2027 Euclid avenue. The officers of the company are: President, W. F. Schmitt; vice-president and general manager, C. H. Davies; secretary and treasurer, J. J. Schmitt.

More Branches on Makers' Trees.

The United States Tire Co. has opened a branch in Washington, D. C. It is located at 1303 H street.

The Dayton Airless Tire Co., of Dayton, O., has opened a branch in Cincinnati, at 803 Race street. It will be in charge of D. H Phister.

The Stromberg Motor Devices Co., of Chicago, has opened a branch in Detroit at 465 Woodward avenue. It is in charge of N. H. Minniter.

The Haynes Automobile Co., of Kokomo, Ind., his established a branch in Fresno, Cal., of which W. G. Dandy is manager. It will be subsidiary to the Haynes branch in San Francisco.

The Kline Motor Car Corporation has opened a branch in San Francisco which will be under the direction of Frank C. Renstrom & Co. It will control practically all the Kline business on the Pacific Coast.

The Cutting Motor Car Co., of Jackson, Mich., is about to establish a factory in Kansas City, which will be in charge of H. Beach. The branch will control parts of Missouri, Texas, Oklahoma, Kansas and New Mexico.

Minor Business Troubles.

Following the filing of a bill of complaint by the Fisk Rubber Co., a receiver was appointed last week in the Federal court in Baltimore, Md., for the Southern Auto and Marine Supply Co. The rubber company claims an indebtedness of $275.31.

Creditors this week filed a petition against the Central Tire Supply Co., of 2540 Broadway, New York City; the petitioners and their claims are: Diamond Rubber Co. of New York, $1,024; B. F. Goodrich Co., $453; Lowe Motor Supplies Co., $127.

On the petition of creditors, United States Judge Day, in Cleveland, O., last week, appointed a receiver for the Ohio Auto Carriage Co., of which Ralph Goldsworthy is proprietor. The petitioners are Dr. H. D. Champlin, the Horning Electric Co. and the Allenized Water Co., all of Cleveland.

The George F. Wallin Co., Inc., of 266 West 58th street, New York City, dealer in accessories, on Friday last, 1st inst., made an assignment to Louis Frankel for the benefit of its creditors. The company was incorporated March 27, 1911, with a capital stock of $10,000; George F. Wallin was president and Charles A. Christman secretary and treasurer.

An involuntary petition in bankruptcy was filed in the Federal court on Monday last, 4th inst., against the Auto and Aeronautic Supply Co., of 2100 Broadway, New York City, by the H. Philips Rubber Works, the Century Tire Co. and the Stein Laplock Tire Co. The liabilities are $3,400 and the assets $2,500. Henry Philips was appointed receiver with authority to continue business 20 days.

New Process Completes Plant Enlargement.

The New Process Rawhide Co. has enlarged its already extensive plant in Syracuse, N. Y., by the addition of a four-story wing extension, 65 x 185 feet, at right angles to the old building, and by a heating plant, 60 x 50 feet, in the rear. The new buildings are fireproof throughout, having steel frame work, reinforced concrete floors, concrete roofs, brick curtain walls and steel window sashes. New equipment, to the value of $100,000, has been installed in the buildings, making what is believed to be the largest and most complete single building plant in the world devoted exclusively to gear making and gear fitting.

England's Exports and Imports Go Higher.

During the nine months ending with September, Great Britain's exports of cars, chassis and parts attained a value of £2,532,537 as against £2,126,602 during the corresponding period of the previous year. During the month of September itself, the exports increased from £273,301 to £340,125. For the nine-month period, the imports totalled £5,452,685 as against £4,565,193. For the month, the record was £531,059 as against £485,118 during September, 1911.

Deposit Dealer Disputes Tire Bill.

Difference of opinion over a bill of $66 is responsible for an action now being prosecuted in the Supreme Court for New York County by the Fisk Rubber Co. against William G. Dailey, a garage operator at Deposit, N. Y. It is in the nature of a disputed account.

Recent Losses by Fire.

Elgin, Ill.—Manley's Garage and fourteen cars destroyed. Loss, $17,000.

Rochester, N. Y.—C. D. Brown, garage and livery equipment destroyed. Loss, $50,000.

OVERCHARGING THAT CAN BE AVOIDED.

Not a little of the distrust with which car owners sometimes regard proprietors of repair shops is due to causes which, while not directly the fault of the repairmen, can be and should be remedied by them, for the consequences are injurious, from a business point of view. An example from real life will best bring out the point.

A new motor had to be installed in a car, and it was decided to put in one that differed considerably from the original engine. The repairman who was entrusted with the work made an estimate that was satisfactory, but he was not tied down to the figure he named. As the shop was crowded, the work was done in a neighboring shop, there being a working arrangement between the two establishments. A couple of trusted men were detailed for the job and were evidently implicitly relied upon. To make a long story short, the time required to install the engine was about double the estimated time and the bill presented exceeded the estimate by a large amount. Moreover, as it turned out, the work was most unsatisfactory and had to be done over again. The men "loafed on the job," doing practically nothing for days at a time, and yet convinced their employer that their time was honestly employed. The repairman made his bill accordingly, fought the objections to its amount and in due time received his check.

The discovery of the poor workmanship, coming after the payment of the exorbitant bill, cost the careless repairman many profitable jobs, for the story was somewhat widely circulated by the owner of the car. The case is by no means unique. There are not a few repairmen who take the word of their men for what is not so, and render what they believe to be honest bills; but they rarely escape being classed with the "sharks" and their reputations suffer accordingly.

The remedy is a systematic method of checking which will compel the men to account for their time in detail, so that any waste of time can be detected and stopped at once. With a good checking system, "soldiering" to any great extent is rendered very difficult, and leakage in many unsuspected directions can be effectually stopped.

SOLVING THE "SHOW ISSUE" PROBLEM.

Solving the used car problem is not the only difficulty that has confronted the trade. The solution of the so-called "Show Issue" in itself has constituted no small problem. While the used car problem always faces the trade, the "Show Issue" problem confronts the industry with greatest force at about this season of each year.

Every publisher who by any hokus-pocus can give his publication even a temporary automobile complexion feels justified in formulating and presenting to the trade a "Show Issue." Practically all of them are issued for advertising purposes only; the purposes they may serve and the good they may do are secondary considerations.

Of right, the automobile publications which work year in and year out for the interests of the industry are most entitled to consideration, but in many instances their Show Issues have left much to be desired and have not served the best purposes of those whom they are designed to serve. Always they have made their appearance at about the time the shows are nearing their completion; never at a time or in a form to permit intelligent planning on the part of dealers who attend the shows, or who would attend them were truly adequate information available.

In seeking to render this service, and to evolve a solution of the problem, Motor World has decided to issue its big Show Number three weeks in advance of the opening of the New York show. In other words, it will be a Show Information Number and will bear date December 28th. The information it will present, and the way it will be presented will be of real help to those who exhibit and to all who contemplate viewing the exhibitions; it will permit intelligent planning and promote and facilitate intelligent purchases. It means a breaking away from long established custom, but we believe it will be a departure that will be welcomed by exhibitors as sincerely as it will be welcomed by dealers.

Thanks to the unremitting efforts of their manufacturers, it no longer is possible rightly to place much blame on spark plugs for irregular running of the gas engine. Sooting and short-circuiting and cracking is the exception and not the rule nowadays. It has not been easy to bring these necessary adjuncts to the internal combustion engine to their present state of perfection, for theirs is a hard life; and they have a hard past to live down. But where there's a will there's a way, and the way to permanent improvement has been found and well established.

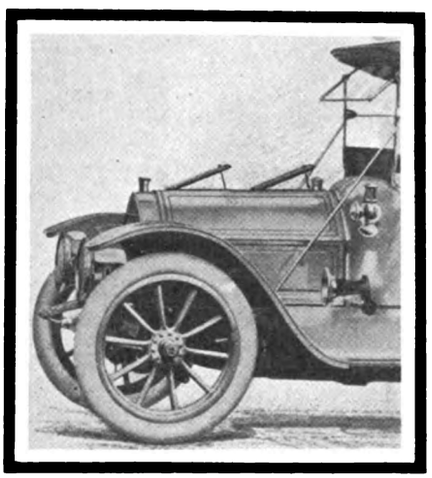
KEEPING JACK FROST OUT OF THE COOLING SYSTEM

Pros and Cons of the Best Three Methods Discussed—Why Alcohol Is Least Harmful—Proper Proportions to Use.

November is a seasonable time to recall the fact that the radiator of a car radiates just as effectively when the air becomes colder than the water as it does when the water grows warmer than the air. The result is that the radiator becomes a highly efficient freezer in winter—the more so for the reason that water that has been heated freezes more rapidly than water from which the air has not been expelled by heating. Therefore, something should be done to prevent freezing even when the air hardly seems cold enough to make any trouble in the circulating system.



Of course, there is the good old makeshift of throwing a robe or blanket over the radiator; but this has disadvantages other than the purely esthetic one of unsightliness. In the first place, the robe may be removed by some conscienceless miscreant. In the second place, the robe gives most protection where the least is needed and the least protection where the most is wanted. The warm air and warm water naturally rise and the colder elements settle to the bottom and are still further cooled by contact with the outer air; the pump, return piping and the bottom the radiator are liable to freeze in cold weather while the top of the radiator still may be comfortably warm. It helps somewhat to make a protector for the bottom of the radiator to retain heat at that point, for once the water freezes there it is decidedly difficult to thaw it without getting the car into a warm place. The safest procedure, however, is to fill the circulating system with an antifreezing solution and submit to the necessity for giving it a little attention.

The three substances that are most familiar as reducers of the freezing point of cooling water are alcohol, glycerine and calcium chloride. Each has its advantages and each has objectionable features. Alcohol is rather expensive, evaporates out of the water, leaving a weak mixture that has a problematic freezing temperature, is apt to be deceptive because the rate of evaporation is unknown, and has a deteriorating effect on rubber. Glycerine also has a disintegrating effect on rubber hose connections, and it decomposes at high temperatures with an accompanying evil odor. Calcium chloride sets up an electrolytic action on the metal that contains it, and, if impure, as it not infrequently is, also has a corroding effect. Alcohol is the least harmful of the three.

One part of alcohol to three of water will not freeze until the mercury drops to zero; 3½ parts of alcohol to 6½ parts water will stay liquid until the thermometer registers 15 below zero. A mixture of 25 per cent. glycerine and 75 per cent. water freezes a few degrees below zero, and by increasing the proportion of glycerine to 35 per cent. the freezing point goes down to 15 below zero. Calcium chloride 20 per cent. and water 80 per cent., by weight, will freeze slightly below zero, and 25 per cent. of the substance will bring the freezing point down to 20 below.

Little Known Features of Well Known Cars

That heated air rises, and that high temperatures and changes of temperature through wide limits can in no way be construed as being beneficial to paint and varnish are little points which are doubtless known to all those who have to do with the production of motor cars, but it is rare that use is made of the knowledge to insure longevity to the paint work on the hood which covers the motor. On Pierce-Arrow cars, however, cognizance is taken of both facts, and to the ample space around the flywheel which is afforded for the ventilation of the motor compartment has been added that afforded by two small ventilators on the top of the hood, by way of preventing chipping of the paint on the hood.

PIERCE-ARROW HOOD VENTS

As shown in the accompanying photograph, the ventilators are provided with hinged doors, the hinges positioned on the forward ends, so that when the car is in motion the warm air which otherwise would be pocketed up against the metal hood to the detriment of the paint work, is drawn off. In cold weather, when no added ventilating space is needed or during rainstorms, the ventilators can be closed, spring clips being provided to prevent rattling. Naturally, when the car is stopped, either the action of the fan, if the motor is running, or convection currents if otherwise, insure ventilation.

November 8-16, London, England—Society of Motor Manufacturers and Traders' annual show in Olympia Hall.

December 7-22, Paris, France—Paris Salon.

January 6-11, Cleveland, Ohio—Cleveland Automobile Show Co.'s exhibit in the Central Armory.

January 11-18, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Pleasure cars only.

January 20-25, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the First and Third Regiment Armories.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

January 27-February 1, Detroit, Mich.—Detroit Automobile Dealers' Association's show in Wayne Gardens.

January 27-February 1, Buffalo, N. Y.—Buffalo Automobile Dealers' Association's Show in the State Armory.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Pleasure cars only.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

February 10-15, Minneapolis, Minn.—Minneapolis Automobile Show Co.'s show in the National Guard Armory.

February 17-22, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in the Convention Hall.

March 3-8, Pittsburgh, Pa.—Pittsburgh Automobile Dealers' Association's show in Duquesne Garden.

SOLUTIONS OF THE USED CAR PROBLEM

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Four Best Articles Dealing With the Subject.

By MARSHALL L. COOPER, Denver, Colo.

As the best solution of the second hand problem confronting the trade, I suggest that the automobile manufacturers and dealers throughout the United States form an association and call in all the old wrecks, throw them into the scrap and pro rate the expense by assessment on all those who constitute the organization.

By JOHN WETAH, Racine, Wis.

There seems to be but one practical solution for the disposal of the old car, and it is within the ability of practically all legitimate dealers. It is a method that some dealers in large cities have pursued to some extent, but it does not seem to have been considered to any extent by the dealers in small towns. It is the reconstruction of the old models so that they can be used for commercial purposes, which usually can be done at very little expense, especially if the dealer is careful to place the car where it is best suited for the purpose.

There are hundreds of purposes for which old cars can be used and where they will give good service. Almost any retail merchant, contractor, real estate man, truck farmer, or expressman can use these old cars when properly equipped—and in most cases it could be equipped or converted at a very low cost. In most cases it simply would mean the fitting of a body-box back of the front seats, such as can be purchased from wagon makers at a reasonable figure or such as can be made by a local carpenter under the direction of the agent.

One thing the dealer must be careful of is not to misrepresent the capacity or ability of the car, or he will kill off many future prospects. He must from the start be prepared to stand back of any promises he may make, as he must not forget that he is now dealing with a class of people who are buying with a view of making money. Every successful purchaser will increase the dealer's business in this direction, and, per contra, a dissatisfied customer will kill many prospects.

I do not mean that the agent can take in trade all the old cars that are brought to him regardless of their age and worth and sell them for commercial purposes, because many old one- and two-cylinder cars are not worth the price of a new set of tires, and should be consigned to the scrap heap, excepting such parts as the dealer may be able to use in repair work. However, most of the four-cylinder models which have been made within the last three or four years are still good for commercial purposes and could be taken in trade at reasonable figures, and in some instances, after conversion, could be sold at a profit. If the small dealer prepares himself to handle the old cars in this way, he will find that many sales he now loses to the city dealers he will be able to make himself, and at the same time build up a profitable repair and supply business by the increased sales he will make during the season.

It looks as though many of the good low-priced car builders will build six-cylinder models, and while many of these will be new sales, there will also be many trades where the dealer must take the old four-cylinder cars as part payment; and as most dealers have only a limited capital to do business with they must prepare themselves for a market to dispose of the old models taken in trade, and there cannot be any better way of disposing of the old models than as outlined.

It is much better than unloading these old models and selling them to irresponsible people who should not be encouraged to buy automobiles, as they usually become a burden on the dealer, for it is frequently necessary for the dealer to keep such cars in repair for a considerable length of time, especially where such cars are sold upon time payments. This would not generally be the case where such a car was sold to a merchant, as it is easier to bank paper given by a merchant than paper given by a man dependent upon a salary for a living.

There is no better time than the fall of the year for the dealer to commence making his trades and getting in the old models, overhauling and equipping them with suitable bodies and finding customers for them—he can better afford to do this now than later, when he should be working on new prospects.

There are many arguments the dealer can use to enthuse the prospective purchaser with when offering an old model in this way—one in particular is that the car can be sold at a reasonable price—that it is a standard product; that repairs and replacements can be made with less delays than would be the case with most of the new light delivery cars now being offered, as most of them are assembled products, and while they are guaranteed by the manufacturers, some of them are not financially able to stand back of their experiments.

These arguments are sound, and if they are properly placed before the prospect they will bring results, as the price that can be made is a great temptation. Every agent should equip one of the old models himself and offer it for demonstration, but by all means keep it clean and do not have it nicknamed "Betsy" or "Maud," as is usually the case where there are hangers-on around the garage. Otherwise the dealer should go after this business as he would to sell a new car from the factory—but the chances of sales will be much better if the demonstrating car is kept clean and ready for business.

WIDE-AWAKE MERCHANDISING In the MOTOR TRADE

LEARNING FROM OTHER BUSINESS SUCCESSES.

Selling automobiles is a real business, after all. The "game" idea is being pushed so far back that it is almost out of sight and, figuratively speaking, the vast majority of dealers have taken in their belts a notch or two, rolled up their sleeves and pitched into real work.

Such dealers are learning to appreciate the meaning of merchandising and beginning to apply it to their business. They are studying the successes of the grocer, the hardware man and the department store. They realize that from these established businesses they may learn much that is of permanent value. They are looking for "germ" ideas from which they may evolve plans or methods of merchandising suitable particularly for the automobile business.

Department Store as a Model.

Naturally, the department store looms large on the horizon because of general success of such stores and because they display the merchandising instinct to an unusual degree. Of course, exactly the same methods cannot be employed in the sale of automobiles, but the same principles that make the department store a success will help any dealer in the more profitable conduct of his business.

The fundamental idea back of the department store is expressed in this thought: "It pays to do all of the things you can for the head of the family." The more things you can do for the family the more opportunities you have of doing them—at a profit.

Opportunities Within Easy Reach.

At once someone asks, "How on earth does that apply to the automobile dealer?" Nevertheless, it fits in with the modern idea of the automobile merchant in many ways. And once he gets the idea well fixed in his mind and begins to use his imagination and his vision the automobile merchant sees a wealth of opportunities at his door—nay, within his very reach—that he never saw before. He changes the department store man's slogan to read, "It pays to do as many things as possible for the automobile owner. The more things you can do for him the more opportunities you have of doing them—at a profit."

Doing Customers a Good Turn.

The moment an automobile dealer gets this idea—and acts on it—he becomes a merchant. He commences to look for opportunities for his customers. For instance, someone from a factory drops in and offers him a certain lot of tires "at a price." He can sell them under the market if he buys them and still make a profit. He knows what size is most in demand, so he 'phones half a dozen customers and tells them of the bargain he has for them—or posts a sign in the garage, quoting the special prices. He has done a good turn for every customer who takes advantage of his suggestion and has made a profit besides.

Big Things Have Small Beginnings.

Again, he hears of a special offer on spark plugs, on robes, on metal polish, on wrenches, tools, or whatever it may be. He handles lot after lot and cleans them out. Manufacturers' salesmen learn what he is doing and they come to him with special stuff. He sells not only to his own customers, but there soon comes in the man who bought a car elsewhere. He gives this man a splendid deal on what he wants, gives him every other attention, and the man comes again—gets into the habit of dropping in for supplies. He feels at home in the dealer-merchant's garage—begins to talk car—and pretty soon, instead of a spark plug customer the dealer has a car customer.

"The merchandising idea isn't so bad or so impracticable, after all," he ruminates. "It's helping to bring in new customers and it's helping me to keep the old ones."

This type of dealer sees still further opportunities. He sees at once how every man in his employ can be made a salesman. He interests them all in his plan. Next time a transient tourist drives in for gasolene and oil he gets it quickly—and while he is pulling out his change the garageman says, "How's the water in your radiator? Had I better put in a little?" "How about oil?" "Here's some great cylinder oil in one-gallon cans—most people like to carry an extra gallon—they feel safer with it," and so on.

People like to have things suggested to them. Often they forget or overlook the very thing they intended buying. With a force of employes working along these merchandising lines a profitable business can be built with very little, if any, increase in overhead expense.

DISCOURTESY THAT DRIVES AWAY TRADE.

Two men of more or less prominence in the Chicago accessory trade, and two of their friends were on their way to a funeral a few Sundays ago—all four were pallbearers and dressed accordingly. Discovering the need of more air in the tires, they drove into an Oak Park (Ill.) garage. The proprietor was there—but, alas! he was properly attired in "Sunday clothes," tennis shoes, etc.

"Can we get some air here?" politely asked one of the gentlemen.

"Yes; you'll find a pump over there in the corner," said the dapper proprietor, resuming the perusal of his Sunday paper.

They found the pump, of course, and inflated their tires, but—and here's where the moral lies—in the car were two "prospects," both of whom were going to buy a car very shortly, and one of them was rather keen on the car sold by this particular dealer.

As they went out the latter remarked: "If that's the 'obliging' agent I would have to

Digitized by Google

do business with, excuse me from buying a ——— car!"

Just as you never know where lightning will strike, so you can never tell when you are driving away a prospect.

The spirit of courtesy is always good business. The man who runs a garage has to do a lot of things for which he receives no thanks, but it's much better salesmanship to have the thanks coming than to have it the other way.

CLOSING SALES AND DEVELOPING PROSPECTS.

A Cleveland dealer, who handles five counties in addition to the city of Cleveland, keeps one salesman and a mechanic continuously on the road. They travel together, and as soon as they enter a town they get into touch with the live prospects. Where a sub-dealer is established, they help him and have been the means of closing many sales. In towns where there is no sub-dealer they learn through the merchants and town gossips who in the vicinity are interested in cars, and they go after them in earnest fashion. The plan has worked wonders in developing business where a catalog or photograph would not arouse more than passing interest.

KEEP REPAIR JOBS WELL OUT OF SIGHT.

The sight of automobiles in every possible stage of repair—some with engines dismantled, others with transmissions out, and again another with differential being fixed, is not calculated to inspire confidence in the product. Nevertheless, this is precisely the exhibit that greets the man at probably 50 per cent. of the garages at which he may call.

That repairs are necessary and that most of them are due to careless driving or neglect, may be true, bue it is no reason why repair jobs should occupy the center of the stage, so to speak.

The business of the automobile dealer primarily is to sell cars. Anything that will help him sell them should be featured. Anything that in the least hinders his sales should be retired to the background or take place behind the scenes.

This means that the separate repair shop, whether it is in the sales building, shut off by partitions, or in another building, is a vital element in modern automobile merchandising.

A Boston dealer who removed his repair shop from immediately below his salesrooms to a location two blocks away found that it paid, and paid well. Thereafter the angry wail of the disagreeable customer was never heard in the vicinity of the salesroom. Incidentally, he found that the efficiency of the separate repair department was immeasurably increased as a result of the separation.

It is well to remember the value of first impressions and to appreciate that it is good business to put one's "best foot foremost." Repair jobs out of sight are out of mind of the purchaser.

MAKING ADVERTISEMENTS SERVE DOUBLE PURPOSES.

One way to cash in on the manufacturer's advertising and link it up with your store is to cut out the advertisements as they appear and attach them neatly to the windows of the store or to bulletin boards placed in the windows.

In the last analysis the manufacturer's advertising is done for the benefit of the dealer and places him directly in touch with the consumer.

The weak part of a proposition always is when the dealer fails to recognize the opportunity and let it pass altogether.

A good plan is for the dealer to run his own advertisement in his local paper immediately following the appearance of the manufacturer's announcement in the big general magazines and weeklies and follow it up by the clipping and pasting procedure referred to. This costs little and focuses the big advertising campaign of the manufacturer down to each particular store, thus unmistakably identifying the latter as the place where the cars so advertised are sold.

A page advertisement from the Motor World, for instance, neatly clipped and trimmed and mounted on a clean, stiff piece of cardboard, with a heavy red or black line around to set it off, makes an interesting and valuable display that is sure to attract.

PAYS TO BE GENEROUS WITH FENCE SIGNS.

Garagemen seeking the tourist trade—and there's no end of them—find that one of the most profitable investments they can make is to sign-post the roads several miles in all directions. It helps the tourist and usually he goes straight to the garage so advertised. The inevitable conclusion is that the garage with enough enterprise and public spirit to do such good work deserves the most generous support. Of course, there is nothing new about the idea. The point is that there are thousands of opportunities for doing this work, which is a very inexpensive and fruitful form of advertising.

FREE AIR—WITH NO PRESSURE.

Of all the maddening things that can happen to a motorist, none is more irritating than to find that the pressure behind the supposed free air pump is taking a short vacation. Dealers who have this air pressure equipment in their garages will find that it pays to have it continuously on the job. Otherwise a piece of equipment that is supposed to draw trade is likely to drive it away.

ANOTHER SIX CYLINDER ADDED TO RUTENBER FAMILY

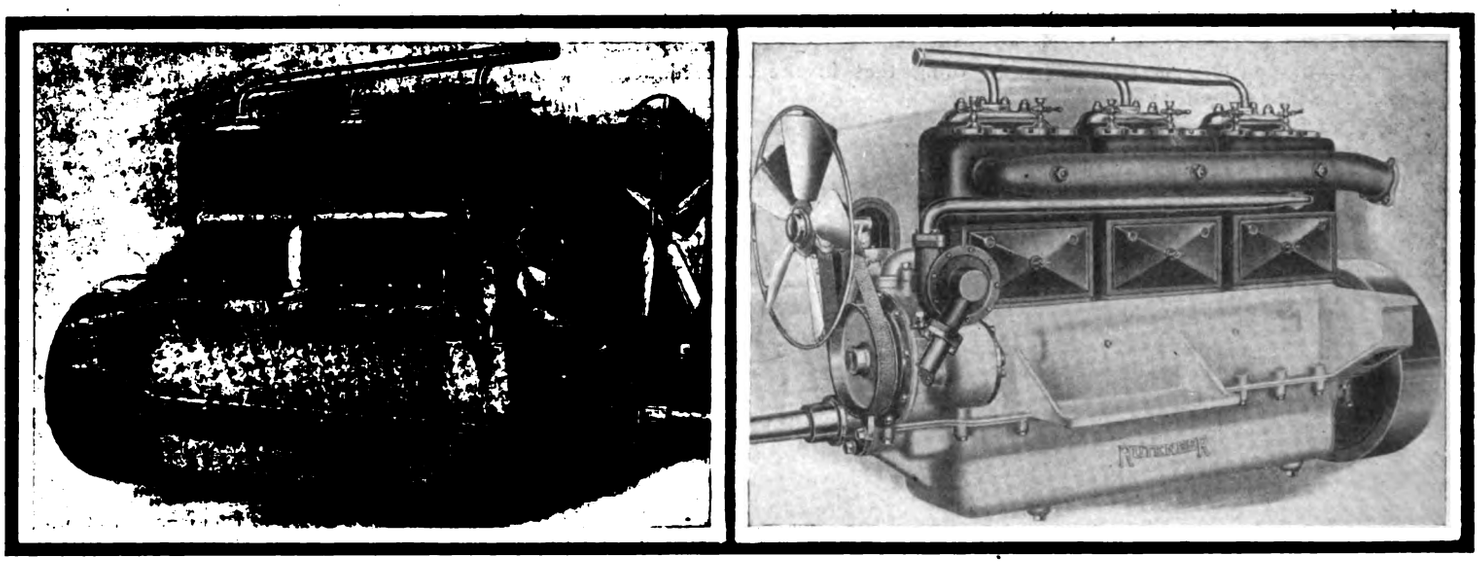
It Is of the Long Stroke Type With Cylinders Cast in Pairs—Provision Made for a Lighting Generator.

Supplementing an already comprehensive line of both motors and complete unit power plants, the Rutenber Co. of Marion, Ind., the $1,350,000 company which recently took over the Western Motor Co. of Marion and Logansport, Ind., former producers of Rutenber engines, has added still another motor, Model 28, the design of which differs in several respects from all of its predecessors. Its principal point of variance lies in the fact that its cylinders are cast in pairs instead of being cast singly, the latter construction having been one of the distinguishing features of all Rutenber motors until a short time ago, when a smaller model long stroke block motor was added to the line.

The new motor is a "six," and consequently the pair method of casting the cylinders permits of the increase in rigidity which this construction affords. Incidentally, by casting the cylinders in pairs, better facility for providing more liberal bearing space between the three pairs is obtained. The crankshaft is large in section and is mounted in four die-cast bearings formed of Hoyt's nickel Babbitt metal.

In dimensioning the cylinders, the company has relied upon its own experience in the production of successful long-stroke motors, and hence has adopted a conservative ratio or stroke to bore. Like the previous four and six-cylinder motors from which the new model gains most of its features, the bore and stroke are 3¾ inches and 5¼ inches, respectively. Similarly, many of the other construction details of the new motor reflect well-known Rutenber practice.

Silence Studied in Timing Gears.



The distinctive method of arranging the water pump and magneto shaft drive from a vertical shaft, for instance, is retained, as is the centrally split barrel crankcase and the lubrication system. By reason of the arrangement of the water pump shaft and magneto shaft drive only three gears are required, and as these are helically cut and are of wide face, wear and noise are reduced to the minimum. The crankcase is split on the center line with a large oil reservoir of eight quarts' capacity in the lower half. The lubrication system is of the combination splash and force feed type, in which the cylinders and pistons are lubricated by splash and the main bearings by pressure, two cam-operated pumps being provided, one forcing oil through suitable ducts to the bearings and the other pumping oil over the timing gear train in the front of the crankcase. The overflow serves to maintain a constant level in the crankcase compartment.

Motor Has Three-Point Support.

In common with several of the other types of Rutenber motors, the new engine is supplied with two different crankcase arrangements, the one being standard with the flywheel open and the other having the flywheel enclosed in a bell housing which is machined at its after end for the reception of any one of several standard gearsets produced by several manufacturers of such mechanisms. In any case, the motor is arranged to be supported at three points in the chassis frame and the flywheel is supplied machined for either cone or multiple disc clutch. All water pipes and intake manifolds are brazed brass tubing and the valve mechanism is completely enclosed by means of light, removable metal plates, thus rendering easy valve adjustments. The motor base also is supplied equipped with a bracket for the mounting of any one of a number of standard electric lighting generators.

Cylinders Difficult to Replace.

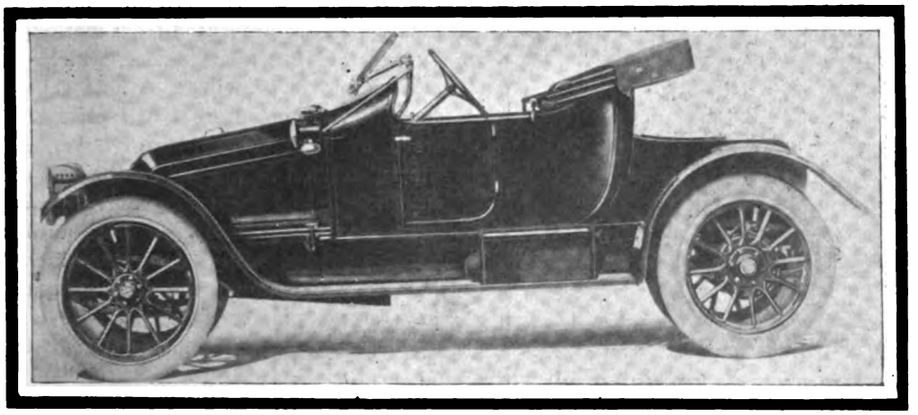
While it is a simple enough task for one man to put on a single cylinder and get the piston rings into the bore, it is very different when it comes to handling four cylinders cast en bloc. A very good method is to block up the cylinder casting on the crankcase just above the point where all the pistons, when the cranks are horizontal, are on the same level. Then by turning the crank two of the pistons can be worked into their cylinders and the cylinders let down until the other two can be eased in without withdrawing the first two. While this sometimes can be done by two men, it can be done much more satisfactorily by three.

INTAKE AND EXHAUST SIDES OF THE NEW RUTENBER "SIX," SHOWING LIGHTING DYNAMO BRACKET

Iron Pipe for Truing Grindstones.

A rough and ready tool for truing up a grindstone consists of a piece of iron pipe, the end of which is held against the stone at a slight angle and rolled across the face of the stone on a rest. A little experimenting will quickly show the best cutting angle.

Slot Facilitates Turning of Cap-Screws.



A small cap-screw that is difficult to reach with a wrench often can be turned by a screwdriver, a slot being cut in the head with a hacksaw. Such a slot should not be cut so deep as to weaken the head.

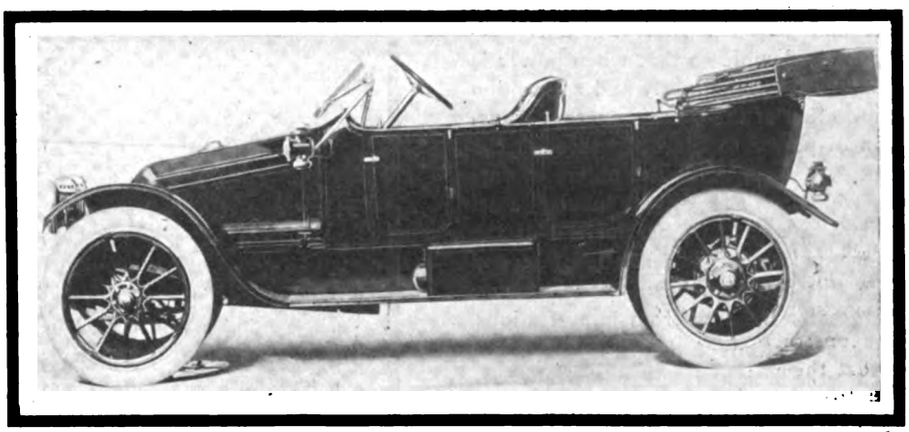
FRANKLIN HOLDS FAST TO THE "STAND PAT" POLICY

Little Room for Improvement Found in "Series Two" Cars—Phaeton Body Constitutes Chief Element of Novelty.

Except for a few comparatively unimportant changes in the details of bodies and the addition to the line of a single new body type, the H. H. Franklin Mfg. Co., of Syracuse, N. Y., launches its cars upon the second season of series production, as opposed to the yearly model idea, without alteration. So far as the chassis of the two six-cylinder and the two four-cylinder types are concerned, there is an entire absence of anything different from previous practice; there is not so much as a bolt turned over. The details of the air-cooling system, the valves and valve-operating mechanism, the lubricating apparatus—everything has been deemed so satisfactory as to be worthy of continuation under the Franklin nameplate.

NEW FRANKLIN "LITTLE SIX" 30-HORSEPOWER VICTORIA PHAETON



The new body, styled the victoria phaeton, is mounted on the "little six" 30-horsepower chassis, which made its initial public apeparance in January last, and which, according to the Franklin people, has proved so popular that 40 per cent. of the cars sold since that time have been built on the "little six" chassis. The new body is of the two-passenger variety, with a folding seat, dropping into the rear deck when not in use, upon which two extra passengers can be carried. The hood is of the sloping form that is characteristic of all Franklin models, and over the dashboard there is a deep, flaring cowl which swings easily into the lines of the forward part of the body; the sides and the doors are high, but there is sufficient length to the car as a whole, in conjunction with the skilful way in which the lines are worked out to avoid any of the awkward and "humpy" appearance that is apt to characterize a machine in which less designing ability is evident.

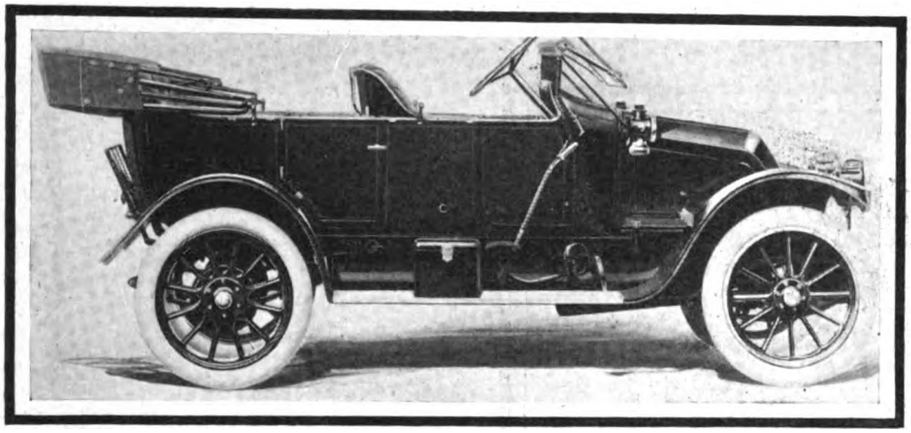
There are some slight alterations in the designs of the bodies of the model D and G touring cars—six-cylinder 38-horsepower and four-cylinder 25-horsepower, respectively, both for five passengers—which are noticeable more as general effects than as detail changes. Here there is a little rounding out and there a smoothing down of lines, the logical developments of body designs that are basically correct and need no more than gentle touches. It may be said that the result is a heightening of the effect of harmonious continuity that characterizes the bodies of all the Franklin models—a lack of any suggestion of cutting up the car into sections.

Series two consists of four chassis, the same as series one. Two of these carry four-cylinder motors of 18 and 25 horsepower, and two six-cylinder motors of 30 and 38 horsepower, respectively. The smallest chassis mounts only a two-passenger runabout body, is priced at $1,650, and its designation is model G runabout. The larger "four," like the smaller, mounts but one body, which, however, is a five-passenger touring type and is known as model G touring car; the price is $2,000. The popular "little six" is fitted with two bodies, the new victoria phaeton for two passengers and a five-passenger touring body. Both are known as M models and both list at the same price, $2,800. The biggest of the Franklins, the 38-horsepower "six," carries no less than four bodies. Model H limousine, at $4,750, and Model H seven-passenger touring car, at $3,750, each are listed at $250 less than their former prices in series one; model D five-passenger touring car and model D torpedo phaeton each are priced at $3,500. The two last named cars differ from the first only in that there is a slight shortening of the wheelbase.

A detail which comes under the head of added equipment and which tends to enhance the comfort of the occupants of the car in hot weather, when comforts most are appreciated, is the dust screen which is found in the model H limousine. The screen is placed back of the driver's seat, so that when the window is dropped dust is excluded, while the admission of air is practically unimpeded.

The well-known and successful Franklin air-cooling system, with its flywheel fan, air-jackets for the cylinders, partitioned hood and tight joints, of course remains the distinguishing feature of the car. The cylinders, separately cast in all cases, have integrally cast valve cages, avoiding possible leakage through joints. Valves are of special steel and specially heat treated in order to secure the highest possible resistance to the effects of the high temperatures to which they necessarily are subjected. All valves are in the cylinder heads and are operated by overhead gear and long push-rods. The exhaust valves, which have to withstand by far the greatest heat, are peculiar in that the steel heads are faced, on the seating surfaces, with cast iron fused on by oxy-acetylene welding; the object is to take advantage of the remarkable resistance of cast iron to corrosion and pitting and its natural lubricating qualities, due to the graphite content.

"LITTLE SIX" MODEL IN FIVE-PASSENGER TOURING CAR FORM



Digitized by Google

The bearings all are of the die-cast babbit type that, originated in the Franklin factory years ago, has been in use ever since. These are made in a special department of the H. H. Franklin Mfg. Co., which also makes bearings for automobiles of other makes.

Other Franklin features are the re-circulating oiling system, with separate leads to each of the main bearings of the motor and a sight-glass on the dashboard which shows the amount of oil delivered to the motor; Franklin carburetter with four jets and a hot-air supply which can be regulated by a butterfly valve; dual ignition system with high-tension magneto and a centrifugal governor that automatically controls spark advance; drive through multiple disk clutch with bronze and steel plates; three-speed gearset and propeller shaft which is purposely made flexible so that when power is applied it will twist slightly and so cushion the application of the driving energy; transmission of power to the body through the springs of the car, with the object of further cushioning the drive; tubular steel axles, laminated ash frames instead of the usual channel steel. The ash is of second growth, this selection being made because of the greater freedom from imperfections.

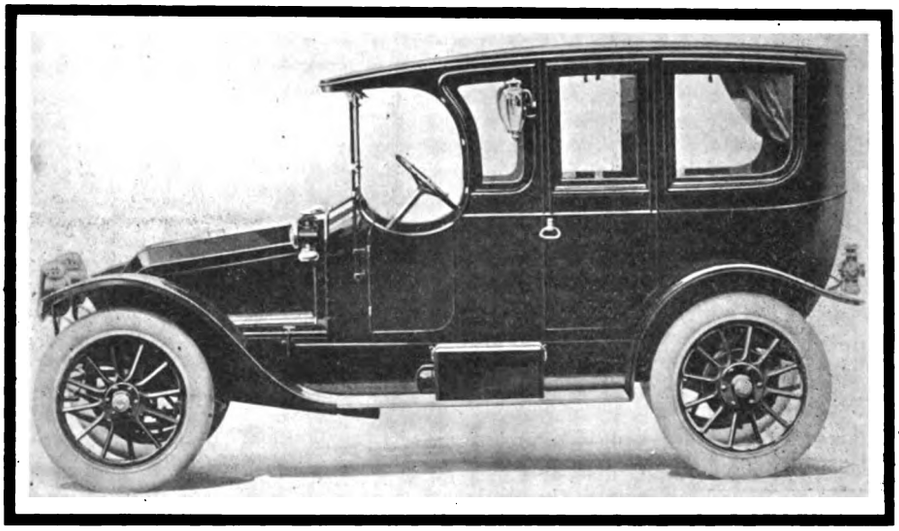
The construction of the Franklin car is such that the weight is comparatively low, and the tires are large in proportion to the loads they carry. To these facts, together with the resiliency of the wood frames and the excellence of the full-elliptic springs are ascribed the easy riding qualities that these machines possess.

In the matter of equipment, Franklin cars are sufficiently taken care of so that they are ready to go on the road without extra expenditure for things that usually are needed. The headlights are acetylene, supplied by a gas tank, while the other lamps are combination oil and electric, there being a storage battery to supply the current. There is a top, with side curtains and top cover, glass windshield, trunk rack, and the usual outfit of tools and tire repair equipment.

FRANKLIN FOUR-CYLINDER 25-HORSEPOWER STANDARD TOURING MODEL

Facilitating Production of Steel Pistons.

Steel as a material for the manufacture of gasolene motor pistons offers several important advantages, chief among which are lightness and strength. A drawback, however, is found in the very considerable expense of such pistons in the ordinary way, and it is with the object of combining the good qualities of steel pistons with cheapness of production that the Oxygen Welding Co., Ltd., of Birmingham, England, has developed an ingenious system in which a welding process takes a prominent part.



Short lengths of steel tubing are used for the bodies of the pistons. Through holes cut in the walls the piston pin bosses are inserted and welded from the outside. Steel disks are welded in to form heads, each disk having in its center a small projection by which the rough part is held in machining. After the welding has been completed the pistons are machined up in the usual way; but it is obvious that all that is necessary is to take off the roughness left by the welding and to accurately finish the working surfaces. The thickness of the tubing employed is no greater than is necessary to permit this work.

Tests of welded steel pistons, made under the hammer, are said to indicate that there is no weakness in the welded joints. The efficiency of the welding system and the low cost of the material used, notwithstanding its high quality, together with the small amount of machining required and the fact that very little material is wasted, all combine to keep the cost of production down to a low figure.

The regular stock pistons turned out by the Birmingham concern are fitted with pins which are prevented from working out by a rather ingenious device, which, however, is old in principle. A hole drilled in the pin contains a steel ball pressed outward by a fairly stiff spring. When the pin is inserted in the bosses the ball drops into a hole and the spring exerts sufficient pressure to keep the pin in place until it is sharply rapped with a hammer, which will force the ball down and free the pin. A key on the pin, engaging in a keyway in one of the bosses, eliminates the possibility of turning.

Connections as a Source of Trouble.

If an electric motor or a generator refuses to function, or runs with excessive sparking that cannot be traced to faulty brushes, incorrect brush position or other easily detected and easily remedied causes, the ends of the armature coils should be examined where they are soldered to the commutator bars, especially if the machine has been working very hard and has been unusually hot. Sometimes the solder melts and the ends of the wires are thrown out by centrifugal force, breaking the connection; and sometimes the wire itself is broken by centrifugal force and vibration.

MODEL H 38-HORSEPOWER "SIX" LIMOUSINE, WHICH SELLS FOR $4,750

REILLY'S STANDARD FOR MEASURING SALESMEN

Making the Size of the Obstacle Designate the Size of the Man, He Advises the Sales Manager Not to Renew Contracts with Complaining Dealers —Declares No Car is Hard to Sell if Salesman is Competent.

"Rough and rocky" was sadly lacking as a term descriptive of the session into which the Sales Manager had been plunged. Three against one is not fair odds in any fight, and when the battle is one of arguments and the trio has as support for its contention certain facts which seem unanswerable, the lone man is likely to perspire mentally and wish that some good fairy would wave her wand and end the struggle. In the solitary fighter's estimation, Joshua lost much of his greatness, even though that Biblical

THE TRIO OF BELLIGERENTS DEPARTED

hero had made the sun stand still for an hour so he could have more time to fight.

Three dealers, each one of them believing himself aggrieved and the victim of adverse circumstances, were hammering hard at the Sales Manager—in fact, they had been hammering persistently for months through correspondence, and now they were gathered at the factory to find out "why the company didn't build a good car." Resolved into its real form, the demand was not for a "good" car but a "perfect" car.

Dealers Demand Better Proposition.

They said there were many objections to the line—the cars were hard to sell because people kept bringing up the bad points, their business had not been all they had expected it would be when they signed up, they knew other lines of cars that offered the same commission and that had no weak points, and if the Sales Manager didn't come across with a better discount or agree to eliminate all weak spots they did not purpose signing up for the coming year —and each of the three thumped his fist on the desk when he delivered his ultimatum.

Sales Manager Acts Cautiously.

After two hours of harrying, the Sales Manager was tempted to tell the three to hurry for a warmer clime and consider themselves "fired" as dealers, but he disliked acting rashly. The trio of belligerents were picking up their hats preparatory to departing when the telephone tinkled.

"Mr. Reilly is here," said the telephone girl from the front hall. "He wants to know how busy you are."

As the Sales Manager responded, "Let him come in," the three said they would expect a definite decision within a very few days, and the Sales Manager's sigh of relief as they left could hardly have escaped their hearing.

Reilly a More Welcome Caller.

Storm clouds on the Sales Manager's face were not exceedingly uncommon, and Reilly had long since failed to let these frowns worry him to any extent. "More trouble, sure enough!" was his cheery greeting as he dropped his hat on the desk and settled into a chair.

"Don't sit in that chair," requested the Sales Manager; "the man who just sat there is one of the most disagreeable specimens I ever met. Sit over here," and Reilly, always willing to oblige, did as he was requested.

"What's the matter with him?" asked Reilly.

The Situation is Explained.

"Matter? Everything's the matter—and the other two are just like him, only not quite so bad."

"What are they up to now?" queried the dealer.

"The same old story, Reilly; they know more wicked things about our cars than I ever dreamed existed. They threaten not to sign up for another year. They say the cars are hard to sell, because they have so many weak points. They want better cars or more money. I'd like to cancel their contracts right now, but we've had them only one season and I don't like to have it look as if I had picked out three poor dealers. I don't see what ails them. Most of the other dealers sell enough cars, and you sell more than enough, but these three claim the cars are poor sellers. I cited you as an instance, and what do you suppose the biggest and ugliest one said?"

"What?"

"He said, 'Aw, don't tell us about Reilly;

"LITTLE, LIKE THAT," SAID REILLY

I've heard of Reilly until I'm sick! He gets along because you play him for a favorite.'"

"Oh, he did, did he?" snorted Reilly. "Well, let me give you that guy's pedigree. He couldn't sell gold dollars for fifty cents apiece. He shows himself up for a little man by his own confession. He used to be a druggist, and he got along after a fashion, but as 'drugs were so hard to sell,' he quit. Now he expects to be a howling success as an automobile dealer and salesman, and blames you and the car because he isn't."

"Just what do you mean by a 'little man'?" queried the Sales Manager.

Defining the "Little Man."

"Little—like that," and Reilly held out his hand about a foot from the floor. "Don't you know," he continued, "that a salesman is measured by the number of obstacles he sees and the size they appear in his eyes.

Digitized by Google

The big men in the sales field recognize no such things as weak points in their lines; they may know they are there, but you never could discover it from talking with them. The little man can't see anything else. The weak spots look so big he forgets that good ones exist.

"That's one of the things I casually asked that salesman of mine when I hired him. I told him before I engaged him that there were certain weak points about the cars and that they might be hard to sell, and he was willing to take a chance if I was. I never was so glad of anything as that I took that chance; he's a bird!

Avoiding Weak Points in Sales Talk.

"Weak points are something he never talks about if he can change the subject. Big, strong points are right on the end of his tongue. I've watched him sell cars; I've been where I could hear him talk, and it's a pleasure to listen to him after the weak-hearted defense some salesmen put up, instead of leading the discussion themselves and not being put on the defensive.

"I'll wager that your dealer friend who just left here hates to see a prospect come in, because he knows he is going to have the time of his life avoiding being made a monkey of. He knows there are certain weak points in our cars, and you know it and I know it. When a buyer calls, your dealer friend, instead of starting a live, red-hot argument in the proper way about why the car is a good buy, lets the buyer bring up the weak points and break up the story. Customers don't realize that it is rude to break up a salesman's argument; all they seem to think about is getting their money's worth—and generally a little more.

Psychology of the Poor Salesman.

"When a customer says our tonneau is small this dealer probably stops talking about the rest of the car and allows himself to be drawn into a discussion of this particular defect, and the more he discusses it the more pronounced it becomes in the customer's mind. One thing leads to another until what should have been a story of reasons why the man should buy the car has developed into a line of reasons why the car is a poor purchase—he doesn't tell why the car is a good one, but tries to explain why it isn't a poor one. The result—no sale. And one such experience makes the next one worse.

Obstacles Get no Recognition.

"But my salesman! Ho, you ought to see him work. He never recognizes an obstacle to selling. If the prospect brings one up, my boy makes the best answer he knows how in the fewest possible words and never gives the customer the chance to get too deeply into the argument on that point. Instead, he leads him to some feature of the car that is a ripping good proposition and hammers hard on it, and he follows it up with some more just like it. As for reasons why the cars are hard to sell, his only use for them is to find an argument that is good enough to beat them. He's what I mean by a big man—he never recognizes an obstacle as of any importance and doesn't look for reasons why the cars are hard to sell.

Physical and Mental "Six-Footers."

"It's just like men, taken physically. A brick wall six feet high is a hard thing to get over for a man who is only five feet tall, while a six-foot man would make much easier work of it. But when the little man says he doesn't give a damn if the wall is a foot higher than he is and that he's going to get over it anyway, he immediately puts himself in the big man class; see?"

"THAT DECIDES ME," HE SNAPPED

"But how," asked the Sales Manager, "am I going to get these dealers in the big man class? I can't remove the obstacles all at once, and that is what they demand, or else they want more money for surmounting them."

Small Men Who Never Grew.

"You can't get them out of their class. They've been in it too long. They grew small in the first place and never got over it."

"But they want to know at once what I am going to do," said the Sales Manager.

"For all the good they are, you might as well oust 'em," answered Reilly. "New ones couldn't be any worse, that's sure!"

"That decides me," snapped the Sales Manager. "It's what I've wanted to do, but wanted to get someone else's opinion."

When the stenographer came in answer to her bell the three letters that the Sales Manager dictated, about not renewing three certain contracts, were the red-hot, sizzling kind.

Where Electrical Instruction is Free.

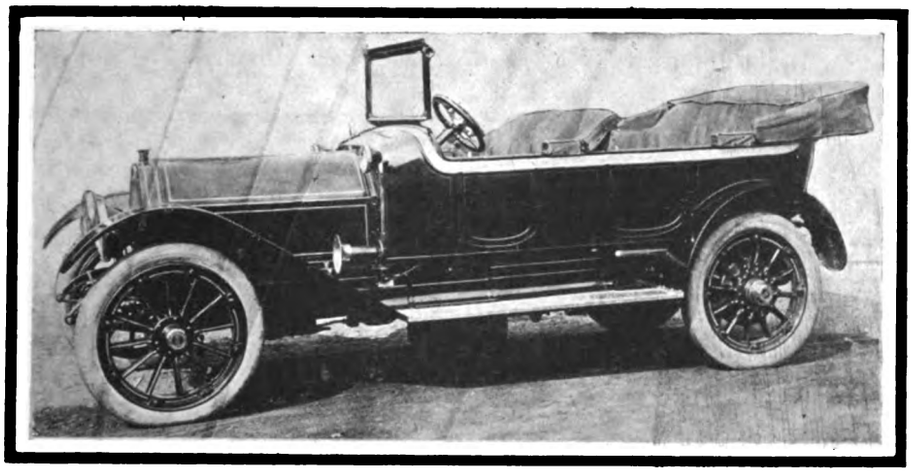
Although it is not generally known to exist, for the simple reason that no effort ever has been made to exploit it, there is in Detroit a well-equipped free school and laboratory for instruction in elementary electricity and allied mechanics. It has been there for the past two years—at 1221 Woodward avenue—and is maintained by the Dayton Engineering Laboratories Co. of Dayton, O., manufacturer of the Delco combined electric lighting, engine starting and ignition system. H. E. Phillips, who is at the head of the educational department of the company, is in charge.

The purpose of the school is to instruct those who are progressive enough to seek instruction in elementary electricity as applied to automobile construction and, incidentally, to make plain the construction and operation of the Delco apparatus in a manner that will assist in its proper care and the repair of such slight troubles as from time to time manifest themselves. In addition to teaching the principles of electricity, wiring, the terms used, insulation, etc., the principles of the gasolene engine and of automobile construction also are taught, tuition in every case being free. Combined with the school there are club rooms and reading rooms, and no pains have been spared to make the school attractive. That a large measure of success has been attained in this respect is evidenced by the fact that at one time this season some 1,200 pupils were enrolled.

Minute Damage That Causes Sparking.

An electric motor or generator commutator that has been burned or abraded or has been accidentally bruised should be carefully examined to see if there are any places where the copper bridges over the spaces that are filled with insulating material. Such minute connections may be difficult to detect, but nevertheless they are capable of short-circuiting two coils and causing considerable sparking, and so should be removed.

To Reduce the Clashing of Gears.



By constant use the bearings of the clutch collar and the primary gear shaft of a car are apt to become slightly loose and so permit the clutch and gearshaft to spin a good deal when changing gears; the result is a disagreeable clashing unless the parts are given time to slow down. The simplest remedy is to tighten up the clutch collar bearing and so provide a slight braking effect, which will prevent spinning.

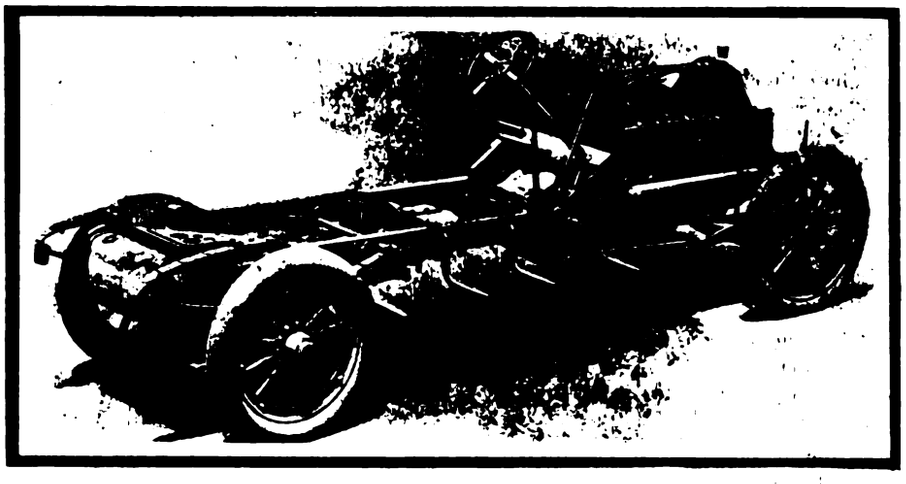
NEWER SERIES ALCO CARS REVEAL IMPORTANT CHANGES

Alterations Include New Clutch, New Springs and New Brakes—Electric Lighting System Added—"Fours" Abandoned.

Reflecting the experience of a number of years of successful production and marketing, the American Locomotive Co., of Providence, R. I., at length has come to the centering of its attention on the construction of its six-cylinder model, a car which nominally rates at 53.4 horsepower, but which actually develops well over 75 horsepower on test. As is but natural, the company's experence has been productive of certain standards of manufacture which are adhered to, but in the newer series of Alcos there have been incorporated a number of departures from previous practice, chief among which are the adoption of a new form of dry multiple disc clutch supported in a new manner, so that it forms with the engine a single rigid unit; the adoption of three-quarter elliptic rear springs and a general revision of the transmission system to include a new method of hanging the torsion member and several other changes of lesser import. Also, a Gray & Davis electric lighting system has been added as an item of standard equipment. The prices of the several models remain the same.

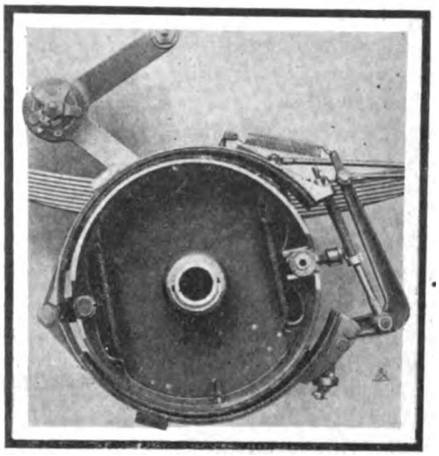


ALCO "SIX," UPON WHICH PRODUCTION ACTIVITIES WILL BE CENTERED

As heretofore, Alco bodies will be distinctive by reason of the broad white band which girdles them, which idea was original with Alco engineers, though it has been widely copied of late. Another mark, newly added, which will serve to distinguish Alco cars in the future is the adoption of a radiator emblem—a replica of the hub-cap design. Otherwise, the exterior appearance of the cars remains very nearly the same, but only to the superficial examiner. Comparison with the older series of cars reveals that the rear seat has been widened by several inches, the upholstery has been deepened to lessen the shocks incident to rough roads and the doors have been widened, and in the open cars the door handles have been relegated to a place of comparative obscurity within the body. Running boards are cleaner than ever before, the usual tool-box having been placed beneath the front of the running board with an entrance through the apron.

Supplementing the usual complement of electric lights, a large electric swiveling searchlight has been added by way of increasing the comfort and safety of touring at night. It is mounted on the cowl at the driver's side and is carried in universal joints, permitting it to be turned in any direction to reveal hidden bumps in the roadway, route signs or the landscape. The face of the searchlight is seven inches in diameter. The step light, also original in Alco construction, is retained; it lights automatically when the door is opened. In the open cars, as in the closed cars, there is a dome light in the top to facilitate the reading of road directions at night. In the Berline body, the interior lighting scheme includes Pullman berth lights set in the rear corners in addition to the dome light.

In keeping with the policy of the company in delivering its products ready for the road, the equipment is complete in the full sense of the word and includes: Windshield, top with side curtains and slip cover, illuminated 100-mile Sears-Cross speedometer, upholstery slip covers, electric lighting system, including a swiveling searchlight, trunk rack, foot rest, robe rail, tire brackets and concealed tool-box containing an assortment of tools, spare parts, etc. The closed cars have, in addition, speaking tubes and toilet cases, and the Berline is fitted with Pullman berth lights. The prices are $6,000 for the open touring car, which accommodates seven passengers; $6,750 for the Colonial limousine, and $7,200 for the Berline limousine.



Except for a few more or less unimportant alterations which best may be styled refinements of a well tried design, the Alco motor is substantially the same creation as has given such excellent service for the past several years. Cylinders, as heretofore, measure 120 x 140 mm. (4.72 x 5.51 inches) and are cast in pairs with the valves on opposite sides. The valves are interchangeable and measure 59 mm. in diameter (2 5/16 inches); the valve port shape has been altered slightly to permit of uniform valve caps being used over both intake and exhause valves, the object being to allow the easy use of double ignition. The centrifugal water pump has been moved 2½ inches nearer the front of the crankcase to make space for the Gray & Davis lighting generator, which is driven by a straight through shaft from the timing gears.

THREE-QUARTER SIDE VIEW OF THE LATEST ALCO CHASSIS

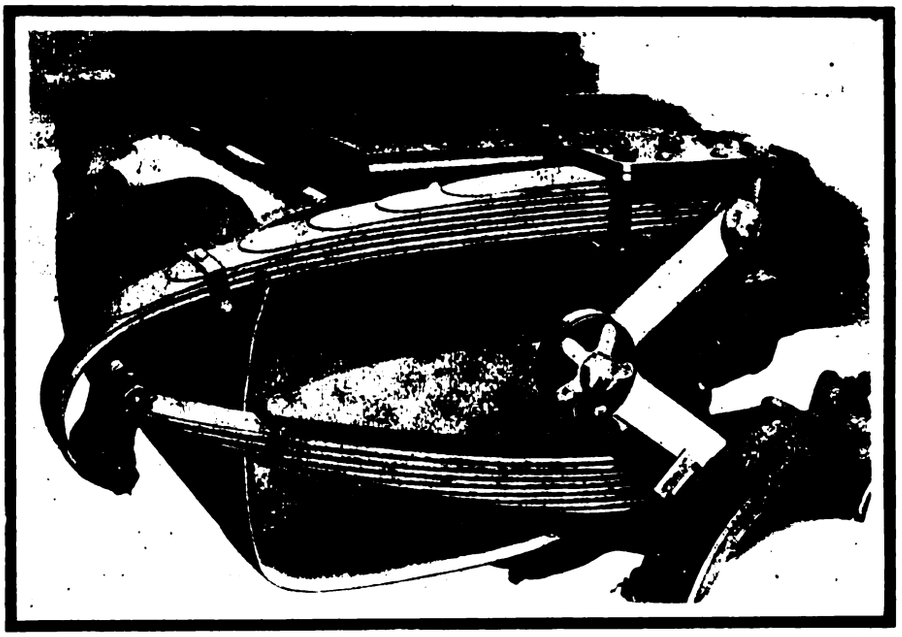
ALCO DIVIDED BRAKES

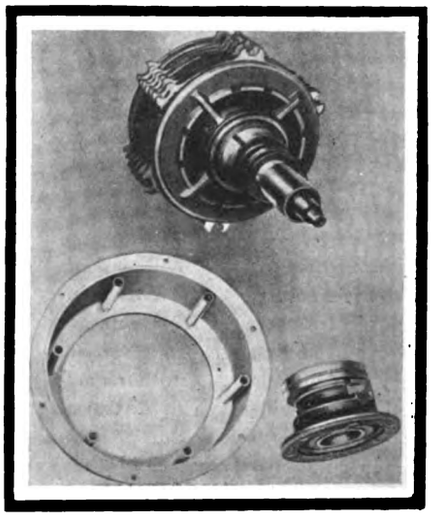
plugs. An oil gauge on the exhaust side of the motor serves to indicate the depth of oil in the crankcase and a manometer on the dash gives visible evidence of the operation of the oil pump.

In the transmission elements there have been made a number of important changes, chief among which is the adoption of a new dry multiple disc clutch mounted in an unusual manner that makes it a rigid unit with the motor without impairing its accessibility. By way of attaining this valuable end, the clutch bearings are mounted in an extension of the upper portion of the crankcase, which is extended still further to enclose the clutch. The lower half of the crankcase, however, has not been extended to cover the clutch, so that the mechanism is left fairly free and is readily accessible. To exclude road dust and dirt, the lower part of the clutch is protected by means of a light, removable cover.



The clutch itself is of the regulation multiple disc type, employing seven driving discs faced with a friction material and eight bronze driven discs. Although the discs separate themselves readily without aid from separating springs, etc., and dragging and spinning practically is eliminated, a clutch brake nevertheless is added as a measure of precaution to ensure smooth action. Throughout the design, accessibility has been made a fetish, and to this end adjusting nuts and bolts have been so placed that they may be easily reached without the necessity for special tools. By reason of the employment of compound leverage in the clutch pedal the pressure required to release the drive has been reduced from 75 to 35 pounds. Another excellent feature is that all end thrust is taken by a large ball bearing on the crankcase.

Although the general design of the chassis frame remains the same as heretofore, it has been strengthened by the elimination of some 35 rivets and it is hung lower, thus increasing the stability of the car and ensuring a practically straight line drive. The rear springs, as previously mentioned, now are of the three-quarter elliptic variety and have been designed with particularly flat upper members in order to maintain the center of gravity of the car as low as possible. The spring suspension both front and rear has been supplemented and rendered more efficient by the addition of Truffault-Hartford shock absorbers. Coincident with the alteration in the spring suspension, the size of the tires has been increased to 37 x 5 rear and 36 x 4½ front; demountable rims are standard equipment.



The change gear mechanism is unaltered and provides four forward speeds and reverse, selectively obtained, with the following final gear ratios: First, 10.34 to 1; second, 6.25 to 1; third, 4.18 to 1; fourth, 3 to 1; reverse, 10.34 to 1. Complete universal joints have been incorporated between the clutch and the gearset, providing for slight disalignment without deleterious results, and as they are completely housed, as is the clutch, the under pan has been eliminated. Also, a new type of universal joint has been placed between the gearset and the rear axle, which is of the full-floating type, and the radial action now is taken by this block joint instead of by the propeller shaft on a spleined surface as heretofore.

By way of eliminating the shocks incident to starting and stopping, the torque member has been swiveled at both ends, permitting an unusually free movement of the rear wheels over rough roads. The front end of the torque member is supported in a spring mounting and encased in a leather, grease packed housing. The driving shafts have been fitted with additional stuffing boxes to eliminate the possibility of grease leakage. In order to permit of steadier running on highly crowned roads and to make for easier steering, the front wheels have been slightly dished.

As a last, final improvement, calculated to render the operation of the car immeasurably safer under all conditions, the brakes have been redesigned, the brake bands, instead of being continuous, now being broken in the center to permit of a clamping action. Two complete sets of brakes are provided, both mounted on the rear wheels, the one being internal expanding and the other external contracting. Rattling has been eliminated by fastening the bands by means of a number of iron clips arranged around their peripheries. Non-burn friction material ensures smooth and efficient action and reduces the tendency to squeak as the result of quick stops.

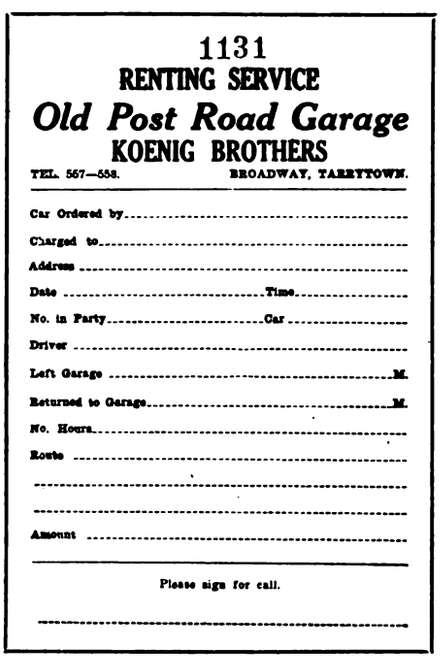
RENTAL SERVICE MAINSTAY OF GARAGE BUSINESS

Peculiar Conditions That Confront Dealer-Garagemen in Town of 5,000 Inhabitants—Revenue from Repair Shop Second to Livery Department Receipts—Car Sales Declared "Not Worth Bothering With."

Conducting a salesroom, or maintaining a garage, in a town of 5,000 inhabitants is a vastly different proposition from doing business of the same sort in a city of 500,000. Both suggest problems which are not free of knots, but in the larger community the dealer, or garageman, has at least more rope; frequently it serves only to hang him, but when this occurs it usually is the fault of the man himself. When a salesroom or garage is located in a town of 5,000 inhabitants, distant one hour from New York City itself and surrounded by the suburban homes or estates of millionaire New Yorkers, practically all of whom maintain private garages, the problem is, if anything, more complex than usually is the case, and the manner of its solution does not lack instructiveness.

Profits Which Accrue from Transients.

That it is possible successfully to maintain a combined salesroom and garage in such a place is evidenced by Koenig Bros., who, for the past ten years, have engaged in the automobile business in Tarrytown, N. Y., a short 25 miles from the metropolis itself. For five years of the ten they have operated the Old Post Road Garage, which is a structure that would do credit to almost any community. It is a thoroughly modern, fireproof, two-story, concrete, brick faced building, having also a well-lighted concrete basement.



As its name indicates, it is located directly on the main line of travel between New York and Albany and Buffalo. Hundreds of automobiles pass its doors in the course of a week, which implies that the revenue derived from such transients is not inconsiderable, but such patronage is by no means the main support of the establishment. According to Frederick Koenig, but one-third of the firm's receipts is derived from these transients.

Rental Service the Best Rent Payer.

Strange to say, and supplying a straw which shows the wind's direction, the chief source of the Koenigs' revenue is their livery service, their repair shop being the next best paying department of the business. Four cars, including the demonstration car, which this season covered 17,000 miles, constitute the Koenig rental "stable." The rates that apply vary from $3.50 to $4.50 an hour, according to the car and the time of day. Although the best business, naturally, is done in the evening, little difficulty has been experienced in keeping at least two of the cars operating throughout the day.

Good Will Which Nets a Profit.

The returns from this source are considerably increased by a road map and guide of

KOENIG BROS. RENTAL TAG

Westchester County which Koenig Bros. have issued as a means of advertising their establishment and through which the goodwill of the different taverns and hotels has been earned because of mention made of them. The bonifaces usually reciprocate by recommending the Koenig service whenever opportunity offers.

"Rescue Service" that Works Both Ways.

In addition, the Koenigs advertise, in a limited way, in the local prints, and also have most of the roads leading to Tarrytown fairly well posted with their signs.

Their "rescue service" likewise turns more than a pretty penny into their coffers in the course of a twelvemonth. The service comprises a "rescue wagon," which is an old chassis fitted with an open commercial body in which are stored jacks, block and tackle and the necessary tool equipment for rendering first aid to a disabled machine. It is at all times kept ready for instant response to telephone calls.

Sales End not Over-Profitable.

The Koenig brothers—there are two of them—are agreeable men and, save in one respect, the lay-out of their building and the conduct of their business is in keeping with the attractive appearance of the structure itself. The sale of cars is extremely limited—the Koenigs have disposed of but four Abbott-Detroits, for which they are agents, during the past year—and they frankly state that the profits from sales of cars makes their sale "hardly worth bothering with." The size of their town does not justify carrying a stock of new cars, and as a result they employ merely a demonstrator which, as stated, also does duty in livery service.

Even the "Dead" Cars Presentable.

The first floor of the garage is devoted to storage of cars, and even a casual visitor cannot but be impressed by the fact that all of them present a well-kept appearance. Remarkable to say, a number of the cars have been kept on dead storage during the entire summer, and why this should be the case, Nicholas, the younger of the brothers, admitted he did not know, unless it was due to the fact that this is "a Presidential year." But even the dead cars are kept presentable at all times. They are washed and polished whenever the employes have little or nothing to do, "just to keep their hands in," remarked the younger Koenig.

Fire Apparatus a Drawing Card.

Occupying a prominent place immediately inside the entryway is a most unusual feature of a garage—a large, modern, automobile fire engine. It belongs to the Tarrytown Volunteer Fire Department and its appearance behind one of the two large show windows rarely fails to attract attention to it. The Koenigs themselves are members of the fire department and most of the other enthusiastic "vamps" who are competent to operate the machine make it their business to remain in the vicinity whenever possible. Incidentally, the Koenig Bros. are paid $15 a month for storing the formidable piece of fire apparatus.

Digitized by Google

Perhaps because of their interest in such matters the Koenig garage is otherwise unusually equipped for fire prevention, or fire extinguishment. There are ten approved hand fire extinguishers attached to as many pillars throughout the place.

Shop Equipment Not Lacking.

All repair work is kept absolutely free of the garage—that is, the main floor of the garage—a runway in a rear alley affording a ready means by which a car may be taken into the machine shop, which is located in the basement. The latter is well equipped, considering the size of Tarrytown. It includes a large lathe, a drilling machine, a forge, a power hacksaw and a more than ordinarily complete assortment of tools. The machine equipment is operated by electric power and utilizes the services of three men. In addition, there are two vulcanizers of size sufficient to retread tires of even the largest diameter, as well as several smaller vulcanizers for the repair of inner tubes and small abrasions on casings. Two men are employed for the vulcanizing work, which is one of the profitable ends of the business.

CARD THAT ACCOMPANIES CAR INTO REPAIR SHOP

Card Systems in Repair Department.

And in the rental and repair departments, as well as in the selling and renting end of the business, systematic methods are followed. There is a rental tag, and to the tires or tubes received for repair are attached tags which bear all necessary details, as shown by the accompanying illustration. Each tag is separable, the first section being given to the owner as a receipt upon delivery of the tire to the garage; the second one goes to the bookkeeping department, and the third, which remains on the goods, is returned to the owner when he surrenders the original receipt. Naturally, the head of the tire repair department fills out the work which was done. A similar system is followed in the machine shop, save that three cards are used—an instruction card to the workman telling him just what is to be done on the car in question, a stock requisition card which is presented to the stock clerk when the workman has ascertained the materials which will be required, and a time card which accounts for the time consumed by the work in hand—all of which are filed in the bookkeeping department.

Accessories Out of Public's Sight.

The stock of accessories which is carried is unusually complete. It is valued at between $3,000 and $4,000 and embraces everything from the smallest cotter pin up to tires, magnetos and storage batteries. The tires carried in stock include all sizes, from 28 x 2½ up to 38 x 5. Remarkable to relate, however, the accessories are dis-

played where callers or passers-by cannot see them, which appears to be the one blemish on an otherwise well-conducted establishment. They are kept on the second floor, where the Koenig office also is located. In explaining the failure to display them on the ground floor, or in the show windows, where they must be seen by everyone who enters the garage and by most of the hundreds who pass the place, Frederick Koenig smiled and gave a reason for the upstairs location that likewise is unusual.

"We used to keep a showcase of accessories downstairs," he said, "but so many young fellows dropped in and occupied the time of the girl who was in charge of it that we simply took the bull by the horns and placed the showcase upstairs, where the whole stock is kept."

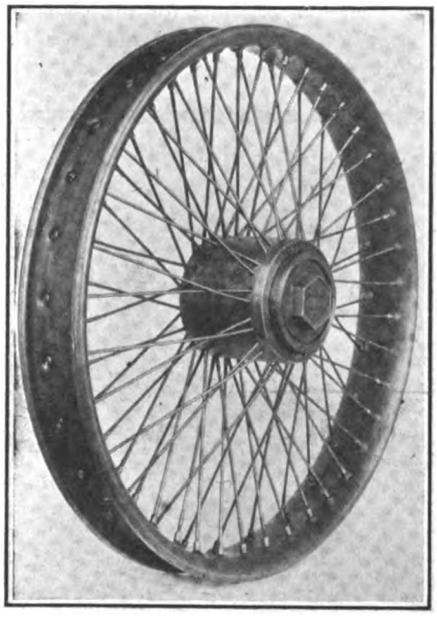
The sale of gasolene is considerable, but for some reason or other, and despite the favorable location of the garage, the sale this year decreased from 45,000 gallons to approximately 25,000.

"Baths" that Facilitate Repair Work.

When an automobile is taken to pieces for repair, much time and unnecessary labor can be saved by a methodical examination of such parts as are disassembled. The first requirement is to thoroughly clean every part, no matter how minute. There are several ways of performing even such a simple task.

The average repair man can make use of a wide, open metal vessel and use kerosene and gasolene mixed, to cut away the heavy grease and dirt, after which a small quantity of gasolene should be used to make the "bath" thorough. If hot water or a steam jet are available, many parts can be washed without injury—such, for instance, as crankcases, cylinders, gearboxes and gears. But for large shops and service stations a salt bath capable of being heated to high temperature will quickly dissolve all grease and dirt when the parts are immersed therein. The grease will rise to the surface and can easily be skimmed.

Unless certain parts, especially aluminum parts, are well rinsed afterwards, the alkali will have an injurious effect on the metal; to counteract such effects a second bath containing a weak solution of nitric acid is advisable, as it will remove the salt and promptly nullify its injurious action on the aluminum.



Threads for Brass and Steel Differ.

Should it become necessary to put brass screws, nuts or bolts in place of iron or steel ones, the threads should be examined to see if they are of the same pitch; usually brass threads are finer than those cut in iron or steel.

SIMPLICITY IN DESIGN OF E-C REMOVABLE WIRE WHEEL

Only One Removable Part and Unusual Arrangement of Spokes Its Chief Characteristics—Diminutive Hub Employed.

Emphasizing the already well defined trend toward wire wheels, the E-C Sales Co., of 332 La Salle street, Chicago, Ill., which some little time ago brought out a demountable artillery wheel, which was illustrated and described in the April 4th issue of Motor World, has added a demountable wire wheel which partakes of several of the features of its wood predecessor.

E-C DEMOUNTABLE WIRE WHEEL

CONSTRUCTION OF HUB

The wheel is distinctive both by reason of the treatment of the spokes and the construction of the hub portion, neither of which is exactly like anything else of the kind. As may be seen by the accompanying illustration, the spokes are so arranged that they cross over from the inside of the hub to the outside of the wheel rim and vice versa, which construction, it is pointed out, materially strengthens the wheel and minimizes the possibility of end play and the danger of collapse due to unusual strains imposed in rounding corners at high speed. The rim is of the clincher type and is designed to accommodate but one style of tire.

As is the case with the wooden wheel marketed by the same company, the wheel itself is the only part which is demountable and there are no loose parts to be lost on the road or mislaid when shifting wheels. Mounted in the hub of the wheel and visible in the picture showing the complete wheel there is a movable ring with a small hole at its upper and lower extremities. With the aid of a spanner which fits into these holes, the ring may be unscrewed, which action loosens a sleeve within the hub and permits the removal of the wheel. The movable ring and the sleeve both are attached to the wheel portion of the hub and come away with it.

The axle portion of the hub is hexagonal in shape, with rounded corners, and is tapered to permit of adjustment for wear and to ensure positive keying and rigidity. By reason of the construction, the hub is unusually solid, and, it is claimed, will withstand without impaired efficiency an amount of abuse that is truly extraordinary. Another feature to which attention is directed is that the comparative narrowness of wheel and hub render easier its mounting on running boards or at the back of the tonneau, where space is restricted; there are no projecting parts to be knocked and injured or to catch on other projections.

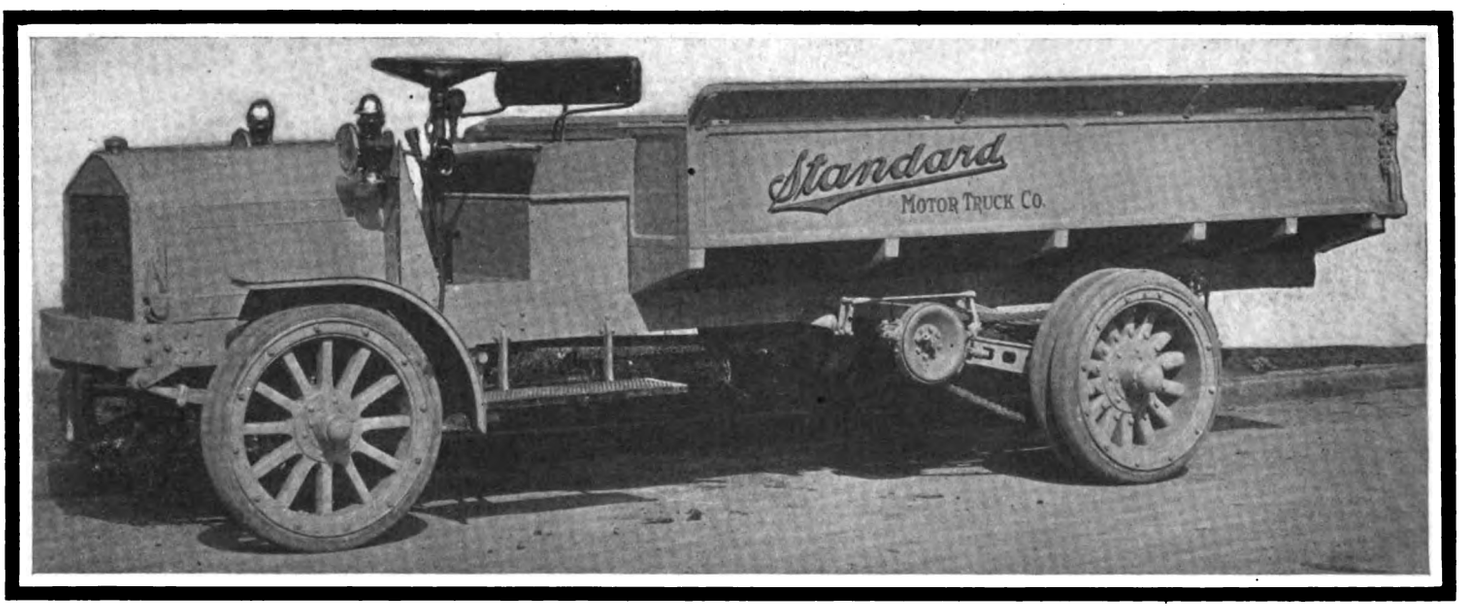
Bent Valve Stems Beyond Repair.

Occasionally the suggestion is made that a valve stem which is bent should be straightened before being used again. While it may be within the bounds of possibility to do such a thing and do it satisfactorily, it is far outside the bounds of probability. A bent valve stem, even if the deflection is so slight as to be imperceptible, is sure to cause abnormal wear of both itself and its guide, and it is almost impossible to grind such a valve to a seating that will remain tight.

Dust that Gathers in "Dust-Proof" Cases.

Because an electric motor or dynamo is completely enclosed, so that it is impossible for dust and dirt to work in from the outside, it does not follow that the interior will be free from dust. On the contrary, the gradual wear of the brushes and the slower wear of the commutator produce a dust that is more or less abrasive and also is a good conductor of electricity.

Digitized by Google



STANDARD TRUCK STANDARD IN CONSTRUCTION AS WELL

Power, Transmission and Other Units the Products of Recognized Parts Specialists—One Capacity But Many Sizes.

Taking several leaves out of other books in which the word standard is defined to mean the use of parts the manufacture of which in large quantities by recognized specialists has made them to all intents and purposes standard construction, the Standard Motor Truck Co. of Detroit, Mich., which is a newcomer in the commercial vehicle field and is headed by Howard Wilcox, whose name and fame as a racing driver are known far and wide, has brought out its initial product—the Standard truck.

As the name of the vehicle serves to indicate, there is absolutely nothing radical or experimental in its make-up; smaller parts and transmission and power units are of well-tried design and construction, and particular pride is taken in the fact that the names of the manufacturers of these parts stand for all that is good and proper in automobile construction and are well known almost wherever self-propelled vehicles are used. The motor, for instance, is a Continental, manufactured by the Continental Motor Mfg. Co.; the axles and jackshaft bear the mark of the Timken-Detroit Axle Co.; the gearset is the product of the Brown-Lipe Gear Co.; the steering gear is by the Gemmer Mfg. Co.; the springs are made by the Perfection Spring Co.; and so-forth throughout the whole of the vehicle. The assembling and final testing and guaranteeing is done by the Standard company, of course, and, needless to add, each separate part bears also the guarantee of the individual manufacturer.

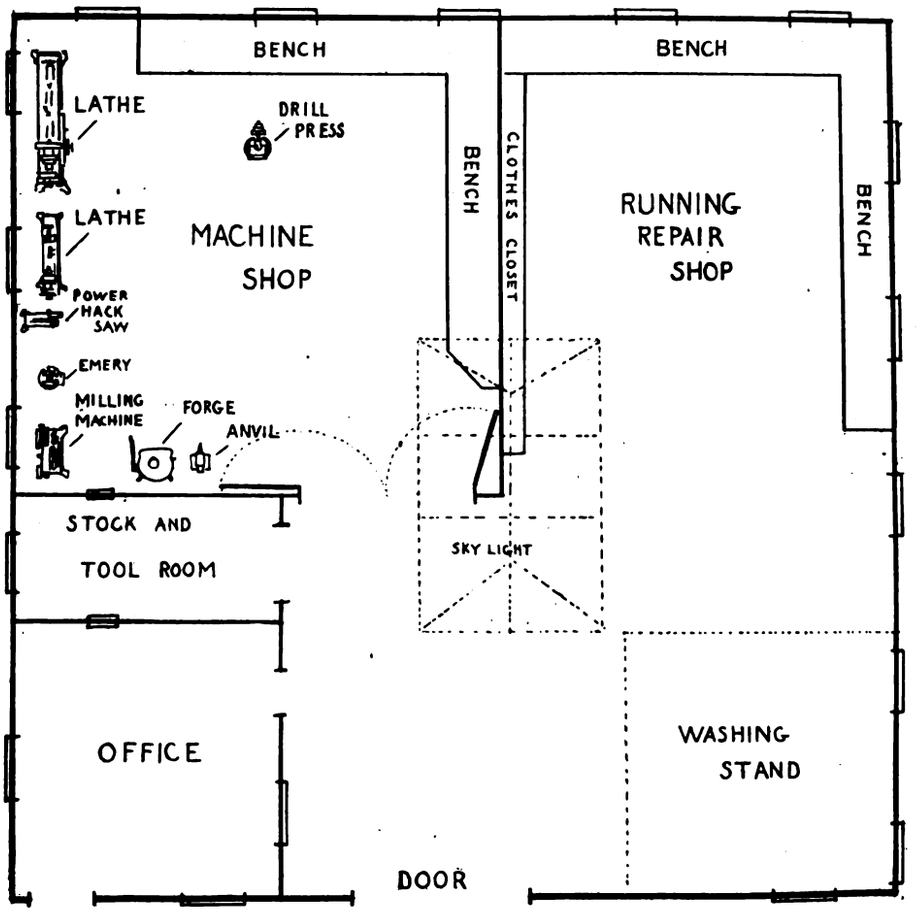
Preferring to center attention on the production of a single model, the Standard is made in but one capacity—6,000 pounds—though by reason of wide variety for choice in the length of the wheelbase, which may be either 10, 12, 14 or 16 feet, the available loading space may be made suitable for a large number of trucking requirements. The standard length of the frame back of the driver's seat is 12 feet 3 inches. The weight of the standard chassis is about 6,100 pounds, and it lists at $2,750. Other frame lengths, suitable for the transportation of furniture, lumber and poles, etc., add $50 to the list price.

THREE-QUARTER VIEW OF STANDARD THREE-TON TRUCK, WHICH LISTS AT $2,750 WITHOUT THE BODY

The motor is the well-known Continental vertical L-head type with the gearset and clutch contained in an extension of the crankcase, making of the whole power plant a single rigid unit. Cylinders are cast in pairs and measure 4½ x 5½ inches, bore and stroke, respectively. By way of increasing efficiency and reducing the depreciation due to excessive speed, the motor is fitted with a positive throttling governor which may be adjusted to permit a maximum motor speed of from 600 to 1,000 revolutions a minute, the speed varying according to the class of work for which the vehicle is intended and the contour of the roads over which it will be run. Final gear ratios also may be adjusted to suit requirements, no less than eight different ratios being available; they may be altered quickly and easily after the truck has been placed in service. A high tension Eiseman magneto with automatic advance serves for ignition and a Stromberg carburetter furnishes "mixture."

As is the case with the majority of modern vehicles, accessibility has been made one of the keynotes in design. The jackshaft is simple and rugged in construction, with the differential and bevel gear drive contained in a pressed steel housing to which access is gained through a removable cover plate. Power is transmitted through the intermediary of a multiple disc clutch and a three-speed, selectively operated change gear mechanism. The clutch is of the dry plate type and is completely enclosed. Final drive is by means of side chains.

In the tire equipment, liberal provision for the inevitable overloading has been made. The tread of the front wheels is 65 inches, with 36 x 5 solid rubber tires, and is so proportioned that the front wheels track with the inner dual rear tires, which also measure 36 x 5 inches. The tread of the rear wheels at the outside is 71⅛ inches. Another excellent feature is that the wheels are made according to S. A. E. standard dimensions and may be fitted with any standard demountable rims. The front wheels have 12 2½-inch spokes and the rear wheels have 14 3½-inch spokes the length of which between the hub and the felly is but 6½ inches. The services brakes are operated by a pedal and are of the external contracting type mounted on the outer ends of the jackshaft. The emergency brakes are internal expanding, acting on 18-inch pressed steel drums mounted on the rear wheels, and are operated by means of the orthodox hand lever.



Following the tendency toward left-hand drive, and to obtain the advantages which accrue under that system of construction, the steering wheel is placed at the left side.

LAYING OUT AND EQUIPPING A REPAIR SHOP

Careful Planning That Brings Cash Returns—Facilitating Work by Dividing Cars Into Classes—Quality, Quantity and Cost of Machine Tool Outfits for Various Requirements; Second-Hand Machinery.

In the days when all tools were more or less crude and a great deal more depended upon the laboriously acquired skill of the mechanic than upon the implements of his trade, someone invented the saying which infers that man who turns out an indifferent piece of work and then blames the tools for the shortcomings of the job is a bad workman.

FLOOR PLAN FOR ONE-STORY MODEL REPAIR SHOP

Good Tools that Produce Good Work.

The relative status of men and equipment has changed greatly since that proverb was created, for no matter how skilled may be a mechanic, he cannot do work that will come up to the standards of the present time with poor tools and, per contra, good tools enable many men who are comparatively unskilled as mechanics to turn out work that would be considered miraculous by the venerable sage who first uttered the almost worn-out proverb. All of which applies directly to the automobile repair shop which is called on to do a great deal of work that is useless if not accurate, and which depends for its excellence more upon the tools than upon the men who wield them. There are many classes of work which cannot be properly done even by the most highly trained mechanics without first-class tools.

In the laying out and equipment of an automobile repair shop it is of the greatest importance that cognizance should be taken of the fact that good tools are essential to good work; further, that the quality of the work frequently is limited by the quality of the tools, be the mechanics never so skilful. This, of course, applies particularly to machine tools, which primarily are tools of precision. And all conditions that affect the operation of the machines are liable to affect the quality of the work done. Therefore, the machines should be placed where they will be well lighted; they should be driven by power that is ample to maintain proper speed even if all the machines are in use at the same time; they should be accurately lined up and leveled and mounted on good foundations; and they should be properly used, properly cared for and properly repaired and adjusted when repairs and adjustments are required.

Time that is Saved by Saving Steps.

Once the machine tools are placed, they are, of course, fixtures; any work that is to be done on them must be brought to them. As some of the parts that may require machining are heavy, time and trouble can be saved by so laying out the shop that a car having in it heavy parts requiring work done on them can be brought close to the place where the work is to be done. One man's time walking across a shop from a car to a machine and back again does not amount to a great deal; but if several men do this every day for a month or a year the aggregate will be far from inconsiderable. A heavy part often can be swung across a narrow space by a couple of men in a few seconds, whereas the transportation of the same part across the shop would necessitate loading it on a hand truck, wheeling it over, dodging whatever obstructions might be in the way, unloading it from the truck and repeating the operation upon the completion of the work. For this reason it is economical to place machine tools in such positions that cars can be brought fairly close to them; the traverse from the car to the machines most likely to be used should be as short as possible.

Making the Most of Floor Space.

Not the least important part of the process of establishing a repair shop is the working out of the floor plan in order to make the most of the available space and to economize in the time of the men. The accompanying illustrations shows a floor plan that is suitable for a shop of moderate size, fitted up with a good equipment of tools and arranged to permit the proper distribution of cars without confusion. This ship is approximately 50 feet square, one

Digitized by Google

story only, with plenty of windows and a large, light skylight in the roof. The building is divided into four sections; on the left of the entrance is the office, and adjoining it the stock and tool room; on the right is the washing stand. The rear half is occupied by the machine shop on the left and the running repair shop on the right, the latter being open to the space at the front of the building, so that cars can be driven into the building. Wide doors give access to the machine shop from the space at the front.

Classifying Repair Work.

The object of having a running repair shop separate from the machine shop is to provide a place for cars that require only light work done on them, such as the overhauling of the ignition apparatus, grinding in a set of valves and other work requiring no machine tools. This leaves the machine shop free to deal exclusively with machines that need more or less extensive repairs involving a good deal of machine work. Such cars are taken into the machine shop and stand close to the machines, so that all long "carries" are avoided. By reference to the illustration it will be observed that there is space for a car on each side of the drill press. If a motor is to be removed from a car it can be placed on a bench by a very short lift, or any part can be taken to a bench or direct to the machines most likely to be used—the lathe or drill press—with very little expenditure of time and trouble. The machines most frequently used are placed in the most convenient positions, and all are abundantly lighted from the windows; the forge and anvil, which need the least light and are used comparatively infrequently, are furthest from the windows. The running repair shop is equipped with benches, vises and ordinary bench tools; all the benches are lighted by windows.

Equipping the Machine Shop.

The office location is such that incoming and outgoing cars can be observed through the window in the partition. Between the office and the machine shop is the stock and tool room; a small window affords communication between the two rooms and a window at the opposite side of the stock room opens into the machine shop. Naturally the machine shop will make the most frequent demands upon the stock room; therefore the two are placed in convenient proximity.

From the entrance a car may be driven direcly into the machine shop, the running repair shop or the washing stand, as may be required. There is no possibility of the inconvenience and bother that is caused by the necessity for washing a car in the repair shop proper; the water and mud are confined to one corner of the place.

Coming to the very important matter of the items of equipment of the machine shop, it may be said that the outfit shown in the accompanying plan is sufficient to cope with practically anything that is likely to turn up in the repair line; a shop so equipped would be suitable for a town of considerable size, and would by no means be out of place in any of the larger cities. The tool equipment suggested includes a large lathe with a gap bed, with sufficient clearance to permit the handling of a flywheel; a small speed-lathe, an emery grinder, a power hacksaw, a fairly large drill press, a small milling machine, a forge, and an anvil. The usual quota of vises, pipe vises, tool racks and so on are taken for granted. A single line of shafting will serve the countershafts for all machines requiring them. The big lathe and the drill press will be used more frequently and for heavier work than the other tools, and so are most conveniently placed.

Electricity as the Motive Power.

The ideal method of driving the various machines undoubtedly is by individual electric motors, each machine having its own small motor with separate starting switch. From an operative point of view this is the best arrangement, and it also is the most advantageous from the point of view of economy in the use of electricity. The expense of installation is very considerable, however, and it is more likely that the average shop will drive from one large motor with the usual shafting arrangement and belts. Under all ordinary circumstances electric drive is most likely to be employed. In order to economize floor space the motor will be mounted overhead—a very common and very satisfactory arrangement.

In a locality where the charges for electricity are high, it is a good idea to run the shafting in roller or ball bearings. The expense of this is not excessive, and the amount of power saved often is surprising, especially if the shafting is not hung with perfect accuracy or if the building is inclined to sag and throw the shafting out of line.

Machine Tools and Their Cost.

The cost of the chief items of equipment for a repair shop of the character and capacity of the one outlined is capable of considerable variation, according to the owner's ideas as to what is needed in his particular locality or what machinery will handle the class of work he may have his eye on. Assuming, however, that the shop is to be equipped as indicated in the illustration, and that the machine tools are to be of good, substantial construction, not excessively high-priced on the one hand, and not of the kind in which essential features are sacrificed for the sake of reducing the cost on the other hand, the expense will be about as follows: Gap bed lathe to swing a flywheel in the gap and take a crankshaft between centers, $375. Back-geared drill-press, $125. Plain speed lathe, 9-inch swing, with hand rest and countershaft, $50. Emery grinder, to take two 12-inch wheels, $30. Milling machine, $250 Power hacksaw, $22. Forge and anvil, $25. Total, $877.

When Cost Must be Kept Down.

If closer estimates are necessary the figures may be lowered considerably by substituting for the gap lathe a straight bed machine of say 14-inch swing costing about $250, and for the 9-inch speed lathe an 8-inch lathe at $30. A smaller emery grinder can be had for $22, drill-press for $75 and forge and anvil for $20. A shaper as a substitute for the milling machine will cost $125. This totale $522, or $355 less than the first list, and the total may be still further reduced by the omission of the shaper.

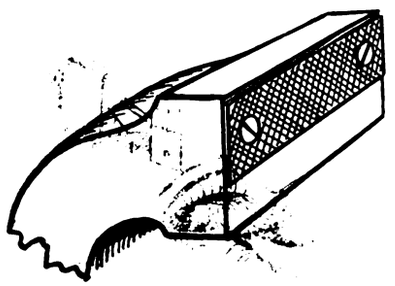
It is for the owner of the shop to decide for himself whether he can afford the cost of the complete equipment, or, looking at the matter from another angle, whether the jobs that could be handled with the more complete equipment but not with the other would justify the investment. It may be said that in any good-sized town where there is a rather wide range of work, it is highly probable that the better equipment would prove to be a profitable investment. It is rather discouraging to would-be patrons to be told, "I'm sorry, but our lathe isn't big enough to swing that wheel," or, "That's a job for a milling machine or a shaper, and we haven't either in the shop," and so on.

How a Complete Equipment Pays.

Nine times out of ten a man who takes such a job to another shop takes the next one there, too, so that the mere possession of a good equipment of tools may bring in considerable business of a general character. It does not take very long for a shop to get a reputation for being able to perform any job, even if it is of an unusual character. Everyone who is at all familiar with repair work has heard some such remark as, "Oh, I know what you can do; take it around to Jones's shop. They do lots of things like that," when a question arises as to who shall do a difficult piece of work.

A smaller shop can be maintained with considerably less machinery, though it goes without saying that cutting down the equipment means that the variety of work that can be performed is reduced and that cer-

Digitized by Google



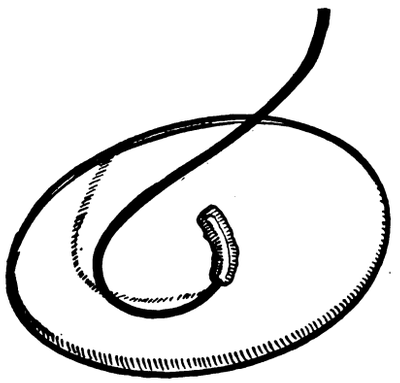
tain jobs must be refused or part of the work must be farmed out to other and better equipped establishments. A decided objection to this plan is that the man who pays the bills is called upon to pay two profits on the work that has been farmed out, unless the "farmer" cares to remit his share of the profit, which is not very likely. The usual equipment of a small shop is a lathe, drill press, emery grinder, and perhaps a power hacksaw; of course, there are plenty of places that make shift to get along with only a lathe, using it for everything from milling to tool grinding, including drilling. Such "shops," however, cannot be said to count very heavily in any way. But with a good lathe of not less than 12-inch swing, a drill press that will drive a ¾-inch drill, an emery grinder and a power hacksaw a great deal can be done. The cost of this outfit will be in the neighborhood of $350.

It often is possible to obtain second hand machine tools of really good quality and in good condition, and by so doing the cost of equipment can be very considerably reduced. It is absolutely necessary, however, to have second-hand machine tools carefully examined by a machine tool expert, for there are many possible defects that would not be detected by an inexperienced person. In the larger cities a little "browsing" very often will disclose bargains, if time is taken to seek out the right tools and the seeker is not content to accept something that is not suitable merely because it is cheap. A first class machine, properly taken care of, is not easily worn out and often is practically as good as a new one. But the chief trouble with second-hand tools is inaccuracy, and this should be watched for with care.

Renovating Old Vise Jaws.

After an indifferent vise has been in use for some time the inside faces of the jaws become so highly polished that if any round piece of metal is inserted it invariably slips unless the jaws are tightened unduly, which failing may be overcome by interposing a file between the work and the faces of the jaws. The accompanying illustration shows how a file can be attached to the jaws of the vise permanently, or until such time as it is no longer useful for the purpose intended.

The jaws of most vises are hardened and some difficulty may be experienced in drilling them, but if the drill point is sufficiently hardened and turpentine is used as a lubricant, the operation can be performed with the exercise of a little patience. There is no necessity to use new files, as those that have passed the stage of ordinary utility answer the purpose just as well. Before the file can be drilled it must be softened, and as there are always a sufficiency of old files available in most shops there is no necessity to reharden them.

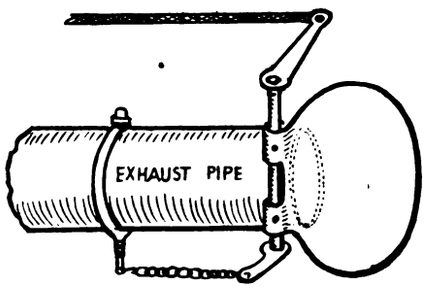


FILE FACED VISE JAW

Rubber Sleeves that Prevent Chafing.

Insulated wire and rubber gas tubing frequently are passed through holes in sheet metal and so are in more or less danger of chafing. This can easily be prevented by slipping over the wire or the tubing, as the case may be, short pieces of heavy rubber-and-fabric tubing held in place by a little rubber cement. In extreme cases fiber tubing should be used to take the wear. It goes without saying that it always is best to remove the cause of the trouble, but if this cannot be done the next best thing is to guard against the effects. It is cheap insurance against trouble.

Making Visible Inaccessible Parts.



Despite the fact that accessibility rightly has become a fetish and there are few parts in the modern automobile that cannot be reached quickly and easily, it is not always easy to see the work in hand or to make quick inspections without removing part of the body-work or the pan beneath the engine. In such cases, a small mirror forms a valuable adjunct to the repair man's kit, and it is comparatively simple to equip one for such uses with the aid of a piece of soft copper wire and some solder. The wire should be fairly heavy, about eight or 10 inches in length, and should be soldered to the back of the mirror. The flexibility of the wire permits it to be bent in almost any shape, in order to reach out-of-the-way places and obscure corners, while at the same time it is stiff enough to hold the mirror firmly. With a mirror wired in this way, it is a simple matter to explore the whole of the inside of a crankcase, for instance, provided the crankcase is fitted with inspection plates, of course. It is not difficult to increase the practicability of the device still further by attaching to it a small electric light operated either by a dry battery or by current from the electric system on the car.

WIRE HANDLED MIRROR

Getting Pressure on the Gasolene.

No matter where the air pressure hand pump is situated, so far as the driver is concerned, it always is an unpleasant undertaking to have to apply pressure while the automobile is in motion. There are, however, several ways of obtaining initial pressure with little trouble, but this cannot be said to be true while the car is in motion. The running of the car is dependent upon a minimum pressure being maintained and in many cases this is effected by passing part of the exhaust gases through a compensating valve. This valve needs constant attention, and should foreign matter find its way under one of the valve seats a leakage will result, perhaps sufficient to starve the carburetter of gasolene and seriously affect the running of the motor.

TO OBTAIN EXHAUST PRESSURE

By closing the outlet of the exhaust pipe with a small clappet valve, such as is herewith illustrated, and actuating it by a cord from the driver's seat, no matter how much the valve may leak it is possible to maintain several pounds pressure with a minimum effort.

Two bent wire hooks can be provided, one allowing the valve to be held open by the spring and the other so that the orifice of the exhaust pipe is partly closed. This point must be found so that some pressure is delivered for maintaining a head of gasolene, but not so much as to cause back pressure on the motor sufficient to result in loss of power.

Completely closing the orifice for a few seconds suffices to rush the pressure up if it shows signs of giving out.

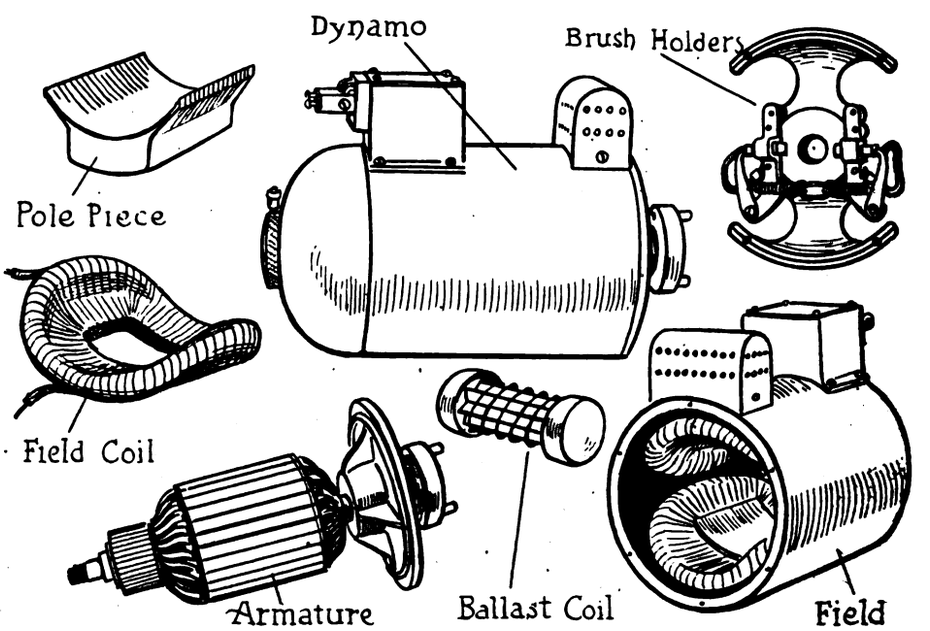
ELECTRICITY AS AN ILLUMINANT MADE PLAIN

Limitations of the Old Proverb Concerning Letting Well Enough Alone Pointed Out in Their Application to Electric Lighting Systems—When Attention is Needed and Where—Battery Location Discussed.

(This is the seventh of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by dealer and owner alike.)

Like many another old saying that has done duty almost since time immemorial, "Let well enough alone" has its limitations and is susceptible of wide interpretation. It is to be assumed, of course, that in the majority of cases where the quotation is put to use, the "well enough" part of it signifies that the object to which it applied really is "well enough" in the true sense of the words—that a device or a mechanism is functioning properly, for instance, and giving no indication of derangement. In this case it is good policy to let it alone. The difficulty, however, particularly to the layman, is to determine just when "well enough" fits the case, and in this connection the operation of the electric lighting system forms an excellent example in point.

Where Astuteness is Required.



When an electrical apparatus of the kind comes from the manufacturer it may be expected to be in perfect condition, and though the latter part of the saying anent letting it alone would seem to be particularly applicable, it is not well always to let it severely alone. Which does not necessarily mean that it should be taken down part by part and boiled in oil just to make sure that it will keep on working well. But it should be examined from time to time no matter how well it is working, for no such system will operate indefinitely without any attention whatsoever. In a great many cases it is possible to prevent serious troubles by remedying slight troubles as they manifest themselves. Slight troubles, often so slight as to make little apparent change in the operation of a system, may be checked only upon periodical inspections, and even then they may not be apparent to the unskilled worker unless he knows exactly where to look for the most likely sources of trouble or derangement.

Prevalent Fear of Lack of Ability.

It is a mistake commonly made by countless numbers of persons to imagine that they are unable to care for a given piece of mechanism whether it be an electric lighting system, a sewing machine or a phonograph. They get into a sort of panic when some little thing goes wrong and immediately call in a repair man to do work which is so simple as almost to be ludicrous—to the repair man. But the repair man needs bread and butter, and he does not laugh. Sometimes he makes a big job out of a very little one and doubtless much of the timidity of the average individual to tackle work out of his line can be traced to this very cause. Actually, if electric lighting systems are given attention and at least a part of the care that has been outlined as necessary in the past six issues of Motor World, there need be very little cause for anxiety on the part of the owner; there is so very little that can get out of order and such slight troubles as develop are so easily remedied that there should be no necessity for the services of an expert—provided the owner is conversant with the characteristics of the system with which his car is equipped. Knowledge, however, is essential, but it is quite easily acquired.

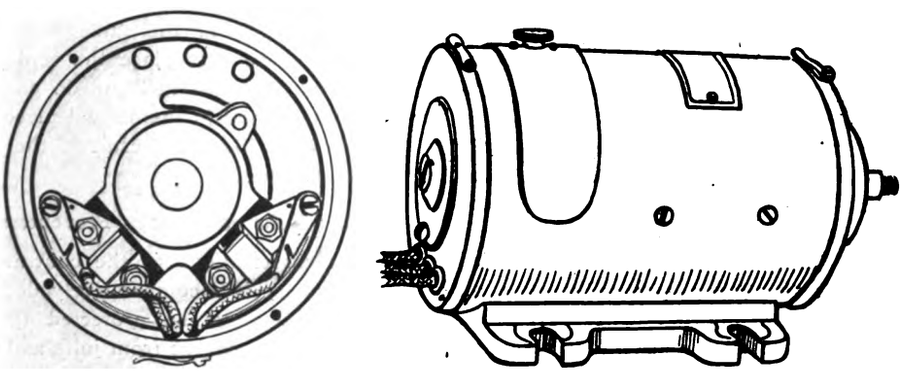
The Problem of Output Regulation.

From these articles it may be gathered that one of the greatest problems with which the manufacturer of such devices has had to work has been the provision of some simple means of positively regulating the output of the generator. In central station work, it is a comparatively simple matter to regulate the output of dynamos by varying their speed, but for automobile work such methods are impracticable. Hence, it becomes necessary to provide some other means of accomplishing the end. Either a mechanical or an electrical device of some sort must be used. Both are used with a great deal of success, though due to the greater simplicity of electrical devices they are generally more in favor.

RUSHMORE DYNAMO DISSECTED, SHOWING COMPONENT PARTS

In several systems combination electro-mechanical devices are used, and these too have given good service wherever used.

Unusual Electrical Governing.



In the dynamo manufactured by the Rushmore Dynamo Works of Plainfield, N. J., positive regulation is obtained electrically in a manner different from that employed in any other system. The method employed is unique and is based upon a little-known though well-proven peculiarity of iron. The dynamo itself is of the shunt wound type and in addition is equipped with what is known in electrical engineers' parlance as a "bucking coil." The current that is passed through this bucking coil is

Digitized by Google

regulated with the aid of a simple coil composed of a few turns of iron wire mounted on a heat resisting mandrel and carried in a ventilated housing on top of the dynamo.

Hot Wire that Chokes off Current.

The peculiarity of the iron wire referred to is the fact that its resistance to the passage of current remains practically constant, or increases only very slightly up to a certain critical temperature. After the critical temperature is reached, however,—the iron wire heats because of the resistance offered to the flow of the current—its resistance rises very rapidly. When its resistance is low, as when the dynamo armature is rotating slowly and little current is being generated, very little current flows through the bucking coil and the strength of the field and consequently the output of the dynamo increases in proportion to the increase in the speed of the armature. When the speed reaches a certain limit, however, the heating of the coil of iron wire, which is styled a "ballast coil," increases its resistance and forces a part of the generated current through the bucking coil, the result being that the field strength is reduced and the current output held practically constant. The critical temperature in the ballast coil is reached at about 15 miles an hour car speed when the current output is about 12 amperes. At higher speeds the current remains practically constant, and never exceeds 13 or 14 amperes maximum, under any conditions.

END AND SIDE VIEWS OF HARTMAN ENCLOSED DYNAMO

Inherent Simplicity of Regulation.

From the foregoing it may be judged that the output of the generator is governed directly by the iron ballast coil in conjunction with the bucking coil, which depends upon the ballast coil for operation. Consequently it is a simple matter to adjust the dynamo to deliver almost any current between about 4½ and 15 amperes by inserting a different size ballast coil in place of the one in use. If the ballast coil is removed, which operation is simple, for the reason that the coil is made in the form of a cartridge fuse and may be lifted out of its holder quite easily, the dynamo becomes a simple differential machine and will deliver a practically constant current of 4½ amperes regardless of speed variations. Obviously, it is not permissable to replace the ballast coil with a coil other than that supplied by the manufacturer. However, the coils are inexpensive, and, as it is such a simple matter to alter the dynamo output by changing them, as, for instance, when the car is driven chiefly at night and a heavy current is needed, that it is a wise plan to have several cartridges on hand.

Caring for the "Ballast Coil."

By reason of the inherent self-regulating feature of the Rushmore dynamo, there is absolutely nothing in the regulating apparatus to get out of order or even to require attention. It will operate for indefinite periods with uniformally good results, though it is the better part of wisdom occasionally to examine the ballast coil and remove from it any accumulations of dust and dirt which may have collected.

Characteristics of the Cut-Out.

The automatic cut-out is located in a small tight housing on top of the dynamo at the front and is an electro-magnetic device of the usual pattern. When the battery current exceeds the generated current, the circuit between the dynamo and the battery automatically is broken, thus preventing the battery from discharging itself through the generator. Owing to the fact that the latitude of movement of the moving parts is exceedingly small, they never will require lubrication, and the only attention the device will require concerns itself with the contacts. These may be cleaned occasionally with a very fine flat file or two pieces of fine emery cloth glued to opposite sides of a piece of thin Bristol board. Care should be taken to remove all filings or dirt from the mechanism before the cover is replaced. Although adjustment should not be necessary for prolonged periods, it may be made by turning the small screw at the bearing end of the electro-magnet armature. Whenever such mechanisms are examined, the wiring and the binding screws should be carefully scrutinized to make sure that no worn places or breaks are present and that the screws are tight.

Solid Construction of Dynamo.

The dynamo itself is unusually rugged and substantial, and there is nothing in its make-up, barring the brushes and the commutator, which might require even occasional inspection. As an indication of its inherent simplicity, the entire field magnet circuit, which mounts the pole pieces, is merely a length of cold drawn steel tubing cut to the proper size and finished. To it are fastened the pole shoes, which also are sliced off a bar of steel tubing drawn to the proper size and shape. So accurate is the drawing that further machining is unnecessary. Barring the armature, which is standard in construction, the whole machine is virtually a solid mass of iron and copper wire, which is practically indestructible except under conditions extraordinary.

Management of the Commutator.

The armature shaft is mounted in ball bearings of liberal size and requires no more lubrication than does the ordinary magneto; a couple of drops of fine machine oil about once or twice a season is sufficient. The care required to maintain the commutator and brushes in proper condition to render their best service already has been outlined. The brushes should be removed and thoroughly cleaned from time to time to remove accumulations of grease and carbon dust, and the wire connections made tight, for continued vibration is likely to loosen them. The commutator should not show signs of wear for long periods, provided it is not abused by permitting the brushes to spark or to cut it due to the presence of hard particles of carbon or other foreign matter. Occasionally, a minute quantity of fine vaseline, applied with the aid of a piece of felt while the armature is rotating, will assist in preserving the surface smooth.

Why Wiring May Cause Trouble.

In the Rushmore system, as in every other system, great care should be taken to see that the wiring is properly connected. Probably nine-tenths of all the troubles originating in such systems can be traced to faulty wiring—wires either improperly connected, or loose connections, or the use of wire that is too small in cross section. Where doubt exists regarding the proper size of wire to use, a larger size rather than a smaller size always should be used. Wire that is too small causes resistance to the

Digitized by Google

passage of the current and a consequent decrease in the output of the generator in addition to which there is danger that it may become broken or that it will heat up and cause fire. The latter is unlikely, however, in view of the fact that the current employed is compartively low and is merely cited as a possibility that should not be overlooked.

The Hartman generator, manufactured by the Hartman Electrical Mfg. Co., of Mansfield, O., differs from many of those that have been described, essentially in that it is of the constant voltage instead of the constant current type, the theory being that the constant voltage machine permits the lighting load to be carried direct by the dynamo without danger to the lamps, and also delivers a "taper charge" to the storage battery during charging operations. The method of obtaining regulation also is different, and is vested in an electromechanical device which varies the field resistance through the current according to the speed of the armature.

Operation of Voltage Regulator.

The regulating device is contained in a tight housing, which with the switches, etc., occupies a place on the dash of the car or in any other convenient location. The housing also contains the automatic cut-out which is an electro-magnetic device. Owing to the fact that the movement of the armature in the regulating device is very small—it is less than 1/32 of an inch—and that the steps of resistance that are inserted in the field circuit are so small as to eliminate the possibility of arcing at the contacts, there is practically nothing in the mechanism to get out of order or to require attention. It will be sufficient to make sure that it really is performing its functions properly, and this may be ascertained by turning on the lights and noting whether they brighten perceptibly when the engine is speeded up. If they do brighten, it may be taken for granted that the regulator has suffered some derangement, for under normal conditions the brightness of the lamps should remain practically constant regardless of speed changes between about 500 and 2,000 revolutions a minute.

Indices of Impending Trouble.

If the lights brighten perceptibly when the engine is speeded up, the regulator should be examined to make certain that accumulations of dust or dirt have not short-circuited some of the contacts or that the armatures have not become stuck, preventing their operation. Accumulations of dirt should be removed with a soft brush, and if the contacts give evidence of corrosion, they may be cleaned with very fine emery cloth or a fine flat file. Owing to the fact that terminal blocks for the connection of the various wires from the battery, the load and the generator are supplied, little difficulty should be experienced in making the proper connections.

The Function of the Fuses.

The Hartman system, like many others, is thoroughly protected by fuses, the purpose of which is to prevent the lamps from burning out in the event that a surplus of current accidentally passes to them, and also to protect the wiring of the dynamo and the car. Obviously, in the event of failure to generate, or in case the lamps cannot be lighted, the first place to look for trouble is in the fuse block. Generally, the burned out fuse will serve to indicate the location of the troube which always should be corrected before a new fuse is inserted. Individual fuses are used in the individual lighting circuits so that the blowing of a single fuse does not cripple the whole lighting system. Spare fuses are carried in the cover of the fuse box, and their insertion is but the work of a minute.

The Hartman generator is completely enclosed, as shown by the accompanying sketches, and therefore practically is proof against the insidious action of dirt and water. Access to the commutator and brushes is through a removable plate on top of the field housing. The brushes are formed of a special composition calculated to resist sufficient wear to necessitate their replacement during the life of the car. In case adjustment becomes necessary, however, or they require to be cleaned, they may be removed simply by lifting the spring returned arm which serves to hold them in contact with the commutator. Their position will require to be shifted, of course, according to the direction of rotation of the armature, and in order to permit this adjustment the brush holder is fastened in place by means of a couple of brass screws shown in the end view of the commutator end plate. Loosening the screws permits the position of the brushes to be shifted. To change the direction of rotation of the armature it is merely necessary to reverse the wires leading to the brushes.

Need for Adequate Insulation.

As is the case with the majority of other lighting systems, failure to generate generally can be traced to broken wires or faulty connections. Great care should be taken in installing any system to make sure that the wiring is adequately insulated. It is poor policy to use cheap wire just because it is cheap; it is certain to give trouble in the end. No automobile can be expected to run without any vibration whatsoever, and any slackness in the wiring which permits incipient chafing is sure to result in trouble of some kind. For this reason the wires should be carefully hung to the woodwork wherever possible and two wires never should be placed under the same staple. Where the wiring leads from the body to the chassis a liberal loop should be allowed to permit of slight movement between the parts for tightly stretched wires are extremely likely to break at unexpected moments and from unsuspected causes.

Disposal of the Storage Battery.

Another more or less frequent source of trouble lies in the disposition made of the storage battery which forms an integral part of all such systems. The battery should be placed in an accessible position and should be securely braced to prevent movement under violent bouncing of the car due to bad roads. No battery ever should be placed in the same box with tools, for in the first place the tools are likely to become loosened and do damage to the battery, and in the second place the acid fumes are likely to result in the corrosion of the tools.

Rubber Balls as Damage Preventers.

Despite dissertations to the contrary, a storage battery is a comparatively delicate structure that must be protected to the greatest possible degree from jolts and jars and mishandling generally. Often it is possible to secure a battery in place in a box normally slightly too large by squeezing small rubber balls such as commonly are sold by stationary and toy stores between the battery and the box. The balls prevent movement of the battery and at the same time prevent violent shocks being transmitted to it. It is not wise, however, to place rubber balls beneath the battery; a rubber mat formed of a few thicknesses of an old inner tube will serve the purpose better.

Simple Improvement for Battery Terminals.

The terminals of storage battery leads and of the jumpers which connect the different trays of cells together, made of heavy brass or copper, sometimes are of the ring type, so that their removal necessitates the taking off of the nuts which secure them. These ring terminals can easily be converted into the more usual and far more convenient hook form by the mere sawing out of the side of each a section large enough to permit the ring to slip off the stud when the nut is loosened. The cut-out should be made as close as possible to the shank of the terminal so that the wire cannot slip off of its own weight if the nut accidentally becomes loosened.

MULTITUDE AND MULFORD IN EVIDENCE AT BRIGHTON

Large and Enthusiastic Assemblage Looks On While Mulford Takes Major and Minor Events—Two Spills Occur.

If the crowd which turned out to witness the second speed offering of the Motor Dealers' Exhibit Co., which was run on the Brighton Beach track, in Brooklyn, N. Y., on Election Day, November 5th, can be taken as a criterion, the oft-reiterated statement that interest in automobile speed contests is waning certainly is far from true. Of course, the balmy weather which prevailed was in a measure responsible for the vast multitude which more than filled the grandstand and overflowed into the field, but that a goodly proportion of the very enthusiastic 10,000 was attracted as a result of the fine program which was offered and the perfect management which was in evidence at the previous meet on Saturday, October 19th, was equally obvious.

And the program, and the manner in which it was carried out, left nothing to be desired. Ralph Mulford, who drove the surprising little Mason car, was the hero of the day. He accounted for both the feature events—a 100-mile free-for-all and a ten-mile event for cars with displacements under 600 inches; also he finished second to Len Ormsby (Kline) in a five-mile handicap event in which he started from scratch and gave the winner a 20-second handicap. The other event which was decided, a ten-mile free-for-all handicap, went to Mitchell (Mason).

The field for the free-for-all "hundred" numbered 13, all those who were scheduled to start lining up save Chandler (Studebaker), who had broken a crankcase before the start of the program. Pullen (Mercer) assumed the lead in the first lap, with Mulford close behind. The others were strung out within a distance of half a mile. Lewis in the Stutz gradually crept up, and at the end of the third lap took the lead from Pullen.

The first to stop at the pits was Len Ormsby (Kline), who experienced slight motor trouble; Mulford stopped during his fourth round for a tire replacement. Lewis held his position until the end of the tenth lap, when he put into the pits for a tire replacement and LeCain (Stutz) went to the fore, with Thebaud (G. J. G.) and Ferguson (Mercer), who had had tire trouble, and Mulford were trailing along behind, gradually making up for lost time. As Neil Whalen (National) was rounding the turn into the homestretch on his 19th lap his mount skidded and very nearly crashed into the fence, but the driver righted it in time. LeCain still held the lead at the end of the 23rd lap, but Dave Lewis was driving like a demon and before the 30th circuit was completed he had wrested the premier position from his team mate.

The one accident of the day which had even the semblance of being serious occurred when Whalen slewed sideways through the fence on the club house turn on the 29th lap, chopped down a few saplings, bringing up against an embankment 50 feet from the track, with both driver and the mechanician, Joe Becker, injured and the machine badly smashed. Both men were rushed to the hospital, but their injuries happily are not of a very serious nature. Just before Whalen's mishap LeCain had come to grief at the same spot, when a tire burst and the car turned twice around and ran backward into the field.

Tire trouble again cost Lewis his position, and the distance half completed saw Pullen (Mercer) leading, with Ferguson (Mercer) in second place and Lewis third. Lewis's fast driving soon closed the gap between himself and the leader, and the 60th circuit saw him again in the lead with Mulford running a very close second and Mitchell (Mason) in third place. Lewis came to grief on the next lap, when his car skidded and turned completely over, without injuring either of the occupants.

After ten minutes of the hardest kind of work, the car was again started in the contest, but after making two circuits of the track, was ruled off by the referee because of a bent front axle.

The last 25 miles were run "in the shadows," for darkness came before the race was completed. Mulford and Mitchell "see-sawed" for the lead, while third place was hotly contested between Pullen and Wishart, the Mercer drivers. Mulford gradually pulled away from his team mate and finished the distance in 1:42:11. Mitchell finished less than a minute later, and Wishart followed after an interval of 45 seconds. Pullen (Mercer), Thebaud (G. J. G.), Ormsby (Kline), Le Cain (Stutz) and Minker (Kline) still were running in the order named when the race was called.

The ten-mile event for the Rector trophy resulted in a dual contest between Lewis (Stutz) and Wishart (Mercedes). The latter led up to the ninth mile, when Lewis assumed the lead and finished in 9:17.50. Ormsby's was an easy victory in the five-mile handicap event, and he easily completed the distance in 5:01.20, leading home Mulford, the scratch man, and Limberg (Mercer). The ten-mile free-for-all handicap went to Mitchell (Stutz), who had a 50-second handicap and finished in 9:47.55, with Lewis (Stutz), who had a 10-second handicap, in second place. The summary:

Ten miles, for cars with displacements of under 600 inches—Won by Ralph Mulford (Mason); second, Spencer Wishart (Mercedes); third, Neil Whalen (National). Time, 9:17.50.

Five miles, for cars with displacements of under 301 inches, handicap—Won by Len Ormsby (Kline), 20 seconds; second, Ralph Mulford (Mason), scratch; third, Limberg (Mercer). Time, 5:01.20.

Ten miles, free-for-all handicap—Won by Mitchell (Mason), 50 seconds; second, Dave Lewis (Stutz), 10 seconds; third, Spencer Wishart (Mercedes), scratch. Time, 9:47.55.

100 miles, free-for-all—Won by Ralph Mulford (Mason); second, Mitchell (Mason); third, Spencer Wishart (Mercer); fourth, Ed Pullen (Mercer). Time, 1:42:11.00.

Thompson Retires from Speedway Project.

Because he realizes that it will take more capital than can readily be raised to build the motor speedway on the New Jersey "meadows," which feat is being undertaken by the Metropolitan Motor Speedway Association, and because he further realizes that his time is too much taken up with other business ventures to devote the needed attention to the project, Jefferson DeMont Thompson has resigned the presidency of the association. Who will fill the vacancy is not as yet known. At the office of the association, however, it is stated that new capital to the amount of $150,000 has been raised and that, with the engineering work which has to do with the filling in of the swamp land completed, it is expected that the filling in will be started within the next few days. Where the new capital came from was not stated.

Sedwick Sails for Foreign Entries.

Charles W. Sedwick, manager of the Indianapolis Motor Speedway, is booked to sail to Europe tomorrow. While abroad he hopes to enlist the support of several of the more prominent continental manufacturers with a view of securing entries for the May meeting of the speedway. Incidentally, several radical changes are to be made in the speedway plant itself. The present press stand, judges' stand and executive buildings, which are grouped near the starting line behind the pits, are to be torn down and will be replaced by one large, modern, five-story pagoda building.

Speare Again Heads Massachusetts Body.

Lewis R. Speare was again re-elected president of the Massachusetts State Automobile Association at its annual meeting in Boston last week. J. B. Coghlin, vice-president, and James Fortescue, secretary-treasurer, also were re-elected.

MAY BUILD CENTRAL GARAGE TO END PARKING IN STREET

Birmingham Proposes Semi-Municipal Shelter to Relieve Congestion—How Other Cities Have Met the Problem.

The parking problem—that is, how best can be alleviated the congestion resulting from the leaving of cars in front of office and other buildings in the downtown section—has struck Birmingham, Ala., as it has other municipalities, and this "Pittsburgh of the South" has made tentative plans for a solution; it is none other than the making of an appropriation for the construction of a semi-municipal garage for the accommodation of private owners.

The city engineer and the mayor recently made thorough investigation of conditions and found that the proprietors of business in or near office buildings complained that the closely placed line of cars at their curbstones interfered seriously with their trade and that a hardship was being worked upon them by this wayside parking. Much trade is said to have been diverted to streets where the practice of parking automobiles does not exist.

Should the suggestion be carried out the garage will be built in as central a location as possible, so that owners who drive to their offices in the morning will be able to walk from the garage to their offices after taking the cars to this shelter. However, if the car is not to be left for a great length of time it wil lbe permitted to stand at the curb. It is planned to make exceptions of certain stores which do not object to cars standing at their doors while the occupants are shopping. Pittsburgh, Pa., after which the Southern city likes to call itself, has had a more or less similar scheme in operation for some time. The Pittsburgh garage, a private institution, however, was originally erected to care for trucks operated by business houses, but considerable trade has come to it from pleasure car owners who formerly felt the inadequacy of downtown parking facilities.

In certain other cities, among them Detroit, Mich., parking is permitted at the curb, because of lack of a better method of disposing of the cars, but they are obliged to stand obliquely to the street line, thus making it easy to remove any car from the line or for another to add itself thereto. In Syracuse, N. Y., a few months ago the congestion of cars caused the public safety officials to paint parking spaces in certain of the public squares and regulations as to placing were enforced. In Los Angeles and other cities the "move on" ordinance is quite strictly enforced; cars are permitted to remain standing in the same place not longer than 20 minutes.

Legal Status of Road and Ditch.

Fixing the dividing line between a road and the ditch beside it might be a difficult problem, but aside from this feature of the case the law has declared that the road and the ditch are two separate pieces of construction; in other words, the ditch is not a part of the road.

This decision was made this week in the New York City Court by Justice Green, who was asked to set aside a verdict of $767 awarded by a jury to William P. Hardenbergh, former president of the New Jersey Zinc Co., in an action against the Employers' Liability Assurance Co. of London. Hardenberg's car ran into a ditch and was damaged, and when he took his disputed damage claim to court the jury gave him the full amount asked.

The insurance company moved that the verdict be set aside, claiming that the policy did not cover damage to the car through collision with any part of the road and alleging that the ditch was a part of the road. The judge, however, ruled otherwise, denied the motion and, in giving his opinion, cited three dictionaries as authority for his decision that a ditch, although it runs alongside of a road, is not part thereof.

What Makes Petrol Peter Out.

If the sale of "petrol" in sealed tins to British motorists has advantages, it also has disadvantages, and not the least of them is the comparative ease with which the purchaser can be given short measure, despite elaborate precautions against the practice evident in careful "sealing" of the tins. Of late, complaints of short measure which had been particularly numerous led one motorist to make investigation, and the excuses he received in explanation of palpable shortages were numerous and ludicrous.

One dealer explained that the fuel was expansible to a readily distinguishable degree and that certain climatic conditions resulted in considerable shrinkage in volume. Another advanced the theory of evaporation, though the tins supposedly are hermetically sealed by the producers. After considerable investigation he discovered at least one method by which the unscrupulous dealer "milks" the tins. The screw-caps with which the tins are fitted were turned sufficiently to permit the fuel to ooze out drop by drop with the tin inverted over a receiving vessel, but the cap was not loosened enough to break the seal. Thus a considerable quantity of fuel could be abstracted from the tins before they were vended to the unsuspecting motorist.

DISBROW AND HIS TROUPE PLAY TO LOUISIANA CROWD

Make a Two-Day Stand at Shreveport, Where Endicott, Nikrent and Disbrow Share the Honors—Time Trials Are Abundant.

Louis Disbrow and his troupe favored Shreveport, La., with their presence on Sunday and Tuesday last, when, under the auspices of the Shreveport Automobile Club, they performed. The program provided was not of a hair-raising nature, five of the ten events being time trials. There also was a match race on each day, leaving but three open events, all of which were free-for-all handicaps. William Endicott, Louis Disbrow and Joe Nikrent each placed one of them to their credit. The summary:

Sunday, November 3rd.

One mile, time trials—Ulbrecht (Case), time, 1:03¾; Joe Nikrent (Case), time, 1:04⅕; Kilpatrick (Hotchkiss), time, 0:57⅘; Endicott (Case), time, 0:57⅕.

Five miles, match race—Won by Joe Nikrent (Case); second, Ulbrecht (Case). Time, 5:32.

Two miles, time trial—Louis Disbrow (Fiat), time, 1:57.

Ten miles, free-for-all handicap—Won by William Endicott (Case); second, Joe Nikrent (Case); third, Kilpatrick (Hotchkiss), Time, 7:44.

One mile, time trial—T. C. Jones (Cadillac), time, 1:09⅕.

One mile, time trial—Louis Disbrow (Simplex), time, 0:57⅗.

Five miles, free-for-all handicap—Won by Louis Disbrow (Simplex); second, Joe Nikrent (Case); third, William Endicott (Case). Time, 5:02⅗.

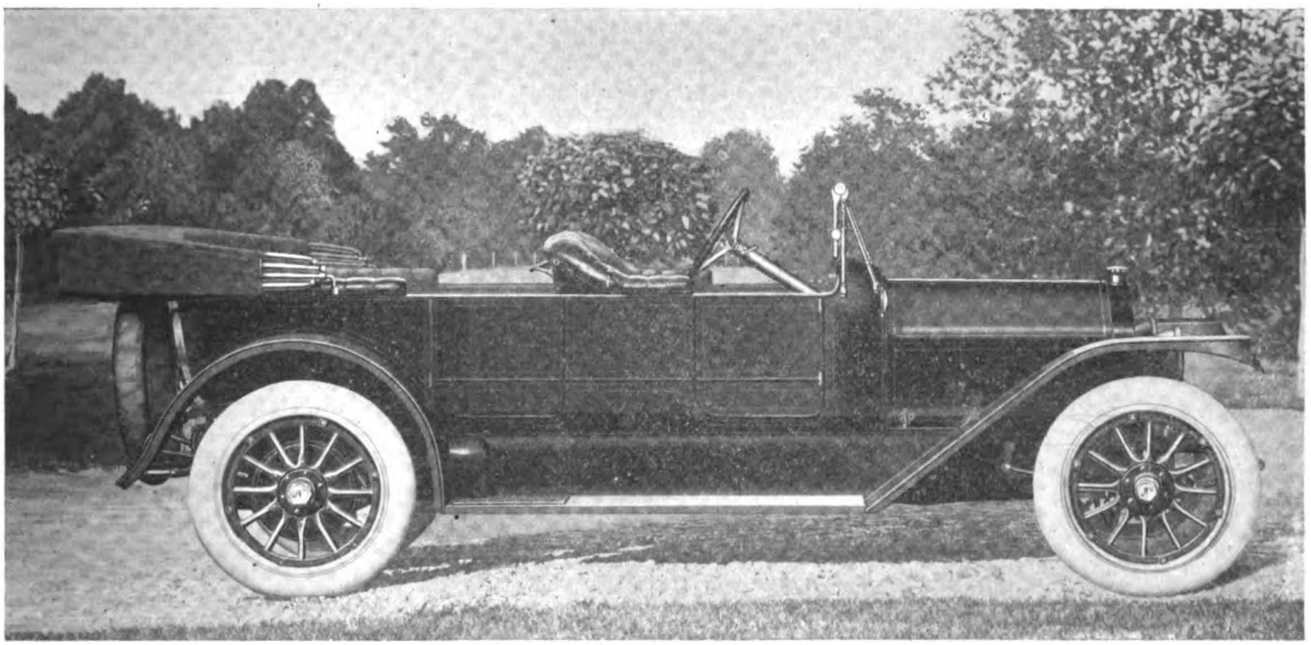
Tuesday, November 5th.

One mile, time trials—T. C. Jones (Cadillac), time, 1:05⅕; Joe Nikrent (Case), time, 0:56⅕; William Endicott (Case), time, 0:55⅘; Kilpatrick (Hotchkiss), time, 0:56⅕; Ulbrecht (Case), time, 0:61.

Five miles, match race—Won by William Endicott (Case); second, Ulbrecht (Case). Time, 5:12⅗.

Ten miles, free-for-all handicap—Won by Joe Nikrent (Case); second, William Endicott (Case); third, Kilpatrick (Hotchkiss). Time, 11:02⅘.

New Texas Automobile Club.



At a meeting held at Cuero, Tex., and which resulted in the formation of the DeWitt County Automobile Club, W. M. Ratcliff was elected president. The other officers are: Vice-president, Walter Ruffert; secretary-treasurer, Alfred Frobese.

Five Passenger Touring Car, One of Five Models, Improved Series V

Announcement of National Improved Series V

Do not compare the NATIONAL with any car except those costing $5000 or more. You have studied the 1913 announcements of other high-grade cars, and now without wasting words on superlatives we invite your candid reasoning—we can prove the NATIONAL offers you in Quality, Utility, Luxury, Reputation and Intrinsic Worth as much or more than any $5000 car for

$2750 to $3400

FIVE MODELS

Write us at once for our dealers' proposition and advance catalog

Compare these features with the very highest priced 1913 cars and you realize why we claim to offer you the greatest value on the market today

Long Stroke (4⅞ x 6), flexible and noiseless Motor, with enclosed valves.
Left Side drive.
Center control.
Gray & Davis Electric Starter.
Gray & Davis Dynamo Electric Lighting System.
Bosch double dual Magneto.
Multiple jet Carbureter.
12-inch Turkish Upholstery.
Full heavy nickel Trimmings.
Electric Horn.
Adequate baggage carrying Compartment concealed in body but easily accessible.
Powerful and reliable Brakes.
Spacious interior.
Tire Pump, integral part of the motor.
128-inch wheel base.
Adjustable ventilating and rain vision Wind Shield.
Hoffecker Speedometer.
Tire Carrier in rear.
Silk mohair Top, Cover and Curtains.
Full floating Rear Axle.
Resilient springs; ¾ elliptic in rear; semi-elliptic in front.
Large gasoline pressure-feed Tank with Gauge in rear.
Robe rail, foot rest, and foot mat in running board.
Plain, continuous, enclosed Metal Guards.
Easy riding qualities, unexcelled.
Oiling System, demonstrated to be perfect.

When Loss of Seconds Means Loss of Lives

You have read of many instances where the loss of a second resulted in an accident and loss of life.

Eliminate this danger by equipping your car with an Electric Self Cranker.

It is instantaneous, absolutely sure, economical, convenient and clean.

If your car stalls, just push a button and go ahead, leaving danger behind.

"Dead centers" cut no figure with good Electric Cranking systems; they start your car always—in summer or in zero weather.

But the heart, the brains and the initial energy of every one is a reliable Storage Battery.

That's why 90 per cent. of all the manufacturers equip Electric Cranking and Lighting Systems with

CLBA

Storage Batteries

Use the Class A CLBA with an Electric Lighting Generator
Use the Class B CLBA with an Electric Self-Starter

METALLURGIQUE

Will Sell in Your Community

DEALERS

The European Car Idea is Growing in America — is your Ear to the Ground

Dealers who read this announcement will do well to consider the advisability of forming an agency connection with us for handling the Metallurgique—a car for the classes—a distinct and exclusive product, sensational in body design, equipment and appointment. These cars are limited in quantity—unlimited in quality.

From the radiator of unique design to the end of the rear springs—from tire to top, this powerful, unbreakable car offers value in service away beyond that of any other European or any American product. There is a selling argument in every item from steering knuckle to engine.

Luxury of appointments are regal—beauty of design and finish supreme on both sides of the water. Service unlimited.

The Metallurgique is the only logical car for men of wealth and position who desire an equipment that will make all others appear commonplace.

Let us help you find and please and sell to those in this class. As a preliminary, write and get the literature and terms. We can throw more light on the Metallurgique, Europe's choicest product.

Stewart
Delivery Cars

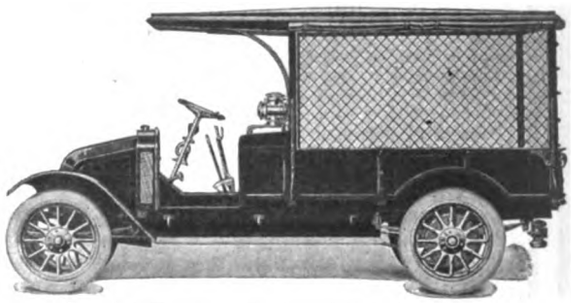
Sell Stewart Trucks In Winter Months

Now is the time when touring car sales begin to drop off. Cold weather slows down the business of every dealer who sells only pleasure cars.

But for the dealer handling Stewart Delivery Trucks, there is no let up. These cars sell just as well in winter as in the summer months. In fact, there is more need for motor delivery during the cold, snowy days and the rush of holiday trade than at any other time. Merchants are already worrying over their holiday deliveries. They know that their horse equipment will be inadequate.

We are in a position to guarantee prompt deliveries of Stewart Delivery Trucks in time for the holiday rush. We can furnish dealers their demonstrators almost immediately. Now is the time to go out and secure this desirable business. Merchants are looking for the right car; one that is scientifically designed for delivery service. See these five reasons why Stewart Delivery Trucks are money-makers for dealers:

1. NO SEASONS:
   The dealer can sell Stewart Delivery Trucks every month in the year. There are no seasons—no hold-ups for new models to appear while your rent and expense pile up. Every month's sales should be an advance over the previous month. Your sales force can be kept busy every day.
2. NO TRADING:
   Merchants buy delivery trucks to use, not to look at. They are never out of style. So long as the car runs, the merchant will use it, and the longer it runs the better he is pleased. Instead of having to take old cars in trade, every one you sell is a help toward selling additional ones to the same buyer.
3. SMALL EXPENSES:
   Selling commercial trucks, your operating expenses are only about half what they are in selling pleasure cars. Fancy salesrooms unnecessary; no joy riding; no expensive entertainment; no second-hand cars in storage running up your investment. Selling commercial trucks is a straight business proposition, handled in a business way.
4. EASY SALES:
   It is easy to find prospects for Stewart Delivery Trucks. Every merchant using two or more horse-drawn vehicles is a prospect. Merchants are coming to realize the convenience and saving of motor delivery. It isn't a question of getting them to adopt motor delivery, but of showing them the right car. We have it. If their competitor buys delivery trucks, they must buy to keep up with the race.
5. REPEAT ORDERS INSURE A STEADY AND GROWING BUSINESS.
   The sale of one car to any merchant with several delivery vehicles is sure to lead to other sales.



The dealer who gets started now is going to get the cream of the business, besides laying the foundation for a permanent future business that will increase year after year.

The Comfort Car for 1913

Every KisselKar representative is ready to give you every opportunity to convince yourself that the KisselKar is the greatest comfort car in the history of the industry.

No car can equal the KisselKar comfort without equalling the liberal wheelbase—and few cars do.

Few cars have such commodious tonneaus—which give greater distinction and riding comfort.

No other car has equally deep seats which allow the occupants to lounge back and fully relax without need to brace against lurches or sidesway on rough roads.

The highest priced car built will not equal the rare riding comfort of the KisselKar.

No car can surpass the road capabilities of the KisselKar—the quick getaway—the reserve power to master the extremest road conditions—the ability to slow down "on high" to a creeping pace, and to climb hills at easy speeds without rushing down one hill to get up the next. In the two great factors of car quality—easy riding and easy driving, the KisselKar is the unmatched car of America.

KISSELKAR SERVICE is supplied by a national service organization maintained by the manufacturers with specially constructed buildings at principal points of America, as service-centers, to co-operate with sales agencies in giving owners the service that lowers running cost, retards depreciation, and insures uninterrupted pleasure.

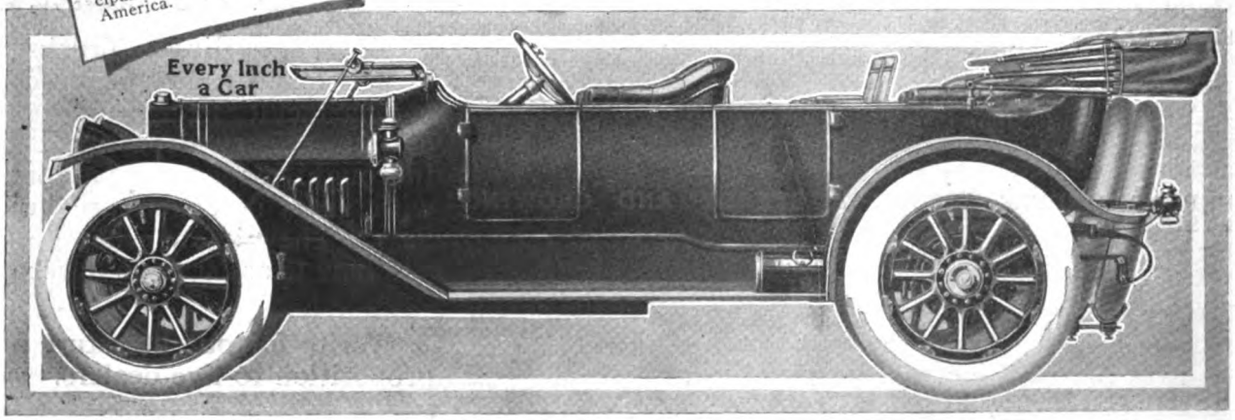
KISSELKAR

"Thirty," $1700 "Forty," $2000
"Fifty," $2500 60 H.P. "Six," $3150

Electric Lighted and Started

Full equipment including top, windshield, speedometer, shock absorbers, demountable rims, and everything belonging to a perfectly appointed car.

KisselKar Trucks, 1500 lbs., 1, 2, 3, 4, 5 Ton



Write for 1913 KisselKar Catalog. It is a great aid in judging automobile values. If interested in any type of power commercial vehicle, write for truck catalog.

TIRE PRESSURE GAUGES

An Important Announcement

A SCHRADER'S SON, INC., manufacturers of the well-known Schrader Universal Tire Pressure Gauge, beg leave to announce to the trade that they have acquired the entire right, title and interest in and to the Twitchell Tire Gauge Patent No. 927,298 dated July 6, 1909.

In view of the acquisition of this patent, purchasers of the Schrader gauges are relieved from any possibility of suits for infringement under the Twitchell patent. The Schrader Gauge will continue to be the highest type of pencil gauge both with regard to accuracy and durability.

Realizing that there is a wide demand for the Twitchell gauges, we have empowered the Twitchell Manufacturing Company of Chicago to continue to supply the market with Twitchell gauges under the Twitchell patent, so that no question of infringement can arise with regard to the product of this concern.

The Allen Auto Specialty Company, manufacturing the Allen Tyrometer, has taken a license under the Twitchell patent, and the suit pending against this company has hence been withdrawn.

We believe that the acquisition of this patent by A. Schrader's Son, Inc., will clear up the gauge situation and relieve our friends of any feeling of uncertainty which they may possibly have had in the past. We also believe that with the Schrader Universal Tire Pressure Gauge, the Twitchell Gauge and the Allen Tyrometer the field for gauges is fully covered, and a variety is offered which allows an ample chance for selection from the different types.

No other gauge is licensed under the Twitchell patent, and hence to avoid any possibility of infringement our friends are asked to restrict their dealings to the three gauges above mentioned.

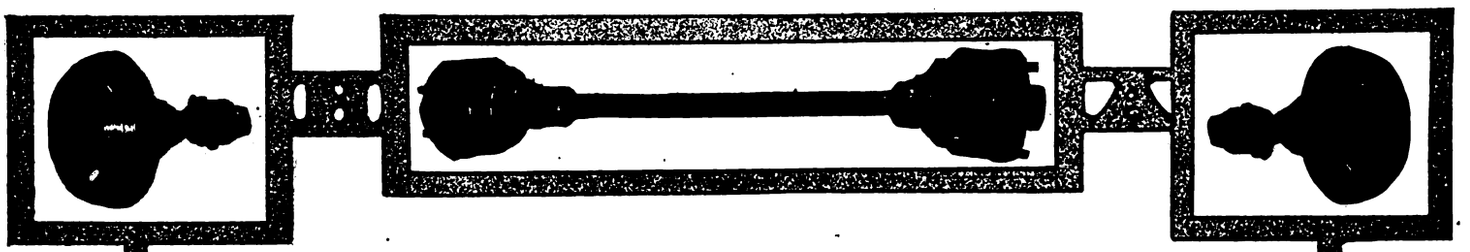
The Twitchell patent has been sustained in several suits, and the following gauges have been held to be infringements thereof:

The Northam Gauge—held to be an infringement by the United States Circuit Court for the Southern District of California in the suit of Charles R. Twitchell vs. Northam Auto Pressure Gauge Company.

The Prest-O-Lite Gauge—held to be an infringement in the suit of Charles R. Twitchell vs. Prest-O-Lite Company in the Southern District of New York.

The Safety Tire Gauge—held to be an infringement by the Supreme Court of the District of Columbia in the suit of Charles R. Twitchell vs. Rudolph & West Company.

Furthermore, in the suit against the New York Sporting Goods Company the sale of the Edelmann "Economy" gauge was enjoined. This decree was obtained by default, E. Edelmann & Company of Chicago failing to defend its customer, as is usual. Following this, suit has been brought directly against E. Edelmann & Company, which suit is now pending. All other dealers in infringing gauges will be promptly prosecuted.



In closing, we wish to assure the trade and consumer that in the future, as in the past, it will always be our endeavor to supply them a reliable gauge at a reasonable price and under satisfactory business conditions. Our gauges may be obtained from all tire manufacturers, jobbers, supply dealers and garages, or direct from us.

Retail price, $1.00 each.

Type F, 400 Drive

Manufacturers contemplating bringing out a "40" will be interested in the detailed description of our new Type F-400 Drive, 40 horse power capacity, pin and ring type.

Details of this universal joint are shown here for your initial information and guidance, and this Universal, like every other Hartford product, embodies quality throughout. Material, high carbon steel, drop forgings all through, with all working parts hardened and ground to gauges with very close limits. All parts are interchangeable and the factor of safety is greater than that usually found in the general run of universals.

We are equipped to turn out this, or any other universal, promptly and every designer of a "40" can get a goodly amount of information by sending for our representative or by writing.

Hartford Universal Joints and Cone Clutches are built to meet individual requirements and we are always ready to co-operate with the engineers of car factories.

SPECIFICATIONS:

A—Total overall length of complete drive.
B—Center of T-Head to end of square. Made to any length specified.
C—Length of Transmission Hub, Standard 2". Max. 2".
D—Diameter of Transmission Hub, Standard 2⅜".
E—Diameter of Propeller Shaft, 1⅜".
F—Width across flats, Standard 1⅛", 1 3/16", 1¼", 1⅜".
G—Width across corners, Standard 1 7/16", 1½", 1⅝" or 1 9/16", 1¾".
H—Length of Rear Hub. Standard 2". Max. 2".
I—Diameter of Straight Round Hole or Maximum Diameter Taper Hole.
J—Taper per foot: Standard 1½", ½", ⅝".
K—Keyway. Standard ¼" x ⅛", 5/16" x 5/32", ⅜" x 3/16".

Here is an Accessory the Sale of Which is Most Active in Winter Time

¶ It does not require much effort to convince the wise dealer of the value of an accessory which is a live seller during the dull winter months. Perhaps that is one of the reasons that the Warm Hand Wheel is getting on to such a marked degree with the automobile dealers and supplymen throughout the country.

¶ Not only in the Warm Hand Wheel a commodity which is an absolute necessity during six months of the year on every car and every truck in the country, but it is an accessory which gives the dealer a good margin of profit at the same time that it is selling fast.

¶ The Warm Hand Wheel is operated either through storage batteries or electric lighting outfit and it may be easily installed upon any car in a few moments' time. On Ford cars the Warm Hand Wheel operates by means of the current generated by the magneto, which is built in the fly wheel of the Ford car. It operates without affecting whatsoever the efficiency of the magneto, for the purpose for which it is intended.

¶ The Electric Warm Hand Wheel is so much of a necessity that it is to the advantage of every salesman in the automobile industry to insist upon having cars equipped with the Warm Hand Wheel. With it the individual will drive his car a great deal more in winter than without it, because the Warm Hand Wheel actually keeps the driver of the car as comfortable in winter as he is in summer.

¶ And just incidentally, right now the Warm Hand Wheel is as much a necessity as it will be in the very severest portions of winter weather. As stated above, it is required over six months of the year, and its installation on cars will mean more car usage in winter than ever before.

¶ The retail price of the Warm Hand Wheel is $15.00 with a liberal dealers' discount. You had better get in touch with us because we want representation in your territory.

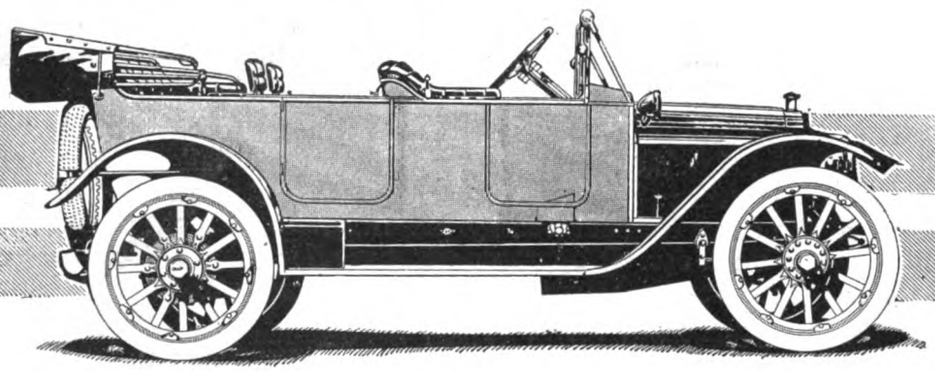
The Silent Car

ELECTRIC LIGHTING
SELF STARTING



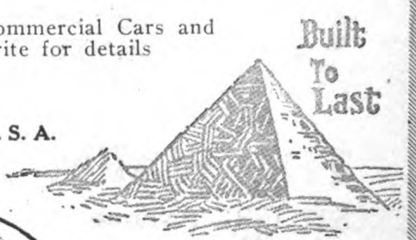
Through eight years of unbroken success the sales of

Dorris Motor Cars

have grown steadily of their own momentum—**like a snow ball rolling down hill.**

The Dorris is a seller and a repeater—a car of unlimited satisfaction, of Maximum service at a Minimum cost—eletcrically self-started and lighted, with all modern refinements of finish and appointments, and the perfection of detail which marks a car of the highest quality.

It shows its exceptional value and ability most under the hardest use in comparison with other machines. It always receives a boost from the owners and wherever it is fairly introduced it takes possession of the territory and dominates the market. In short, it's a car on which to build **permanent,** unlimited success.



With a new factory more than doubling our capacity we are this year ready to **materially** extend our field.

And for a limited number of progressive dealers in some of the richest motor car territory of the country, we have a proposition of such unusual attractiveness that no live dealer can afford not to know about it.

If you are an established dealer, we can show you the way to a bigger, more stable and more profitable business. If you are not yet in this greatest business of the age, but like motor cars and have energy, ambition, perseverence and a clean record, we will show you the way to bigger and surer rewards for your time and labor than in any other stable business in America today.

We manufacture a complete line of Pleasure and Commercial Cars and can make you a wonderfully interesting proposition. Write for details today.

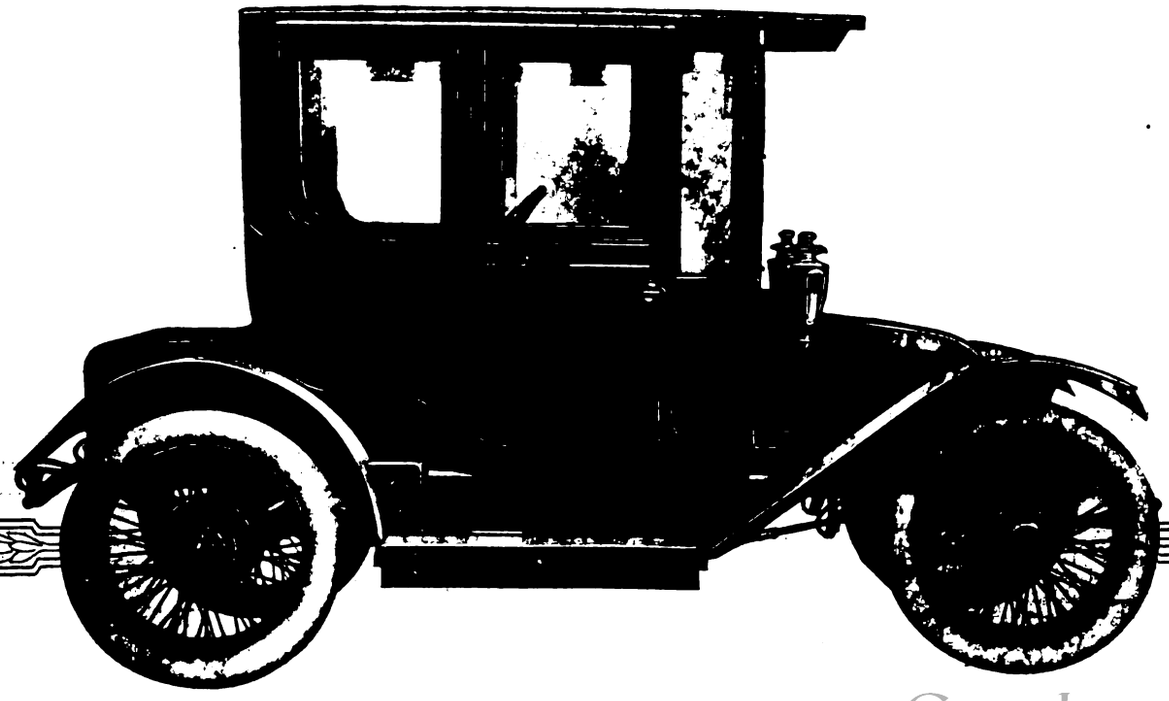
THE BEST OF AMERICA

Buffalo Electrics for 1913 embody the best in American design and construction. In many respects they show a decided influence of advanced European practice. The originality and skill of our engineers are not evidenced by anything of a freakish nature—rather by the degree of refinement they have accomplished in those standards accepted as best in both Europe and America.



Wood wheels are regular equipment on Buffalo Electrics for 1913. While the use of wire wheels is prevalent in Continental Europe, and while they add a certain distinctive style to Buffalo Electrics, their adoption as special equipment on our cars comes as the result of their strength, economy on Tires, ease of repair in case of accident, and many other sterling qualities.

DEALERS

A series of announcements will appear in this paper describing the features of Buffalo Electric Construction. We want you to judge for yourselves whether or not the 1913 line is superior to any other. There remains some very desirable territory to be assigned to high-grade dealers. Write today for full particulars regarding our selling plan.

BUFFALO ELECTRIC VEHICLE CO.

Why Ames Agents Make Money

The Ames "45" is built to satisfy the most critical buyer. And it does! The Ames "45" represents more real automobile value for $1,635 than any car built. Comparison proves it! The Ames "45" is built by men who stand for quality, integrity and square dealing. And the earned reputation of the car substantiates it.

A Real "Kentucky Thoroughbred"

The Ames "45" is a real "Kentucky Thoroughbred." It shows the perfection of the carriage-builder's art in the beautiful lines of the body—in the luxurious, hand-upholstered leatherwork—in the honest, careful workmanship, attained by two generations of expert carriage builders. This, coupled with the sturdy Continental engines, used by over sixty of America's foremost automobile builders, together with other high-priced equipment, puts the Ames Car in a high-quality class alone.

$1635 **The Kentucky Thoroughbred—Ames "45"** **$1635**

Note These Sales Points Long stroke, powerful Continental Motor—the only motor that has won the unqualified approval of automobile engineers the country over—Electric (Dynamo) Lights—Real Self-starter—Left-hand Drive—Full equipment—"Amesbilt" Bodies and Tops. A combination of power, speed, endurance and graceful lines.

GET THE FACTS

Our 1913 Agency Proposition is the most liberal and profitable agency connection offered today. You need the information we can send you along this line—it means money to you. If you would represent a car that is in "Class A"; that is backed by millions of dollars; that is coupled with powerful sales-aids for agents; that sells for a reasonable price—then mail in the coupon—it brings all the facts. We think you'll find the information we send interesting and profitable to you.

Read These Specifications

Motor—Powerful four-cylinder Continental, unit power plant, en bloc cylinders. Bore 4¼ inches, stroke 5¼ inches. Three-bearing crankshaft. Valves enclosed. Ask any engineer if it isn't the best motor built. Cooling System—Centrifugal force-feed pump. (We tried the "thermo" and it didn't satisfy.) Carburetor—Schebler model O, 1¼-inch, hot-air jacketed. You can't "load" it. Horsepower—Forty—actual, not estimated—more at higher speed. Ignition—New Remy dual system high-tension magneto, not connected with starting and lighting system. Lubrication—Force-feed plunger pump system with constant level. Oil driven by pumps direct to main bearings. Sight Feeds—Oil indicators on dash. Clutch and Transmission Unit—Warner make. Multiple-disc clutch. Discs, Raybestos lined, running either dry or in oil. Transmission, selective type, 3 speeds forward and reverse. Shaft mounted on annular bearings. Electric Lights—Motor-driven dynamo with storage battery auxiliary. Lamps—12-inch headlights, 7-inch side lamps, 6-inch tail lamp—all electric lighted and all controlled from dash. Self-Starter—Gas starter furnished as regular equipment. Positive acting, 100 per cent. efficient. Combination electric starting and lighting motor-generator furnished at extra cost. Speedometer—The widely-advertised Stewart Model B. Top—Best mohair. Side curtains and boot of same material. Color—Black body with gray striping and gray wheels. Axles—Hess, large size. Front, I-beam, drop-forged; rear, pressed-steel, full-floating type. Both axles on annular bearings. No "axleitis" in Kentucky Thoroughbreds. Body—"Amesbilt," aluminized sheet metal. Five-passenger touring car and two-passenger roadster. Gear Ratio—3½ to 1. Tires—34 x 4 inches, Goodyear oversize "No-Rim-Cut." Springs—Special analysis steel. Front, half elliptic, 36 x 2; rear, three-quarter elliptic, 48 x 2. Steering Gear—Worm and gear type. Steering wheel, genuine walnut, corrugated, 18 inches diameter. Wheel on left side. Upholstery—Black No. 1 leather, long-grained, dull finish, hand-upholstered. Filling, best curled horsehair. Wheels—34 inches diameter, wood, artillery type, large hub flanges, heavy spokes. Rear wheel spokes bossed and bolted to brake drums. Rims—Baker "Bolted-on," demountable. Extra rim and tire holder furnished as regular equipment. Wheelbase—118 inches. Drive—Bevel gear, two Spicer universal joints, pressed steel torque arm.

Pullman

Are You a 10% Dealer

ANY dealer depending on his own effort will not average better than 10 per cent. of the possible sales in his territory.

A broad statement, but easy to prove. The 90 per cent. minus is the difference between INDIVIDUAL EFFORT and TEAM WORK.

The sale of AUTOMOBILES, that is, intelligent sales, require the same systematic and modern selling methods as applied to any other great industry. The individual must first be located before he can be sold, and how many DEALERS are **in touch** with the next purchaser?

In nine cases out of ten the PROSPECT starts "shopping" through the automobile district and YOUR LIVE PROSPECT is no secret; the other dealers know he is in the market and proceed accordingly.

Pullman Dealers Work Differently—They Know of the Prospect in Advance

Back of every PULLMAN DEALER is the PULLMAN SALES MAKING MACHINERY (blue print on request), a wonderfully modern selling organization that spends many thousands of dollars to locate your prospect, to get you in touch. This plan is original with the Pullman Company. It's the final answer to successful distribution. In future years all AUTOMOBILE MANUFACTURERS will be forced to extend DEALER CO-OPERATION, just the same as the manufacturers of typewriters and sewing machines. The Pullman Company does it NOW. May we submit the selling plan? Three big leaders for 1913—all fully equipped and up to PULLMAN STANDARD.

Cameron's Great Car Find a "40" Like It

There are 72 makers this year building Forties. For legions of motorists are demanding cars of reasonable size and power.

Each of these makers strives in some way to outdo the others. As a result, some of the most luxurious cars ever built are now in the Forty class.

And prices on "40's," since this war began, have been fairly cut in two. So some of the greatest values in Motordom now are in 40-horsepower cars.

Find if you can, among our 72 rivals, any value that compares with this.

300 Improvements

We have spent four years on the Michigan "40." We have sent out and watched 5,000 cars. We have worked out some 300 improvements.

Our engineer-in-chief is W. H. Cameron, who has built 100,000 cars.

For body designer we have John A. Campbell, whose body designs are used by kings.

Each part and detail is built by an expert, picked out by Cameron. After four years, the result is one of the greatest cars that ever went out from a factory.

Electric Lights—Four Speeds Big Tires—All for $1,585

In the Michigan "40," W. H. Cameron reveals his splendid genius.

He has given you safety, by making all driving parts sufficient for a 60 h. p. car.

He has given you economy by using extra wide tires. He has given you comfort by his 14-inch cushions, by wide, long springs, and by unusual room.

He gives you the luxury of hand-buffed leather, and a 22-coat body finish.

He gives you four forward speeds, extremely rare in cars under $3,000. He gives you electric lights.

And, by enormous output and model equipment, we have made it possible to give you all this for $1,585.

What Other Car Compares?

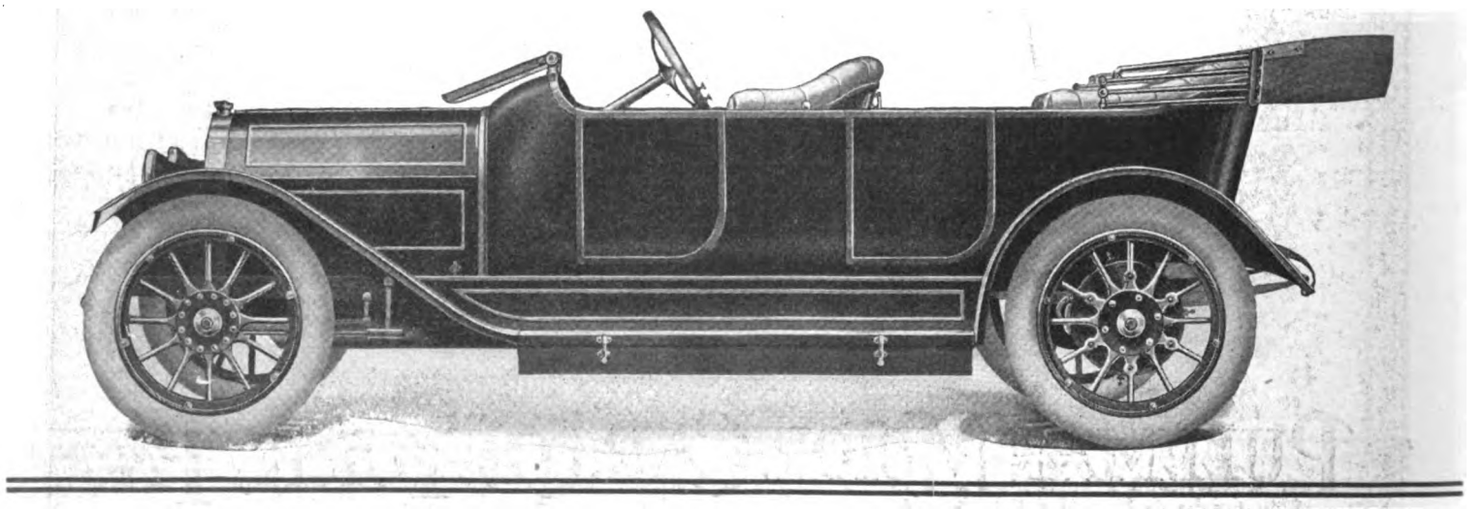
What other car in the whole Forty class gives you this much value?

Make your comparisons. Watch all the costly features in which makers skimp. See if any car, built by able men, makes an offer this year which compares with this. That is the way to get the utmost from this war of Forties.

Write for our 1913 catalog, and we will tell you where to see this car.

Michigan "40" $1,585

With All These Special Features:



Four forward speeds, like all leading foreign cars.
Electric lights with dynamo.
Oversize tires—35 x 4½ in.
40 to 46 horsepower.
Cylinders—4¼ x 5¼.
Wheel base, 118 inches.
Rear seat, 50 in. inside.
Cushions, 14 inches deep.
Centre control.
Left side drive.
Brakes extra efficient.—drums 16 x 2¼ inches.
Springs 2¼ in. wide, 37 and 50 in. long.
Firestone demountable rims with extra rims.
Steering post, clutch and brake pedals all adjustable to fit any driver.
Body finish 22 coats.
Nickel mountings.
Electric headlights, very powerful, 12½ in. diameter.
Sidelights flush with dash.
Windshield built in.
Mohair top, side curtains and envelope.
Electric horn.
$50 4-inch Speedometer.
Foot rail—robe rail.
Rear tire irons.
Tool chests under running boards.
An average of 50 per cent overcapacity, to allow big margins of safety.

Self Starter

Either gas or electric, furnished at moderate extra price. We do not include it because men differ about the type they want.

Michigan Motor Car Company, Kalamazoo, Mich.

The Beauty of an Automobile

Depends Upon Its Sheet Metal Parts

THE curve of the body, the dip of a fender, the shroud or even a running board not in harmony with the general design may spoil the good appearance of a costly product. And unless these sheet metal parts are strongly braced and correctly made they will rattle with the road vibrations.

Largest Users of Sheet Metal in the World

Ask the Hayes organization about your sheet metal problems. We make everything in that line for the automobile: hoods; fenders; pans; shields; shrouds; gasoline tanks; tool, battery and Prest-O-Lite boxes; mufflers, etc., and all-metal and wood-metal automobile bodies.

Not only are we the largest users of sheet metal in the world but our two enormous plants are devoted to sheet metal products exclusively.

The Hayes engineering staff will gladly give you expert advice, go over your blue prints with you, smooth out the wrinkles and, if you desire, take the entire problem off your hands. By this means you can save valuable factory space, increase production and be sure of deliveries **ON TIME.** The highly specialized Hayes factories can underbid the motor car manufacturer for his own sheet metal parts and Hayes "quality" and standardized workmanship have never been questioned.

We deliver to you in any shape or stage of completion you want—fitted to your chassis and enameled or ready for your own paint shop with anti-rust baked on.

Pass on your sheet metal problems to the Hayes organization and both save money and increase your production.

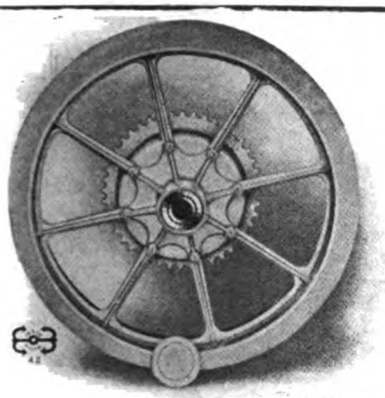
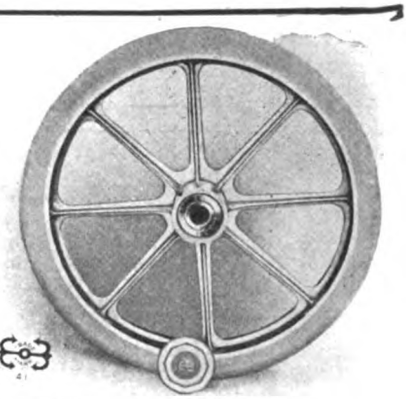
In destruction tests, actual practice and speed contests *Rudge-Whitworth Detachable Wire Wheels*



have demonstrated their superiority over the wooden artillery wheel—being stronger, lighter, more economical on tires, more flexible, adapted to any axle and elegant in appearance.

Under Rudge-Whitworth patents and methods the Standard Roller Bearing Company, of Philadelphia, will manufacture Rudge-Whitworth Detachable Wire Wheels, fitted with Houk Q D Rims, for the American trade.



George W. Houk Co.

5003 Lancaster Avenue **PHILADELPHIA, PA.**

Digitized by Google

SHELDON STEEL WHEEL

"Guaranteed to Outlast a Score of Cars"

The wooden wheel is passing and will shortly be relegated to the horse-drawn vehicle only—and it takes but a glimpse into the immediate future to arrive at this conclusion.

Extreme dynamic conditions, coupled with exposure to water and the burning sun, alternately, has called for something better than the best second growth hickory obtainable.

As a final evolution, designed to overcome the degenerative wooden wheel and the only partially satisfactory wire wheel, comes the SHELDON Steel Wheel, a light, solidly constructed, imperishable device that offers advantages plain to engineer, dealer and layman.

The engineering features of the SHELDON Steel Wheel afford an economic disposition of material to counteract tremendous side pressure, providing against side strains in taking a corner under load or striking a curb "side on." There are no flange bolts to come loose, causing quick destruction. Time, temperature and shock cannot affect the solid steel construction in the slightest degree.

The SHELDON Steel Wheel offers a pronounced saving in tires through its superior resiliency, its lightness and ability to radiate frictional heat—and frictional heat is a constant and ever-growing menace to the life of the tire.

The SHELDON Steel Wheel makes starting easier and the truck more accelerative.

Under strains in which the wood wheel would collapse beyond repair, the SHELDON Steel Wheel can be doubled up and straightened out again.

These are bare facts in the case. The subject is long and ought to be of intense interest to truck manufacturers. We are now in a position to equip commercial cars right now. Our facilities for prompt deliveries are as great as a tremendous organization can make them. Write for the details.

TIMKEN
AXLES & BEARINGS

Getting Maximum Power from Engine to Wheels

It isn't only the size or rated horse-power of your engine—
It's how *much* of that power gets to the *wheels*.
Right here is where good gears count—and count mighty strong.

Gears that are good enough to meet Timken ideals of efficiency can't be completely made by any gear-cutting machine—even the finest.

They have to be *ground* to perfect accuracy. This increases expense, but Timken does it because it makes for quietness and efficiency.

What's more—we couldn't find a gear-grinding machine or method in existence that would remove *all* the little inaccuracies left by even the finest cutters.

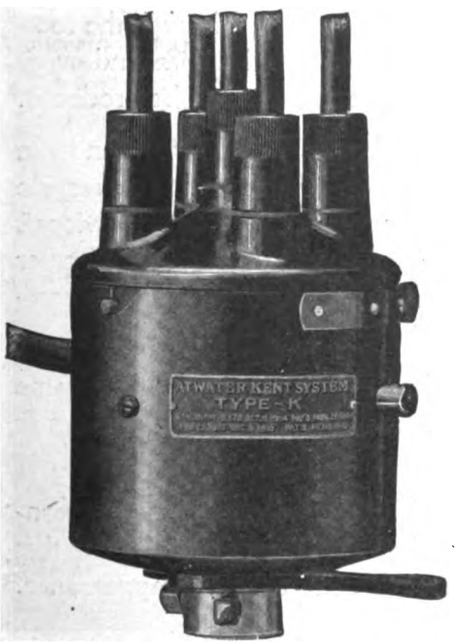
So we invented a process—designed and built a special machine.

Two other important facts—

Timken Gears are combined into a unit driving-plant assembled and tested before it is bolted to the axle-housing.

And they are kept always in perfect mesh by Timken Tapered Roller Bearings, which are adjustable.

These things are all necessary—not one could be left out of the top value car. They mean getting the full mileage from every last drop of gasoline.



Get the whole story of axle and bearing importance and construction by writing to either address below for the Timken Primers, T-7 "On the Care and Character of Bearings," and T-8 "On the Anatomy of Automobile Axles."

Omaha.....Omaha Rubber Co.
Chattanooga.....Sanford Bros.
Dallas.....Fisk Co. of Texas.
Denver.....Auto Equipment Co.

Of extreme interest to every motorist

THE Automatic Spark Advance feature of the Type "K" Atwater Kent System is a long stride forward in ignition practice.

With this device, the control of the spark timing is entirely automatic (although the hand lever can be used if desired). This means that the spark is always properly timed to get the greatest possible power from the motor at any speed from three to seventy miles per hour.

No human mind can follow accurately the speed variations in an automobile motor and accordingly regulate the spark setting to get the best results.

The automatic spark control of the Atwater Kent System is more than human in its performance—it is sensitive to the slightest variation in speed—immediate in its response and positive in its action. The operator can forget his spark lever, knowing that his spark is being better regulated than he can do it himself.

The increased safety due to the automatic retarding of the spark for starting is alone more than sufficient to commend it to the modern motorist.

The Type "K" System is especially adapted for use in conjunction with lighting and starting equipment, or as sole ignition in place of the high-tension magneto. We regard it as being fully up to the high standard of merit for which Atwater Kent equipment is known.

Interesting Booklet D and detailed information sent upon request.

"The Horn that's Made for the Discriminating"

TUTO HORN

THE TWO TONE HORN

Fit For the Finest Cars.

THE clean-cut, elegant design of the TUTO Horn harmonizes well with the simple lines of 1913 cars and this together with high grade workmanship and finish makes the TUTO the ideal horn for any car, high priced or otherwise.

¶ The TUTO horn is the only electrical warning device complete in every little detail, with its mountings in keeping with the permanent portions of a fine car.

¶ There are protected coverings for the cord where it extends up the steering column to the button, escutcheons to cover the bushings which go through the footboard or dash, and also for the openings where the cord goes to the horn, and every screw and clasp is provided so that a finished and permanent job can be produced.

¶ All of these fixtures have been specially designed for the TUTO horn and can be procured only with TUTO equipment, yet in spite of this fact, we receive orders for these TUTO fittings from car manufacturers, dealers and individuals all over the country for use in connection with electric warning signals of other makes which were purchased before the customers were acquainted with the completeness and excellence of the TUTO horn.

¶ There can be no better recommendation for the TUTO horn, for these same people express their preference for the TUTO, its superior operating qualities as well as the completeness of its fittings.

¶ To avoid disappointment, specify the complete TUTO horn and have a warning signal which is adequate for every service and which comes complete, so that it can be installed on the highest finished car, without detracting from its appearance.

EMPIRE

"The Little Aristocrat"

Style, Distinction and Character in every line. Thoroughbred Speed, Power and Strength in keeping with the unusual quality of its design. Completely Equipped $950.00 with

Mohair Top,	**Windshield,**	**Prest-O-Lite Tank,**	**Speedometer,**
Top Envelope,	**Robe and Foot Rail,**	**Head, Side and**	**Tire and Tool Kit,**
Storm Curtains	**Pump and Jack**	**Tail Lamps**	**Eisemann Magneto**

THE $950.00 completely equipped Empire Five Passenger Touring Car is indeed a "LITTLE ARISTOCRAT." Everywhere it is winning its way with the intelligent, cultured class, who demand a car of moderate size and price, and *who insist on having a real car*, built of quality materials, and honestly constructed.

Aside from its alluring beauty and style, which impell admiration, THE EMPIRE has proved its durability and efficiency for continued service under the most exacting conditions.

Steep hills, deep mud or sand never impede the "LITTLE ARISTOCRAT." Its surplus power converts road obstacles into *opportunities for demonstrating its efficiency*.

Its rugged construction and sound materials account for its rare endurance and stability, even under cases of excessive misuse.

Even *we* underestimated the high merit and popular appeal of the EMPIRE Five Passenger Touring Car. We knew that in time "THE LITTLE ARISTOCRAT" would come into its own kingdom. We foresaw increased demand. But we were amazed, *when necessity*, two months ago, *compelled the establishment of a second factory*. Our increased facilities now make it possible to supply the big demand.

If *you* are in the market for a car of moderate size and price, send for our new illustrated "LITTLE ARISTOCRAT" Folder, which describes THE EMPIRE completely and in detail.

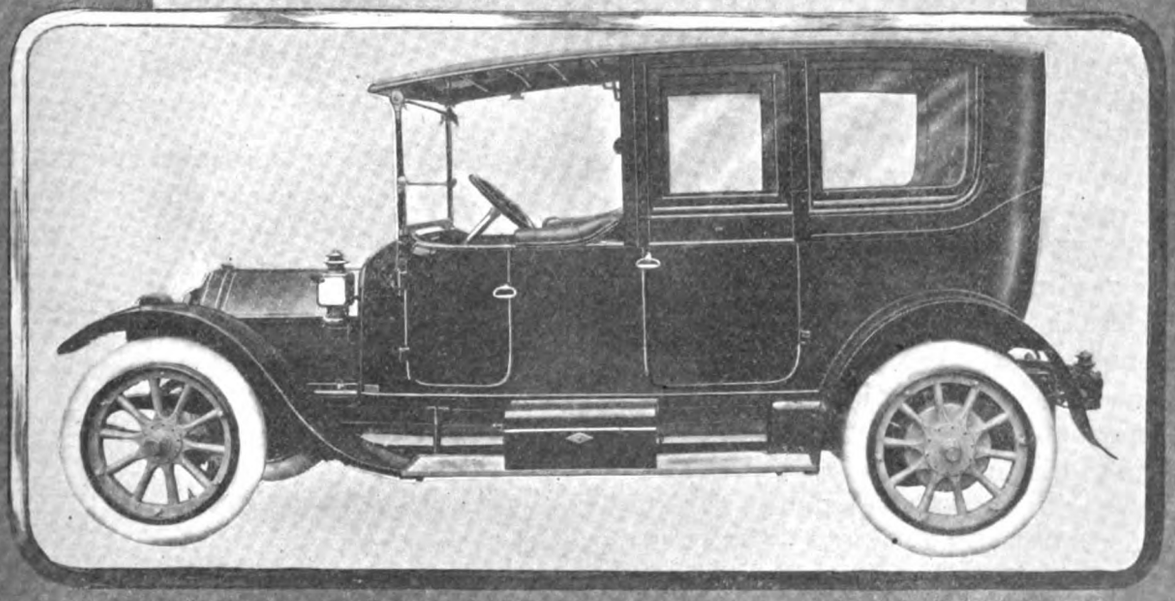
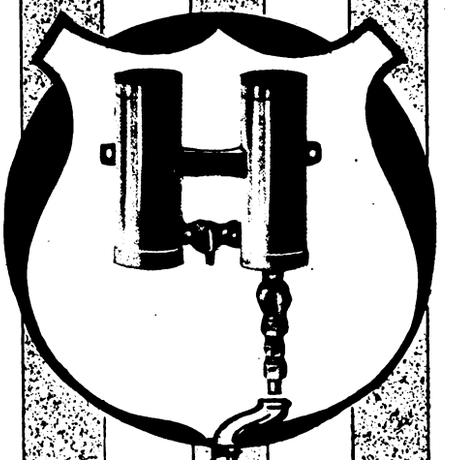
Lancia
Dealers Make Good



In handling the Lancia, the dealer automatically creates an exclusive and most desirable selling connection—and the fact that he may be surrounded by many American agencies lends still *more* prestige to his own proposition.

You, Mr. Dealer, can sell Europe's most exclusive product at American prices and you can, on this basis, offer Lancia cars and equipment to those who are fastidious not only in regard to rakish, unusual European design, but who also understand the actual service value of a car made in Europe, where steel making is an exact science and where engineering genius of the world has reached the high water mark.

Canvass your list of prospects—you can interest plenty of them in a very unusual and distinctive type of motor car, with racing and endurance records back of it that are beyond cavil.



We await your inquiry and we promise our selling co-operation.

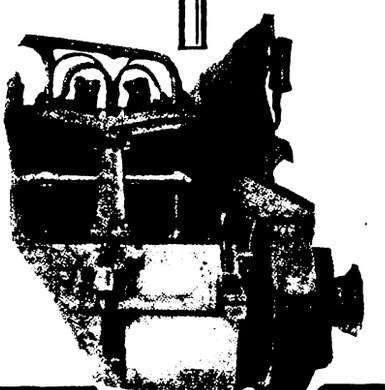
DEALERS Your Trade will want this as soon as they see it

Its a fuel saver—trouble saver—A Primer and engine cleaner



The National Compound Mixer and Primer is one of the most valuable and necessary adjuncts to any car—one that not only saves from 10 to 40 per cent of gasoline but which actually increases the engine horsepower from 10 to 40 per cent.

The National Compound Mixer and Primer

is not an experiment—it is a well-tried and proven piece of apparatus now in use on thousands of cars—and it is one that you can well afford to investigate with a view of selling it to your trade.

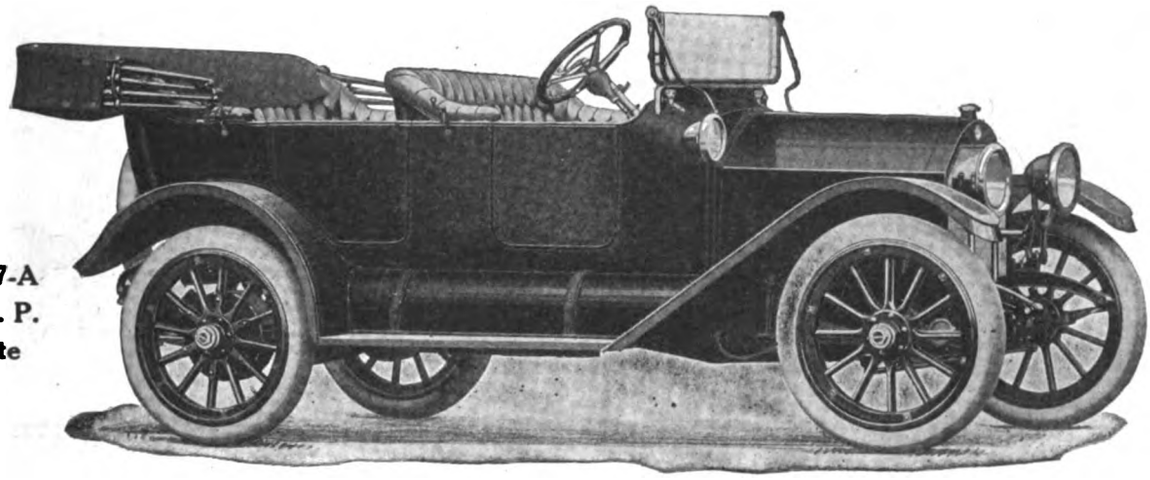
This device, shown here, furnishes air to the imperfect mixture before it enters the cylinders in exactly the right proportion to utilize the power in every molecule of gasoline.

Here is where speed, power and economy are conserved, for it is a proven fact that ordinarily a large proportion of gasoline is simply burned up inside the engine and not exploded. With the National Compound Mixer installed, combustion is complete, with more miles per gasoline to the engine's credit.

You Can Instantly Prime the Engine

by simply turning the primer valve located in conjunction with the mixer on the dash, for as the gasoline is drawn from the primer into the cylinders, a quantity of air is taken from the mixer, insuring an explosive mixture—this primer can also be utilized in cleaning the engine when desired.

A Liberal Dealer Proposition



awaits live wire members of the trade who can appreciate why the National Compound Mixer and Primer will appeal to car owners.

You don't have to worry about the installation. This can be accomplished in 20 minutes. You don't have to worry about your commission, because it is liberal. Write today.

1913 Marion 37—A $1475

Model 37-A
30-40 H. P.
Complete

Good Roads, Clay Roads, Hilly Roads This Car Is Built for Them

FOR ten years Marion cars have been making enviable records in every kind of service. Now comes the best and finest Marion of them all. It is a big, handsome, faithful 30-40 horsepower five passenger touring car, built for cross country enjoyment. It will be hard for you to find roads which will thoroughly test its pulling strength. It is built for the very tasks to which you will put it. Solid to the core, it is just the car for the up-to-date motorist.

Built for wear first of all, and then equipped with every comfort and convenience, this new model of the famous Marion line is matchless. Electrically lighted, self-starting, constructed with lots of room, with style and beauty apparent in every line, it makes Marion ownership an appreciated pleasure.

It is sturdy throughout. The motor, cast in pairs, with all valves enclosed, is powerful, efficient, and economical. It will give you no trouble. It has three-point suspension. The pressed steel frame is strongly reinforced. The four double acting brakes are large and effective. The rear system, with its expensive bearings, is unusually rugged and is double trussed.

These few items indicate the staunchness of the Marion car as a whole. It presents to you a splendid opportunity to own, for a moderate price, an automobile with the appearance and features of the most expensive cars. Moreover, ownership of a Marion is an inexpensive pleasure.

For those who want a larger and more powerful car we have the electrically starting 48-A, the Marion de luxe, at $1850. The Marion "Bobcat," $1425, is the snappiest speed car of the year.

We offer to automobile dealers, or to business men entering the trade upon a substantial basis, the fairest sales agreement ever written. Ask us about territory.

Big Features Establish Big Value

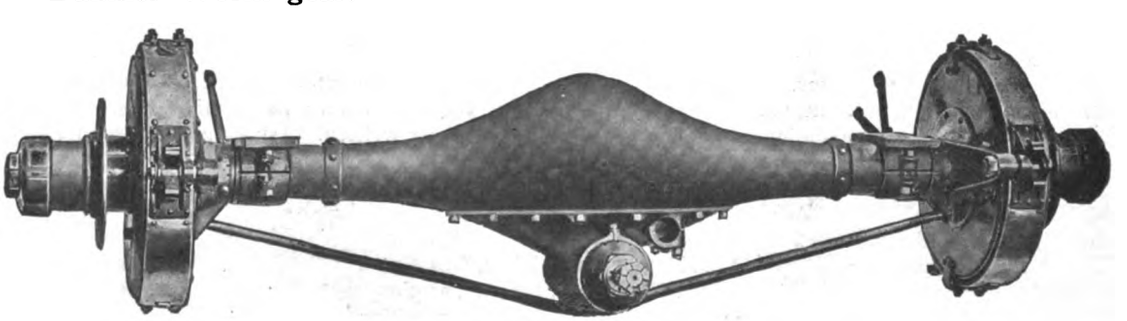
American American

Fight Friction and Win Power With

American Axles

In every field of mechanical endeavor there is an endless fight to secure maximum power by a constant warfare upon friction.

In automobile construction the greatest advance along this line has been shown in *American Axles*.



They make rated horsepower real horsepower by eliminating the chief frictional load between the motor and the drive wheels, which, in a car, is always to be found at its axle.

American Axles lead all others by reason of: (a) perfection of their design; (b) highest quality of all materials employed; (c) extreme accuracy of their workmanship.

American Axles are triumphs of refinement, achieved without loss of strength or reliability, largely through the use of exclusive, patented features.

It is to your interest to make sure that the car you buy shall give you all the advantages inherent in *American Axles*.

And in this line only have you the option of Bevel Drive gear or Lanchester-Daimler Worm gear.

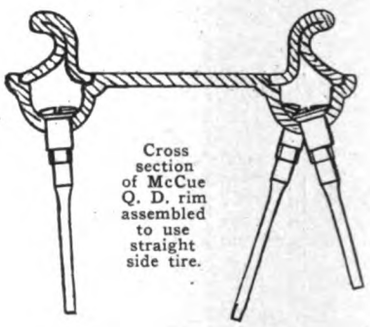
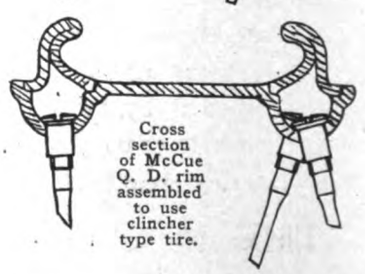
Stutz right rear McCue Wire Wheel goes through Vanderbilt and Grand Prix races (700 miles) with original tire and original air.



Herewith is shown a reproduction of the right rear McCue wire wheel taken from the Stutz car which made such a remarkable showing in the Vanderbilt and which was the only American car to finish the Grand Prix, in which race it won third place. This actual photograph, which has not been retouched, shows the condition of the tire after practically 700 miles of racing use. The tire is scarcely worn and unquestionably would stand up for a great many more races if mounted on wire wheels.

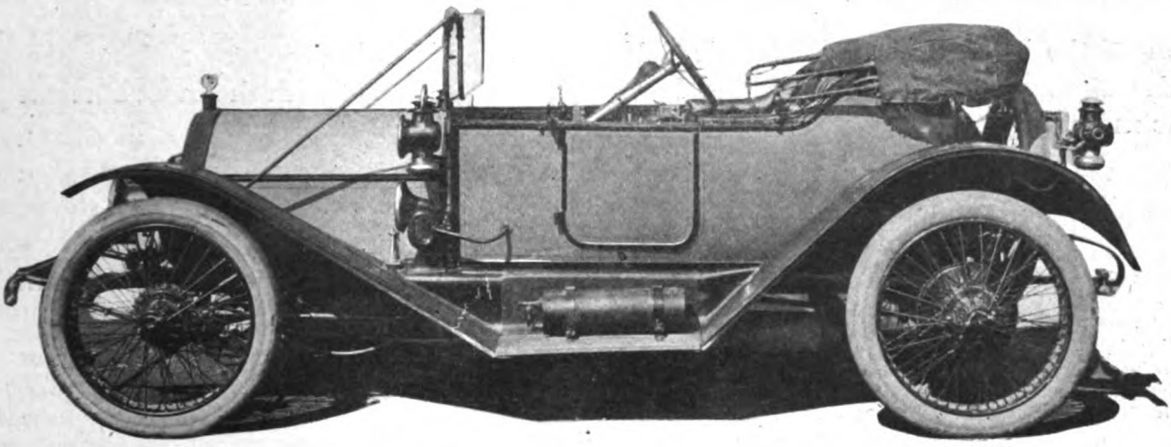


As a matter of fact in both races the Stutz car only changed two tires, the opposite rear to this one, in each race. And as we told in previous advertising copy neither one of these tires really needed to be changed. The car stopped for supplies and as a precautionary measure one rear tire was changed in each race. Contrast this with the wooden wheel equipped cars, many of which changed from 15 to 20 tires in each race and you can realize readily that there has been no exaggeration in the claims of tire saving ability for wire wheels.

McCue Wire Wheels May Be Had Equipped With Q. D. Rims

As may be seen by the illustration herewith, the McCue Company is now supplying Q. D. rims on their wire wheels. The general all around advantage of the McCue Q. D. Rim is that that portion of the wheel which is presented to the tire is perfectly smooth and flat. The spoke nipples are inserted in grooves which are rolled into the rim. Just incidentally these grooves add a considerable degree of stiffness to the rim as well as providing means of preventing the nipple head from coming in contact with the tire. These Q. D. rims, of course, are furnished on the detachable wheel. Another point very much in favor of McCue Q. D. Rims is that by simply reversing the position of the rings the same set of rims may be used either for straight side tires or for the clincher type.

Cross section of McCue Q. D. rim assembled to use straight side tire.



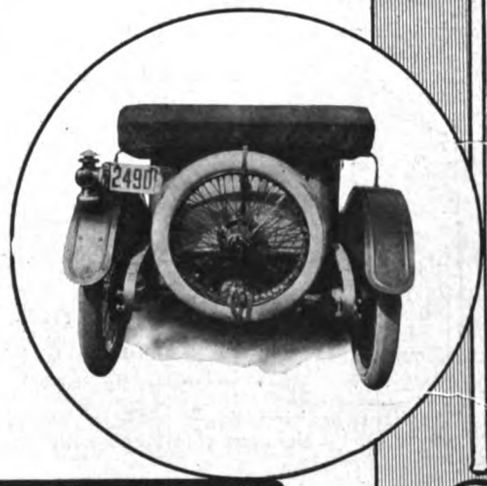
Cross section of McCue Q. D. rim assembled to use clincher type tire.

McCUE WIRE WHEELS

Digitized by Google

Firestone-Columbus cars are also equipping with wire wheels, as shown by the illustration of the five-passenger Model 82E touring car, below.

Another prominent American concern that is taking up wire wheels is the Columbus Buggy Co., makers of the Firestone-Columbus car, which, as stated above, is equipping certain models optionally with McCue Wire Wheels.



There is now a long list of American manufacturers who are using wire wheels for 1913 and this list is increasing daily.

Every dealer in the United States is interested in having wire wheels adopted because wire wheels in use mean more cars in use. If your manufacturer does not grasp the tremendous opportunity before him, help yourself by insisting upon having wire wheels upon the cars you sell. The chances are your manufacturer has simply neglected the matter and will be glad to comply with your request for him to do so. Wire wheels are here to stay and it is simply a question of whether you will reap the reward by being early in the game or whether you will be forced into it by your competitors.

Write that letter today.

THE McCUE COMPANY, Buffalo, New York

The illustration below shows the method of carrying the spare wire wheel employed by the Firestone-Columbus company.

Important Announcement

The Dreadnought Moline M-40 now equipped with Electric Self-Starter and Lighting System—each operating independently of the other.

With the installation of the Ward-Leonard Electric Self-Starter and Lighting System, and our new standard equipment, the famous Dreadnought Moline M-40 at once takes rank with the most efficient of foreign and domestic motor cars.

We cannot place too much emphasis upon the efficiency of the Electric Starter and Lighting System, nor upon their installation as independent units.

Operates the same as our Double Independent Ignition System.

The advantage of which lies in the fact that each system is absolutely independent of the other. If anything should happen to the magneto the car can be operated on the time distributor system. Or upon the magneto if the distributor should get out of order.

Each system operates on a separate set of plugs. With the dual system, commonly used, the distributor of the magneto is used to distribute the battery current for starting. As only one set of plugs are used, if anything should go wrong with the magneto the car is laid up until the repair is made. We avoid this trouble with our Double Independent Ignition System by furnishing a set of dry cells for operating the distributor system—so that we are entirely independent of the lighting system for ignition.

The independent system is also used on our Electric Starting and Lighting Mechanism.

The dynamo for producing the current is entirely independent of the motor that cranks the engine. So if anything happens to the starting motor, the engine can still be started by hand cranking and the electric system is not disrupted. Where the dynamo and engine are one and the same an accident renders useless not only the starting but the lighting mechanism—a serious matter if that should happen at night.

Makes both Dynamo and Motor most efficient mechanically and electrically.

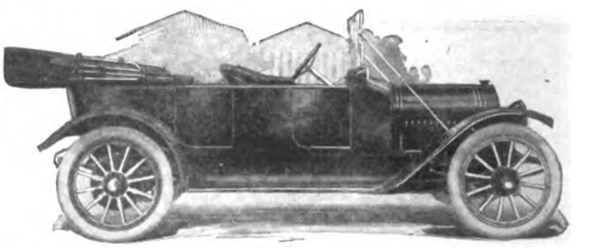
It is a well-known fact that it is impossible to convert a low output dynamo into a high output motor and get proper efficiency out of the motor. By building them as separate machines it is possible to make both motor and dynamo as efficient mechanically as it is possible to build these small units.

The weight of this system is much lighter than the Combination outfit.

A further advantage is—With our system, if anything should happen to the dynamo we can start a number of times and light for a considerable length of time on the charged battery. With the combination system it would be impossible to start at all with the electric starter, under similar conditions.

We have started the Dreadnought Moline M-40 hundreds of consecutive times with this starter.

This is a proof of unexcelled efficiency. Its mechanical perfection results in high efficiency because the device is fundamentally right. Mechanical perfection would be an idle boast if the idea was not theoretically sound. We unhesitatingly affirm that you will find our system as described here to be theoretically sound, mechanically perfect and of the highest attainable efficiency.



Dreadnought Moline M-40—$1950

Now Completely Equipped

Standard Equipment: Ward-Leonard Electric Self-Starter and Lighting System, Six Lights, Black Enamel with Nickel Trimmings, including Dash Illuminator, Dynamo and Storage Battery. Double Independent Ignition System. One Piece Glass Windshield. Firestone Q. D. Demountable Rims with extra Rim. Moline Silk Mohair Top and Top Cover. Speedometer. Tire Irons on Rear. Foot Rail. Robe Rail. Gasoline Gauge on Dash. Complete Tool Equipment, including Pump and Jack, Tire and Repair Kit.

Price, Fully Equipped, $1950

We have a particularly interesting proposition for dealers—and in certain sections—open territory where a good demand is now being created. We will be glad to send you our catalog and to write you personally any further information you desire. Our printed matter will interest you and our letters will be personal.

"In Exchange for your empty tank, accept only a genuine Prest-O-Lite Tank, filled with genuine Prest-O-Lite Gas."

This is the message that is going to Prest-O-Lite users everywhere.

In it there is a hint for the wise dealer, as well.

You know that no imitator of the Prest-O-Lite Tank has ever successfully imitated Prest-O-Lite Service.

You also know that no imitator ever made good the large claim "more gas and better gas than Prest-O-Lite."

So does your customer.

Imitations are getting harder and harder to sell. There are now mighty few dealers trying it.

Most of those who yielded to the old but ever tempting claim, "More Profits," have come back home.

To the dealer who is still trying to force imitations on people who won't have them, perhaps because he has money tied up in them, we can only say:

"The sooner you resume earning your good old Prest-O-Lite profit, the sooner you will make your income what it used to be."

The Prest-O-Lite Co. 287 E. South St. Indianapolis, Ind.

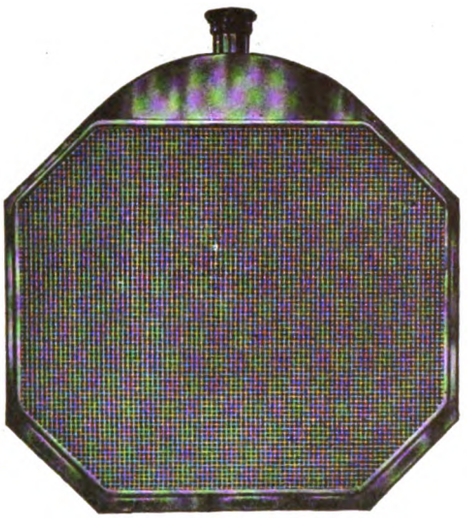
Kelly-Springfield
Automobile Tires

As a matter of fact, dependable tires are the basis of real automobile usefulness.



Kelly-Springfield road mileage is a few thousand miles higher than the average. That reduces the cost of the tire.

The easy resiliency of Kelly-Springfield Tires is one phase of our argument. But staunchness and durability, born of the best rubber composition, skill and the incentive to make good tires better, offer a reason even more convincing—wear.

When you buy Kelly-Springfield Tires you are not experimenting. We have done that for you.

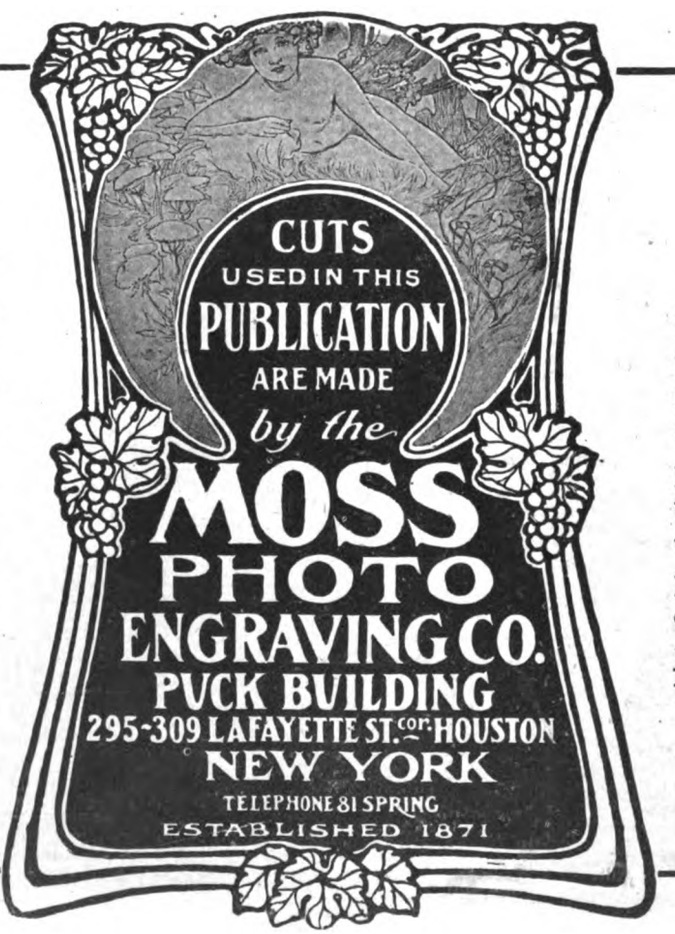
THINK THIS OVER - very carefully and read it twice, if necessary.

Is there any part of an automobile engine, or any other gas engine, that is more important to its efficiency than a Valve?

Your engine leaves the factory running smoothly and sweetly tuned up to its highest power. Perhaps the valves pit—warp - go out of shape fail to hold compression. Then the power diminishes, and what can be more aggravating to the driver, who has known the fullness of the pulling power of his motor, than to have it grow less and less?

You cannot slight this part by putting in an inferior product—valves that will give trouble, or even break from inexperience in their manufacture—valves of unsuitable material, not suitably heat treated.

Too much is at stake, and a slight extra cost at the outset, which is the exception, may save you many times over a probable later expense.



This Company, with the experience of many years as a guarantee, will furnish you with properly made valves, of the materials best adapted to your requirements.

Not only QUALITY, but efficient SERVICE is a factor—surely there is a satisfaction in getting the kind of work you want—when you want it.

THE ELECTRIC WELDING PRODUCTS COMPANY

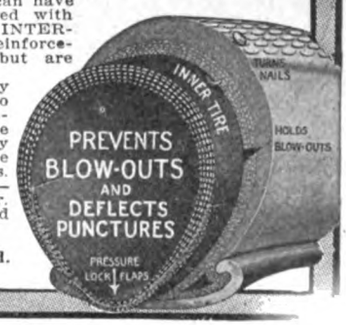
Stop Tire Troubles

INVESTIGATE AND LEARN WHY SO MANY THOUSANDS OF MOTORISTS ARE DISCARDING INNER SHOES, RELINERS, FILLERS, AND OTHER MAKESHIFTS FOR INTERLOCK INNER TIRES—AND WHY INTERLOCKS ARE HANDLED AND RECOMMENDED BY THE BEST SUPPLY DEALERS AND TIRE HOUSES ALL OVER THE COUNTRY.

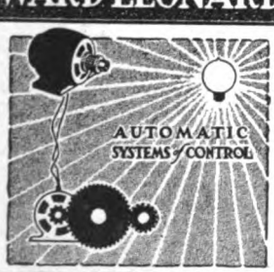
One weak point of the automobile to-day is that you can't depend on its tires. INTERLOCKS revolutionize this condition by making your tires so strong that blowouts become practically impossible. INTERLOCKS save half your tire expense—save repair bills—double your mileage—prevent punctures and completely free you from all fear of tire trouble.

What INTERLOCKS Are.—The INTERLOCK is a complete inner tire (not an inner shoe) which is placed between the outer casing and the inner tube to strengthen the outer casing and protect the tube. It is the only reinforcement which is locked by air pressure to the rim and which becomes an integral part of the tires, and, therefore, cannot heat or chafe. Even if the tire is broken the INTERLOCK will hold.



INTERLOCKS Insure Safety.—You know that the sudden blowing out of a tire may easily ditch any car when going at fair speed—the safety of INTERLOCKS should appeal to you.

Reduce Your Tire Expense.—You can have the tires on your new car equipped with INTERLOCKS if you specify them. INTERLOCKS are the only perfect tire reinforcement. They cost a little more but are cheapest in the long run.



For your present car—ask any dealer or supply house, or write to us for the name of your nearest supply source. INTERLOCKS will make any fairly sound tire more than carry you through the season. They are easily placed and are made in all sizes.

We Want Dealers Everywhere.—Write for Special 30 Day Offer, Booklets, Prices, Records of Road Tests and Testimonials of users.

If You Need Motor Lamps

You Need This Catalog

We want you to write for the Solar Catalog before you decide on your motor lamps, for this is the most complete line of lamps on the market. Solar Lamps have been preferred by most motorists for the past fourteen years because of their brilliancy, their style, their strength and their several exclusive advantages—their special short focus lead glass lens mirror reflectors—the patented double ray light projection (in the Solarclipse), giving two distinct fields of light, for city and country use—the new black finish, the only such finish that's proof against heat and moisture—and other features that other lamps lack.

To fail to see Solars before you buy is to fail to include in your consideration the very finest lamps in existence. Solars are made for oil, electricity, gas and in combination, for pleasure cars, motor trucks, carriages, motor boats and airships. Write for catalog now—while you think of it. (136)

Reinforcing Casing

TIRE CUTS ruin casings. They admit moisture to the carcass, cause the fabric to rot and weaken, grow larger end in blowouts.

You can repair CASINGS and INNER TUBES anywhere in 15 minutes, better than a Repair Shop can do—and for *one cent*.

Universal Auto-Vulcanizer

Patented

A practical vulcanizing outfit complete, with enough repair gum to make 40 patches. It weighs 3 pounds and can be carried in the tool box. **Simplest and most satisfactory device for eliminating tire troubles that has ever been devised.**

Absolutely automatic. Place the patch—attach the Vulcanizer—put in the gasoline light it. No further attention required. In 15 minutes the job is done.

It *can't burn, scorch* or *injure* tube or casing. It *can't* get out of order. It *can't* fail to do its work. So simple, anyone can operate it. The Universal Auto-Vulcanizer saves its cost a *hundred times* over in trouble and expense.

Price Complete, $4.00 Ready for Instant Use

Guaranteed Satisfactory or Money Refunded

HORN LEGAL?

driven by horse or human power, might be inadequate for automobiles.

"An adequate signal is one which will give a sufficient warning of danger. Three requisites at least must obtain before an automobile warning signal can be adequate:

1. It must be certain in operation. The ordinary rubber reed horn deteriorates when exposed to dampness.

2. It must be loud enough to be heard. The rubber reed horn does not always emit a sound loud enough to carry the necessary distance.

3. It must be easily operated. One using the ordinary rubber reed horn must take his hand off the steering wheel to blow his signal, losing time and taking an additional risk.

"I have not found any court decisions exactly covering this point, but in my opinion in every one of these requirements the ordinary rubber reed bulb-horn often does not measure up to the true standard."

OSBORNE I. YELLOTT, *General Counsel for the Automobile Club of Maryland*, Baltimore, Md.:

"I do not agree with you that there is no doubt that the hand-operated bulb-horn is today illegal in those States where the law requires that an adequate and suitable signal should be used on motor vehicles, but I do think that such laws leave entirely open the question of the adequacy of the bulb-horn, and that such question is to be determined by the Courts under the circumstances of each particular case.

"In other words, I do not think a motorist can safely rest by merely providing himself with a bulb-horn and relying upon the same for use as a signal under any and all circumstances.

". . . . I am clearly of the opinion that the word "adequate" as used as an adjective governing the word "signals" in motor vehicle laws, must be taken to mean that the signal must be sufficient to give reasonable notice of the approach of the motor vehicle under the circumstances of the particular case and that no motorist could safely rely, in the event of the adequacy of his signal being questioned, upon the fact that he had used the best bulb-horn obtainable. . . ."

ARTHUR J. HALLE, *Halle & Geismer, Attorneys*, Cleveland, O.:

". . . . Independent of statute or ordinance, a person operating an automobile, particularly over cross-walks, where it may endanger life or limb, must use a high degree of care to prevent injuring pedestrians; and some courts have said 'must adopt every known safeguard.'

"In the trial of such a case for damages, a court could very properly say to the motorist: 'You relied upon the ordinary bulb-horn to warn this pedestrian of your approach. It is common knowledge that the sound of such horns often does not reach the ears of pedestrians in time, and oft-times is not heard at all. You had knowledge of this, yet you took no other precaution. We hold that this is not the exercise of the high degree of care that the law requires under the circumstances' . . ."

SIDNEY S. GORHAM, *Miller, Gorham & Wales, Lawyers, Chairman of the Legislative Committee, Chicago Automobile Club*, Chicago, Ill.:

". . . . While I believe the supposed magistrate's opinion is correct in holding that the bulb-horn is not an adequate signal device and does not meet the requirements of the law in States where the use of adequate warning signals is required, I am inclined to believe, in view of the fact that the bulb-horn has for so long been recognized as at least a suitable warning signal for motor cars, that a conservative court would be slow to adopt the advanced position taken by the supposed magistrate in your advertisement.

"I do believe, however, that the bulb-horn will ultimately be held inadequate by the courts and that the writer of your supposed magistrate's opinion will one day come into his own as a prophet who will not be without honor even in his own country. . . ."

DAVE F. SMITH, *General Counsel for the Los Angeles Automobile Club*, Los Angeles, Cal.:

"From a legal standpoint I think the argument that the bulb-horn's use is illegal wherever the law demands an adequate signal, is sound, and will stand.

"A signal to be adequate must be sufficient at all times, not occasionally, or under certain circumstances, but under any and all circumstances except such as are termed Acts of Providence.

"The bulb-horn, therefore, is not adequate."

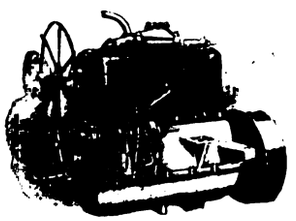
BUDA — the Power that Pulls them All

Fog and sentimentality are being lifted from automobile selling. After much practical experience the public has learned that an automobile has *"innards." It is beginning to probe among the valves and gears and ask specific and "nosey" questions.* It has an almost impertinent hunger for *FACTS.* So the *wise* manufacturer and dealer are beginning to volunteer information—*absolute, precise* data.

But because the public has neither the time, opportunity or expert training to become conversant with manufacturing details there has arisen a demand for an impartial authority, a *commissioned proxy* to tell the buyer what he would know if he had the training and time to investigate. As to the engine, the real heart of a car, the dealer and manufacturer are learning that the *Recognized Authority,* respected by the BUYER, is the

BUDA MOTOR

1 Service at the Wheel



2 The public persuaded by demonstrated efficiency

3 Dealers pulled into line by public demand

4 Manufacturers follow the dealers' insistance

Yes—tell the buyer about the long stroke, the large and enclosed valves, etc., but if you want to convince more quickly and with more directness *SAY "BUDA." Corroborate, reaffirm* what you claim with the name *BUDA. The public comprehends BUDA instantaneously.* To The Public "Buda" means

—demonstrated efficiency in thousands of cars now in daily use.
—the selection of the most prominent and successful manufacturers.
—a Special Oiling Device.
—a superior "get-at ableness".
—the satisfaction of knowing that in case of accident, interchangeable parts can always be secured from a Company which is so well financed and which has been conducting a successful business for 25 years.
—and it *means the Pioneer in the "Cast-in-Block" method in the U. S.*
—and it means the following:

Buda Model "T"

1913 Specifications

Model "T" Motor, 4¼ x 5½ — Model "O" Motor, 4⅛ x 5½
Model "Q" Motor, 3¾ x 5½ — Model "M" Motor, 3¾ x 4½

Kline Kar Model 6-60, Touring, $3500

DEALERS

YOUR experience with other cars should tell you that it does not pay to handle a line that constantly worries the life out of you with complaints from the user, who has trouble with the machine. This user knows now that he is better off when he buys a car of quality in the first place, even though he must pay a little more for it, and he will soon begin to demand such a car of his dealer.

It is up to you to have the car in your line when he calls. The Kline Kar will answer all the requirements this prospect may impose and more.

Prices $1850 to $3500

Talks *on* Selling Automobiles

No. 3

Sales to the Surplus-Capitaless

One of the two reasons why you do not sell twice as many cars is the fact that so much money is tied up as active capital "on the books" of business and professional men in your territory.

The other reason is that, unlike them, you can not extend credit—at least not enough to make a real increase. In almost any other line you could "carry" hundreds. But not in the automobile business, where every sale means $500 or more.

Result, you are not reaping the benefit of half of your good-will.

Right here we step in. Our business is financing sales of automobiles of all descriptions to the kind of people you would trust if you could do a credit business.

We supply the cash to pay the manufacturer on delivery of the car. We pay your commission at once. And the customer settles with us on the easy payment plan, at legal—not "installment house"—rates of interest.

We assume all the risk, under our plan of giving Credit Where Credit Is Due.

Write today and let us explain the details of how we can capitalize the rest of your good-will for you, and help double your sales.

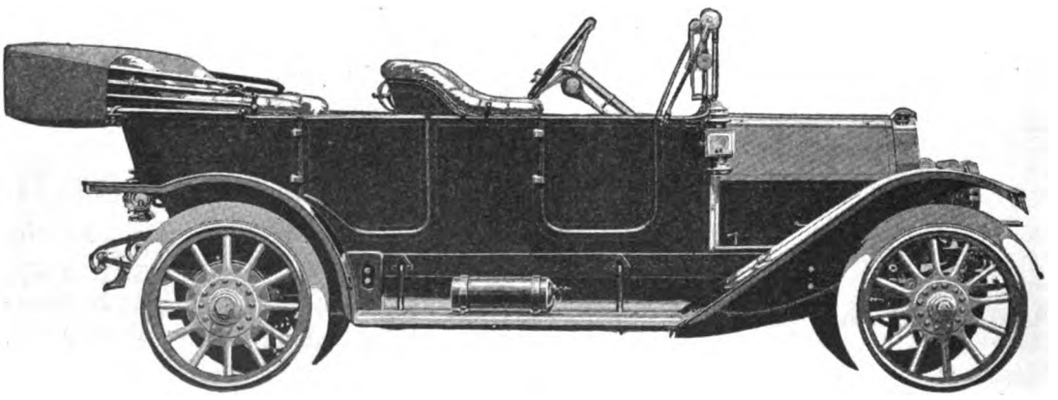
High-priced feature No. 3

Be sure that your car is Thermo-Syphon cooled. Most popular priced cars depend upon the centrifugal pump—but not the Overland. By the latter system, cooling is taking place with the first engine revolution—when HEAT is required for the development of the engine's best work.



With the Thermo-Syphon system, cooling varies, NOT WITH SPEED, but directly with the temperature of the cylinder walls. Thus Overland motors do not heat climbing hills.

In the Thermo-Syphon system, a circulation is set up ONLY WHEN THE CYLINDER WALLS HAVE BECOME HEATED.

Neither is there any pump to get out of order in this Overland system of cooling.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, November 14, 1912 No. 8

STUDEBAKER'S SURPRISE; LAUNCHES "SIX" AT $1550

New Model Accompanied by Sweeping Changes in Entire Line—Two New "Fours" and Three Closed Cars.

While popular priced "sixes" made, half-made and unmade, have been more or less widely heralded, one of them, full-born, has come from an unexpected place—none other than the Studebaker Corporation, of Detroit, Mich., which has kept its plans so closely to itself that comparatively few were aware that a "six" was in prospect.

In fact, the surprise is a double one, or, rather, a triple-barreled one, for not only is the new "six" an exceedingly attractive one which sells, completely equipped, even to an electric lighting and engine starting system, at $1,550, but two other new cars, both "fours," have been brought out as well, and all of them are radically different from the "20s" and "30s" that have borne the Studebaker nameplate in the past and which have remained substantially without change for the last three years. Marking a still further innovation in Studebaker products, the line now includes full-fledged limousine models in addition to the coupe that has been listed in the past. Furthermore, another new coupe and a Sedan have been added and all of the new models will be marketed in addition to the older Studebaker line. The prices of the older "20" and "30" models remain unchanged and are $800 and $1,190, respectively.

The two new four-cylinder models, styled "25" and "35," are priced $885 and $1,290, respectfully, and are exactly similar to the "six" except as regards a difference in size commensurate with their power. All have block cast motors of the most approved long-stroke type, the dimensions of the "25" and the "six" being 3½ x 5 inches, and of the "35" 4⅛ x 5 inches. Transmission elements include cone clutches and three-speed selectively operated gearsets mounted adjacent to the rear axle after the manner of previous Studebaker practice. Both the "35" and the "six" employ a new type of full-floating rear axle, the "25" having a new semi-floating axle, and the equipment of all is the same except that the smallest model is fitted with an acetylene gas primer-starter in place of the electric lighting and starting apparatus with which the two larger models are equipped.

Top, windshield, electric horn, demountable rims and the usual complement of tools, spare parts, etc., all are included in the equipment list. For the present, the "25" is supplied only in touring form, though the "35" and the "six" and supplied as coupe, Sedan and limousine as well. The "35" coupe and Sedan sell for $1,850 and $2,050, respectively, and the "six" limousine lists at $2,500.

Flanders Closes Deal with U. S. Motor.

Walter E. Flanders, of Detroit, will be the president and general manager of the reorganized United States Motor Co., of which the Flanders Motor Co., of Detroit, also will become a part. The negotiations to this end have been concluded, but the formal contract cannot be signed until the reorganization of the company actually is effected and the property comes into the reorganizers' possession, which probably will not come to pass before January next. Meanwhile, negotiations are in progress which probably will result in Flanders's retirement from active participation in the affairs of the Flanders Mfg. Co., of Pontiac, Mich., of which he is president and general manager, but which is not included in the United States Motor reorganization plan.

Whitesides Truck Factory Shuts Up.

Because of internal differences, the plant of the Whitesides Commercial Truck Co., of New Castle, Ind., has been ordered closed by the board of directors. Its future is problematical.

BRISCOE SAILS TO EUROPE; WILL BRING BACK NEW CAR

Former Head of U. S. Motor to Re-engage in Automobile Manufacture—"Watched" Before His Departure.

Benjamin Briscoe, former president of the United States Motor Co, sailed to Europe on Saturday last, 9th inst. He will be absent six or eight months, during which he will obtain sorely needed rest. Not all of his time, however, will be spent in seeking relaxation. For when he returns it is his intention almost immediately to re-engage in the manufacture of automobiles; and before he returns his plans, and even the car which he will produce, will be announced.

Two or three of his trusted engineering lieutenants will join Briscoe while he is abroad, and there they will not merely work out the design of the new car which is in mind but actually will fashion it; they will bring it with them to America. It is known that the car will be of the under $1,000 type. Just where it will be manufactured in this country it is, of course, too early to say; but that he will be able quickly to command the necessary facilities there is no doubt. Incidentally, Mr. Briscoe's brother, Frank Briscoe, head of the Briscoe Mfg. Co., of Detroit, already is in Europe, but whether he will become interested in the new enterprise the future will develop. It is stated, however, that Benjamin Briscoe's old partner, J. D. Maxwell, is not likely to be associated with him in the new project.

Before Briscoe sailed on Saturday last he received tangible evidence of the regard in which he is held by his old associates and most of the other workers in the United States Motor Co. It took the form of a testimonial banquet at the Hotel Astor, during the course of which the guest of the even-

Digitized by Google

ing was presented with a magnificent Tiffany chiming stop watch and fob. It was the gift of the "men folk." The good will of the young women employes of the big company was attested by a large bank of chrysanthemums which graced the banquet hall.

Alfred Reeves, vice-president and general sales manager of the United States Motor Co., and Horace De Lisser, a former vice-president, were the chief speakers of the evening. Both are bound to Briscoe by more than ordinary ties of friendship, and their feeling was reflected in their remarks. Mr. Briscoe was genuinely affected but, among other things, he managed to say: "The greatest heritage, the greatest thing that a man can have, is friendship, and I believe, as I always said, I would rather stand here to-night as the recipient of your friendship and love than be possessed of all the treasures or wealth that could be laid before me."

Boli and the Joneses Go to Dallas.

L. A. Boli, who two years ago left the life insurance business in Dallas, Tex., to assist in organizing and exploiting the American Automobile Co., of New Albany, Ind., whose memorable "clink of gold" stock selling campaign ended in failure, has returned to Dallas and assumed the presidency of the Southwestern Motor Sales Co., which is capitalized at $500,000 under the laws of Arizona. C. Charles Jones and his brother, N. E. Jones, the Nebraskans around whose Jonz car the "clink of gold" campaign revolved, is one of its vice-presidents and N. E. Jones is its treasurer. Martin A. Seward is the other vice-president and W. L. Marsh secretary. The company is located at 1608 Commerce street, where it will represent the Lozier, Speedwell, Staver and Little cars and Speedwell and Staver trucks.

New Men Enter R. C. H. Corporation.

J. P. Hartz and C. P. Sieder, two of Detroit's well-known business men, entered the R. C. H. Corporation at its annual meeting on Thursday last, 7th inst.. when Hartz was elected treasurer and general manager and Sieder vice-president. R. C. Hupp remains president, L. G. Hupp secretary, and F. R. Bump assistant general manager. In addition to R. C. Hupp and Messrs. Hartz and Sieder, the directors chosen are G. W. Rogers and J. G. Robertson, of Akron, O.; C. G. McCutchen, of Jackson, Mich., and John Kelsey, F. M. Randall and J. H. Clark, of Detroit. In accordance with the arrangement outlined at a previous meeting, the active management of the R. C. H. Corporation was vested in an executive committee composed of Messrs. Hartz, Kelsey, Randall, McCutchen and Hupp.

OBSTACLES TO U. S. MOTOR REORGANIZATION REMOVED

Court Refuses to Permit Minority Stockholders to Intervene—Sale Probably in January—Tentative Plan Submitted.

Objectors to the pendant reorganization of the United States Motor Co. were practically bowled over by Judge Hough in the United States District Court in New York on Monday last, 11th inst., and the way thus was cleared for the sale of the property to the Wall street interests who controlled it and who are shaping the reorganization.

There were two separate objections, both, however, seeking the same end. They were filed, respectively, by the minority stockholders of the United States company and the minority stockholders of the Columbia Motor Car Co., each of whom sought permission to intervene in the suit which resulted in the appointment of receivers.

Judge Hough held that where one corporation has so managed or mismanaged the affairs of another corporation as to produce inability to pay obligations, and where a large part of the assets of the controlling corporation consist of stock in the managed corporation, the willingness of the directors of the latter to become parties to a suit against the controlling corporation binds the stockholders, even though the managed corporation may be solvent.

In his ruling on the application to intervene on the ground of lack of jurisdiction and insufficiency of the allegations contained in the bill of complaint, Judge Hough quoted the proceedings in the Metropolitan case. The action of the various defendant companies in answering the complaint brought by the Brown & Sharpe Manufacturing Co., of Rhode Island, practically constituted a waiver of jurisdiction, which bound the stockholders.

In the course of his remarks Judge Hough said that the creditors before beginning the insolvency action had gained an insight into the financial standing of the companies and had found it to be worse than they anticipated. He also said that the published reports showed paper assets of nearly double the amount of the liabilities. Judge Hough added, the shareholders might naturally be expected to refrain from taking any precautions in their own behalf, but by sitting still and doing nothing they could not claim that they had been wrongly dealt with.

A tentative decree of sale, submitted by W. E. S. Strong and Roberts Walker, the receivers, through their attorney, J. N. Rosenberg, provides that the properties of the United States Motor Co. shall be offered for sale in six parcels, as follows: No. 1—All the property of the motor company; No. 2—Property of the Alden-Sampson Mfg. Co.; No. 3—Property of the Brush Runabout Co.; No. 4—Property of the Columbia Motor Car Co.; No. 5—Property of the Dayton Motor Car Co., and No. 6—Property of the Maxwell-Briscoe Motor Co. Immediately after all these parcels have been offered for sale as a whole, all of the property constituting the six parcels shall be offered for sale together.

Should any bidder fail to make good his bid upon its acceptance by the court then the sums deposited by such bidder shall be retained by the receivers as and for liquidated damages, but not by way of penalty, it being adjudged that the damages so suffered by the receivers will be substantial, but incapable of exact ascertainment. Any bid for one or more parcels or for the property as an entirety may contain such terms in relation to the payment of the purchase price, and generally such other terms in relation to the payment of the purchase price, and generally such other terms as shall not be inconsistent.

At the close of arguments on the tentative decree of sale Judge Hough directed certain amendments of minor details to be made in the decree, and that it be presented for final action next Monday. Judge Hough said that he would set the sale for some time in January, and probably would name the date at next Monday's hearing.

Four M's Company Shortens its Title.

The Marshalltown Motor Material Mfg. Co., of the Iowa city of that name, has changed its corporate title to The V-Ray Co. The latter name is in keeping with the designation of the spark plug made by the company.

McIntyre Adds Popular-Priced "Six."

Following the trend of the times, the W. H. McIntyre Co., of Auburn, Ind., has added a "six" to its line. It is rated at 40 horsepower and lists at the remarkably low price of $1,485.

Californian Secures Kokomo Accounts.

F. Lenoir has opened up in Los Angeles, Cal., as the representative of the Byrne-Kingston Co. and the Kokomo Electric Co. His salesroom and service stations are located at 804 South Olive street.

Baudette Buys Pontiac Wheel Plant.

O. J. Baudette has purchased the plant of the embarrassed Pontiac Wheel Co., in the Michigan city of that name. It will be added to the body works of O. J. Baudette & Co.

BANKERS OFFER $150,000 FOR THE WYCKOFF ASSETS

If Accepted, Business Will Be Continued and Creditors Receive About 25 per Cent.—Merger Plan not Abandoned.

After a long succession of false alarms, the affairs of Wyckoff, Church & Partridge, Inc., of New York, which company went into bankruptcy on March 14th, 1912, are in a fair way of clearing. The prospective adjustment is due to an offer of $150,000 for the assets of the corporation made to the receiver by H. B. Hollins & Co., New York bankers, whose name previously had been associated with the Wyckoff, Church & Partridge negotiations.

When information was sought, Hollins & Co. stated that they are acting in their "professional capacity" and therefore could say nothing, but it is known that they represent Howard C. Dickerson, George A. Ellis and Chester Griswold, who, in turn, are representing other men who at the same time do not desire that their identities be disclosed. It is understood, however, that they are not at present identified with the automobile industry. Messrs. Dickerson and Ellis are lawyers and Griswold is treasurer of the Motors Engineering Co., and was at one time affiliated with the Wyckoff, Church & Partridge entourage.

The Hollis offer applies to all of the Wyckoff, Church & Partridge assets, excepting the cash on hand, which it is understood amounts to approximatealy $50,000, and any claims or rights of action that Wyckoff, Church & Partridge may have against the Driggs-Seabury Ordnance Co., of Sharon, Pa. The property sought includes two leaseholds in New York City and the factory at Kingston, N. Y., in which the Guy Vaughn cars and American Commer trucks were being produced.

As a condition of the purchase H. B. Hollins & Co. agree to release the receiver from all claims of the bondholders to the amount of $200,000 of Wyckoff, Church & Partridge, Inc., on any property of the firm except the property securing the mortgage and bonds, and will give a release from the claims against the property made by Griswold & Webb.

The Hollins offer will be considered at a meeting to be held on November 22nd at the office of Nathaniel A. Prentiss, referee in bankruptcy.

According to the receiver, John S. Shepard, the Hollins offer, if accepted, will render available for distribution to creditors the sum of $189,304, which will permit of a dividend of between 25 and 27 per cent. to those creditors whose claims are unsecured.

Several months since, as was stated in Motor World at the time, efforts were making to bring about a merger of the Hudson Motor Car Co., of Detroit, the Fiat Automobile Co., of Poughkeepsie, and several other manufacturers, in the shaping of which H. B. Hollins & Co. were known to have a hand. When asked yesterday whether their present offer had any bearing on that project, Walter Kutzleb, of the Hollins firm, made light of the suggestion but admitted that the merger plans had not been wholly abandoned.

Buffalo Supply House in Trouble.

As a means of relieving its financial stringency, the Frey Auto Supply Co., of Buffalo, N. Y., on Monday last, 11th inst., filed a voluntary petition in bankruptcy in the United States Circuit Court in that city. Judge Hazel at once appointed as receiver George P. Urban, secretary and treasurer of the George Urban Milling Co. His bond was fixed at $5,000. The liabilities of the company, of which Charles L. Kelsey is president, are $18,500.87, and its nominal assets $22,344.55, but in applying for the appointment of a receiver the company frankly admitted that it probably can realize only about $6,000 of the $10,000 accounts receivable, and that its stock on hand, valued at $22,000, would not bring anything approximating that sum at forced sale. The largest creditor is George P. Urban, whose claim, amounting to $1,350, is secured by an equity assignment. The other large creditors are the Empire Sales Co. and the Diamond Rubber Co. Previous to the institution of these proceedings several actions had been filed against the Frey company by creditors.

Fire Damages Kelsey Wheel Factory.

Fire on Saturday afternoon last, 9th inst., damaged the turning and finishing departments of the Kelsey Wheel Co.'s plant in Detroit to the extent of about $5,000; the entire loss is covered by insurance. The damage, however, will cause no interference or delay in the Kelsey operations, as in laying out the plant each department was equipped in duplicate to meet just such an emergency as has arisen.

St. Louis Partners Disagree and Sue.

Claiming that their business was closed up recently following the burning of their place of business at 5033 Delmar boulevard, St. Louis, John H. Phillips has brought two suits in the Circuit Court against his partner, George F. Kirsch, demanding a financial settlement. The concern was capitalized at $2,000, each man owning half the stock.

ADAMS'S PATENT ON TIRE TREAD IS DECLARED VALID

In Face of Unusual Language, Court of Appeals Reverses Lower Tribunal—Holds Midgley Tread is an Infringement.

When, in July of last year, Judge Platt, in the United States District Court in Hartford, Conn., decided that "it would be absurd as well as highly inequitable" to bring to bear on heavy automobile tires an invention, such as that covered by the Calvin T. Adams patent, No. 609,320, conceived only with light bicycles in mind, his conception of absurdity and equity was sadly at fault. In more polished diction, this inference is contained in the decision of the United States Court of Appeals for the Second District, handed down on Monday last, 11th inst., which sweepingly reverses Judge Platt's ruling in the suit of the Metallic Rubber Tire Co. against the Hartford Rubber Works Co., in which the Adams patent was at stake.

The complainants, to whom the patent had been assigned, alleged that the Hartford Midgley wire tire tread infringed the Adams patent, but after only one week's deliberation Judge Platt declared the patent invalid and dismissed the charge of infringement. The Metallic Rubber Tire Co. at once appealed, and the Court of Appeals in its decision, written by Judge Noyes, not only reverses Judge Platt and sustains the Adams patent, which was issued August 16, 1898, but sharply criticises the Hartford Rubber Works Co., which at one time possessed a license under the patent, for, upon the expiration of its license, "putting out a product which even if not infringing, closely simulates the patent structure."

The language of Judge Noyes in sustaining the patent is as follows:

The invention of the patent—according to the specification—relates "to means for preventing the yielding tires of bicycles and other wheeled vehicles from slipping on the roadway, as they are particularly apt to do when the roadway is smooth and wet."

The patentee accomplishes his purpose by imbedding "in the material of which the yielding tread of the tire is composed, a peripheral succession of hard bearings, such as metallc wire, interwoven with the rubber or yielding material of the tread, so as to lie partly on the surface of the tread, the exposed portion of the wire being substantially flush with the surface of the tread, so as to bear upon the roadway and prevent the tire from slipping thereon, and yet readily yielding with the tire to allow the rubber or flexible material of the tread to act as a cushion in the usual way."

The patentee, then, after illustrating a method of making a tire according to his alleged invention, points out that when the wire stitches upon the surface are worn off "the exposed ends of the wire will act in the same way as hard bearings to prevent the wheel from slipping."

The patent contains but one claim which is as follows:

"The combination, with a cushioned vehicle-tire, of

Digitized by Google

a tread applied to the entire periphery of the tire, and having metallic wire interwoven with itself, parts of said interwoven wire lying substantially flush with the outer surface of the tread, and forming cushioned antislip bearings covering the sides and bottom of the tread."

The defenses are (1) invalidity; (2) non-infringement; (3) abandonment by manner of prosecuting application; (4) want of equity.

Concededly the nearest approach to the patent in question is the Phillips English patent, and the question of anticipation may well be determined by examining that patent and comparing it with the one in suit.

The principal object of the Phillips patent was to protect and strengthen pneumatic tires. It illustrates numerous ways for stiffening and protecting tires and, among others, points out that the tread or wearing portion may be re-inforced and strengthened by stitching the rubber with metal wire, threads, cord and the like. Some of the drawings of the patent are very similar to those of the patent in suit. The prevention of slipping, however, is not stated to be either an object of the Phillips patent nor a result of the use of its structure. Moreover it is not clear that the non-skidding effect would be obtained by following the teachings and drawings of the Phillips patent. Wire sewed into a tire to reinforce the rubber would naturally be flexible wire while only stiff wire would furnish the "hard bearings" required to prevent slipping, especially after the wearing off of the loops. The Phillips patent shows that rubber tires may be stiffened and protected by wire stitching but, in our opinion, does not teach that exposed wire stitchings will make hard bearings to prevent skidding. Indeed many things in the Phillips patent point in the direction of covering the wires and it is never essential that the stitches should be flush with the surface of the tread.

For these reasons we think that the Phillips patent does not anticipate and is insufficient to negative invention. There being nothing else in the prior art nearly as close, it is unnecessary to further examine the art and the patent is held to be valid. This result is quite equitable for the objection of invalidity comes with rather ill grace from a defendant which has had a license under a patent and which, upon the expiration of the license, has put out a product which, even if not infringing, closely simulates the patented structure.

In our opinion the defendant's structure infringes. The patent requires alternate imbedded and surface loops and we fail to see that it is material whether the result be obtained by crinkled or coiled wires. Furthermore we find nothing in the patent requiring that it should be so narrowly construed as to include only wires stitched or woven into the tire. We perceive no reason why the word "interwoven" in the claim should not be held to be the equivalent of the word "embed" in the specification. Stitching or weaving is not an essential part of the invention. The claim covers the combination of the wire and rubber as a result and we think that the defendant should not be permitted to escape the charge of infringement by combining its wire and rubber in a different way from the stitching or weaving illustrated in the specification.

We find nothing in the proceedings in the Patent Office to estop the complainant from enforcing the patent and no want of equity in its cause.

The decree of the District Court is reversed with costs and the cause remanded with instructions to enter a decree for the complainant for an injunction, an accounting and costs.

Ball Company to Produce Car Heater.

The Atlas Ball Co., of Philadelphia, of which Thomas J. Heller, well known to the automobile trade, is vice-president, has acquired from the Al-Ton Motor Accessory Co., of Akron, O., the sole right to manufacture the Al-Ton motor car heater. The device is of the sort which utilizes heat from the exhaust of the engine and, according to Heller, arrangements are being made to produce them in very large quantities.

GRABOWSKY IS FINALLY FORCED INTO BANKRUPTCY

Creditors' Committee Throws Up Hands and Detroit Creditors Have Receiver Appointed—Liabilities Exceed $350,000.

After having encountered financial obstacles last winter, and despite the labors of a committee of creditors which was constituted a voting trust, and which then took over the management of the business in an effort to save it, the Grabowsky Power Wagon Co., of Detroit, finally has been petitioned into bankruptcy.

The petition was filed in the Federal court in Detroit by the Gillispie Auto Sales Co., the Delameter Hardware Co. and the Ditzler Color Co., and on Thursday last, 7th inst., Judge Tuttle named the Security Trust Co., of Detroit, as receiver.

The petitioners alleged that while insolvent the company made preferential payments to the Firestone Tire & Rubber Co. and other unnamed creditors. They also alleged that 15 or more suits were pending against the Grabowsky company, including the action instituted September 17th by John C. Kimble, a stockholder, who applied for an injunction to restrain the creditors' committee from what he styled the contemplated sale of the assets at a sacrifice.

Apparently, however, matters were brought to a climax by a letter issued by the creditors' committee, in which the latter practically threw up its hands and admitted that the recovery of the company was impossible. The committee stated that the plant no longer could be operated at a profit and that, as all orders had been completed, the factory had been closed down save for the employment of a few men to fill calls for repair parts.

The liabilities of the company are said to exceed $365,000.

Court Rules Against Surety Company.

Holding that a surety company, which furnishes an undertaking to one of the parties in a lawsuit, must make good a judgment even though it be taken by consent or default, the First Department of the Appellate Division of the Supreme Court, located in New York City, this week ruled that the United States Fidelity and Guaranty Co. must pay the E. R. Thomas Motor Branch Co., of New York City, the sum of $3,264.17. In the Supreme Court the case was decided against the Thomas company. As previously told in Motor World, the action grew out of an agency contract between the Thomas branch and the S & V Motor Co. of Brooklyn, and in a suit brought against the S & V, after considerable maneuvering, judgment in favor of the Thomas branch was given by consent. When the S & V failed to pay, suit was brought against the surety company.

Prest-O-Lite Argues Two Cases.

Arguments were heard last week in the United States Circuit Court of Appeals in Chicago in the case of the Prest-O-Lite Co. against the Searchlight Co., the former seeking to overthrow the decision of Judge Kohlsaat of the District court, who recently ruled that the Prest-O-Lite patent No. 664,383 was dead, despite numerous judicial decisions to the contrary. The lower court's decision was made on an application for a preliminary injunction.

Another Prest-O-Lite case was argued this week in the Federal court in Cincinnati, where an injunction was asked restraining Coughlin & Davis from infringing the Prest-O-Lite patents. In this case the attorneys for the defense made much of Judge Kohlsaat's decision and asked that the bill of complaint be dismissed. There also was a similar action brought by the Commercial Acetylene Co. against Coughlin & Davis.

More Knights Coming from Indianapolis.

Having come into full control of the former Atlas Engine Works in Indianapolis, the Lyons-Atlas Engine Works is preparing to diversify the plant's production of Knight engines. It now is turning out a 4½ x 5 four-cylinder motor, but shortly will produce a "six" of the same dimensions and later smaller "fours" and "sixes."

Three More Added to M. C. A. Roll.

At a meeting of the directors, held in New York on Thursday last, 7th inst., three more applicants were elected to membership in the Motor and Accessory Manufacturers, Inc. They are the John W. Blackledge Mfg. Co., of Chicago; James L. Gibney Rubber Co., of Philadelphia, and Westinghouse Electric & Mfg. Co., of Pittsburgh.

Tire Company Enlarging Branch System.

The United States Tire Co. recently has opened sub-branches in Newark, N. J., Birmingham, Ala., Rochester, N. Y., Washington, D. C., and Milwaukee, Wis. In the near future sub-branches also will be established in Providence, R. I., Worcester, Mass., Baltimore, Md., and Syracuse, N. Y., and Columbus and Toledo, O.

"Air-free, care-free, swear-free" is the euphonious and unusually catching manner in which a Cincinnati dealer is exploiting the Dayton airless tire.

The Week's Incorporations

Norfolk, Va.—Allen Motor Co., under Virginia laws, with $2,000 capital; to deal in motor cars. Corporators—E. I. Allen and others.

Chicago, Ill.—Michigan Avenue Garage Co., under Illinois laws, with $5,000 capital; to operate a garage. Corporators—Edward Richter, James D. Donnell, A. J. Moran.

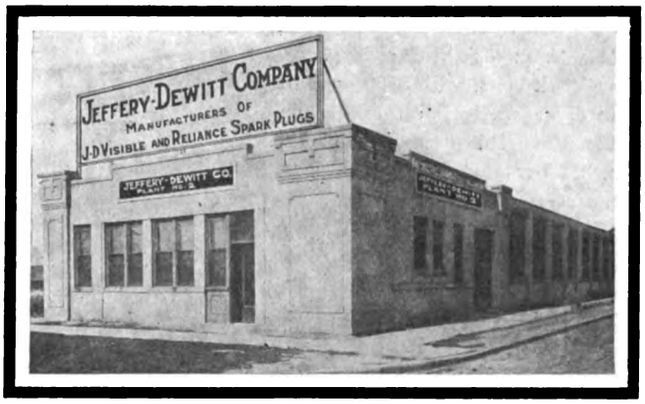
Warsaw, Ind.—Warsaw Auto Co., under Indiana laws, with $4,000 capital; to deal in motor cars. Corporators—Walter H. Stanley, John E. Armstrong, Allen S. Widanan.

Corporators—A. Walther, L. Worfel, E. Vandenberge, Anton Rein.

North Tonawanda, N. Y.—Twin City Auto Co., Inc., under New York laws, with $5,000 capital; to deal in motor cars. Corporators—Walter A. Arenz, Raymond Le Roy, Frank J. Wallenberg.

Chicago, Ill.—L. & M. Co-operative Tire Association, under Illinois alws, with $10,000 capital; to deal in motor car tires. Corporators—J. R. Williams, J. H. Richards, H. J. Richards, T. J. Salliman.

leum. Corporators—David O. Porter, W. B. Morrison, F. P. Springstead.



Brooklyn, N. Y.—Carlton Garage, Inc., under New York laws, with $5,000 capital; to operate a garage. Corporators—Joseph F. Cox, Marie J. Cox, 202 Prospect place; Philip H. Fett, 593 Carlton avenue.

Indianapolis, Ind.—Ham-Meix Mfg. Co., under Indiana laws, with $150,000 capital; to manufacture motor starters. Corporators—Harry W. Hamilton, Ben. F. Meixwell, Samuel B. Sutphin, Harold Taylor.

TWO NEW ADDITIONS TO DETROIT'S ALREADY IMMENSE AUTOMOBILE MANUFACTURING INDUSTRIES

WHERE DISCO STARTERS ARE MADE

PLANT NO. 2 OF JEFFERY-DEWITT CO.

St. Louis, Mo.—Maxwell Motor Sales Co., under Missouri laws, with $5,000 capital; to deal in motor cars. Corporators—Joseph Fillo, B. R. Ford, Charles B. Darrow.

Hartford, Conn.—Auto Owners' Supply Co., under Connecticut laws, with $5,000 capital; to deal in motor car supplies. Corporators—G. Herbert Peck, I. G. Cranton, R. S. Kilbourne.

Indianapolis, Ind.—Hunter-Hammond Auto Co., under Indiana laws, with $12,000 capital; to deal in motor cars. Corporators—F. Ellis Hunter, Harry L. Hammond, John B. Berryhill.

Dodge Center, Minn.—Dodge Center Improvement Co., under Minnesota laws, with $25,000 capital; to deal in motor cars, etc. Corporators—D. T. Rounseville, C. M. Cooper, E. E. Abbott.

Grand Rapids, Mich.—Page Auto-Hoist Co., under Michigan laws, with $50,000 capital; to manufacture motor car devices.

Portland, Me.—Maine Power Truck Co., under Maine laws, with $10,000 capital; to manufacture motor trucks. Corporators—Irving L. Peabody, Harry E. Nixon, Geo. E. Peabody, John W. Thomas.

Newark, N. Y.—Lippard-Stewart Sales Co., under New Jersey laws, with $50,000 capital; to deal in motor vehicles. Corporators—Benjamin P. Burton, Benjamin B. Burton, Robert C. Bennett.

Mount Vernon, N. Y.—Mount Vernon Local Auto Express Co., under New York laws, with $1,500 capital; to operate a motor express. Corporators—Lucy Jacobsen, Elizabeth Jacobsen, Fred Cardillo.

Los Angeles, Cal.—Broadway Auto & Equipment Co., under California laws, with $20,000 capital; to deal in motor cars and equipment. Corporators—F. A. Lechleider, H. V. Vultree, M. C. Lechleider.

Indianapolis, Ind.—Petroleum Development Syndicate, under Indiana laws, with $100,000 capital; to refine and deal in petro-

Norfolk, Va.—Auto Lighting Corporation of America, under Virginia laws, with $1,500,000 capital; to manufacture motor car devices. Corporators—A. D. Newcomb, Wailes Hank, W. J. Simpson.

Salt Lake City, Utah — Automobile Speedway, Co., under Utah laws, with $100,000 capital; to operate a motor speedway. Corporators—D. C. McEntyre, O. H. Hewlett, Fred Stuaffer, D. W. Adamson.

New York, N. Y.—Distributing & Importing Co., under New York laws, with $100,000 capital; to deal in motor cars. Corporators—Paul La Criox, Harvey T. Andrews, Henry A. Miller, all of 2 Rector street.

St. Louis, Mo.—Auto Products Co. of America, under Missouri laws, with $25,000 capital; to manufacture motor car parts and accessories. Corporators—Warren W. Smoot, A. E. Smoot, Eugene B. Stinde.

Cleveland, Ohio—Ideal Tool & Specialty Co., under Ohio laws, with $15,000 capital; to manufacture motor car accessories, etc.

Corporators—J. C. McLeland, G. H. Penty, George K. Moulton, J. A. Hecker, Clifford Fuller.

Detroit, Mich.—Detroit Puncturine Co., under Michigan laws, with $1,000 capital; to manufacture tire filler. Corporators—M. H. Chamlain, Jr., Louis W. Taylor, R. R. Montgomery.

Chicago, Ill.—Auto Combination Lock Co., under Illinois laws, with $50,000 capital; to manufacture motor car devices. Corporators—Howard L. Masson, Harry M. Snow, Francis W. Robinson, William J. Liddy.

Columbus, Ohio—Columbus Auto Parts Co., under Ohio laws, with $25,000 capital; to manufacture motor car parts. Corporators—Reynold E. Klages, Charles H. Krag, C. Krag Klages, John J. Stoddard, Walter D. McKinney.

New York, N. Y.—Atlas Tire Co., under New York laws, with $10,000 capital; to deal in motor car tires. Corporators—Ralph W. Morrison, 181 West 73d street; R. D. Placak, 318 West 53d street; F. F. Nichols, 135 Broadway.

New York, N. Y.—Light Car Corporation, under New York laws, with $500 capital; to deal in motor cars. Corporators—Julius F. Myers, 581 West 161st street; Oliver R. McMahon, 852 Broadway; W. P. Myers, 56 West 11th street.

New York, N. Y.—Bryant Auto Painting Co., under New York laws, with $2,000 capital; to paint motor cars. Corporators—Adolph Berkowitz, 218 East 6th street; Benjamin Davis, 181 East 104th street; Paul Ostruk, 1296 Avenue A.

St. Louis, Mo.—St. Louis Motor Transportation Co., under Missouri laws, with $25,000 capital; to operate a motor delivery. Corporators—William R. Bush, Frank J. Bush, Knox Taussig, William A. Thomas, Richard S. Locke.

Brooklyn, N. Y.—King's County Automobile Association, Inc., under New York laws, with $2,000 capital; to deal in motor car accessories. Corporators—Murray H. Himowich, 82 6th avenue; Alfred Lenick, 619 West 127th street; Louis S. Harris, 1061 Trinity avenue.

Recent Losses by Fire.

Detroit, Mich.—Kelsey Wheel Co., plant damaged. Loss, $5,000.

Lebanon, Pa.—Hurshberger & Aturnes, garage and 25 cars destroyed. Loss, $25,000.

Hightstown, N. J.—Perrine & Wilson, Mercer street, garage destroyed. Loss, $2,500.

Chicago, Ill.—Schacht Motor Co., 1507 South Michigan avenue, building and 30 cars destroyed. Loss, $35,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve To Place Many Workers In New Places—Few Leave the Industry.

F. W. Robartes has been appointed manager of the Washington (D. C.) branch of the Locomobile Co. He succeeds James J. Flynn, resigned.

C. F. Pratt, former president of the Ohio Motor Car Co., of Cincinnati, which now is in the hands of a receiver, has joined the Ames Motor Car Co., of Owensboro, Ky. He has been elected vice-president of that concern.

Hugo Ogren, manager of the Colby Motor Car Co.'s Chicago branch, has been transferred to the factory in Mason City, Ia., of which he has been made superintendent. F. Frees has succeeded him as manager of the Chicago establishment.

H. M. Fauvre, manager of the Indianapolis branch of the Diamond Rubber Co., has been promoted to the management of the Chicago branch. He has been succeeded by O. C. Reavell, who previously was connected with the Diamond branch in Kansas City.

W. F. Gordon has been appointed manager of the United States Tire Co.'s branch in Dallas, which controls the States of, Texas, Louisiana, Mississippi and the southern portion of Alabama. Previously Gordon was assistant manager of the United Motor Dallas Co.

T. B. Goodloe, who has been in charge of the Richmond sub-branch of the United States Tire Co., has been appointed manager of the Atlantic branch of the same organization. Goodloe is succeeded in Richmond by J. G. Given, who has been a salesman in the company's Philadelphia territory.

J. L. Perkins, superintendent of the Saurer truck factory in Plainfield, N. J., has relinquished that position to become superintendent of the Rushmore Dynamo Works, in the same city. Before going into motor trucks Perkins for many years was identified with the machine tool industry, having been in charge of important departments in the Pratt & Whitney and Brown & Sharpe plants.

A. H. Jones, former manager of the United States Tire Co.'s branch in Seattle, Wash., has been engaged to manage the branch store in that city which will be opened by Ballou & Wright, the well-known Portland (Ore.) jobbers. The Seattle branch, which will be ready for business about December 15th, will occupy a building now in course of construction at 817 East Pike street.

Imports Gained Ground in September.

September proved a good month in the matter of automobile imports, 83 cars, valued at $165,646, being brought into the country as against 62 cars, valued at $137,253, during September, 1912. The record represents a gain of 34 per cent. in number, but as the average value of the cars fell from $2,214 to $1,995, the increase in value is but 21 per cent.

During the nine months ending with September, 616 cars, valued at $1,403,174, were imported, as compared with 670 cars, valued at $1,450,222, in the first three-quarters of 1911, a loss of 3 per cent. in value and 8 per cent. in number. The record in detail follows:

	1911		1912	
	No.	Value.	No.	Value.
France	18	$41,297	48	$109,004
Germany	3	7,484	5	11,515
Italy	13	24,014	22	30,363
United K'dom.	14	34,102	6	13,395
Oth. countries.	14	30,356	2	1,369
Total	62	$137,253	83	$165,646

Earl Head of Machine Screw Co.

Having been taken over by the American Hardware Corporation, the Universal Machine Screw Co., of Hartford, Conn., has elected as its president Clarence A. Earl, who is general manager of the Corbin Screw Division of the Hardware corporation. The other officers are as follows: Secretary and treasurer, F. Goodwin Smith, Hartford; directors: Clarence A. Earl, F. Goodwin Smith, Colonel C. L. F. Robinson, Hartford, president of the Travelers Insurance Co., and Colonel C. M. Jarvis.

Uncel Sam Sues Stepney Wheel.

For failure to file its corporation report for the year ending December 31, 1910, on time, the Federal government on Monday last, 4th inst., instituted an action against the American Stepney Spare Wheel Co. in the United States District Court for the Southern District of New York. The penalty asked is $10,000, but many such actions, provided the corporation law is complied with, are settled outside of court for $25.

Wagner Dips Deeper into Right Oil.

Fred J. Wagner has assumed the general management of the Consolidated Lubricating Co., of New York, in which he has been a stockholder but has taken no very active part. He succeeds to most of the duties of A. R. Pardington who, however, remains president of the company, which produces the Right oils. J. C. Nichols will continue as treasurer of the company.

AMERICAN CARS CONTINUE GAINS IN FOREIGN FIELD

Export Figures for September Show Increase in Nearly Every Part of the Globe—Total Close to $2,500,000 Mark.

Not only did September develop a substantial gain in automobile exports over the corresponding period of the previous year, but the statistics for September last proved that, contrary to the general condition, but one of the twelve geographical divisions into which the Federal government divides the world showed a loss in number and valuation of cars shipped to other lands; substantial increases were shown, the largest being credited to Canada, which purchased 305 more cars than a year ago at an increased valuation of $219,880, a gain of 183 per cent. in number and 87 per cent. in valuation.

So far as percentage gains are concerned, however, that comprehensive division known as Other Countries is well at the fore, with an increase of 400 per cent. in number and 312 per cent. in valuation, even though this actually means only 84 more cars and an increase of $73,627. The largest number of cars to be shipped to any country went to Canada, 471 cars, valued at $473,465 being consigned to this British dependency. At the foot of the list in value of imports is West Indies and Bermuda, the cars sent to these islands numbering but 23 and had a valuation of $19,750. Following Canada in order of value of cars taken are British Oceania, 231 cars, $194,471; Asia and Other Oceania, 180 cars, $155,676; South America, 150 cars, $153,919; United Kingdom, 153 cars, $104,080; after these the values drop into five figures.

In valuation percentage gains Other Countries, as previously stated, leads with 312 per cent. A close second, however, is Asia and Other Oceania, whose gain in dollars amounted to 247 per cent., or $110,857, the gain in number of cars being but 131, or 27 per cent. The only other country to double the value of its imports over the preceding September was Mexico, which ordered 6 cars more, a gain of 24 per cent. and an increase of 106 per cent., or $36,870, over the value of the former shipments. Noteworthy gains in valuation were made by Italy and France, the former increasing the value of its takings by $10,473, or 80 per cent., while France, with an added monetary gain of $13,914, was 64 per cent. better.

Four divisions more than doubled the number of cars taken in September, 1911; these with the gain in number and percentage, respectively, are: Other Countries, 84, 400; Germany, 26, 236; Canada, 305, 183; France, 34, 121.

British Oceania presented a peculiar combination of figures, a gain in the number of cars but a loss in valuation. In September, 1911, 206 cars, valued at $199,654, were purchased, while in that month this year the number of cars was 231 and the value had shrunk to $194,471, a gain of 12 per cent. in number and a loss of 2½ per cent. in value. The United Kingdom decreased its takings markedly, showing a falling off of 64 per cent. in number and 65 per cent. in value. The first nine months of 1912 are better by $6,687,265, or 58 per cent., than the same period of 1911; the number gain was 7,162, or 63 per cent. The average prices per car were: September, 1911, $967; September, 1912, $906.

The American possessions — Hawaii, Porto Rico and the Philippines—for September, 1912, increased the number of cars bought by 124 and the vaulation by $48,659, respective percentage gains of 288 and 56. For the two Septembers, that of 1912, in valuation of cars, parts and engines shipped to all countries, exceeds that of 1911 by $565,285, or 32 per cent. The average price per car sent to the American possessions in September, 1911, was $1,996, and for the same month this year, $805.

Engine Exports Still Expanding.

Engines to the number of 517, valued at $110,068, were exported in September, 1912, which was a gain of $65,921, or 150 per cent. The two comparative nine-month periods also showed a gain for the more recent of $769,106, or 174 per cent., the totals being, 1911, $65,097; 1912, $834,203.

Tire Exports Show Good Increase.

The value of the tires shipped from the United States in September, 1911, was $266,499, and in September, 1912, $357,040, a gain of $90,451, or 34 per cent. The first nine months of 1912 gained over that period of 1911 by $750,468, or 31 per cent., the respective values being $3,025,736 and $2,375,268.

The record in detail is shown by the appended table:

	September				Nine Months Ending September					
	1911		1912		1910		1911		1912

REVERSION TO BEVEL GEAR FEATURE OF LONDON SHOW

Worm Drive Loses Ground, Though Some Makers Still Recommend It —"Cycle Cars" Constitute Chief Items of Newness.

Since last year, with its influx of Knight engines and other sleeve and rotary and piston valve engines, its front wheel brakes and worm drive to the rear axle, little, if anything, really startling has developed abroad, according to the exhibits which were thrown open to the public at the annual Olympic show in London, England, on Monday, 11th inst.

Perhaps the most significant trend in construction is revealed in a slow but sure reversion to bevel drive from worm drive. A number of manufacturers who last year equipped their products with worm driven axles still adhere to them, though the majority have reverted boldly to the older bevel drive and some few others list their cars with optional equipment, recommendation being made, however, that the bevel drive be chosen. Just why the return to favor of the bevel drive is a feature is not exactly clear, though it would seem to be the concensus of opinion that the worm is not as efficient at low speeds as is the bevel drive.

Despite the marked tendency toward the production of low priced and medium powered six-cylinder engines in the United States, which really is one of the features of the American market at the present time, no such tendency exists abroad. As has on more than one occasion been remarked, "the battle of the cylinders" has been fought and apparently "sixes" have been left for the larger and more luxurious cars. With few exceptions light cars are fitted with four-cylinder motors, though the usual crop of single and two-cylinder motors is quite as abundant as heretofore.

The demand for some sort of a cross between the motorcycle and the automobile has stimulated the production of an entirely new breed of vehicle which in British parlance is styled a "cycle car," and which generally mounts a single or two-cylinder motor up forward under a hood a la automobile with a miniature body providing accommodations for only one passenger, or possibly two passengers seated tandem fashion. Such vehicles are very light, though their usefulness necessarily is restricted, and it is doubtful if it is as great as the usefulness of either of its fathers. Incidentally, in the construction of full size cars the tendency of manufacturers is to center production on a smaller number of models and to put into them better workmanship and better finish.

With regard to mechanism, the striving for quietness still obtains and is apparent in the refined valve mechanism, valve covers, greater care in machining gears and a more careful balancing and finishing of reciprocating parts in order to reduce vibration. Just as certainly as the Knight engine and some of the other so-called valveless engines have bred a desire for quietness, so have they stimulated manufacturers of poppet valve engines into greater activity in reducing the noises of their products, and so successful have some of the latter been that, though the Knight engine probably is just as popular as it was last year, it is doubtful if it has made any very great strides during the past twelvemonth.

Quite naturally, electric lights have appealed to the conservative British motorist and the result of the appeal is evidenced in the increasing number of electric lighting systems which are being placed on the market; in the main they are quite similar to those with which American motorists are familiar. Similarly, the electric engine starter, which at the last Olympic show was conspicuous by its absence, also at last is claiming attention, as is the acetylene type of starter.

Needless to add, the broad subject of carburation has proven a fertile field for investigation. Several new "petrol" carburetters have put in an appearance, with claims chiefly for greater flexibility and greater economy.

Stock-Selling Suit To Be Retried.

Michael P. Caffe, who sued the Newark Automobile Manufacturing Co., of Newark, N. J., as the result of a stock-selling deal, and who was defeated in the New York City Court, has secured a reversal of this verdict in the Appellate Term of the Supreme Court for New York county, and this branch of the judiciary has ruled that he shall have a new trial. In the first trial he was ordered to pay a judgment of $73.83 costs.

Caffe is the assignee of Charles Hallock, who, it is stated, with one L. R. Bonta, entered into an agreement with the Newark company to sell $160,000 worth of the company's stock, they to have exclusive selling rights during the term of the contract. Bonta later assigned his rights in the contract to Hallock. The claim is that while this agreement was still in force the Newark company of its own accord sold stock to the value of $39,500 and that Hallock thereby became entitled to a commission of $5,775. The verdict in the City Court was directed by the judge on July 12 last. The Newark company itself since has gone into bankruptcy.

TRAVELING SALESMAN ACTS AGAINST TRUCK COMPANY

His Contract Cancelled, He Sues for Commissions and Attaches General Motors' New York Property—Attachment Vacated.

Roy E. Taylor, of New York City, last week brought suit in the Supreme Court for New York county against the General Motors Truck Co., of Detroit, Mich., alleging that he is entitled to $1,969.93 as commissions on an extensive campaign as a traveling representative throughout all New England and the entire Atlantic seaboard as far inland as Kentucky and Tennessee. As a preliminary move he, on Thursday last, 7th inst., secured an attachment against the New York property of the truck company, which, however, caused the attachment to be vacated on Saturday by giving a bond.

Tayor claims he entered into his contract August 15 last and that it was stipulated that he should work his rather extensive territory on a commission of 15 per cent. of the net price of whatever trucks were purchased by the dealers he signed up. The net price of the trucks sold was $62,943.75, which brought, Taylor claims, with $6.55 incidental expenses, a total of $3,153.74. From this, however, he deducts $1,183.81, being the amount of money advanced by the General Motors and the commission on a contract that was canceled, leaving due him $1,969.93.

The contract between Taylor and the truck company, he states, contained a clause specifying that 60 days' notice was necessary in case it was desired to terminate the contract; his complaint alleges that he received notice of dismissal September 19 and that his term of employment therefore is not due to end until next Tuesday, 19th inst. Following his dismissal, he attempted to collect, and when a satisfactory settlement was not forthcoming he brought suit.

Two More Sail to Foreign Shores.

John G. Perrin, chief engineer of the Lozier Motor Co., and Paul Kehrig, representing the Oakland Motor Car Co., sailed to Europe on Thursday last, 7th inst. While both men are bent on seeing all that they may see, their particular objectives are the London and Paris shows.

Motz Establishes Branch in Boston.

The Motz Tire & Rubber Co., of Akron, O., which heretofore has been represented in New England by an agency, has taken over its interests and established a factory branch in Boston at 4 Dundee street. It is in charge of M. A. Frank.

NEW YORK, NOVEMBER 14, 1912

NICKLED TRIMMINGS A DELUSION?

To accept as good anything that looks good and is in popular favor is a too general tendency. Sometimes the good-looking thing may be true to its appearance; sometimes it may prove otherwise. Sometimes it is good only for a short while and then relapses into an undesirable condition. All of which may be applied, with an interrogation point, to nickel as a finish for automobile parts.

The question at issue is not that of the relative attractiveness of nickel and brass or the labor involved in keeping them bright. The question is whether the durability of the plating is sufficient to warrant its use. However well nickel may look when in good condidtion, there is nothing much shabbier than a nickeled part from which the plating has been worn in spots showing the dull metal underneath. And, short as has been the vogue of nickel, there already are many cars the nickeled parts of which are so mottled by wear as to badly mar their otherwise spick and span appearance. Plain brass is preferable to nickel in such a condition, even in the eyes of those with strong leanings toward the silvery finish.

No small importance attaches to the matter of polishes when nickel is used, for under the action of the abrasives and chemicals in so-called "lightning brighteners" the plating disappears rapidly. What with natural wear and unnatural cleaning compounds, nickel seems to be due for troubles of its own. And even worse than the polishes are the cheap and easily made "plating solutions" of acid and mercury. These concoctions produce a fine bright finish—which vanishes in a few hours, leaving the surface corroded from the effects of the acid. These chemical crimes are sold for plating brass and worn spots on nickeled parts.

There would appear to be only one way in which the desired silvery appearance can be both obtained and retained, viz., by making bright parts of metal of uniform color throughout. German silver already has been somewhat extensively used for windshield frames, which simply goes to show that the inadequacy of nickel has been recognized by the makers of these things. While German silver is of insufficient strength for many automobile parts, there are metals which are superior to it in appearance and are stronger than brass; these might well be used for making parts that are to be finished bright. As to the question of cost, it will be up to the manufacturer to decide whether he will invest his cars with an evanescent brightness, incur the expense of a more costly material—or go back to brass. Certainly something should be done before manufacturers' plans have been carried so far as to make changes inconvenient and unnecessarily costly.

GUNNING FOR "AUTOMOBILE MONEY."

What the tariff is to congress, the automobile laws now are to the various State legislatures, and, elections being out of the way, legislative gunning for "automobile money" again is acquiring momentum.

New York, as usual, is leading the way. It is a sad year when the automobile law of the Empire State is not tinkered with. The tinkers already are in private session and, as always, the cry has gone up for more money, despite the fact that the establishment of the State automobile bureau provided jobs for more of the "boys" than the sponsors of the original law ever dreamed of.

The revenue derived now exceeds $1,000,000 a year, but it is not enough, and as by far the greatest number of cars in use are of relatively small power and relatively small price, indicating that their owners are men of moderate means, apparently the chief aim of the present legislative tinkers is to compel such owners to pay a still higher price for what was once considered the inherent right to use the public highways, which use remains free for all others.

It is proposed that instead of the present fixed schedule New York cars shall be taxed on the basis of a flat rate per horsepower, say, 50 cents, which will greatly increase the income of the automobile bureau and probably lead to the employment of more of the "boys," even if it does not provide an excess sufficient to improve at least a quarter-mile stretch of road.

The fact that in addition to paying for the right to use the roads the automobilists of New York also are bearing their share of a $50,000,000 bond issue for road improvement, and just have given their support to another issue of the same amount, appears to count as nothing. Apparently they are fair game for politicians of whatever creed and are fit only to be "plucked."

As a matter of principle, it is to be hoped that the automobile organizations of the State will resist the proposed "replucking" operations.

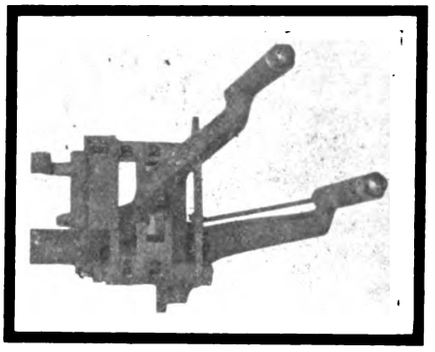
"SNAPPING" SKIDS WITH A MOTION PICTURE MACHINE

Photographic Evidence Afforded by "Movies" Cleverly Employed by Tire Manufacturer—Films for Demonstrating Purposes.

Comparisons may be odious, and doubtless they often are; but there are cases when they are extremely useful. This was the case when the Diamond Rubber Co. made use of moving pictures to make comparisons between smooth tread tires and Diamond safety tread tires under road conditions conducive to skidding and sliding. An Akron street was made slippery by wetting its surface for a block and around a corner into the next block, and two cars, each equipped with one of the different types of tires, were tried out in front of the camera's watchful "eye."

The car with the smooth tread tires went around the corner at a speed of thirty miles an hour, and naturally made a skid that turned the car completely around, while the car with the safety treads, driven at the same speed, turned the corner without skidding. Brake tests, made at similar speeds, resulted in the same way, the smooth treads slipping and permitting the car to "turn round and look at herself," while the safety treads held and the car was stopped in a short distance. The moving pictures taken of the tests will be used for demonstration purposes. They will be exhibited first to the various Diamond tire salesmen and afterwards the public may be given a look.

Electric Dealers Complete Association.



Completing the organization of the New York Electric Vehicle Association, of which Arthur Williams, of the New York Edison Co., and William P. Kennedy, of the Baker Motor Vehicle Co., were made president and vice-president, respectively, at the time of its formation on September 17th last, Henry C. Fling, Harvey Robinson and Arthur Miller were appointed secretary, treasurer and publicity manager, respectively, at a meeting of the board of directors held last week. At the same time, committees were appointed on charging stations, co-operative garage, traffic and service runs, operating costs, advertising and publicity and membership.

The directors of the association are as follows: E. W. Curtis, Jr., General Vehicle Co.; S. W. Menefee, Anderson Electric Car Co.; Nathaniel Platt, Baker Vehicle Co.; C. Y. Kenworthy, Rauch & Lang; M. G. Macdonald, Hupp-Yeats; W. R. Chandler, Flanders; George H. Phelps, Studebaker; V. A. Villar, Champion; John H. Kennard, Couple Gear; W. L. Case, Lansden; Chas. A. Ward, Ward, and A. B. Roeder, International Fritchie. Of these, Platt, Kenworthy, Menefee and Villar and the officers constitute the executive committee.

Little Known Features of Well Known Cars

As a means of preventing the change gear lever from entering the reverse slot unless it is the specific intention of the driver so to place it, the orthodox dog operated by means of a button or a small lever positioned on the handle of the lever has been used since the time selectively-operated change-gearsets first attained to popularity.

One of the little known features of the Haynes cars incorporates the same idea,

HAYNES GEAR SHIFT QUADRANT

which, however, is differently worked out in the design of the plate, which is positioned on the H plate, through which the gear shift lever works, and prevents the lever from being placed in the added slot, in which position the electric starting motor is in gear, through carelessness or thoughtlessness on the part of the operator. Incidentally the arrangement obviates the possibility of damage resulting by reason of the unwelcome attention of street urchins or other unauthorized persons.

The plate, which is hinged and provided with a spring, covers the slot at all times when the slot is not in use, and prevents the entrance of the lever. When it is desired to shift the lever into the starting position, the toe is placed on the small kick lever and the plate is raised against the action of the spring. Since the device must be operated by the foot, there is but slight chance of the operator throwing the starting motor in gear when the engine is running and stripping the gears. When the engine has been started, the gearshift lever is released and automatically brought back into the neutral position by means of springs.

November 8-16, London, England—Society of Motor Manufacturers and Traders' annual show in Olympia Hall.

November 16-23, Atlanta, Ga.—Second annual show of the Atlanta Automobile and Accessory Dealers' Association in the Auditorium-Armory

November 26-30, Grand Rapids, Mich.—Fourth annual show of the Grand Rapids Automobile Dealer's Association in the Klingman Exposition Building.

December 7-22, Paris, France—Paris Salon.

January 6-11, Cleveland, Ohio—Cleveland Automobile Show Co.'s exhibit in the Central Armory.

January 11-18, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Pleasure cars only.

January 20-25, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the First and Third Regiment Armories.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

January 27-February 1, Detroit, Mich.—Detroit Automobile Dealers' Association's show in Wayne Gardens.

January 27-February 1, Buffalo, N. Y.—Buffalo Automobile Dealers' Association's Show in the State Armory.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Pleasure cars only.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

February 10-15, Minneapolis, Minn.—Minneapolis Automobile Show Co.'s show in the National Guard Armory.

February 17-22, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in the Convention Hall.

March 3-8, Pittsburgh, Pa.—Pittsburgh Automobile Dealers' Association's show in Duquesne Garden.

March 24-29, Indianapolis, Ind.—Indianapolis Automobile Trade Association's show.

Solutions of The Used Car Problem

In Competition For

Motor World's Cash Premiums of $50, $25, $15 and $10 For the Four Best Articles Dealing With the Subject.

By A KANSAS DEALER.

In dealing with the second-hand car situation one must consider many things, and not all of them have been considered, and in the articles appearing in Motor World, in fact, I have not seen anything that appears to cover the situation very thoroughly, although some very good ideas have been set forth.

A manufacturer states that the best thing to do is to take the car in low enough so it can be sold at a profit. Very good advice, but this is sometimes hard to do. A dealer may trade for a car that appears to be worth the money he allowed for it, but upon closer, internal examination he will find that it is in worse shape than he supposed, therefore he will either have to repair the machine and add to the cost or must lose on the transaction.

The best thing to do, as a rule, is to make a fair allowance in trading for a second-hand car. Try to deal fairly with the customer and allow all you can, but try to leave a margin for unseen defects.

As to the disposition of the second-hand cars, it is small wonder that they are slow sellers, considering the way the average dealer handles this line of goods.

He trades for a car and then puts it into a back room among the storage or junk, and allows the tires to go down, the brass or nickel to tarnish, and otherwise so neglects it that the car presents a disreputable and run-down-at-the-heel appearance. This is just exactly what should be avoided. If the dealer has cars standing around the shop bearing the general appearance of "junk," the prospective customer is very likely to agree that they are junk, regardless of the argument put forth to dispose of them.

Have you ever observed how some sharp business man will buy a piece of second-class real estate and by repairing the fence, windows, doors and roof and adding a coat or two of paint he is able to sell it for almost double what he paid for it? This is a case of where $100 spent for repairs will add $500 to the property, and the rule holds good with any second-hand machine.

I think the following rules will greatly assist in unloading the second-hand machine of, say, three seasons' use, supposing it to be in the average condition:

Clean the machine thoroughly, removing all dirt and grease from the engine, gear and wheels. If the paint is in good shape, have a painter give the machine a good coat of varnish, but if it needs painting have it done.

Have the metal work cleaned, and if the brass is old, add a coat of some new polish like "Silver-Quick."

See that the tires are repaired and kept pumped up. Nothing adds a more deplorable look to a second-hand car than having three out of the four tires "flat."

If the car has a top and it is faded, a coat of dye will do it good; if it is torn, or any buttons are off, see that they are put on and that the curtains are serviceable.

See that the car will run. If the engine requires attention, don't be afraid to do the necessary work. This does not mean a thorough overhauling, but enough work should be done on the car until you may say truthfully it is in "good running order." Do not dope the gears with a temporary "noise eliminator" for that is an old dodge that long since played out. The buying public is being educated and is looking for such tricks.

Be able to tell a customer the truth about the car, the same as if you were selling him a new one. That is, do not misrepresent anything. Be able to back up all you say. If you tell your prospective customer that you will swear that so-and-so is in fine shape and he takes the car and finds you deliberately misrepresented it, he will tell all his friends that you cannot be depended on.

Keep your cars in a clean, well lighted room, and keep the car, or cars, dusted and presentable and ready to run at a moment's notice. If you have a prospect and he wants to see the car run and you have to spend an hour pumping tires, etc., he is liable to change his mind. If a dealer has many second-hand cars at a time he had better detail a man or two to look after this department; he will find that it will pay.

Every dealer has to trade for a second-hand machine occasionally, and if it is in good shape of course the above treatment will not be necessary, but it always pays to improve the second-hand car as much as possible and it will be found that it can be sold for a hundred or two hundred dollars more than expected if judgment is used in handling it.

Get a reputation of treating a man fairly on a second-hand deal, and you will find that he will send others to you. There are a great many people who would rather buy a good second-hand car than to buy a cheap new one, and this class of trade is generally worth while.

Don't be afraid to tell the people what you have for sale. Advertise—both in the local papers and a few good automobile trade journals. However, make your ads large enough to attract attention. A few well placed ads in two or three papers will beat 200 tucked away in obscure corners. When I see a man trying to do business without advertising, it reminds be of a card I saw a year ago: "Trying to do business without advertising is like winking at a girl in the dark; you may know what you are doing but no one else does."

Having handled automobiles for 10 years and traded for a great many second-hand cars in that length of time, I feel that my suggestions roughly cover the ground. In conclusion, I may say that we have always made a neat profit on second-hand cars, and have never traded for one that was a losing proposition, although we allowed the customer a fair price.

There is only one way to handle the second-hand situation —give the people a square deal. If you follow this rule on the second-hand deals as well as on your new cars, you will have no cause for complaint.

The profit on a new car is generally tied up in the one taken in trade, and it therefore stands to reason that dealers should use good judgment in making the second sale. No dealer enjoys the second-hand part of the business, but as it is a necessary annex it should be handled in a manner that will carry a profit on the right side of the ledger.

FAR REACHING MEANING OF SERVICE AND ITS EFFECTS.

Of course, the automobile dealer is like every other merchant; he is in business primarily for the purpose of making money. As this is the object of all business and all work, he need not be ashamed of it.

The successful merchant who remains successful knows that the fundamental fact that draws and holds trade is service.

Real Importance of Real Service.

Every business success is founded and maintained on service. It enters into the most ordinary things. For example, a housekeeper started trading at a certain grocery store. The store was clean, the clerks polite, and bills rendered promptly and correctly, but the store had one great fault. No matter how badly one wanted an article the grocer did not chance to stock, he never offered to get it; he simply said he did not have it.

In summer time this grocery discontinued the sale of fruits and greens, because they said there was too much competition on the part of the peddlers and there was no money in it for them. They looked always on their side, their convenience, instead of the customer's.

How Anticipatory Methods Save Trade.

There was a certain brand of imported marmalade of which the customer used at least one jar a week. The grocer appeared to buy it in lots of one jar, and if he ran out of it, as he frequently did, the chances were he wouldn't have it in again for a couple of weeks. In the mean time the customer was forced to buy it elsewhere.

As the grocer knew that this marmalade was one of the particular little things the customer wanted, it would have been good business for him to have furnished it, even if he had to buy it from a competitor and retail it without a cent of profit. But, too short-sighted for that sort of thing, he merely said he would not have any for two weeks, and let it go at that.

Of course, the housekeeper went to another store for it, and while there thought she might just as well leave her entire order.

When her husband came home that night she said, "I am tired of trying to trade at "Sleeper's." I know he is a friend of yours, but I simply cannot be bothered going to four or five places for the things that every good grocer should stock and, if you have no objection, we will trade at Lively's. The prices may be a little higher, but the few cents difference will be more than made up by the completeness of their service."

Analogy Between Groceries and Cars.

Thus Sleeper, with his good store and prompt deliveries, lost the trade simply because he and his employes did not understand that service consists in more than prompt deliveries; it consists just as much in carrying in stock or getting the things that a customer wants.

Good customers have been lost to automobile dealers for precisely similar reasons. The little things that make or unmake customers for the grocer, the drygoods man or any other merchant are the simple, ordinary things that win or lose them for the automobile dealer.

Spirit of Readiness That "Takes."

Once you establish a customer, serve him in as many ways as you can; don't let him start trading elsewhere. If you do, it may mean the loss of a car sale to someone else; for the thing that outweighs price to every knowing motorist is service; and it isn't always the service that consists of free replacements and free work; rather is it the spirit of readiness and the desire to serve in all ways that places the customer's interests first, impressed on every employe, that makes every customer a booster and ties him so firmly to you that he has neither inclination nor desire to switch his trade to someone else.

WINDOW DISPLAYS WITHOUT CARS.

"What is one to do in the matter of window displays when he cannot get cars to dispay? Even if we had a car we would not dare to put it in our window, because we are over 27 cars behind on deliveries."

That was the pertinent query of an automobile dealer.

"Are all your salesmen on a vacation?" was asked him.

"Of course not; they are working just as hard as ever—and they are getting orders. We sold three cars yesterday."

"Vacationing" Display Space a Loss.

"Well, then, your window is a salesman; why give it a vacation?"

"That's all right, but how can I use it?"

"Have you any attractive posters? Any reproductions of magazine or newspaper advertisements?" repiled the advocate of window displays. "Have you any good pictures of the factory—or its interior—that makes your car? Couldn't you make an interesting exhibit of the factory, and perhaps show pictures of the men who run it, or of your cars in picturesque surroundings? Or, have you any good local testimonials?"

Advertising Value of Testimonials.

"Why wouldn't it be a bully idea to have a good sign-writer copy the most pointed part of the testimonials in large, readable, lower-case type, together with the writer's name and address—and exhibit one of them in the window for two days, following it with ten or fifteen more, two days apart. Wouldn't that help some?"

"By heck! I never thought of that. It's certainly a good idea and we will work it at once," declared the dealer, as he reached for his file of testimonial letters.

GARAGE SERVICE THAT BRINGS ITS OWN REWARD.

W. L. Reno, who operates the Pasadena Garage, 531 Larned street, East, Detroit, has a waiting list of would-be customers that is as long as one's arm. This is not a metaphor—it is a fact.

"Bill," as everyone calls him, could build a garage twice the size of his present one, which accommodates thirty-five cars, and still have a waiting list. His success is founded on service. He does not sell cars; he simply conducts an efficient garage. And he does so many little things that are unexpected but much appreciated, that many customers who live two miles away and more take the street cars cheerfully to and from his garage rather than keep their machines at places nearer their homes.

Love of the Job That Means Success.

Reno's system is different from that of most garages. Instead of having a large number of men on duty during the daytime he has only one. At night, when most garages have only one man on, Reno has three men working. Every car in the garage is washed and polished every night. And in the morning his customers do not have to take off the radiator cap and look into the radiator to see if they need water; they have grown indifferent if they have stored in the Pasadena Garage long enough, because experience has taught them that every radiator is filled every night.

And the washers take a pride in their work—and, after all, even if it is only washing and polishing cars, love of the job is the secret of success.

Effect of a Rub With Furniture Polish.

One little incident serves to illustrate the idea that dominates the Pasadena Garage. A customer had driven in from Grand Rapids and his car was a "sight." In the morning when he called for it the little runabout glistened like new. "What on earth have you done to my car? It looks so new it scares me," said the motorist, laughingly. "Oh!" said Reno, "Most of the cars came in pretty clean last night—just dusty, you know—so the boys got through early and went over every car with a little furniture polish; it makes 'em look better, doesn't it?"

Only a little thing, but it is one of the many little things that keeps Bill Reno's customers pleased and helps them to extract a new meaning from the old many phased word service.

SELLING ONE CAR TO THE WHOLE FAMILY.

A salesman who sold Packard cars and who was amazingly successful in his chosen calling let fall one of the secrets of his success in the course of conversation the other day.

Family of Three as an Example.

"When I sell a car I sell the whole family on it," said he. "I mean just this: Supposing there is a family of there—father, mother and son. Now, instead of demonstrating only to the father I make it my business to sell all three of them. During a morning I will call and take the mother out for a drive. I try to impress her with the comfort, the luxury, the easy riding qualities of the car, its safety, security and perfect control. My idea is to have her believe that it is about the safest and most comfortable car in which she ever rode.

Study of Temperament Required.

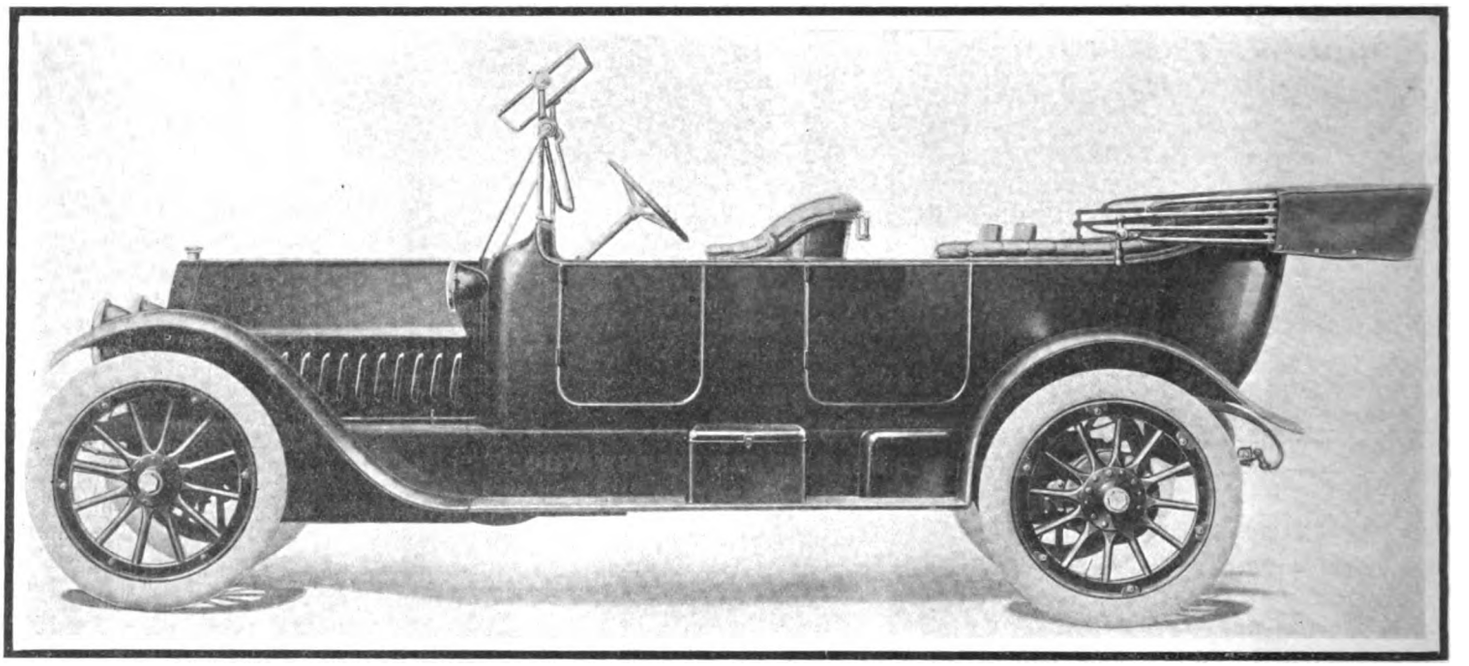
"Later, I get the son, and we'll suppose he likes speed, as most young fellows do. We make for a country road, and I hit her up to beat the band and show him that the car will do sixty miles to seventy miles an hour; I spin round corners on two wheels, if you please, and eat up the road. He goes away thoroughly happy. Then, about twilight I call for father and take him home swiftly, silently and safely. He gets sold on the convenience and safety and style of the car, and when the family get together there is no inside knocker to spoil my sale of the car."

The thought is to study the temperament of prospects and make demonstrations accordingly. It is the old story of studying customers which is so often forgotten, but which always can be remembered with profit.

ONE WAY OF EXTRACTING THE COIN.

Rochester, N. Y., boasts of one garage that does washing and polishing so thoroughly that it pays to check up the contents of one's car before it is taken out. A 30-horsepower touring car left over night in this place had its sod pan removed, its breather cap taken and the electric lights disconnected—all in the ordinary course of a very ordinary wash and polish. The porter was tipped half a dollar to hunt up the missing parts and discovered all except the breather cap and the light disconnections. The tourist discovered the latter some hours later when he was trying to find the road between Elbridge and Syracuse. On the way home the tourist carefully avoided that garage.

GET RID OF THE JUNK PILE.



An eyesore of the most virulent type is the pile of old casings, old inner tubes, old rags, old wheels and old what not that greets the visitor to many garages. In many of them will be found the secret of leakages that are costing the dealer money. Dark corners should be kept clean and free from accumulations of odds and ends. Overlooking these seemingly small details has cost many dealers a pretty penny.

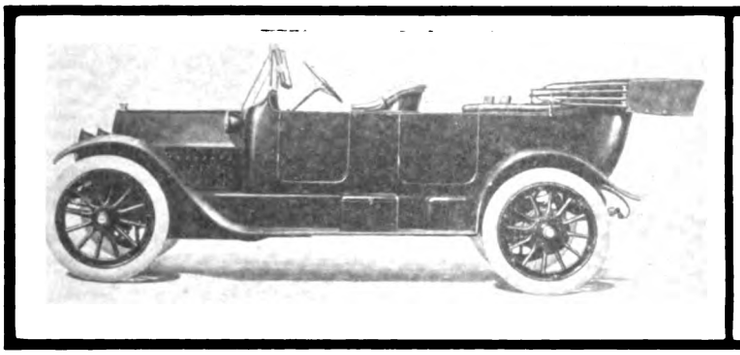
STUDEBAKER LINE RADICALLY RECONSTRUCTED

Rebuilding, Which Is Along Standardized Lines, Includes Addition of Popular-Priced "Six" and Two New "Fours"—Long Stroke Block Motors and Electric Lighting and Starting Systems Employed

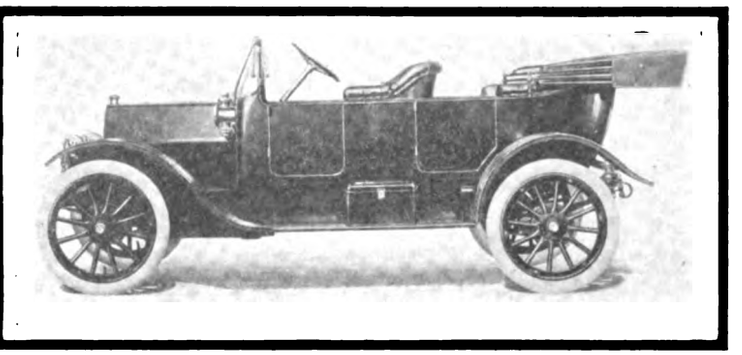
Marking a more than ordinarily notable, not to say startling, deviation from previous practice, the Studebaker Corporation of Detroit, Mich., whose E-M-F "30" and Flanders "20" cars, latterly changed in name to Studebaker "30" and Studebaker "20," have remained without substantial alteration for a period of three years, has added to those models three brand new cars which are distinctly different in very nearly every respect from anything that has borne the name Studebaker. Mechanically and in appearance and price, the newcomers are of the sort calculated to make the world sit up and take quick notice.

STUDEBAKER "SIX" WHICH SELLS FOR $1,550, SHOWING WELL-PROPORTIONED LINES AND DOMED MUDGUARDS



One of the trio is a "six"—an unusually simple and accessible "six," which sells completely equipped, even to a combined electric lighting and engine starting system, at an unusually low price. Furthermore, it is supplied in one model as a limousine, thus marking another innovation in Studebaker products, for until the advent of the new models, the only enclosed model manufactured was a coupe. In the new cars, there is another coupe, and a "Sedan," both mounted on new four-cylinder chassis. The new "six" is styled just plain "six," though it is very far from plain, and the "fours" are designated "25" and "35," respectively, the designations serving in a measure as an indication of their horsepower. All three will be made and marketed supplementary to the well-established Studebaker line.

Carrying out the basic principles of quantity manufacture, essential to the maintenance of minimum "overhead" and bearing direct influence, in turn, on simplicity on service and production cost, there is a very marked similarity in the three new models. In fact, the three motors differ in no whit from each other, except as regards their cylinder dimensions; and all of them are of the typical long-stroke type which now has reached the ascendency. The chassis also are alike except for a difference in wheelbase lengths and in rear axles, the "six" and the "35" employing a new type of full-floating axle and the "25" being fitted with a semi-floating axle. Similarly, the two larger models carry the same types and sizes of bodies.



In the design of the motor—as all three are alike the singular use of the word suffices to indicate the plural—and in the design of other parts of the chassis as well, it is but natural that some few typical Studebaker constructional details which have proven of merit should be retained; they are very few, however. The pistons, for instance, are domed slightly and highly polished to discourage accumulations of carbon; the camshaft is forged in one piece and ground in special apparatus which not only ensures cam shape accuracy but forms in the same operation the cam which operates the oil pump; gearsets are mounted as units with the rear axle; all of these features long have been characteristic of Studebaker cars. Incidentally, pride is taken in the fact that a great number of the component parts of the cars are drop forgings, some 300 individual forgings being required for the three cars.

It is needless to point out that insofar as is consistent and practicable everything has been sacrificed to motor efficiency in the construction and design of the power plant. Motor efficiency, in this connection, may be taken to mean wearability, dependability and a high ratio of output to intake. To these ends, all of the motors are single block castings, in the planning of which the best of foreign and American practice has been drawn upon. Thus are the deleterious effects of possible frame weaving on engine bearings eliminated and manufacturing op-

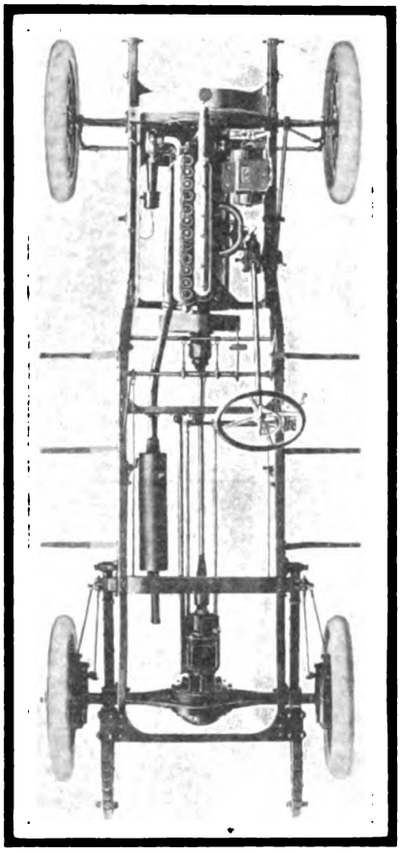
STUDEBAKER "35" TOURING CAR LISTING AT $1,290

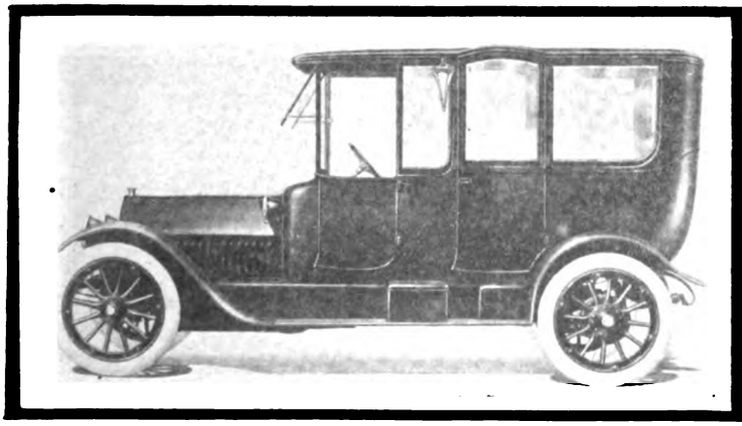


STUDEBAKER "25" WHICH SELLS FOR $885

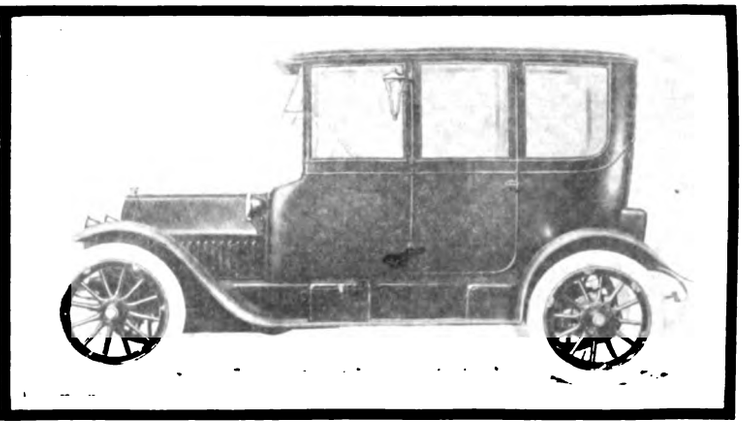
erations simplified. Indicative of the leaf taken from foreign books, though it rapidly is coming to be recognized as practice par excellence by American designers as well, the magneto and water pump are mounted at the opposite ends of a worm driven transverse shaft at the front end of the engine and over the timing gear train. The shaft is driven by a cross-shaft from the crankshaft gear.

Every precaution has been taken to render the motors impervious to the action of water and impregnable to the assaults of road dust and dirt. The valve mechanism, which is all on the same side, cylinders being of the L-head type, is completely enclosed by means of light removable metallic covers which fit snugly and serve a secondary purpose in reducing necessary noises to a condition of inaudibility. The magneto, a Splitdorf instrument operating a dual ignition system in conjunction with a set of dry cells, is enclosed in a waterproof covering; cylinders are coated with rustproof paint and all bright parts are so highly polished as to present no dirt collecting surfaces.

In dimensioning the cylinders, though there is no room for doubt regarding the aptness of the designation "long stroke," a middle ground rather than an extreme has been adopted. In both the "25" and the "six" the bore and stroke measure 3½ inches and 5 inches, respectively, and in the larger "four" the same dimensions are 4⅛ and 5 inches. From which the interchangeability of the parts, bearing directly on



STUDEBAKER "SIX" CHASSIS

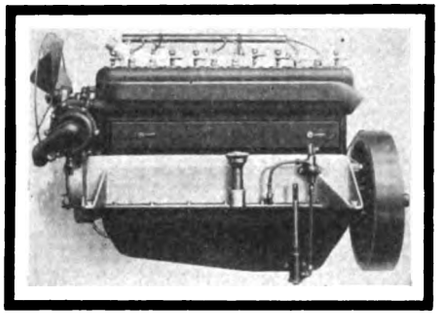


service, may be seen. Also, in view of the dimensions and the ratio of stroke to bore it may be appreciated that the horsepower ratings are nominal at best.

By way of ensuring efficient carburation, free from the possibility of "loading up," and unobstructed exhaust passages, the intake and exhaust manifolds are cast integral. Valves are large with the heads electrically welded to drop-forged stems of liberal diameter and bearing surface. The crankcase is cast bottomless, the place of the lower section being taken by a pressed steel oil reservoir which is readily removable, permitting easy access to the connecting rods and main engine bearings. Lubrication is effected by a method which has proven universally successful, the main oil supply being contained in the pressed steel reservoir, whence it is lifted by a pump through suitable piping and a dash sight feed glass to the timing gear train and to the main engine bearings. Surplus oil drains down into small troughs placed beneath the connecting rod big end bearings and is splashed over the cylinder walls and camshaft bearings, etc. In the "six" the crankcase is made of aluminum; in the other two cars it is cast iron.

The cooling system is identical in all three motors, except for a difference in the size of the parts commensurate with power. Radiators are of ample capacity and the water jackets are proportioned to maintain

STUDEBAKER "SIX" LIMOUSINE SELLING FOR $2,500

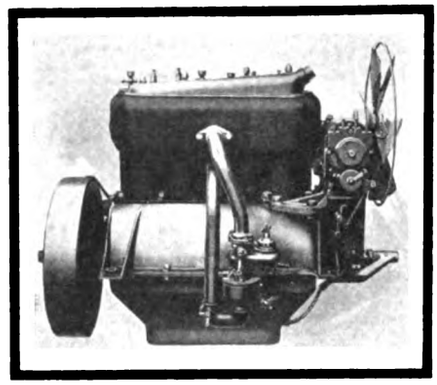


"SEDAN" MODEL ON THE "35" CHASSIS

Digitized by Google

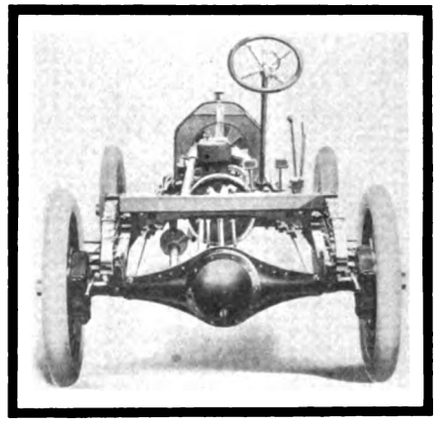
engine temperature at the degree proper for greatest efficiency. One peculiarity of construction which tends to illuminate the thoroughness of design is that the circulation system is arranged to admit the water first on the valve side. Thus the valves are benefited by the relatively cooler water and are less likely to pit and warp because of excessive heat.

The combined electric lighting and engine starting with which both the "six" and the four-cylinder "35" are equipped is the result of collaboration between the Studebaker engineers and the engineers of the Wagner Electric Co. of St. Louis, the latter company being the manufacturer of the devices. Its adaption is such as to warrant little or no attention at the hands of the owner or driver of the car, and its various functions are automatic.



The principal unit of the system is a combined generator and electric motor. It is mounted on a base on the crankcase of the engine and is driven and drives through the

VALVE SIDE "SIX" MOTOR

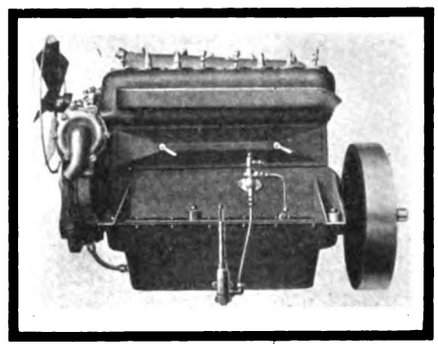


intermediary of a "silent" chain running over a sprocket wheel on the crankshaft of the engine. Mounted with the armature shaft of the motor-generator there is a set of gears to alter the gear ratio between the armature and the crankshaft, according to whether the motor-generator is generating current or operating as a motor to start the car engine. The gears are thrown into mesh by means of a cable, which, when held taut by the operator, enmeshes the gears and in the same operation turns on the current from the storage battery, causing the engine to be "turned over" at the rate of about 80 revolutions a minute. When the engine picks up its own cycle of operations, and the cable is released, the motor becomes a generator and charges the storage battery against its future use. The four-cylinder model "25" is equipped with a simple acetylene gas primer-starter.

From the engine, power is transmitted by means of a cone clutch amply proportioned to resist wear and to ensure smooth action without slip or unsuspected grip. The gearset in each case is enclosed in a unit housing with the differential mechanism, after the manner made familiar in previous Studebaker products. Three speeds forward and reverse are provided, control being selective by means of the orthodox hand lever. In the new rear axle which has been adopted for the "35" and the "six," the weight of the car is carried on the ends of the pressed steel housing and it is possible to remove either or both of the driving axles without disturbing any of the mech-

MANIFOLD SIDE "25" MOTOR

anism or its adjustments. The "25" is fitted with a semi-floating rear axle in which the upper half of the differential housing is removable, permitting easy access to the gears. Control in each case is from the right side, the steering wheel, mounting the spark and throttle levers being at the right side, with the gear shaft and emergency brake levers at the driver's right hand.



NEW FULL-FLOATING AXLE

In the two larger models, the "six" with 120 inches and the "35" with 116 inches wheelbase, the chassis is supported on semi-elliptic front springs and three-quarter elliptic rear springs. The "25" has semi-elliptic front springs and full elliptic rear members. Materially enhancing the appearance of the cars and at the same time reducing the discomforts of travel in rainy weather or over muddy roads, the fenders are crowned slightly to conform to the curvature of the tires. In the two large models the wheels are shod with 34 x 4 inch Goodrich tires mounted on Booth demountable quick-detachable rims. The "25" is equipped with demountable rims and 30 x 3½ inch tires. The steering gear in each case is of the worm and full wheel type.

The bodies on all three models are very similar in lines, the wide flare at the back of the tonneau having been eliminated, thus permitting a comparatively low-hung body slung between the wheels. Touring bodies are arranged for the accommodation of six passengers, two of whom are carried on pivoting seats in the tonneau. When not in use, the seats fold back out of the way.

For the present, the "25" model is supplied only in touring car form; the "35" and the "six" are supplied with all bodies—touring car, coupe, Sedan and limousine. In either case the list price includes complete equipment, the list being as follows: Ventilating windshield, electric horn under the engine hood, top with envelope and patented removable side curtains, demountable rims, extra rim, the usual complement of

LEFT SIDE "35" MOTOR

lamps, tools, spare parts, tire repair kit and jack.

In touring car form, the "25" lists at $885, the "35" at $1,290 and the "six" at $1,550. The "35" coupe and Sedan sell for $1,850 and $2,050, respectively, and the "six" limousine lists at $2,500. Prices of the older "20" and "30" remain $800 and $1,190, respectively.

Calendar that Serves Double Purposes.

Each year the National Acme Mfg. Co., of Cleveland, O., issues a calendar which serves the usual double purpose of keeping tabs on the flight of time and pointing out the advantages of the company's products—automatic machines for making screws and other threaded articles, as well as other turned and milled work, and the calendar itself is both substantial and imposing. Each month's "dates" are printed on a separate sheet, and at the end of the month the sheet, instead of being thrown away, can be mailed to the company and the sender will receive in return his choice of a number of books on screw machines and their work. The sheets are contained in a large and substantial holder of handsome design.

REILLY ADVOCATES THE EDUCATING OF SALESMEN

Explains to the Sales Manager How the Mediocre Salesman With a Little Help Could Become Much More Efficient—Declares Reform in Methods Might Make Big Increase in Sales

"Don't sit de beer on dat sidt, sit it on dis sidt!" commanded the Teuton proprietor of the little road house where Reilly and the Sales Manager had stopped for lunch, and as he said it in his sputtering, nervous way he lifted both steins which the waiter had placed at the left hand of each diner and deposited them at the opposite side of each layout of dishes and eating tools. The little waiter, too embarrassed for words, looked on in silence and with malevolence while the portly host explained to his guests.

"DON'T SIT DE BEER ON DAT SIDT, SIT IT ON DIS SIDT !"

"Dese vaiters iss so stupid! All dey tinks uff iss dere pay. It drifes me grazy! I hope you excoose, chentlemen," was his gesticulatory apology. As the waiter was a new man in the house and apparently new at his trade, Reilly dismissed the incident with a wave of his hand. The proprietor steamed away to new fields of disturbance and the humbled waiter plodded kitchenward.

"Absolutely brainless!" commented the Sales Manager.

"Right, as usual," replied Reilly.

"Some people couldn't learn anything in a million years."

"And still you're correct," was the response.

"If I was the boss I'd fire that stupid fellow."

"Whom are you talking about," asked Reilly, "the waiter or the Dutchman?"

"The waiter, of course."

"Then you're wrong, all wrong!" asserted the dealer. "That Dutchman doesn't know much more about running a business and handling waiters than a hog knows about a rapid fire gun."

"Do you mean to say that the waiter didn't deserve a 'call down' under the circumstances?"

"Maybe, and maybe not," responded the little man of aggressive personality, "but I'll wager that if he were properly handled he never would have done what he did. Not that it makes much difference to me where a waiter sets the beer, so long as he brings it; but I suppose that 'right hand control' is important in the Dutchman's estimation."

"Huh!" was the Sales Manager's only comment.

Not Knowing How to Handle Men.

"'Huh' all you like," retorted Reilly. "That Dutchman is just like fifty per cent. —and maybe more—of the men in every business. They don't know how to handle men or how to get the most out of them in the easiest way. If the Dutchman had properly instructed the waiter beforehand and told him just how things should be done don't you suppose the waiter has intelligence enough to understand and do as he's told?"

"Oh, perhaps," was the Sales Manager's flippant reply, as he tipped the cover of his stein. "What of it, anyway?"

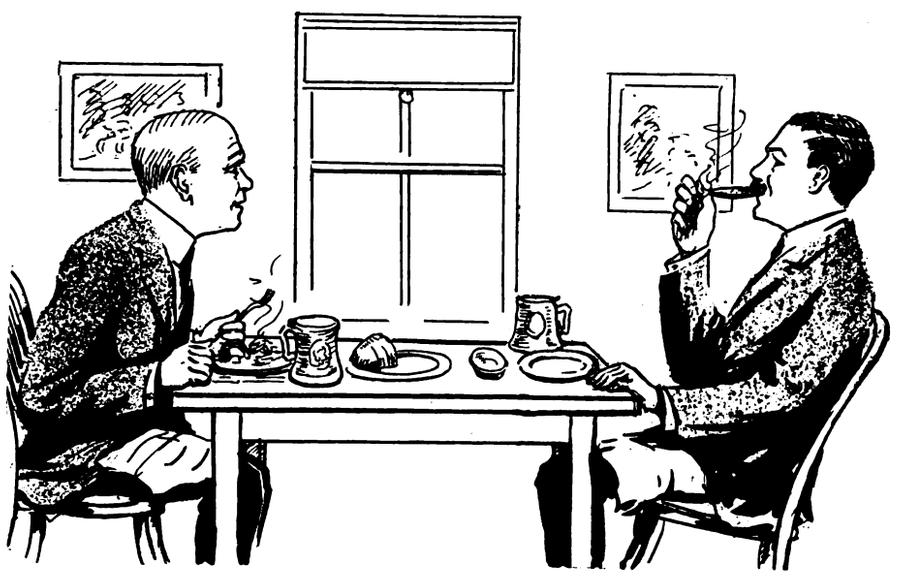
"This of it: if you had fewer dealers like the Dutchman you'd sell more cars."

This hit home, and the Sales Manager figuratively pricked up his ears. "How?" he asked.

"It's all a matter of making an efficient staff of men, even if the staff consists of but one man. How many salesmen do you suppose there are in the automobile business, even in your own aggregation of agencies, who would be much better if they were shown how to be better—if they only had someone to point out the proper way to them instead of criticizing or scolding them every time they do something the wrong way.

Boyhood Experiences an Illustration.

"Look back over your own experience; I can see the same thing in mine; so can almost anyone. When I was a small boy I had a job in a grocery store. It was one of the first positions I had after I gave up being in business for myself—as a newsboy. The grocer I worked for was of this Dutchman type; he was fond of finding fault. I used to be janitor, delivery boy, stable hand, errand boy and. among other things, a salesman. I didn't call myself a salesman at that time, but that is what it amounted to.



"There were many things I didn't know about the business of selling. In fact, there were more things I didn't know than there were things I did know; but I was anxious

Digitized by Google

to learn. The grocer's idea of handling his help was to watch them every minute to see if they made any mistakes, and heaven help them if they did! They got a raking over they didn't forget for a while. Those scoldings were about the only instructions we got. We never knew the right way to do a thing until we had done it the wrong way —sometimes we didn't find out then.

The Boss with the Wrong Attitude.

"I remember one day a woman came into the store after I had been there only a few days and, having come fresh from the street with the newsboys, I said 'Hello, want something?' She wanted something, got it and went out. I didn't want anything, but after she went out I got it, nevertheless. Also, I nearly went out, too. The boss almost flew at me, asked me if I had been brought up in an alley and if I didn't know how to talk to a customer, especially a lady. He stormed around for fifteen minutes, and when I asked him how I ought to address a customer he got worse. Tell me? Not him. He said I ought to know enough to be decent, at least, and that was all the instruction he would give me.

"I WANT THE HIGHEST-PRICED MAN I CAN AFFORD"

Reilly Learns Without Teacher.

"But I was determined, and when another customer came in I watched the boss wait on her. I listened to what he said and got a few pointers that way. After that I watched him closely and, although I used to get in trouble quite frequently, I managed to develop into a fairly good clerk. But if I hadn't had my wits sharpened by a schooling on the street I would have been a long time learning the right way of doing things. However, I learned in time, and when I found a chance for another job I jumped for it. The grocer offered to give me more money if I'd stay, but I didn't like his way of doing business and told him so. It was then only that he spoke well of what I'd done.

Helping Salesmen a Good Investment.

"All the way up from boyhood I've found these same conditions, and they exist today in many places of business. When I got to a point where I employed men I made it one of the first rules of my business that no man under me would have to grope in dark as I had groped or lack a kind word when he deserved it. It applies to automobile salesmen, in one of its most important phases, and the absence of the rule is one reason why so many dealers and factories are not getting all they should out of their salesmen.

"Of course, the salesman I have now was a good one when he came to me, but I actually developed one who, since he left me, is making good in a bigger field in a more important position. He didn't know much about selling when he came to work for me and wasn't as well up as he might have been on automobiles in general and our line in particular. But he was a willing sort of a lad. Without instruction he would have made an average salesman of himself, but I was sure he was capable of better things. I myself had learned a few things and I set out to teach them to him.

Knowledge Withheld is Money Lost.

"I used to talk to him by the hour when there was opportunity and he absorbed information as a sponge does water. Whatever I knew about selling I told him, and I drilled him persistently on the selling points of our cars and I let him read anything and everything that came my way. Do you remember those selling instructions you used to send to dealers? One day when I went over to see your dealer in the next town, and while talking with him, I discovered that he actually kept them locked in his private office, where no one but himself could get at them.

"'Don't you let the salesman see such things?' I asked.

"'I should say not!' he replied. 'I keep those instructions for my own information. If the salesman doesn't know anything about selling let him learn; that's what I'm paying him for. Also, if I start out to teach him he'll be so good in a little while that I'll have to pay him more money. It's money in my pocket, don't you see?'

Public Criticism Another Blunder.

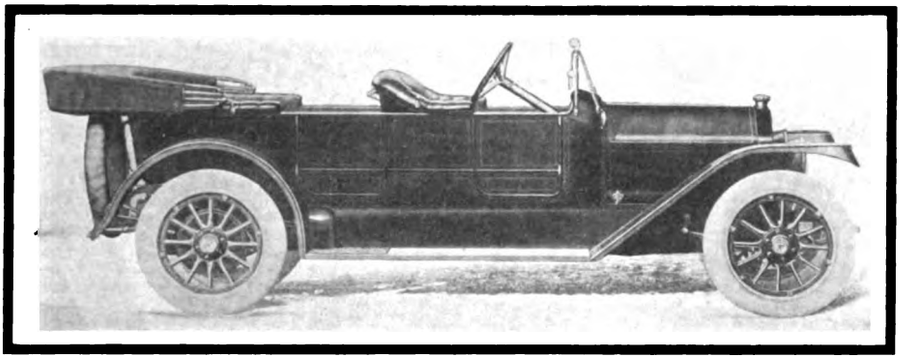
"I didn't see, but I didn't say so. While I was there he took occasion to criticize the salesman for the way a deal had been handled the day before. He was severe about it, too, and right before me. That rubbed the salesman the wrong way, and when his boss wasn't within hearing I overheard the salesman mutter something about 'that damned old fool.' And secretly I agreed with the salesman.

"The salesman that I developed started at rather small pay, because he was a beginner. Had I let him alone he would have gotten to that point of mediocrity that characterizes so many automobile salesmen, and I could have kept his salary quite low. But I don't want a low-priced man working for me; I want a high-priced man, the highest-priced man I can afford. My helping the salesman sent him along fast, and as he became better I kept increasing his salary. By and by he became so good he left me and went to a better position. I didn't blame him or call him an ingrate, because I had gotten all there was in him while he was with me.

Efficiency that Might Result.

"Jim, if you only could get your dealers who have salesmen to do all they can to make the salesmen more efficient, it would work wonders; I believe sales would go up 50 per cent. The system might not be so bad, either, with the salesmen who are connected with the factory. Most salesmen don't get to be their best without help. There are hundreds of average men who could be put several grades higher by a little effort on the boss's part and"——

Reilly's lower jaw and his gesticulating arm stopped simultaneously. The Sales Manager had tipped back and was lighting a cigar; a look at the plates of both showed what the Sales Manager had been doing while Reilly orated.



"Gee! Jim, wait for me," he exclaimed; "I'm four laps behind," and the dissertation terminated with a vigorous assault on the mound of sauerkraut and pigs' knuckles.

SEMI-RACING ROADSTER LATEST NATIONAL MODEL

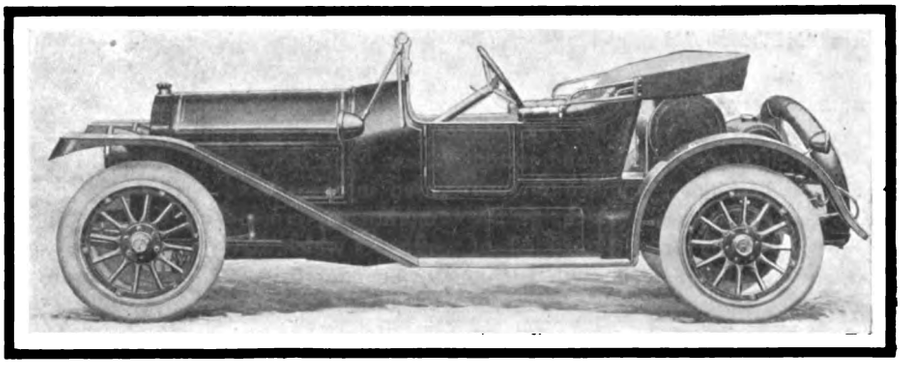
"Improved Series V" All Electrically Lighted and Started—Same Chassis Continued Practically Unaltered—A Few New Details.

With the addition of a single new body type, the incorporation of electric lighting and motor starting systems and a few minor changes and improvements made with a view to rendering quieter and more comfortable a car already above the average

SIDE VIEW OF IMPROVED SERIES V NATIONAL TOURING CAR

in silence and smoothness of operation and in its provision for the comfort of its occupants, the National line is continued as the "improved series V," the numeral being unchanged and the added adjective applying to the things that have been done to make the car better. The National Motor Vehicle Co., of Indianapolis, Ind., is one of the increasing number of makers holding the opinion that the series system, rather than the yearly model system, is more advantageous to builder and buyer alike.

All the National models, as in the past, are mounted on what is essentially a single chassis; that is to say, all chassis are alike except that in the two-passenger machines the wheelbase is 120 inches and in the touring models the axle-to-axle distance is 128 inches and the frames are heavier. The new model is essentially a speed car; it has the straight, cowlless dash, the low seats and the rakish steering column of a racer and differs from the out-and-out racer only in that the seats are designed and upholstered with a view to real comfort and the finish is up to touring car standards. The other models are a two-passenger roadster, also on a 120-inch wheelbase, a small tonneau car, a five-passenger and a seven-passenger touring car, the last three all having 128-inch wheelbases. There is only one chassis change that does not extend through the entire line, and that is the increase that has been made in the depth of the touring car frames to better resist sagging tendencies.



The electric lighting and motor starting system, which is part of the regular equipment of all models, is the Gray & Davis, in which there is a dynamo, driven from the engine, for generating current which is accumulated in a storage battery, and a separate motor for starting the engine, the motor drawing its energy from the storage battery. The dynamo is driven by a silent chain, the driving sprocket being mounted on one of the camshafts near the front of the engine, and is of the constant voltage type and generates at low speed; the regulating system is such that overcharging of the battery is not possible. The engine-starting motor is brought into engagement with the engine by means of a foot-operated plunger, which at the same time throws in the starting switch; the engine is turned over by the motor at the rate of 100 revolutions per minute. There is sufficient power in the electric motor to propel the car in case of emergency. The storage battery is of sufficient capacity to start the motor many times and to carry the lighting load for several hours without recharging; it is placed on the left running-board, at the front.

Of the minor mechanical changes that have been made in the National long-stroke 40-horsepower motor the most important one has to do with the lubrication system, which is of the type in which a constant flow of oil, maintaind by a mechanically driven pump, is forced through the drilled crankshaft, suitable ports permitting the lubricant to flow out at the various bearings. Heretofore the overflow, collecting in the bottom of the crankcase and being thrown about by the lower ends of the connecting rods, has been depended upon to provide lubrication for the cylinders. In the new series, however, positive pressure feeds have been provided for the cylinders, the same pump serving to supply all the feeds. A slight increase in the power output of the motor, as well as quieter running, have been secured by the employment of cams the contours of which have been improved; the cam shafts have been increased in diameter and run in larger bearings than formerly. The spiral timing gears have been made quieter, and the pistons have shared in the refining process. The method of attaching the water circulating pump to the engine has been simplified, and its removal is now an easy matter. The radiator fan has been re-designed and, as a result, is more efficient.

The tire pump, which is built into the front of the crankcase, is now operated by a positive type of clutch, in place of the cone clutch that formed the connecting link in previous models. The air-pump for creating pressure on the gasolene is of new design and has been placed more conveniently than before.

Rattle has been eliminated from the steering gear by the introduction of a spring device which takes up any shake that might cause noise. Hardened steel bushings have been put into a number of places where it is desirable that there should be high resistance to wear and also easy repalcement when excessive wear has occurred. The efficiency of the brakes has been slightly improved; drive from the live axle shafts to the hubs of the rear wheels is through enlarged dog clutches; and room has been found for a little improvement in the springs, the object sought being the prevention of all tendency to permanent set.

Needless to say, the National car retains the left-side steer and center control that its makers so strongly advocated; the control

IMPROVED SERIES V NATIONAL ROADSTER SHOWING STRAIGHT LINE EFFECT

Digitized by Google

system is absolutely unchanged. In the matter of bodies, the roadster has had its sides lowered a trifle; the touring cars have been given a more accentuated curve at the backs of the seats; the boxes on the dashboard have been put a little higher; and the lamps have been sunk in the dashboard. In the touring models the space under the front seats has been arranged to contain a small trunk, and access is obtained from the rear, so that extremely useful storage space is provided for touring. Protection against spattering mud and water has been made ample by the widening of the mudguard flanges. The tool box is hung under the chassis and is reached through an opening in the guard extending from the inner edge of the running-board to the body; a neat door covers the opening. Improved tire irons for carrying two tires are paced in the rear. Add a slight enlargement of the general dimensions of the touring car bodies, and the list of changes is complete.

The price list has undergone some revision and the figures have made an upward movement. The semi-racing roadster is listed at $2,750, which formerly was the price of the regular roadster, that machine having been increased to $3,150. The small tonneau car, the old price of which was $2,900, now is priced at $3,300, and the same figures apply to the five-passenger touring car. The seven-passenger touring car, the price of which was $3,000, now costs $3,400. These prices include regular equipment in all cases.

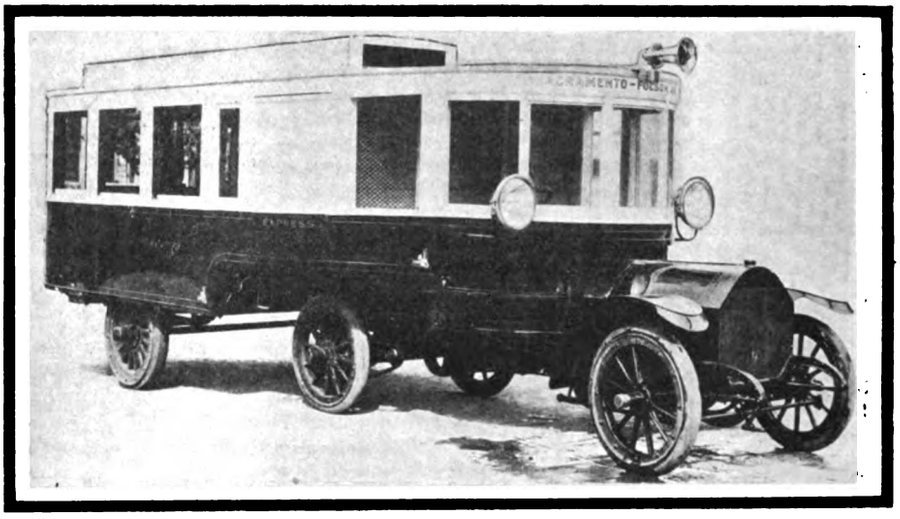
Advocates "Mill Ends" Instead of Waste.

Everyone who ever has wiped off a piece of machinery knows how hard it is to find a clean "corner" on a dirty rag, and likewise how dirty are the rags and cotton waste which ordinarily are supplied for such service. "New mill ends," which, as the term implies, are the ends clipped off of bolts of cotton goods at the mills, it is claimed are not only more satisfactory for the purpose than either old rags or waste, but are more sanitary and cheaper in the long run, for being perfectly flat and of light and even weight they "go farther." Their use for automobile work is being exploited by the American Mill Ends Co., of Detroit, Mich., which supplies the "ends" in 50 and 100-pound bales.

Temperature Names and Their Equivalents.

The color designated as dull cherry red in the manufacture or preparing of tools and tool steel corresponds to a temperature of 800 degrees Fahr. Light straw corresponds to the lowest temperature given a name—222 degrees Fahr.—and yellow-white to the highest temperature—1,300 degrees Fahr.

SIX-WHEELED OMNIBUS FOR TWENTY FOUR PASSENGERS



Ingenious Tractor-Trailer Idea of a California Dealer that Works Well —New Lease of Life for Pleasure Chassis.

As an aid in solving passenger transport problems, the motor omnibus is perhaps a little better understood and certainly more generally used abroad than it is in America, though the movement in favor of such vehicles gradually is spreading, and from an almost insignificant beginning at length has reached proportions and made possible results which are worthy of attention. In a great proportion of the cases outside of New York City where motor 'buses are used in the United States, they are what might be termed "made-over" vehicles—vehicles which, having served a useful term doing one sort of work, have been partly, or wholly, reconstructed and placed in new duty—and of them it is doubtful if there is any which is more ingenious and, incidentally, more efficient and dependable than the six-wheeled hybrid shown by the accompanying illustration.

The 'bus is principally a 1906 Locomobile pleasure car chassis—it already had been driven some 120,000 miles—partly reconstructed and made to do duty in its new service by its owners, A. Meister & Sons Co., who are the Sacramento, Cal., representatives of the Locomobile Co. of America. It operates on what has been styled the Sacramento-Folsom Air Line and makes two trips a day—about 90 miles—at an average speed of 20 miles an hour between the two California cities for which the line is named. The total weight is 6,000 pounds.

In the design of the 'bus, beauty of outline scarcely is its dominating feature, though it is none the less useful and efficient for its somewhat outre appearance. The stage portion of the vehicle, designed by its owners, is a massive structure mounted in the rear on an extra pair of rubber-shod wheels and in the front on the center of the Locomobile chassis. A modification of the "fifth wheel" idea permits the necessary flexibility between the two portions. The passenger carrying end of the 'bus is tastefully upholstered in leather and affords accommodation for 24 persons. In addition, there is liberal space for the carrying of the passenger's baggage and a limited amount of express matter.

During the time the 'bus has been in operation, it has not missed a trip and has proven a popular addition to the transportation facilities between Sacramento and Folsom. That the bus is comfortable is evidenced by the fact that it is cutting in, even if ever so slightly, on the railroad traffic between these cities. One feature which tends to increase its popularity is the fact that its time of arrival and departure from Sacramento are such that theater parties may be taken in and home again the same evening. A complete electric lighting system serves to illuminate the roads and the 'bus after nightfall.

LOCOMOBILE 'BUS WHICH OPERATES ON SACRAMENTO-FOLSOM AIR LINE

Heating Due to Deformed Fan Blades.

If a motor persists in running hot, and search in other directions does not serve to disclose the cause of the malady, it is well to inspect the blades of the fan and see that they have not been flattened or otherwise bent out of shape. With a pressed steel fan revolving at a high rate of speed, it does not take a very hard blow to deform the blades and lessen the efficiency of the device.

CONCENTRATION ON ONE LINE A SALES BUILDER

Dealer of Six Years' Experience Gives Striking Reasons Why Energies Were Centered on a Single Factory's Product—Modern Methods and "Still Hunt" are Other Points in Sales Plan

In these days of system and systematizing, when the automobile factory sales department that has not a method of teaching its dealers how to secure prospects and to follow them up is viewed askance by its fellows, there probably are few dealers who have not had brought to their attention a method of helping increase their sales profits; and while many of these men in the field have adopted the various systems with profit—for no system at all really is ruinous—a few have worked out selling and prospect-hunting plans of their own.

Secrets of Success That Are Plain.

In which connection the methods of the Central Motor Car Co., of Bloomfield, N. J., safely may be said to be entitled to unusually respectful consideration and, contrary to being unwilling that their fellows in the trade should learn the secret, Ernest H. Cadmus and Charles W. Smith, who virtually constitute the concern, are only too pleased to spread their selling scheme broadcast. That this is effective is evidenced by the company's prosperity.

Summarized, the selling system centers about three principal points: Concentrate on one line; "still hunt" your prospects and be square with the public. The line is the Regal; the prospects are numerous. Next year, the calendar year of 1913, the company expects to dispose of 80 cars.

When a Motor World man dropped into the company's concrete home at Washington and Farrand streets, Smith was out on one of these "still hunts" and Cadmus was in charge.

Wherein Concentrated Effort Pays.

In past years the company has represented several lines of cars, carrying the entire number at one time; at the beginning of the present year all but the Regal were dropped. Asked why a single line was preferable, Cadmus was specific.

"There are several reasons," he replied. "One is that with one line we can secure larger territory. We now have the counties of Essex, Morris and Passaic. This gives us an ample field in which to work and place sub-dealers and sell a larger number of cars in a season. Therefore we get a larger commission. It will mean a 5 per cent. better commission this year than last. If we sell 80 cars, as we expect to do, it will mean $2,500 in money, and that is worth picking up. We have been selling Regals for five years, and this enlarged territory will bring us a better commission in parts. The increased percentage here ought to be about $1,000, so you see that by sticking to the one line and selling a lot of it our increased revenue will amount to approximately $3,500.

Confusion Engendered by Variety.

"There is another reason one line is better than several. We are able to concentrate our energies. The Regal line is well adapted for concentration because of its diversity of models. We can give a man any kind of a car he desires at quite a broad range of price. We can hammer harder on one line than we can on two or three. We make a more thorough study of it and really are better salesmen because of it. When we exploited several different makes it was not so easy for a buyer to make a selection; he had too much to choose from. Now if he is not determined not to buy a Regal we generally can sell him one."

Home-Made Investigating Method.

Cadmus smiled when he was asked what methods were employed in looking up prospects.

"Well," he said, "I guess we are somewhat different from most dealers." He hesitated a moment, as if to find a name for the system, and then added: "I think we could almost call it a 'still hunt' method. We didn't get it from anyone; we just worked it up ourselves."

"How does it work? What is the scheme?" asked the questioner.

How a "Still Hunt" Is Conducted.

"Well, I'll explain," replied Cadmus, his big, forceful personality backing up his opinion at every stage, "but first it is necessary to understand how prospects generally are handled. As a rule when it becomes noised around that man is in the market for a car he is besieged by dealers. First one is after him, then another; they call on him and phone him and they all so shower him with printed matter and personal arguments that the poor man becomes confused, he doesn't know what to buy, and often he winds up by postponing his purchase or by not buying at all.

"One thing we never do is to drive up and stop our demonstrating car in front of a man's house. That is an almost certain signal for the rush to begin. If some other dealer doesn't see your car with the manufacturer's tag at the prospect's door someone else sees it and the news travels fast. Neither do we make a practice of getting into this rush when we hear that some other dealer has been to see a man. We get far more results by our 'still hunting.'

No "Front-Door" Demonstrations.

"Our leads to prospects generally are secured through friends and owners of cars we have sold. When we hear in this way that someone is in the market we beat around the bush and get our bearings. Then, instead of driving up to the man's house and giving the news a chance to travel, as it will in a small town, we arrange otherwise. We plan to give the prospect a demonstration without attracting attention. We have him come to the garage or arrange to give him a demonstration in such a manner as not to attract attention to the fact that he is a prospective buyer.

"Men are more pleased with such arrangements than they would be to have themselves almost publicly paraded and to bring down on them a regiment of dealers. And in this way we are able to show up the points of our cars without there being a half dozen or so of other cars in the prospect's mind. If such a man has any intention of buying a car we generally can sell him one. What's that? You ask if he may not afterwards get 'sore' when he finds he would rather have bought some other car? Hardly. One of our greatest assets is our satisfied owners. We do everything in our power to keep them satisfied. We believe in playing fair. My father was in this town before me and his father before him, and when I can't keep up the family reputation for square dealing I'll quit."

The Part That Service Plays.

Cadmus means what he says. Service—that abused term—is a vital part of the company's policy. Owners feel at liberty to drive into the garage and ask to have

Digitized by Google

their cars looked over. If it is a matter of adjustments merely or insignificant repairs there is no charge; if, however, anything wrong is discovered the owner is glad to pay. The company's reputation—for it really is not a myth—assures him that if he is asked to pay there is a legitimate reason. And the concentration on one line helps out in the service. When a car comes in, the workmen, by being thoroughly familiar with the one line, know just where to look to ascertain the car's condition and are quick to remedy irregularities. It is specialization, that keynote in present day efficiency theories.

Emphasizes Company's Reputation.

One point that is hammered home by Cadmus and Smith is the advantage of buying of a reliable man in the buyer's home town. Then if anything goes wrong with the purchase it is up to the dealer to make it right and adjust any differences with the factory, whereas if the purchase is made through a distant dealer there often is greater difficulty in adjusting matters. The company's reputation, built up through a course of some six or seven years, is made much of.

On the used car proposition the safe and sane business way is followed. No more is allowed for a car than can be secured for it at resale, and this traded-in stock is turned over quickly.

"A man came to me one day," said Cadmus, "and wanted to trade in his car. I offered him $400. He said another dealer had offered him $700. He gave me his name —he was a dealer who handled a $2,000 car —and I showed the prospect how the other dealer, by cutting his commission, could make this price, while we, with a smaller commission, so far as dollars are concerned, could not do so. He saw the point.

When Commission Cutting Paid.

"As to throwing away commissions in trading just to make a sale, we don't often do it. We did it once, but there was a real reason for it. Smith and I had quite an argument about it at first, but we finally agreed that it was the best thing to do. The man who wanted to trade for a good price wanted so much that we would make practically nothing if we traded. But this man, who was very insistent, was quite close to another man to whom we wanted to sell a car. We traded, and in that way this man influenced the other and we made the profit on the second sale. Otherwise we would have made no sale at all. As it is, we have both men for customers in supplies and so forth and we considered it the best way out of a perplexing situation. The man on whose car we made the regular profit is a physician and we looked upon him as more or less of an advertisement for our line, as he is all over town and gives a car a chance to show what it is made of. And if we keep him satisfied—which we will—he can help us a lot."

The parts and supplies trade is thriving with the Central Motor Car Co. The regular stock is valued at about $3,000. Last year the company sold over $12,000 worth of tires and in January, 1911, the sales of one brand exceeded $1,200, and January is considered a dull month in tires. Gasolene is bought at 15½ cents and sold at 20. The monthly sales are about 3,500 gallons, but the dealers say there is little money made in this commodity.

Storage Conditions That Prevail.

Storage is quite a heavy part of the business, and although the building, which is but one story, is only 45 feet wide at the front, 70 at the back and 100 feet deep, 30 cars can be stored. The average number is 22—all live storage. Prices range from $10 and $15 for small models to $25 and $30 as top prices. The cleaning and attention required in large cities is not demanded in Bloomfield; cars which are in and out frequently are cleaned only when cleaning is required.

The location of the garage is advantageous. At present the street is somewhat torn up, but when the authorities have finished the improvements that are now under way the garage will stand on an advantageous corner of a spacious square. The street is heavily traveled and the garage is but a few feet from the D., L. & W. station. Demonstrating expenses are kept down by concentrating on one line, as but one car is required where otherwise one would be required for each of the different lines carried.

Pleasing the Trade a Principle.

Pleasing both the transient and the regular customer is a business principle. Two toilet and wash rooms are kept scrupulously clean, and always there is soap and clean towels, and the tourist who drives in for storage is pleased to find a place where he can in comfort remove the dust and grime of travel. Cadmus well expressed the company's attitude when he said: "We do not believe in getting a man's money and then saying 'To hell with him!' We are in this town to stay and are going to stay; and we have the future to look out for. The only way we can do it is by building a reputation for reliability and fairness and by gathering around us a satisfied trade."

Combine to "Solve" Petrol Question.

Unless a hitch of some sort develops, it is promised that British motorists soon will be able to obtain their "petrol," which is the British designation for plain gasolene, at a tithe of what it costs at present. In order to bring about this desirable state of affairs a company to be styled Motor Owners' Petrol Combine, Ltd., which is to be modestly capitalized at not less than $5,700,000, already is in process of formation, headquarters having been established at Egyptian House, Picadilly, London, W., England.

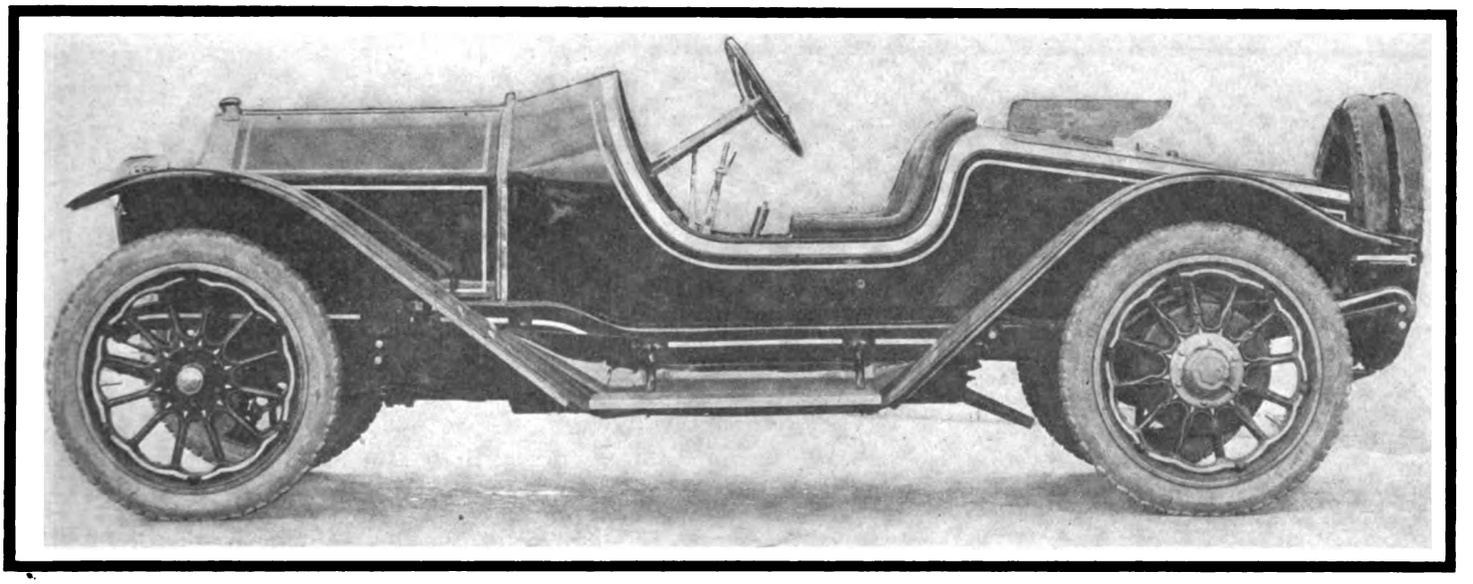
The idea, of course, is to permit those who participate in the stock distribution of the "combine" to purchase their fuel from themselves, so to speak, at prices set by themselves, and in order to accomplish this end it is proposed to own oil fields as well as ships, refineries, storage plants, rolling stock and distribution plants in all of the principal cities in the country, which is a tall order for motor owners in Great Britain or any other country.

Treatment for Over-Size Piston Rings.

It is not always possible to obtain a set of new piston rings that can be inserted in the piston grooves without any fitting, though very often this may be done. Sometimes the rings are a trifle tight in the grooves. When this is the case the proper thing to do, assuming, of course, that the tightness is not due to dirt or carbon in the grooves, is to ease the rings by rubbing their sides on a sheet of fine emery cloth laid on a perfectly flat surface, such as a sheet of plate glass or an accurately planed block of wood. The rings should be constantly turned while rubbing to prevent the removal of too much stock in any one place. The utmost care sholud be taken to wash off all traces of emery before putting the rings in place. There should be no trace of looseness or of binding in a properly fitting piston ring.

Flame Test for Carburetter Floats.

An invisible leak in a carburetter float of the hollow metal type can be found by heating the float sufficiently to expand and vaporize the gasolene that has leaked in, but not sufficiently to melt the solder, if any is used. A lighted match run around the float will ignite the vapor issuing from the microscopic hole. If the float is immersed in boiling water for a few seconds the gasolene will expand sufficiently for the purpose.



Old Corks as Spare Valve Protectors.

A simple method of ensuring the good condition of spare valves is to punch a hole in a large cork and run the valve stem through the hole so that the cork abuts against the valve head. The cork may be held in place with the aid of a spare valve spring, washer and pin. Wood will serve the purpose if no cork is available.

TWO NEW MODELS IN THE PATHFINDER LINE

One is a "Martha Washington" Coach for Three and the Other a Two-Passenger "Cruiser" With Flowing Lines—Electric Lighting and Starting System Adopted—Few Alterations Found Necessary

PATHFINDER "CRUISER" MODEL—A LOW HUNG ROADSTER WITH A "MIDSHIP COCKPIT"

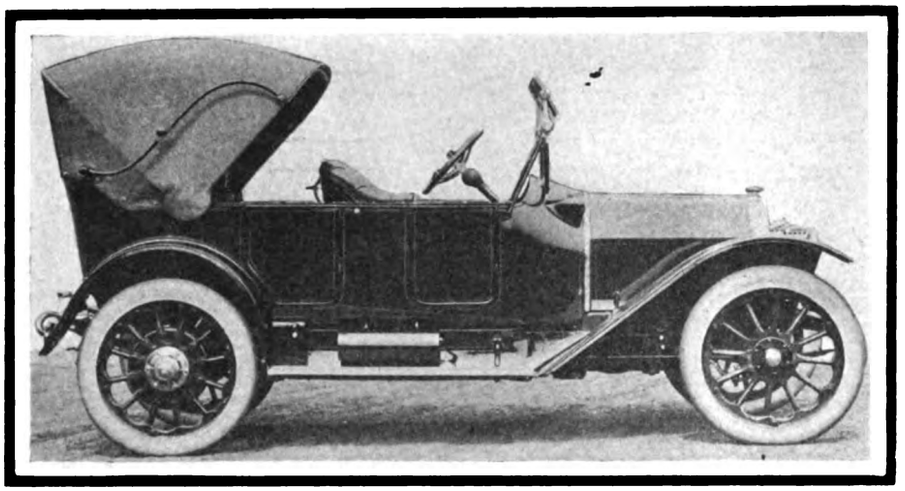
Although two new models have been added to the Pathfinder line made by the Motor Car Mfg. Co. of Indianapolis, Ind., the same chassis is employed for all, the newcomers increasing the body styles from four to six. Two additions are a Martha Washington coach, a three-passenger, inside driven car, and the "Cruiser," a two-passenger vehicle, on which the option of either wire or wood wheels is offered. Prices range from $1,875 to $2,500.

The power plant is a Continental block motor with the valves all on the same side; its bore and stroke are 4⅛ inches and 5¼ inches, respectively, and it develops better than 42 horsepower at 1,300 revolutions a minute. The crankshaft is of the three-bearing type with well-proportioned liberal size bearing surfaces.

The crankcase is made of nickel aluminum alloy and is of the two piece type with the oil reservoir, easily removable, contained in the lower half; a patented breather pipe conveniently located on the upper half of the case serves as a filler pipe in addition to relieving the crankcase pressure. The remainder of the lubrication system consists of two plunger pumps and suitable piping to lead the oil to the bearings. One of the pumps forces oil directly to the main crankshaft bearings, whence it drains into compartments under the connecting rods and is splashed over the cylinder walls and auxiliary bearings, and the other forces oil over the timing gear train in the front of the crankcase. The overflow is strained into the oil reservoir and re-pumped over its rounds. A sight feed on the dash serves to indicate the operativeness of the pumps.

By way of ensuring quietness of operation, the timing gears are helically cut and the valve mechanism is completely enclosed by means of light removable covers held in place by means of thumb nuts. Cooling is effected on the thermo-siphon system, radiation being assisted by an 18-inch ball-bearing mounted fan; the radiator is of the honey-comb type. "Mixture" is furnished by the latest type Schebler carburetter and the motor is sparked by an Eisemann high tension magneto with the plug leads carried in a special aluminum housing effectually protecting them from breakage or short circuits.

The pistons are cast of a special grade of reverberatory air furnace iron and are extra long and accurately ground to size. Each is fitted with four diagonally split eccentric expansion rings which have been treated in special machinery designed to relieve casting strains and ensure even pressure all the way around the cylinder walls. Five oil grooves are turned in the outside of the pistons to assist in distributing the lubricating oil in an even film. All pistons and connecting rod assemblies are carefully weighed and balanced to minimize vibration. Wrist pins are formed of seamless cold-drawn steel tubing carbonized and accurately ground to size; they are pinched in the small ends of the connecting rods, bearings being in the piston bosses. Connecting rods are of I-beam section and are made of carbon steel drop forged and heat treated with the bearing caps held in place by means of nickel bolts securely locked.



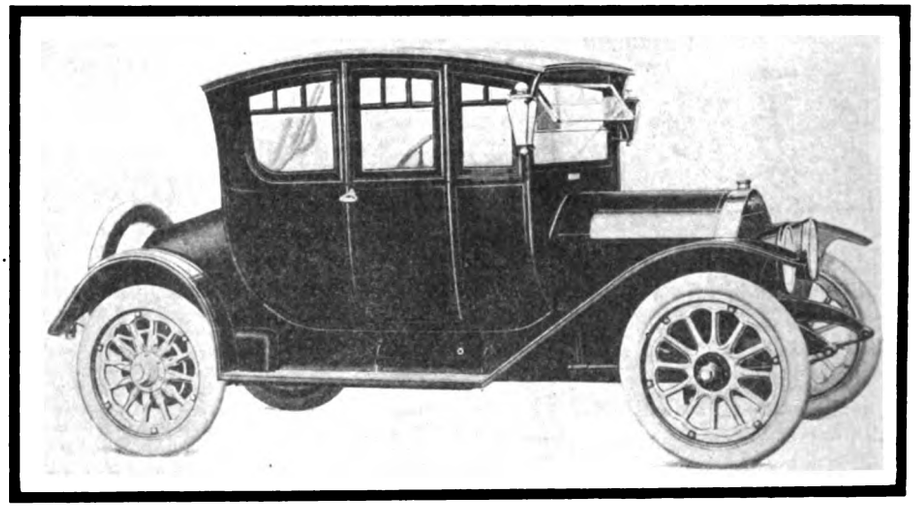
The crankshaft, camshaft and connecting rod bearings are unusually liberal in size and are made of high grade nickel babbitt metal. Connecting rod big end bearings are held in place by means of brass retaining screws. Indicative of the care which enters into manufacture, all bearings after having been carefully fitted into place are expanded on special expansion arbors, reamed and hand scraped.

Distinctive of the Gray & Davis electric lighting and engine starting system, which is the regular equipment on the Martha Washington model only, and which operates at a nominal 6-volt pressure, the generator for charging the storage battery and the engine starting motor are separate units. The former is mounted on a bracket on the crankcase and the latter is hung to the chassis frame and drives the engine through the intermediary of gearing cut in the periphery of the flywheel. Pressure on a pedal serves to engage the electric motor through the gearing and at the same time

Digitized by Google

closes the circuit, causing the engine to be "turned over" at the rate of 80 revolutions a minute. Immediately the engines takes up its own cycle of operations, the electric motor automatically is disengaged and the generator commences to charge the storage battery against its future use for lighting and starting. The whole series of operations is entirely automatic.

From the engine, power is transmitted to full-floating rear axles through a leather faced cone clutch provided with spring inserts, to ensure smooth action and positive release, and a three-speed selectively operated change gearset. The clutch and the gearset are contained in the same aluminum housing, which, in turn, is securely bolted to the flywheel case, making of the whole a rigid unit in which disalignment of the several shafts is impossible. Both service and emergency brakes are located on rear wheel drums and both are internal expanding and carefully equalized. The service brake drums are 16 inches in diameter and the others are 12 inches in diameter.



STANDARD PATHFINDER TOURING CAR FITTED WITH VICTORIA TOP

In the transmission elements, a torsion tube surrounding the propeller shaft takes the place of both torque rods and radius members. The torsion tube is attached to a cross member of the chassis frame by means of a swivelling yoke. The rear axle housing is formed of pressed steel and is unusually rugged in construction. A large inspection plate permits ready access to the differential gears, which may be adjusted without the necessity for removing them or disturbing other parts.

The wheelbase of the chassis has been increased to 120 inches and, as heretofore, the unusual type of "chariot" wheels, which are an exclusive feature of Pathfinder cars, are retained. On all models except the "Cruiser," which is equipped with 34 x 4 inches tires mounted on either wood or wire wheels, at the option of the purchaser, tire sizes are the same—namely, 36 x 4½, both front and rear; demountable rims are standard equipment. Both the front and the rear of the chassis are supported on semi-elliptic springs. Spring shackles are provided with grease cups and every effort has been made to reduce to the minimum the possibility of unwelcome rattles and squeaks.

In the body designs, care has been taken to obtain consistency of lines and to eliminate corners and crevices and "gable end" projections. To the "Cruiser" model, the new two-passenger car of unusual perspective, an even more unusual appearance is lent by the addition of a plate over the rear compartment bearing the name of the car and of the model. The lines of the "Cruiser" are quite in keeping with its nautical designation; they are rather long, without sharp angles, and the "midship cockpit" is distinctly suggestive of the cruising power boat.

The other machines in the Pathfinder line include a standard five-passenger touring car, an "armored" roadster, a four-passenger phaeton and a delivery wagon of 1,500 pounds rated capacity. In all the pleasure car models—the delivery wagon is built on the pleasure car chassis—the upholstery is hand buffed leather over curled hair and measures 10 inches in thickness.

PATHFINDER "MARTHA WASHINGTON COACH" WHICH ACCOMMODATES THREE

Nickeling Solutions to be Avoided.

One of the showiest and most profitable of the many catch-pennies sold by street fakers used to be a solution of mercury and acid, which possesses the property of producing a bright finish, resembling nickel, on brass or copper, merely by applying the fluid with a rag. Unfortunately, the mercury, which forms the bright film, evaporates in a few hours. The effects of the acid, however, are likely to remain, and in some instances real damage can be done through corrosion.

The fleeting character of the "plating" produced in this way has become so well known that the stuff is hard to sell in the street, but there are indications that the "plating solution industry" has been quickened somewhat by the opportunities to sell the stuff to people who find the plating wearing off the bright parts of their cars or who desire to make the cars appear up to date by "nickeling" the brass trimmings. Polishes warranted to act like lightning and which are made of strong acids that actually eat away the metal are also in the category of things which should be given the widest kind of berth, out of consideration for the nickel plating. There are plenty of really good polishes on the market, and there are also plating compounds that really plate There is no difficulty in obtaining the former, and the latter, though limited in their usefulness, are satisfactory enough as far as they go.

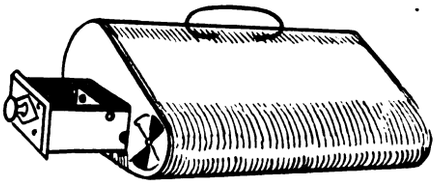
PROFITS THAT COME WITH THE WINDS OF WINTER

Although Few Dealers Make the Most of Them, Automobile Heaters Offer a Fertile Field for Endeavor and Provide a Source of Revenue—Devices That Are Available and Their Methods of Operation

While it is self-evident that a warm car is very much more comfortable than a cold car during the winter months, there are few dealers who avail themselves of the opportunities offered by the several available devices which afford such comfort. Properly displayed and properly exploited, there is not the slightest doubt but that the sale of heaters could be made to realize not an inconsiderable revenue.

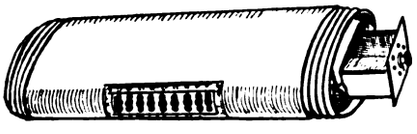
As for the cars as they come from the factory, in only one instance is provision made for heating the car. The exception is the Oldsmobile Defender, in which advantage is taken of the heated air which comes from the radiator and from under the motor hood. The Oldsmobile heater comprises a series of openings in the base of the dash which are provided with shutters so



OLDSMOBILE FOOT WARMER

that they can be closed when heat is not desired. A baffle plate is employed so that grease cannot be thrown through the heater holes from the revolving parts of the motor.

Advantage also is taken of the heated air from the engine in the Reynolds heater, which is designed for attachment to any car simply by cutting a hole in the footboard for the reception of the casing. As shown in the accompanying illustration, it consists simply of a grating which is fitted into the footboard so that the air which is drawn in through the passages in the radiator and which of necessity becomes heated to a degree which is dependent upon the efficiency of the radiator, is admitted to the body. Baffle plates are provided to prevent oil and grease thrown by the revolving parts of the motor from passing through the grating and soiling the interior of the car, and adjustable shutters also are provided by means of which the amount of heated air admitted to the compartment may be varied or shut off entirely, if need be. Heaters of this type, however, can only be placed on the footboard, and therefore are only applicable for heating the forward compartment of the car.

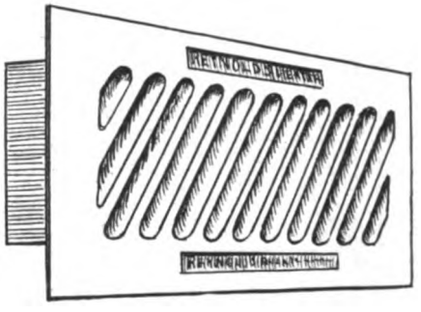


Probably the simplest method of render-

LEHMAN COAL HEATER

ing the tonneau comfortable, and one which involves no change in the mechanism or the body of the car is offered by the use of the familiar coal burning coach heater. As ordinarily constructed, this device consists of a small sheet iron casing which is provided with a drawer. The interior of the casing is lined with asbestos or with other suitable fireproof material; ventilating holes are provided at either end for the escape of the heat, and in some cases holes also are provided in the top or on one side for the same purpose. The fuel consists of a specially prepared brickette, which is ignited by placing it in a brisk fire until it glows, and which then is placed in the drawer, where it slowly burns and throws off considerable heat.

Of this type of heater, probably none is better known than the Clark heater, product of the Chicago Flexible Shaft Co., Chicago, Ill., and which is shown in one of the illustrations. The device is made of heavy



CLARK FOOT WARMER

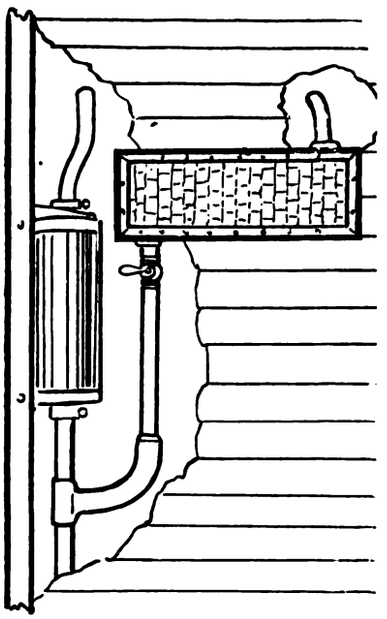
sheet metal and all of the exposed parts are heavily nickel plated; the body of the device is covered with either plush or Brussels carpet, as the case may be. By way of regulating the amount of heat which is radiated by the device, adjustable shutters are provided to cover or partially cover the ventilator holes.

The fuel which is provided is specially prepared, so that while combustion actually takes place the chemicals which are mixed with the carbon or coal in the brickette account for the gas which naturally is emitted during the course of combustion and also help to raise the temperature and render the combustion slower and deliberate. One brickette, it is claimed, will burn 12 to 16 hours.

As made by Lehman Bros., of New York City, the coal burning heater has much the same characteristics. As with the Clark device, the fuel is contained in a drawer and the heat emitted escapes through adjustable ventilators provided in the end pieces and sides. Several different styles are manufactured and different finishes provided to meet varying requirements.

While heaters of this type are eminently satisfactory considered from the standpoint

REYNOLD'S FOOT-BOARD HEATER

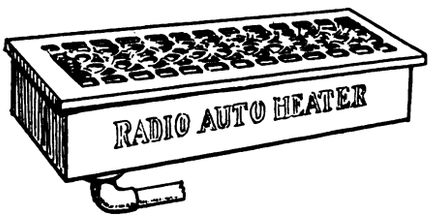


of their ability to make the car comfortable, they have two drawbacks in the shape of the expense for fuel, which, however, does not amount to a great deal, and the necessity for the use of a fire for ignition of the fuel, which spells both time and trouble.

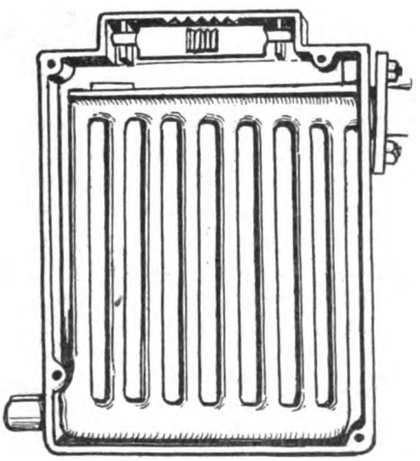
The fact that the better part of the heat units which are available from the gasolene which is used to operate the motor is represented as a waste through the engine cooling jackets and the exhaust, naturally suggests that the heat which is dispersed through these be used to render winter riding comfortable, and indeed in not a few of the heaters on the market, the heat of the exhaust is used directly.

On first thought, the possibility of using the heated water which comes from the cylinder jackets would suggest itself as a good medium for carrying the heat to the car, but the fact that this would necessitate further complication of a system which is a vital part of the operating mechanism, militates against the practice.

Digitized by Google

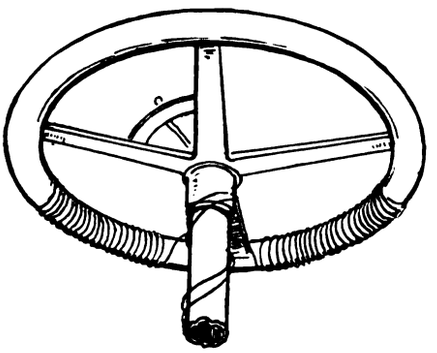


Probably the type of heater which is in most general use is the one wherein the heat of the exhaust gases is used, the gases or part of the gases being intercepted before they reach the muffler and caused to pass through a radiator positioned in the body. The heater made by the Motor and Manufacturing Works Co., of Dunkirk, N. Y., is of this type. The radiator itself is made of cast iron in the shape of a coil, so that surface sufficient to radiate ample heat is obtained. The device is positioned in the floor boards of the car and is covered with a grating. Connection is made to the exhaust pipe by means of a three-way valve, which clamps to the pipe, and a length of flexible metallic pipe which leads to the radiator and makes pipe fitting unnecessary. By closing a shutter which is operated by means of a milled sector, not only is the heat prevented from emerging through the radiator at times when it is not required, but the cut-off valve is operated so that the exhaust passes through the muffler in the ordinary way. Flexible metallic piping also figures in the equipment which accompanies the Al-Ton Heater, which is made in Philadelphia by the Atlas Ball Co. The exhaust gases are similarly used.



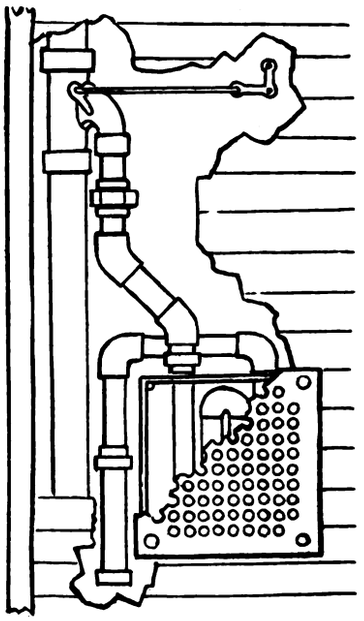
GARRISON HOT-AIR ATTACHMENT

Similar practice is exhibited in the manufacture of the American heater, which is produced by the American Auto-Heater Co., of Buffalo, N. Y. The perforated plate and all of the fittings are made of aluminum by way of reducing the weight to a minimum. The heating coil is attached to the exhaust pipe through the intermediary of a "T" fitting, which is provided with a shut-off valve so that the radiator can be rendered inoperative, and regulation pipe fittings, the make-up being accomplished by means of a union. The gases which pass through the radiator are muffled by means of a smaller muffler, by way of preventing noise.



The Radio heater consists of a cast iron pot enclosed in a steel casing, and covered with the orthodox perforted plate. Attachment to the exhaust pipe is by means of special fittings which are supplied with the device and which include a valve for regulation. The device is made by the Milwaukee Auto Specialty Co., Milwaukee, Wis. The Garrison Gasolene Specialties Co., Philadelphia, Pa., also produces a heater of much the same character. A special three-way valve and special slip joint fittings which are supplied with the device reduce the labor involved in the attachment of the heater to a minimum.

RADIO EXHAUST HEATER



AUTO HEATER COILS

WARM HAND WHEEL

While either of these types of heaters is applicable for use with either the open or closed types of bodies, where the former is used the heat is practically ineffective in keeping the driver's hands at a point near the normal temperature. Not many devices are on the market which provide means for preventing cold fingers, however; probably the best known is the Warm Hand wheel made by the Warm Hand Steering Wheel Co., of New York City. The device is simple in the extreme. It embraces the use of a wheel, the two lower sections of which are provided with special resistance coils so that attachment of the leads to the ordinary storage battery results in the heating of the coils, and consequently the production of a warm wheel rim. So high is the resistance that but little current is used even when the device is operated for long periods. A switch provides the means for rendering the device inoperative when the car is not in operation or when heat is not needed.

AMERICAN COIL HEATER

The electric heater for warming the body of the car also is in course of development at the hands of the American Electrical Heater Co., Detroit, Mich., but as yet the device has not been placed on the market. Naturally a device of this type will offer many advantages because of the ease with which it can be attached and detached.

When all is said and done, with the heating devices which are now on the market, and a windshield to protect one from the cold blasts which are prevalent, driving during the winter months even in an open car can be made fairly comfortable, while the advantages offered by the closed types of bodies make winter driving in the cold weather as pleasant as during the summer months.

PRACTICAL SYSTEM FOR THE SMALL REPAIR SHOP

What Systematic Operation Means to the Average Shop—Card System That is Simple and Covers Every Detail of Work on Automobiles—Methods That Eliminate Argument—Keeping Tabs on Men, Material and Time

In the operation of a very small repair shop, where the proprietor is also foreman, chief mechanic, treasurer, executive head and half the entire force, anything like an elaborate system for keeping tabs on men, material and the progress of the work is unnecessary. It is easy for the "boss" to keep his eye on the entire "force," and with the aid of a single book or a memorandum hook to keep his records of the day's work, receipts, expenditures and so on—records which it is profitable to keep even if the shop force consists of only "the boss and the boy," for no man's memory is as a written notation, especially in the opinion of a disputing customer who has his own peculiar way of remembering things.

Wherein "Keeping Tabs" Is Helpful.

If, however, the business grows until the force totals six, eight or ten men, or whenever it becomes necessary to employ a foreman, the shop is moved to more commodious quarters and it takes all his time to look after the "white collar" part of the work without doing any mechanical labor, the proprietor must, in nine cases out of ten, either adopt some sort of a system or lose money. The fact that the shop may make money does not indicate that a system is unnnecessary, for the chances are greatly in favor of increased profits if the proper steps are taken to avoid waste, not only of material but of time. Under the general head of material properly may come not only the stock used for repair work, but also tools and supplies of all kinds; and time may be taken as including not only the time spent in actual repair work, but also time spent in hunting for lost tools, making new ones, figuring up methods of doing jobs that have been done before but no one remembers just how—and so on. All men are not square dealers, either in time or in the use of the proprietor's property, and a check is required so that those who do not show the proper spirit may be remonstrated with more or less gently, as the exigencies of the cases may demand.

System That Promotes Patronage.

There is still another good reason for the adoption of a system in a small shop. While the customer himself is not always made to feel it, he is in reality the dominant factor in the business. The customer's money and the customer's goodwill are the things that make the business possible. Obviously the more customers the greater the profit; and if local patrons will bring their work always to the same shop—in other words, become steady customers—they can be relied upon to supply an income that can be roughly calculated at a given glance, which may be increased by the coming of new patrons. It does not require mathematical formulas to demonstrate that this way of doing business is far better and more conducive to the peace of mind and the prosperity of the proprietor than dependence upon a continuous influx of newcomers who, perhaps, are not expected to come again the next time there is a job to be done.

Of course, the whole thing focuses at the old, familiar point—the hackneyed statement that "a pleased customer comes again" covers it. What is likely to please a customer? Reasonable prices, work that can be depended upon, reasonably quick service and generally fair treatment and courtesy. In the matter of prices, it is clear that the bill rendered to the customer represents the cost of doing the work plus the repairman's profit. If the repairman knows exactly what the work cost him in time, material and overhead expense, he can add a decent profit and know that he is making a reasonable amount of money on the transaction and that the customer is getting the worth of his money. If it is possible only to guess at the actual cost of doing the work the profit added must be sufficient to cover possible errors in the guess; otherwise the repairman takes the risk of going into bankruptcy.

repairman can keep tabs on his financial condition and find out at any time how he is situated; and he can figure very closely on profits, if necessary, without getting on the wrong side of the books, to attract and hold his customers; or he can add the saving to profits, if no fault has been found with his prices. There is nothing, however, that so appeals to a man as to have a job done promptly and well and then be charged a price a little less than he expected to pay, and a shop that can do these things is not likely to suffer for want of patronage.

Kind of Stock	Quantity

A new card must be made for each day's work and a new card for each new job. Same card must not be used for more than one day or more than one job number. Turn in stock cards at end of each day.

CARD THAT WILL KEEP TRACK OF MATERIAL USED

Three Card System for Small Shops.

A large shop where there are many men and things are done on a large scale demands a system that requires an amount of time and paraphernalia altogether out of question for a small establishment. With three sets of record cards, however, the little shop can get along very nicely, and the time spent in making the records often will be saved in looking up information and settling disputed points, altogether apart from the other advantages accruing from the systematic doing of things. To begin at the beginning—that is to say, when a car comes into the shop for repairs—a card, known as an Order Form, is made out by the proprietor or his deputy. The order forms are numbered consecutively, each car that comes in thus receiving its own "job number." The order form is dated and the time the car came in also is entered. The make and model of the car, its horsepower, factory number and license number and the owner's name and address are taken down. Then follows a blank space in which the details of the repair work required are inscribed, and following this is the trouble-saving formula, "I hereby authorize the execution of the above work," after which the person authorizing the work affixes his signature. In many places, the latter is not required, but it is a wise precaution and one that effectually prevents or settles disputes. The order form is made out in duplicate; one card goes with the car for the information of the men working on it and is returned to the office when the job is finished; the other, the original carrying the signature of the person authorizing the work, goes to the office file. When the work has been completed the date and time are placed on the original, and the record is completed when the date and time of delivery of the car and date of payment are added.

With this card filled and filed, there never can be an unanswerable question as to "Who told you to do that?" or "How long ago was So-and-So's car in the shop for a new clutch leather?" or "I told you to put in a set of new exhaust valve springs; why didn't you do it?" Both owner and repairman are protected, for by turning up the card the whole story is brought to light and responsibility fixed.

Time Checking to Reduce Loafing.

An important part of any system of records is the method of recording the time of the men. This involves not only "time-keeping" for payroll purposes, which is a simple enough matter, but also the apportionment of each man's time to the various parts of the jobs on which he may be engaged, which is not quite so easy of accomplishment. In a large shop a time-keeper is employed to make regular rounds and take from each man a record of what he has been doing, and this is entered in a suitable book. In a small shop, however, it is obvious that this method hardly is practicable, and the only way seems to be to have each man do his own time-keeping, entering up his time on the cards just before quitting-time at noon and at night. In fact, this system has been used to a very considerable extent in large shops, with fairly satisfactory results, although it has been almost entirely superseded by the method already referred to. It has been said, and it doubtless is quite true, that in an extensive establishment it is impossible to get the men to keep anything like accurate records; but the conditions in a small shop are very different, and if a man is given to understand what is expected of him when he is engaged, there is no reason why he should experience any trouble in keeping the cards properly—more especially as he is not expected to do this in his own time, but is allowed time during working hours.

Time Card System in Detail.

The time-card that is here reproduced is easily handled by any man. When a man is put to work on a car he notes the job number on the order card attached to the machine and puts the same number on his time-card; also the date and his own name and his tool-check number. Under the heading, "Work done," he puts down the things he has done and the hours between which the work was accomplished. For instance, "Grinding exhaust valves, 7.30 to 9 A. M. Taking up connecting-rod bearings, 9 to 5.30 P. M.," and so on. If there are unusual conditions which tend to lengthen abnormally the time required for a given job, they should be mentioned under the heading "Remarks." Each morning a new card is started, and each time a man goes

SMITH'S REPAIR SHOP
TIME CARD

CARD THAT ACCOUNTS FOR WORKMEN'S TIME

Digitized by Google

from one car to another a new card is started; the same card never is used for more than one day or for more than one job number. At the end of each day's work the cards are turned into the office.

It goes without saying that this system of keeping time is not perfect; nor is any other. The perfect time-keeping system has yet to be devised. But it is reasonably accurate for small-shop purposes. It gives the proprietor the data he needs for figuring the time-cost on each job, and if the work has been spun out to what appears to be an unwarranted extent the man on the job can be called up and made to explain the items that appear out of the way. Of course, it is possible to "loaf" somewhat and get away with it; but, on the other hand, the fact that a man's record, made by himself, is always under the eye of the "boss" and that he is liable to be "jacked up" for anything not reasonably explainable acts as a strong deterrent. Moreover, comparisons are very easily made between the different men on similar jobs and between jobs done by one man at different times.

Records Better Than Recollections.

All this is extremely useful, for in time a man's cards form an index of his ability and his tendency to deal fairly or otherwise with his employer, and the card file can be made to furnish valuable information as to the time required for a given job, and so on. Again, Mr. Jones brings in his car for an overhauling and is told he can have it in about four days. "I can't wait that long," protests Jones; "you did the job for me in a day and a half last year." Up comes the card record, and it proves to Mr. Jones that his car was in the shop three days and a half; the "boss" has allowed an extra half day in his estimate because of the increasing age of the machine.

The third card is a stock card and, like the other two, bears blank spaces for the date, the job number and the name and number of the workman who makes it out; and it must bear but one date and one job number. The workman fills in what material he wants and the list or the single item, as the case may be, is initialed by the foreman or proprietor, who takes the opportunity, if necessary, to find out why six feet of high-tension cable is needed for a single two-foot lead, or why a foot of three-eighths tool steel should be issued to make a three-inch pin. The stock cards, turned in with the time cards at the end of the day, form a record of all the material issued during the day.

Stopping the Stealing of Stock.

There is no question as to the usefulness of a means of keeping tabs on stock. Only those who have been intimately connected with shop work are aware of the extent to which the misuse of material can be carried —and the term misuse covers not only waste, but the pilfering that is so common, if there is no trail to follow when suppplies seem to melt away with discouraging swiftness. Of course, there are many men who will not help themselves when something they particularly want is right under their hands and there is no check on its use; but unfortunately the other kind are sufficiently numerous to make a checking system valuable, if only as a means of reducing depredations to the minimum. The warning of an old hand to a new one, "Don't ever let the boss catch you swipin' anything; he's tighter'n hell!" perhaps is not all that could be desired from a lofty moral standpoint; but it certainly helps to keep down the bills for supplies of new stuff for the stock-room.

Turning In the Cards of a Day.

At the end of each working day each man has turned into the office time cards, showing in detail how he has spent the day—what jobs he has worked on, how much time on each job and what portion of the time on various portions of the work. Also each man has turned in stock cards showing what, if any, material he has used, and what he has used it for. If any jobs have been completed, the fact is indicated by the turning in of the order form, dated. The day's cards form a very complete record of time, material and completed jobs, and the progress of all work, and if any of the work is lagging it is quickly made evident, so that the proper remedy can be applied.

Collecting Data From the Records.

From the cards the time of the men is transferred to the time-book from which the pay-roll is made up; the stock used is entered up in a stock record kept for the purpose of checking, as nearly as possible, the consumption of material with purchases and to act as a reminder when anything runs low; and completed jobs are properly booked. Up to the time of completion of a job all the cards bearing the job number are kept together. When the last card comes in marked "job completed" all the cards are taken and the time and material costs totaled up, and the basis for the bill thus is obtained. After this the cards are transferred from the active file to the dead file, where they are available for reference, a small card index serving as a guide. A few cases of trouble over work done, facts that cannot be remembered or are remembered differently by different people, disputes over authority to do work or other incidents of the kind that are, unfortunately, sure to crop up more or less in such a business, are sufficient to prove the practical every-day value of such a record and filing system.

How the System Can Be Extended.

It is obvious that there is a good deal of elasticity in the system described. That is to say, it can be varied or amplified very considerably. If the shop is large enough to warrant the employment of a bookkeeper a daily report of the condition of the work could be made with little trouble, so that the proprietor could tell at a glance how things were moving without the trouble of looking up the records; and a weekly or monthly summary should be added. These and other possibilities of the system will suggest themselves as occasion arises. Even should the business grow to really large proportions—through the aid of the system, properly handled—amplifications made from time to time could be made to take care of increasing requirements without change in the forms or in the general method of using them. The stock record will keep pace with any increase if duplicate stock cards are made for the bookkeeper and the stock man. For a small shop, however, that is a little too big to be handled properly without a system, but does not warrant anything of an elaborate or expensive character, the method outlined is one that will be appreciated when its real usefulness has been demonstrated by actual service under working conditions.

Highwayman Steals Prospect List.

Highwaymen, it is generally supposed, care only for valuables; E. R. Greenlaw, a New Orleans salesman, however, claims to have found a robber in whose makeup there is a pronounced streak of meanness, for when the highwayman in question held up Greenlaw one night in the streets of that Southern city the robber not only took Greenlaw's money and jewelry but appropriated the salesman's prospect list. It was in a small notebook and contained the names of several hundred New Orleans people to whom Greenlaw expected to sell Regal cars. But for the fact that the Regal factory possessed a duplicate list, the robbery might have made a big hole in the salesman's business. As it was, it had the effect of delaying some of the sales several days.

Wherein Alcohol and Water Differ.

One of the peculiar properties of alcohol is that it mixes readily with water, the two liquids having a strong affinity for each other. On this account burning alcohol can be extinguished by the application of water, in which it differs from gasolene and oils, which, as is well known, float on the water and burn all the better for the extra spreading out.

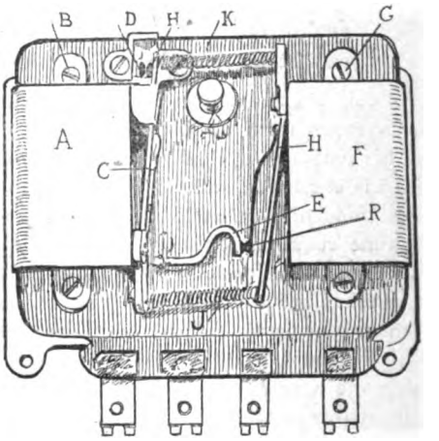
MAKING PLAIN THE ELECTRIC LIGHTING SYSTEM



Characteristics of Three Widely Differing Apparatus Explained in a Manner to Emphasize Their Real Simplicity—The Value of Periodic Inspections—What to do in Case of Trouble

(This is the eighth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by the dealer and owner alike.)

It is well established just where the dealer stands in his relation to the manufacturer and the consumer, but it is not quite so clearly understood that he represents the physical embodiment of service. There can be no gainsaying that a good dealer, a dealer who is good for the reason that he is equipped mentally and with material to render real service, is valuable alike to the motoring community and to the manufacturer. And in this connection the word service can be made to cover a multitude of things not necessarily sins.

WARD LEONARD DYNAMO SHOWING BRUSH HOLDERS AND ARMATURE

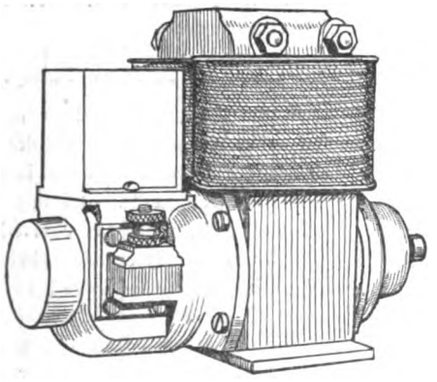
WARD LEONARD REGULATOR

Applying the Ounce of Prevention.

There is one branch of the service business—the service part of the business assuredly should be a well established department—which gradually is receiving greater attention. It is that branch which has to do with periodic inspections of mechanisms to make certain to the satisfaction of the dealer, the manufacturer and the owner, that component parts are fulfilling their functions in the proper manner. In other words, the value of the ounce of prevention gradually is being recognized in its true light in its application to the maintenance of automobiles.

There are few automobile factories which are not equipped with service stations where adjustments, mental and mechanical, can be made and repairs effected with despatch. Latterly, several prominent manufacturers have announced the policy of free inspection from time to time, secure in the knowledge that service of this kind reverts not only to the customer in added satisfaction but to themselves and to their dealers as well. If a likely trouble can be ascertained before it actually develops it can be prevented in nine cases out of ten. The effect on all concerned easily can be imagined. The policy is in a measure an application of the old proverb "Forewarned is forearmed."

Nor is this policy confined to manufacturers of automobiles. It is spreading gradually to manufacturers of accessories as well. Already several service stations maintained by ignition apparatus and carburetter manufacturers offer free inspection at periodic intervals, and, needless to add, the results of the practice have been universally good. Ignition apparatus, of course, always has been and in all probability always will be more or less of a mystery to the average individual. Sad to relate, for there is little real reason for the condition, the same can be said of electric lighting and engine starting systems, which fact lends emphasis to the necessity for service stations where this recent development in the automobile business can be intelligently handled.



Relative Ease of Obtaining Knowledge.

In the larger cities where electrical apparatus manufacturers maintain branch establishments or have representation the problem is no problem at all, for it is a simple matter, and an absolutely essential one, for manufacturers to educate their own representatives. But where the manufacturer has no representation other than that afforded by automobile dealers handling cars equipped with his products the problem is a real one. And in the majority of cases it can be solved only by the dealer educating himself. But that the education is fairly easy of acquisition has been made plain in the last seven issues of Motor World, in which the real simplicity of a number of electric lighting systems has been pointed out and their care and repair elucidated. Incidentally, the articles have served to emphasize the actual lack of complexity of such systems and the really small amount of care that is necessary. In many cases, care and repair mean nothing more than periodic and intelligent inspection. In the present article several other systems are treated in a manner to make plain just where to look for likely trouble and just what to do to prevent or to remedy it.

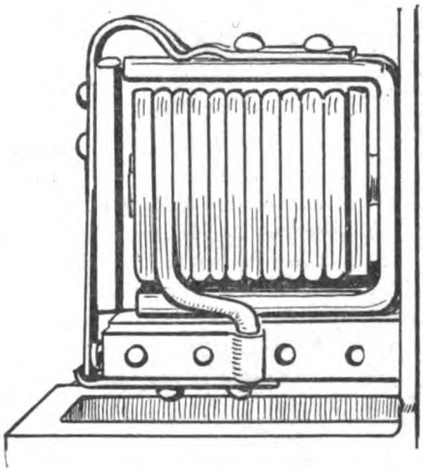
The first consideration in any such system is to keep the apparatus perfectly clean. Cleanliness may not be next to godliness in this connection, but it surely is next to efficient operation, for unless the parts are kept free from dust and dirt and grease they cannot be expected to perform their functions properly and without giving some sort of trouble. In the majority of cases, generators are tightly enclosed to exclude

Digitized by Google

foreign matter, but it is difficult to close all openings to the absolute exclusion of dust —and water—and therefore that which finds entrance should be carefully removed at stated intervals, a soft brush being the preferable means of removal. Of course, where the accumulations have become

FISHER U-TYPE GENERATOR

caked by reason of the presence of oil or grease other means of removal will be necessary and of them none is better than a piece of cheesecloth dampened, but not wet, with gasolene. The gasolene will cut the grease and remove the dirt and will evaporate rapidly, leaving nothing to impair the insulation. Care should be taken, however, not to use too much gasolene, for it is a solvent of rubber and must not be permitted to remain on rubber insulated wires, etc.



When Openings May not be Closed.

Generally, it is not permissible to apply the ounce of prevention by closing up all such openings which serve to admit dust. Sometimes they are put there for the purpose of providing a circulation of air within the machine in order to prevent undue temperature rise. When such is the case, they generally are partly closed by means of screens, in which case care should be taken to keep the screens clean.

As is the case with so many other systems, the generator in the Ward Leonard system, manufactured by the Ward Leonard Electric Co., of Bronxville, N. Y., is completely enclosed and is practically dust and waterproof. The dynamo is of the plain shunt wound type and the armature is of the drum wound type, with the core slightly skewed to increase efficiency and reduce noise in operation. The whole system consists of the dynamo, an automatic electric current regulating device, an automatic cut-out and a pair of storage batteries. The Ward Leonard system differs from others in that it employs two separate batteries instead of the usual one. The batteries are smaller than the ordinary ignition battery. A conveniently located switch permits either to be connected to the lighting or the ignition circuit. The reason for the use of the two batteries is made plain by the wiring plan, which provides for grounding the ignition circuit with an all wire circuit for the lighting system. By the use of two batteries, the danger of short circuits between the two systems is eliminated.

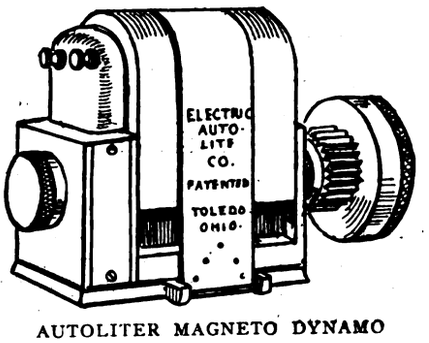
Care of the Brushes and Commutator.

Except for occasional inspection of the dynamo casing and the inside of the mechanism, which should be periodic, to clean away accumuations of dust and dirt and to make sure that wires and connections are unbroken or loosened, little other care will be necessary except that accorded the brushes and the commutator. These parts are the only parts which should ever require more than perfunctory attention. As

FISHER CUT-OUT

the machine is self-regulating, sparking should not occur and the brushes should wear for indefinite periods without replacement.

The brushes and the brush holding mechanism are shown in the accompanying illustration removed from the dynamo, the operation being simple and requiring nothing more than the removal of four small screws and the disconnection of the brush wires. The brushes should be taken out of the holders at regular intervals, say every 1,000 miles, and thoroughly cleaned with gasolene. When they are replaced care should be taken to see that they are put back the same way they were taken out, for after a certain amount of wear they will have acquired a smoothness and a finish which is highy desirable. In making the connections be certain that the brush wires are replaced properly, for it they are reversed the dynamo will not generate. Incidentally, to cause the dynamo to generate when the armature is rotated in the opposite direction merely requires that the brush leads be reversed.



When in the best of condition the commutator will exhibit a brownish, glazed appearance and should not be touched. If it is scratched or cut, however, the brushes should be examined to make sure that they are long enough to press properly against the commutator, and if they are not they should be replaced at once, or taken out if no new ones are at hand. Slight scratches may be removed by applying very fine sandpaper to the commutator with the machine running, care being taken first to remove the brushes. Access to the commutator and the brushes is through a removable cover held in place by means of a thumb nut.

Current regulation in the Ward Leonard system is obtained with the aid of a combined electro-mechanical device contained in a tight housing mounted on the dash of the car. The device itself is shown herewith with the cover removed in order to make plain its structure and operation. In it are combined the automatic cut-out and the regulator. Normally, the circuit between the battery and the dynamo is open and is not closed until a car speed of approximately 10 miles an hour is attained, when sufficient current is generated to charge the storage battery.

Operation of Cut-Out and Regulator.

Immediately the current generated by the dynamo exceeds that of the battery the coil A in the accompanying picture of the cut-out and regulator becomes magnetized sufficiently to attract the arm C, thereby closing the contacts D and H and establishing the connection between the dynamo and the battery. When the engine is stopped, the action of the spring K serves to separate the contacts and the circuit is broken. The action is entirely automatic.

The regulator mechanism is at the right and is different in action from anything else of its kind. The regulator consists of a series coil (F) and armature (H) which mounts a contact (R) and a fixed contact (E). The series coil is set for a predeter-

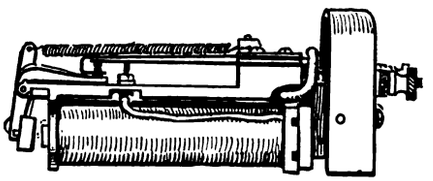
AUTOLITER MAGNETO DYNAMO

mined amperage, usually 10, so arranged that when 10 amperes is reached the magnetism of the coil is sufficient to attract the armature (H), which separates the contacts (E and R), thereby inserting a single step of resistance in the field. When the output

Digitized by Google

drops to 9.9 amperes the series coil is shunted by the decrease in magnetism in the series coil which permits the contacts to come together under the action of the spring (J). Consequently, the armature of the regulator is constantly vibrating, its period of vibration corresponding to the speed at which the car is driven, which governs, in turn, the output of the generator. The speed at which the armature vibrates, however, is so great as to have no effect which can be detected in any fluctuation in the brightness of the lamps.

Care of the Contacts that is Needed.



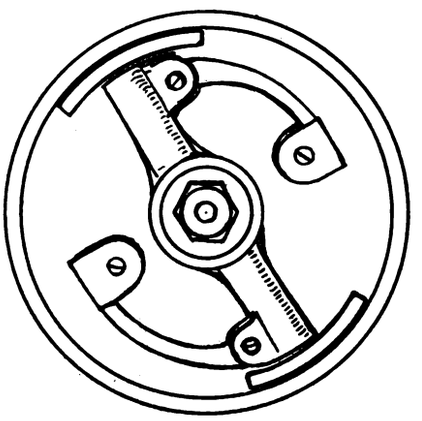
In caring for the regulating and circuit breaking mechanism, the contacts seldom, if ever, will require to be touched, though it can do no harm to inspect the mechanism from time to time to make sure that it is perfecty clean and that it is operating properly. Unless the devices give unmistakeable evidence of some sort of derangement they had best be let severely alone, particularly as regards their adjustment. If the contacts show signs of burning or corrosion, they may be cleaned with a very fine flat file or two pieces of fine emery cloth glued to opposite sides of a piece of thin Bristol board. In lubricating the dynamo, not more than two or three drops of fine machine oil should be placed in the oil holes at the ends of the armature shaft about every two or three weeks—not oftener unless the car is driven continuously.

In the Fisher lighting system, manufactured by the Fisher Electrical Works of Detroit, Mich., the generator is conspicuous for the absence of any regulating devices whatsoever. It is so constructed that it operates at crankshaft speed and the field "builds up" very rapidly until the normal output of about six amperes at 950 revolutions a minute is reached, after which the field "builds up" so slowly as to cause no material increase in current production up to speeds of 2,000 revolutions a minute. The whole system is embraced in the generator, the automatic cut-out and a storage battery.

Duties of "Pig Tails" Made Plain.

The automatic cut-out is contained in a small housing mounted over the brushes and commutator and consists of single electromagnet; it is shown by the accompanying drawing. When the current generated by the dynamo is sufficient to charge the battery the magnetism of the coil is sufficient to attract its armature, thereby closing the circuit. When the engine is stopped, the armature returns to its normal position under the action of a spring and the circuit is opened.

The removal of the cut-out housing, possible by taking out two screws which hold it in place, reveals the commutator and the brushes which should be inspected at regular intervals and cleaned of accumulations of dust or oil. The brushes are fitted with what in electrical engineer's parlance are styled "pig tails," or short wires soldered or otherwise fastened to them to make certain the collection of current. Consequently there is less necessity for taking out the brushes and cleaning them than there is in machines in which no "pig tails" are used. The cut-out is rugged in construction and,



AUTOLITER CIRCUIT BREAKER

as the contact points are platinum-iridium, they should wear for indefinite periods without attention.

What to do When the Current Fails.

In the event of failure to generate, the cut-out first should be inspected to make sure that contact is made when the armature is speeded up. If the contact points come together, but without making the circuit, it is altogether likely that they are slightly corroded, in which case they should be cleaned with a small, flat file. The brushes are the only other parts which are

AUTOLITER GOVERNOR PULLEY

at all likely to give trouble, and these will not give trouble if they are inspected from time to time, their connections gone over and accumulations of grease or oil removed with a cloth dampened with gasolene. No attempt should be made to adjust the brush spring tension, for it is set at the factory for the proper pressure and should not be disturbed. If the brushes apparently do not press tightly enough against the commutator, it is time to replace them with new ones.

For regulation in the Autoliter generator, manufactured by the Electric Auto-Lite Co. of Toledo, O., sole dependence is placed upon a mechanical clutching device which maintains the speed of the armature practically constant, regardless of engine speed fluctuations. The dynamo itself is of the magneto type in which the field is formed of permanent magnets. The armature is of the drum-wound type. The whole mechanism is enclosed and the speed governing the circuit breaking devices are self-contained within the dynamo.

Governing with a Friction Pulley.

By way of obtaining constant armature speed above a predetermined crankshaft speed, a centrifugal governor pulley is employed; it is mounted at the driving end of the armature shaft, which is carried in high duty ball bearings. It consists, briefly, of an outer casing which is keyed to the driving sprocket, silent chain drive being employed wherever practicable, and a pair of arms mounting shoes which bear against the inner rim of the circular housing, the arrangement being shown by the accompanying sketch. These arms are keyed to the armature shaft. When a predetermined armature speed is reached, the action of centrifugal force on the two weights shown in the picture causes the shoes to be lifted away from the contact with the driving rim and the speed of the armature drops until the pull of the centrifugal force decreases sufficiently to permit them to come into contact with the rim again. They are held in their normal position against the rim by a spring.

Access to the governor pulley is had by removing a small brass plate over its end, the plate being held in place by means of a circular wire which fits into a slot. Contrary to expectations, no lubrication whatsoever should be used in the pulley, for, as is pointed out by the manufacturer, the presence of oil is likely to cause undue slippage and therefore reduce the output of the dynamo. Incidentally, it may cause gumming, in which case the parts will stick, so increasing the output as to endanger the battery. The only lubricant permissible under any circumstances is a very little dry flake graphite, though this even should be omitted unless the governor shows a tendency to "hold on" too long, and thus permit the charging rate to be abnormally high.

Removing Circuit Breaker Mechanism.

The cut-out is an electro-magnetic device and is contained within the arch of the magnets. It is held in place by means of two small screws, which, if removed, permit the whole mechanism to be withdrawn. Before it is taken out, however, it will be necessary to remove the brushes. These may be taken out by taking off the two side plates and lifting the tension springs which hold them against the commutator. The

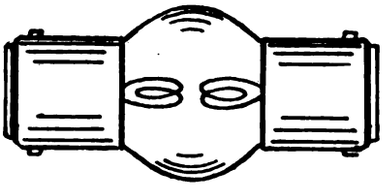
Digitized by Google

cut-out is of the orthodox magnetic type and is shunted across the brushes, the construction and operation of the mechanism being shown by the accompanying drawing. Directly the strength of the generated current is sufficient to charge the storage battery, the circuit is closed, to be opened again automatically when the engine is stopped.

Care Due the Contact Breaker.

Inasmuch as the contact breaker in a magneto makes and breaks the circuit many hundreds of times every minute and, despite this comparatively rigorous work, seldom gives trouble or requires attention, it may be appreciated that the contacts in any automatic circuit breaker scarcely are likely to give trouble, for they operate only when the engine is stopped or started. Incidentally, as they almost invariably are set to operate at or near the charging rate of the battery, they therefore operate under a minimum difference of potential and current and are not liable to damage through sparking. Dirt or oil, especially if the oil is not perfectly free from acid, will cause the contacts to corrode and therefore to offer resistance to the flow of the current. Needless to add, all dirt and oil should be carefully removed.

Causes of Lessened Output.



If with the Auto-Liter the current strength becomes gradually weaker, the trouble must be with either the governor pulley or the brushes. Poor commutation, resulting from dirty or worn brushes or a dirty commutator, will result in decreased output; the remedies for these troubles readily are apparent. If the governor pulley slips excessively at low rotative speeds the current output also will be lower than it should be. Slippage may be arrested by in- find trouble is in the circuit breaker, which return the governor arms. If the current stops altogether the most likely place to find trouble is in the circuit breaker, which may be stuck. Occasionally a light blow with a small tool on the top of the magnets will release the mechanism, though it is always the better part of wisdom in such cases to remove the device and make sure exactly what causes the trouble.

Loose Wires as a Source of Trouble.

Loose wires, of course, are a prolific source of trouble, though despite comparative frequency of the trouble and the ease with which it originates and can be remedied it seldom is given the attention it warrants. There are almost any number of cases on record where a factory expert has been called to remedy "serious trouble" which when traced down has been found to be nothing more than a broken wire or a loose connection. No automobile is absolutely free from vibration, and as long as vibration exists loose connections will continue to cause more or less trouble. The condition, however, suggests the remedy—and it is a remedy that is as readily and easily applied as it is discoverable by systematic and, above all, periodic inspection.

Double-Filament Bulb for Emergencies.

Although the electric light bulbs such as are used in head, side and tail lamps are durable and can be expected to last in service for protracted periods, they nevertheless have a disconcerting propensity for "burning out" at unsuspected moments when their lease of life is about up; there is no way of telling just when an incandescent bulb will fail after it has been in service for some time; no two of them will last exactly the same length of time, though all of them have a comparatively long life. It was for the purpose of obviating the inconvenience of police interference in the event of a non-illuminating tail lamp and to provide a spare emergency

AVERY TWIN-FILAMENT LAMP

bulb that cannot be left at home inadvertently that the Avery Portable Lighting Co. of Milwaukee, Wis., developed the double filament lamp shown by the accompanying illustration.

The bulb was developed primarily for use in the Electrobola lamps manufactured under patents by the Avery company, though its construction is standard and it may be used in any lamp fitted with an Ediswan or "bayonet" socket. In its simplest aspect, the bulb is an ordinary one, except that it has two filaments and two bases; each filament is connected to its respective base. Hence, if one filament burns out on the road it is merely necessary to reverse the bulb and use the other filament. The bulb represents advanced practice over the older though little known type of bulb in which two filaments connected in multiple are used for the reason that both filaments then are incandescent at the same time and the one which remains after one has been burned out may have but very little longer life than the other.

Inoperative Fan for Winter Work.

When the weather becomes so cold that the full heat-dissipating capacity of the cooling system reduces the temperature of the jacket water too much and the engine is kept too cool for the most efficient running, it is better to remove the belt and run without the fan, if this can be done, than to partly cover up the radiator. In the first place, the wear and tear on the fan bearings and the belt are avoided for the time, and in the second place, the appearance of the car is not marred.

Rubber Mallet to Prevent Marring.

It sometimes becomes imperative to hammer or tap a part which has a polished surface, and unless precautions are taken the operation results in a surface which is more or less unsightly. On such an occasion a rubber mallet which can be purchased at a supply store should be used. Lacking the instrument, or the means of obtaining it, a pad can be made from several layers of old rubber, which will prove effective in preventing marring.

Improvement of Hand Drill Possible.

The anti-friction qualities of a hand drill, brace or any tool in which considerable end thrust is brought on a revolving spindle often can be improved very considerably by inserting a steel ball between the end of the spindle and the old bearing surface. Sometimes this is done when the tool is made, and in some cases where it has not been done there is not room for a ball; but where a ball can be used it is a great help.

Grease Facilitates Screw Removal.

Machine screws that are put into hot places, as well as those used where there is dampness, are apt to rust and present difficulties in the way of removal after having been in position for some time. The use of a little graphite grease, or graphite and oil, rubbed on the threads, will make it easy to remove such screws even years after they were put in, so far as any tendency to rust and "stick" is concerned.

Soldering to Remedy Cracked Handles.

If cracked, a hammer handle or any other tool handle made of wood, may be "fished" by binding it with brass or copper wire put on very tightly and wound smoothly and evenly, and then tinned over with very soft solder, which requires but little heat to melt it. The soldering must be done quickly to avoid overheating the wood. A well made repair of this kind is good for years, under ordinary conditions.

Improvised Rivets from Escutcheon Pins.

Very satisfactory rivets for small work can be made from brass escutcheon pins with round heads, the points being cut off as much as may be necessary to obtain the desired length. Escutcheon pins can be obtained at any hardware store.

In the RETAIL WORLD

J. W. Feeter is building a two-story garage on the Milton turnpike, Highland, N. Y.

Biggers Bros., horse liverymen in Birmingham, Ala., have given up that trade and will enter the automobile business.

S. H. and L. H. Tolhurst, of Los Angeles, Cal., are inviting bids for the erection of a one-story brick garage, 60 x 155 feet; it will stand on Figueroa street, south of 7th.

Mahion Morey of Newark, N. J., has secured permission to erect a garage at 12-14 West Jersey street; its cost will be $5,905. Morey is also part owner of the Morey-Larue Laundry Co.

Ernest P. Chesbro of Willimantic, Conn., has purchased Frederick M. Little's interests in the Independent Repair Shop; Chesbro will continue the business with Louis Wilson as manager.

Arthur Ballantyne and R. F. McKinnon, the latter the owner of a blacksmith shop in San Diego, Cal., are to enter the garage trade; their shop, 38 x 80 feet, will adjoin McKinnon's "smithy."

New Automobile Co. has opened up in Jacksonville, Fla., at 919-21 Main street; a garage will be operated and Case cars sold. Judge H. B. Philips is president and N. B. Downey sales manager.

The Southern Garage, in Bakersfield, Cal., has bought out the Central Auto Co., on 13th street; the Central stock and business will be removed to the Southern headquarters, on Chester avenue.

William B. and Fred Waters have purchased the newly established garage business of Morgan V. Disbrow in Red Bank, N. J. They also conduct the Red Bank Garage on West Front street.

The Kansas City Automobile Supply Co., now located at 1504 Grand avenue, in that city, has accepted plans for the construction of a four-story fireproof building on McGee street, near 18th; the cost will be $40,000.

Jackson Motor Car Co. is the style under which a new business has opened up in Nashville, Tenn., at 526 Broad street; H. C. Gillespie is general manager. As the name indicates, the company will handle the Jackson line.

New quarters are being erected by the Tioga Automobile Co., of Philadelphia, Pa., at Broad and Tioga streets; there will be 10,000 square feet of floor space. The company handles National, Hupmobile and Nyberg cars.

The Great Western Auto Sales Co., a new incorporation, has opened up in Indianapolis, Ind., at 425 North Meridian street, where it will sell Great Western cars. C. E. Williams, assisted by his brother, J. E., will manage the business.

Simpson, Swain & Simpson, garage operators in Gridley, Cal., have purchased the City Garage, located at Virginia and Magnolia streets, of J. F. Shaeffer & Son; the new owners will continue their acquisition and also their former garage.

Thomas Roberts, formerly general manager of the United Motor Philadelphia (Pa.) Co., has formed a partnership with Charles N. Reeves under the style Roberts & Reeves; they will handle the Marion car. The firm has located at 1335 Race street.

James Whitney, of Elmira, N. Y., formerly a member of the firm Bishop & Whitney, has formed a partnership with his brother, Albert Whitney of Canaseraga, in the same state, where they will open a garage on Dewitt street; they will handle Ford cars.

Gildel Auto Co. is the style of a new agency in New York City, the name being formed from those of Gilman and Videl, the organizers; the company has located at 1930 Broadway and handles Kline cars exclusively. Gilman is president and Videl sales manager.

The Milwaukee branch of the Studebaker Corporation has been taken over by the Wollaeger Sales Co. The latter part of this month the company will remove from the Studebaker headquarters in the Stroh building to 417-21 Wells street. John G. Wollaeger is proprietor.

The recently incorporated Guarantee Motor Car Co., of San Antonio, Tex., has taken possession of a new garage and salesrooms at 104 East Travis street; Krit and Cole cars are stocked. The officers are: President, J. P. Hagan; vice-president, H. J. Smith; secretary and treasurer, C. W. Voss.

Harry Bransetetter, formerly manager of the Chicago Kissel branch, has branched out for himself; he will erect a commercial car garage and salesrooms on 28th street between Wabash and Michigan avenues, 65 x 150 feet. One or two truck agencies will be secured.

Under the style Imperial Garage & Repair Co. a new business has been established in Hartford, Conn., at 120 Allyn street; L. R. Spencer, T. S. Painter and Howard D. Graves are the men concerned. Graves is Henderson distributer.

M. V. Doud, formerly eastern sales manager for the Locomobile company, has formed the D & H Distributing Co. in Bridgeport, Conn. Kline cars will be stocked. Doud is treasurer and general manager; the other officers are: John Heapley, president; G. H. Crauford, vice-president.

The Cumberland Motor Co., 138-40 3d avenue, North, Nashville, Tenn., purposes building a new home for itself at Broad street and 15th avenue; it will cost $20,000; the site cost $10,000. The company handles Abbott-Detroit, Little and Empire cars. The building will be ready for occupancy February 1 next.

The Petty-Calhoun Co., of Macon, Ga., has dissolved. R. L. Knight and C. L. Calhoun have purchased the interests of Petty, the third partner, and have merged the business with that of the Macon Auto Co. at 519 Poplar street. The Petty-Calhoun Garage, on 3d street, has been discontinued. The Macon Auto Co. now consists of Calhoun, Knight, M. N. Crisswell, J. D. Stubbs and F. T. Abel.

T. A. Probey, who heretofore has handled the Michigan "40" car in Washington, D. C., in connection with the Probey Carriage Co., has formed a separate company to exploit that automobile; the new corporation is styled Michigan Motor Co. and has as officers: President and treasurer, T. O. Probey; secretary, G. R. Stuart; sales manager, F. C. Sibbald. Quarters have been secured at 1230 Wisconsin avenue.

The Williamson Garage Co.'s building at 88-90 Albany street, New Brunswick, N. J., has been purchased by the newly organized Middlesex County Garage and Sales Co. The latter will remodel the structure and maintain a garage; the directors of the new company are: Ralph P. Beardsley, of Highland Park, who will be manager; Jas. Mershon, George L. Burton, Charles A. Oliver, Frederick Gowen and Joseph H. Lee.

TINKERING BEGINS ON NEW YORK AUTOMOBILE LAW

"Flat Rate" Now Proposed to Meet Unceasing Cry for More Money —Other Provisions for Protection of Public.

Tinkering with New York's automobile law—a popular annual pastime—already has commenced, although the legislature has not yet convened and, as usual, the tinkers have rediscovered not only that the public requires more protection but that the State itself needs, or desires, more "automobile money." Assemblyman Callan, the young man who fathered the existing law, is known to be keen for the establishment of a State constabulary to assist in enforcing it, but apart therefrom a number of proposed amendments have been drawn up and are now under consideration for introduction at the next session of the Legislature.

By far the most important of the proposed amendments, and the one which may be expected to be felt most keenly by the owner, is one by which it is hoped to substitute for the existing fixed tax a new measure levying a flat rate of so much per horsepower. Connecticut and several other States already have such a law in force, the Connecticut law providing for a flat fee of 50 cents per one horsepower. The far-reaching effect of the law is best made plain by the increase in revenue which it causes. For instance, if a similar law were put in force in New York State, where cars of less than 25 horsepower are assessed $5, the assessment would amount to $12.50; similarly, 40 and 50 horsepower cars would be assessed $20 and $25, respectively, instead of the $15 fee for both which now is collected. According to statistics, it has been computed that more than 40 per cent. of the cars licensed in New York State are of less than 25 horsepower, and it is estimated that under a law similar to the Connecticut law at least a quarter of the registration fees would be just doubled.

Following is the list of proposed amendments, which, with others, will be taken up for consideration and action by the New York State Automobile Association at its annual meeting in Utica, N. Y., on December 11 and 12:

Requiring all operators of cars to be licensed.

Providing a flat horsepower registration fee instead of the present graduated tax.

Prohibiting the enactment of local speed ordinances.

Prohibiting the use of manufacturers' and dealers' "M-plates" except in demonstrating cars or in removing a car from place to place for the purposes of sale. Manufacturers' plates in duplicate to have separate marks of distinction.

Exempting from tax only cars owned and controlled by State and municipal authorities and used exclusively for official business.

Permitting non-residents registered in other States to operate cars in New York State for an unlimited period.

Legislation to abate the smoke nuisance and unnecessary noise.

Requiring number plates to be kept reasonably clean and prohibiting the loaning, renting or changing of number plates from one car to another.

Requiring public garages, as well as manufacturers and dealers, to keep a record of every automobile which enters or leaves a garage.

Making the operation of a car by an intoxicated person, or in a careless or reckless manner, a criminal offense, punishable upon conviction by imprisonment.

Giving to the State power to suspend or revoke an operator's permit for cause after a hearing.

Giving State automobile inspectors the power of constables, except the service of a process.

Mulford "Makes" Middletown Meet.

Ralph Mulford "made" the race meet which was run at Middletown, N. Y., on Saturday last, November 9th, under the auspices of D. Sheldon. He took each of the three competitive events, and in his Mason car turned the fastest mile in the time trials. His victories comprised a five-mile race for cars with displacements of under 601 inches, a three-mile free-for-all handicap, and what was to have been an Australian pursuit, but which developed into a five-mile time trial when Mulford's single contender — Stork (Thomas) — had motor trouble and dropped out after the third lap. The summary:

One mile, time trials—Mulford (Mason), time, 1:19⅕; Stork (Thomas), time, 1:21⅕; Randall (Buick), time 1:37.

Five miles, for cars with displacements of under 601 inches—Won by Mulford (Mason); second, Randall (Buick); third, Stork (Thomas). Time, 8:28⅕.

Three miles, free-for-all handicap—Won by Mulford (Mason), scratch; second, Stork (Thomas), out 4th lap.

Five miles, Australian pursuit—Won by Mulford (Mason). Time, 6:45. Stork (Thomas) out fourth lap.

One mile, to establish a local track record—Mulford (Mason). Time, 1:16.

One-half mile, time trial—Mulford (Mason). Time, 0:36⅘.

GRENNON WINS "LARGER" EVENTS AT NORFOLK MEET

Driving a Mercer, he Accounts for Two of Three Competitive Events —Cook and Menenghetti also in Evidence.

Far and away the most interesting of the four numbers which formed the program offered by the E. W. Powell troupe of racing drivers on the Lafayette half-mile track at Norfolk, Va., Friday last, 8th inst., was the 10-mile free-for-all, in which Joe Grennon, who drove a Mercer, led home the other contenders—Henri Hickman (Mercedes) and Louis Menenghetti (Fiat). Grennon's time for the distance was 13:21½. Grennon also accounted for the three-mile free-for-all, in which he was opposed by George Cook (Pope) and Hickman in the Mercedes, his time being 4:10. The five-mile event for cars with displacements of under 601 inches went to George Cook (Pope), who covered the distance in 7:01. A single mile time trial driven by Louis Menenghetti in the Fiat in 1:18⅘ completed the program. The summary:

Five miles, for cars with displacements of under 601 inches—Won by George Cook (Pope); second, Henri Hickman (Mercedes); third, H. Kyle (Fiat). Time, 7:01.

Three miles, free-for-all—Won by Joe Grennon (Mercer); second, George Cook (Pope); third, Henri Hickman (Mercedes). Time, 4:10.

One mile, time trial—Louis Menenghetti (Mercedes). Time, 1:18⅘.

Ten miles, free-for-all—Won by Joe Grennon (Mercer); second, Henri Hickman (Mercedes); third, Louis Menenghetti (Fiat). Time, 13:21½.

Decision of Minnesota Referee Upheld.

The decision of H. J. Clark, who, as referee of the Minnesota State Automobile Association's tour to Winnipeg, which was held August 8 to 15, disqualified the Studebaker car driven by H. W. Soules for having "taken a short cut" at Foxhome, Minn., has been sustained by the contest board of the A. A. A. Clarence Munzer, who drove the Hupmobile in the roadster division and whose score was tied with that of the Studebaker driver, has been awarded the Minneapolis News trophy for making the best score in the roadster class.

Charles W. Barnes was elected president of the Kansas State Automobile Association at the annual confention and election of officers at Topeka. D. E. Watkins of Kansas City was elected secretary.

1,017,939. Unloading Device for Motors. Robert B. Williamson, Milwaukee, Wis., assignor to Allis-Chalmers Company, a Corporation of New Jersey. Filed Apr. 30, 1909. Serial No. 493,120.

1. In combination, a motor, a pump driven thereby, means controlling the supply of power to the said motor, unloading means for the pump, and a mechanical connection between said power-controlling means and said unloading means whereby the operation of the former to admit power to the motor operates the latter to unload the pump.

1,017,948. Switch for Ignition Systems. George H. Boynton, Dalton, Mass., assignor to Pittsfield Spark Coil Company, Dalton, Mass., a Corporation. Filed July 13, 1908. Serial No. 443,265.

1. In a switch of the class described, in combination, a base-piece, a switch-lever pivoted thereto, contact-points engaged by the switch-lever, two sets of conducting bars, means for insulating the sets of conducting bars from each other, a plug, the insertion of which closes one set of conducting bars and opens the other set, and upon the withdrawal of which allows the first set to open and allows the second set of conducting bars to close, and connecting means between the plug, switch-lever and the conducting bars.

1,017,953. Recoil Neutralizer. Alonzo C. Buttman and Franklin P. Gable, Grandview, Iowa. Filed Oct. 5 ,1911. Serial No. 652,969.

1. In a recoil neutralizer, the combination with a cylinder connected with one member, a piston therein, a piston rod connected with the piston and extending through the cylinder head and connected with another member, and a spring connecting said members and whose recoil is to be neutralized; of an inlet valve opening inwardly into the cylinder at one side of the piston, an outlet valve opening outwardly from the cylinder at the other side of the piston, relief valves of smaller capacity than said inlet and outlet valves and located adjacent thereto, that near the inlet valve opening outward from the cylinder and that near the outlet valve opening inward toward the same, and independent means for permitting the adjustment of said relief valves.

1,017,954. Transmission Gearing. Horace M. Cake, Washington, D. C. Filed Oct. 12, 1909. Serial No. 522,248.

1. In a transmission gearing in combination, a driving shaft, a transmission head carried on said driving shaft, compensating gears on said transmission head, a face plate carrying a beveled gear thereon, a tubular shaft, a casing integral with said tubular shaft, a cylindrical shaft, a beveled gear carried upon said cylindrical shaft, transmission shafts, gear means for connecting said cylindrical shaft with one of the transmission shafts and gear means for connecting said tubular shaft with the other transmission shaft.

1,017,956. Tire Setting Tool. James F. Carter, Wadley, Ala. Filed July 6, 1911. Serial No. 637,179.

A tool of the class described consisting of a body portion formed of metal constituting a handle, one end of the body portion being bent at right angles and thence forwardly and thence inwardly to form an offset hook ,a staple secured to the body portion adjacent the hook and projecting from the body portion in a direction opposite the hook, and a hook movably connected at one end with said staple.

1,017,961. Anti-Skidding Device. Horace Arthur Fisk, Clinton, Mich.; Jegerson C. Fisk, administrator of said Horace Arthur Fisk, deceased. Filed Oct. 27, 1910. Serial No. 589,346.

1. In an anti-skidding device comprising a continuous band, a plurality of links arranged substantially in the center of the band and having their bottom portions curved, bolt openings formed near the ends of each link, said links being provided with central flanges having serrations formed in their top edges, plates secured to the band and arranged at the side of each link in oblique relation thereto, said plates having upwardly extending flanges formed integral therewith, bolts having forked ends pivotally connected to the upwardly extending flanges, the remaining portion of said bolts passing through the registered openings in the ends of the links.

1,017,973. Wheel for Road Vehicles. Edgar Charles Horner, Clapham Park, London, England. Filed Oct. 27, 1911. Serial No. 657,131.

1. In a wheel for road vehicles; the combination with a hub, an inner tire-retaining flange fixed to said hub, a flat outer ring extending inwardly of said inner tire-retaining flange, a plurality of radially projecting pins fixed to the inner periphery of said outer ring; of a removable outer tire-retaining flange, an inner flat ring extending inwardly from said outer tire-retaining flange and having a plurality of slots extending for a distance from the inner edge of said inner ring only in a direction parallel with the axis of the wheel, said slots being so arranged as to be engaged by said inwardly projecting pins on said outer ring when the inner ring is moved in an axial direction within the outer ring, means for insuring the correct position of the said pins and slots when placing said inner ring within said outer ring, and means for locking said pins in said slots to secure said inner ring to said outer ring.

1,017,980. Elastic Tire. Joseph Lazarus, Boston, Mass. Filed Dec. 12, 1910. Serial No. 596,770.

1. The combination with a wheel, of an elastic tire having two resilient sides connected to each other by chains forming an annular trough-like structure in which the periphery of said wheel is located.

1,018,006. Resilient Tire. Marshall C. Rogers, Williams, Cal. Filed Aug. 29, 1910. Serial No. 579,507.

1. In a vehicle tire, the combination of a flexible, circular continuous casing, having clencher shoulders and clencher rings adapted to engage the same, a felly upon which said clencher rings are supported, a plurality of sectional key-blocks having cups formed thereon, said key blocks having screws passing through the felly whereby the casing is expanded and retained in the clencher rings, and means interposed between the interior surface of the casing and the key blocks whereby the casing is resiliently supported, said means including a non-inflatable filler and a cushion support therefor, said filler having a centrally disposed web on its interior, and said support being inclosed by a key block cup and having a channeled portion to receive said web edgewise.

1,018,027. Resilient Tire for Wheels of Motor Vehicles, etc. Henry M. Bagdigan, Worcester, Mass. Filed Sept. 29, 1911. Serial No. 651,975.

1. A metallic spring tire of the character described; comprising an oppositely flanged circular rim adapted for fitting upon the periphery of the wheel, a series of yieldable resilient sections forming the circumferential exterior thereon, each section composed of a seat member or resistance-plate, a pair of connecting bolts secured in the end of said plates and respectively sliding through holes in the flanges of said rim, coil-springs arranged on said rods for sustaining the resistance plate, an arched bow-spring beneath the edges of the adjacent plate members, a radially yieldable outer shoe inclosing the said parts, a crescent-shaped elastic cushion between the resistance seat plate and shoe, and means securing the outer shoe and plate together and affording yielding action thereof.

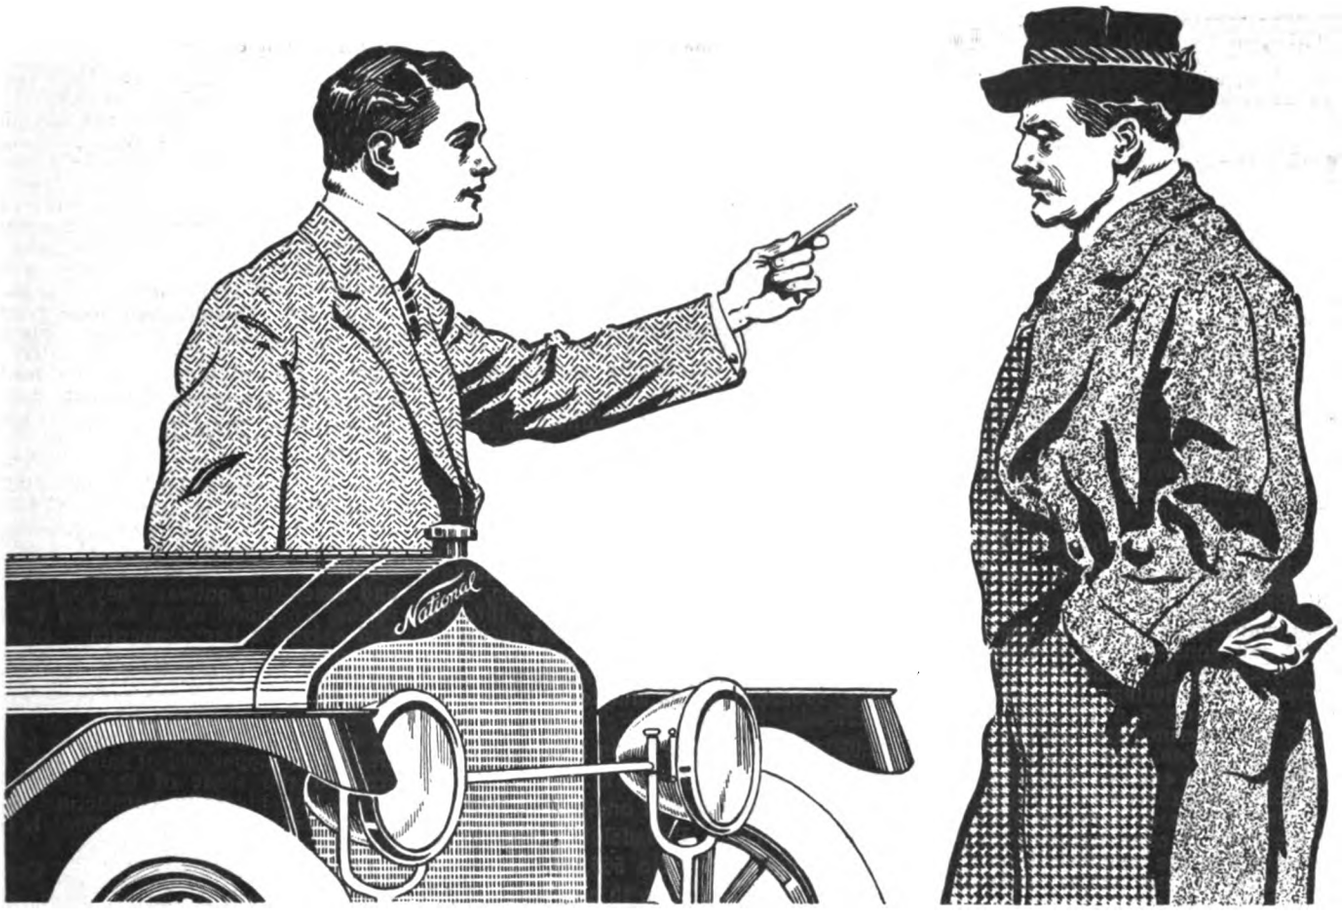
1,018,030. Vehicle Lamp. Charles L. Betts, New York, N. Y., assignor to R. E. Dietz Company, New York, N. Y. Filed Nov. 11, 1910. Serial No. 591,799.

1. The combination with an oil pot having an attaching ring secured thereto and provided with outwardly-projecting attaching lugs, of a lamp body having a flanged attaching collar provided with openings for the passage of said lugs, a spring catch secured to said collar, projecting into the same and engaging one end of one of said lugs, and a stop in said collar engaging the opposite end of said lug, substantially as set forth.

1,018,044. Muffler. John T. Gilmer, Florala, Ala. Filed June 26, 1911. Serial. No. 635,495.

1. A muffler comprising a pair of tubular members adapted to be secured to the exhaust pipe of an engine, and a series of nozzles extending toward each other from the opposed surfaces of said tubular members.

1,018,049. Resilient Tire. Melancthon Hanford and Daniel Lee Taylor, Malden, Mass.; said Hanford assignor to said Taylor. Filed Aug. 16, 1910. Serial No. 577,428.



In a wheel, the combination with a wheel rim, of an annular base piece encircling the rim and having concaved sides, a plurality of load supporting arches, each having its sides curved to fit the curved sides of the base piece, a wear envelop encircling and inclosing the arches, bolts passing through the base piece and the edges of the envelop for securing the latter in position, said bolts each having a male and a female section having screw threaded engagement with each other within the base piece, clamping rings extending around the base piece and having convex sides to fit the concave shape of the load-supporting arches, bolts extending through the base piece, arches and rings and clamping the parts in position, and means associated with the last mentioned bolts and co-operating with the wheel rim to prevent creeping of the tire.

1,018,052. Motor Vehicle. Charles Limon Hemenway and Frank William Updegrag, Covelo, Cal. Filed May 24, 1910. Serial No. 563,230.

In a device of the class described .an axle; a tubular member mounted for rotation upon the axle; a movable axle end; a

You Can Look a Man in the Eye When You Sell the

National

If We Can Prove This, Are You Interested?

We say that the National is superior to any other car in actual worth that sells for the same price—we go further and say that we give you as much service and quality as any $5000 car.

We say that money can not buy better materials than used in the National—that the National has the most flexible motor—the most perfect oiling system—the greatest degree of luxurious upholstery and comfort—and we say that the National is a money-making car for dealers because of its merits and reputation. Don't you think you should at least investigate our claims?

You don't have to exaggerate

It is the path of least resistance to sell National cars because of their apparent and demonstrated qualities. Glance at these few features—can you beat them on any other cars, for the price?

Long stroke (4⅞ x 6) flexible and noiseless Motor with enclosed valves.
Left side drive.
Center control.
Gray & Davis Electric Starter.
Gray & Davis Dynamo Electric Lighting System.
Bosch double dual Magneto.
12-inch Turkish Upholstery.
Full heavy nickel Trimmings.
Multiple jet Carburetor.
Electric Horn.
Adequate baggage carrying Compartment concealed in body but easily accessible.
Powerful and reliable Brakes.
Tire Pump, integral part of the motor.
128-inch wheel base.
Adjustable ventilating and rain vision Wind Shield.
Hoffecker Speedometer.
Tire Carrier in rear.
Silk Mohair Top, Cover and Curtains.
Full floating Rear Axle.
Resilient Springs, ¾ elliptic in rear.
Large gasoline pressure-feed Tank in rear with Gauge.
Plain, continuous, enclosed Metal Guards.
The only perfect Oiling System.

wheel upon the axle end; a plane upon the inner end of the hub of the wheel, the plate being provided with openings; a plate upon the tubular member, provided with a peripheral flange; a brake engaging the flange; fingers upon the last named plate, the fingers being located between the tubular member and the flange, entering, removably, the openings in the first named plate; connections between the axle and the movable axle end, located between the plates; and means for rotating the tubular member.

1,018,085. Automobile Fender. Oscar A. Seppala, Chicago, Ill. Filed July 26, 1911. Serial No. 640,639.

1. The combination with an automobile, of a fender therefor comprising a casing, and a back portion and ground engaging portion containable within said casing, said portions including spring operated lazy tong levers for opening the fender.

1,018,093. Internal Combustion Engine. Oliver C. Blair, Cleveland, Ohio. Filed Jan. 14, 1910. Serial No. 538,097.

1. In an engine of the character described, a cylinder unit consisting of a cylindrical casing provided at the ends thereof with enlargements constituting flat bottomed chambers resting upon a foundation and supporting the intermediate cylinder body above such foundation, said chambers communicating with the ends of the cylindrical bore and combining therewith to form mixing chambers, and heads mounted upon the ends of the unit; in combination with pistons operating in the cylindrical bore of the unit and having stems extending through the heads thereof.

1,018,104. Gas Burner Attachment for Vehicle Lamps and the Like. John Ferguson, New York, N. Y. Filed Dec. 13, 1911. Serial No. 665,428.

1. A gas burner attachment for oil burning vehicle lamps and the like, comprising a spring clip consisting of separable spring jaws adapted to embrace between them the flame guard of an oil burner and a gas conduit secured to said clip and having an upright terminal portion, and a burner tip fitted to the mouth of said terminal portion.

1,018,118. Dumping Motor Vehicle. George W. Lally, Boston, Mass. Filed July 16, 1910. Serial No. 572,319.

1. A dumping motor vehicle, comprising a pivotally mounted load carrier, an elevating screw having threaded engagement with one end thereof, gearing for operating said screw, and a pivoted bracket support for said gearing and the lower end of said screw, said support having an upward projection to fit into a stocket in the lower end of the screw to provide a grit-shedding bearing.

1,018,119. Auto Garbage Truck. George W. Lally, Boston, Mass. Filed Feb. 28, 1911. Serial No. 611,456.

1. An apparatus of the kind described, comprising a vehicle framework having its rearward portion offset downwardly adjacent the rear axle, laterally offset portions fixed to the framework and extending rearwardly, and a receptacle body mounted on horizontal pivots and having support on laterally offset rearwardly extending portions.

1,018,126. Carburetter. William E. Nageborn, Detroit, Mich. Filed May 3, 1909. Serial No. 493,552.

1. In a carburetter, a reservoir, a chamber, a passage communicating with said reservoir and chamber, a valve in said chamber adapted to close one end of said passage and having a cavity formed therein, said chamber being provided with screw threads in its walls, a perforated screw-threaded plug engaging said threads, a rod extending from said plug into the cavity in the ball-valve, substantially as and for the purpose described.

1,018,137. Double or Twin Interrupter for Ignition Systems. James M. Smith, Philadelphia, Pa., assignor of one-half to Wilson D. Craig Wright, Philadelphia, Pa. Filed May 25, 1910. Serial No. 563,239.

1. The combination with a magneto generator of a twin interrupter device for controlling a magneto or normally closed circuit and a battery or normally open circuit, comprising a carrier-plate, a contact means for said magneto circuit supported upon said carrier-plate, a contact means for said battery circuit supported upon said carrier-plate, means for pivotally supporting upon said carrier-plate an interrupter member provided with two interrupter arms, one arm normally contacting with said magneto circuit contact means, the other arm normally disengaged from said battery circuit contact means, and means, connected so as to rotate with the armature of said magneto generator, for engaging said interrupter member to oscillate its interrupter arms to break the magneto or closed circuit and close the battery or open circuit in a single movement of said interrupter-member, substantially as and for the purposes set forth.

1,018,154. Apparatus for Controlling Lights on Automobiles. John L. Beck, Springfield, Mass. Filed Feb. 18, 1911. Serial No. 609,281.

1. In a lighting system for automobiles, the combination with a gas supply tank, a burner within a lamp of the automobile, a pipe leading from said tank to said burner, a valve located in said pipe and comprising a plug having a port of large capacity and a port of smaller capacity therethrough, and electrical means controllable from the seat of the automobile for moving said plug to bring either of said ports into communication with said pipe at will.

1,018,164. Carburetter. Francis A. Chapin, Indianapolis, and William Y. Chapin, Muncie, Ind., assignors to The Chapin Manufacturing Company, Indianapolis, Ind., a Corporation. Filed Jan. 7, 1911. Serial No. 601,414.

1. A carburetter including a carburetting chamber which is substantially U-shaped and has an air intake and a mixture outlet, an air intake valve, a throttle valve, a shaft on which each of said valves is mounted and extending outward beyond the carburetting chamber, arms secured to each of said valves, a bar connecting said arms, a fuel nozzle entering the lower part of the carburetting chamber, a valve extending through the top of the carburetting chamber between the air intake and mixture outlet and projecting down to the nozzle, an arm on the upper end of said valve, another arm on the shaft of the throttle valve, means for pivotally connecting said two last mentioned arms, and a throttle lever on the shaft of the throttle valve.

1,018,196. Automatic Switch. Carlton L. Kennedy, South Braintree, Mass., assignor to The Holtzer-Cabot Electric Company, Brookline, Mass., a Corporation of Massachusetts. Filed Dec. 13, 1909. Serial No. 532,803.

1. An automatic switch, having, in combination, a base, a fixed contact member and a movable rigid contact member mounted thereon, one of the contact members being provided with a sliding-contact surface adapted to engage the other contact member, the moving contact member having direct mechanical connection with the base so as to be actuated by the rotation thereof, and such connection having provision for movement of the movable contact member, by centrifugal action, both in a direction to secure sliding engagement between the sliding-contact surface and the co-operating contact member and in a direction to cause the movable contact member to slide beyond and disengage the fixed contact member.

All Tire Manufacturers will only guarantee their product when filled with air at the recommended pressure.

This Woman Is Not Carrying a Nice Lunch to Eat in the Country

No, it is a nice, heavy rock to block the wheels of the stalled car so her husband may take his foot from the brake long enough to get out and crank up again.

And this particular woman had to "hoof it" to the bottom of the hill in sticky mud before she found a stone large enough, then back up again.

Mad? Tired? Oh, no, she probably enjoyed it, though fearing all the while that hubby's foot might slip and let the machine back down over her.

There's one of the advantages of an Electric Self Cranker—it's always ready to start your engine no matter how often or where or why it stalls—just push on the button and you're off—no stones to lug, don't even leave your seat.

The heart of an Electric Cranking System is a Storage Battery—that's why 90 per cent of all makers have adopted

GLBA

Storage Batteries

Use the Class A GLBA with an Electric Lighting Generator
Use the Class B GLBA with an Electric Self-Starter

Studebaker

An announcement which demanded the largest single advertisement ever placed—5 pages in SATURDAY EVENING POST, November 16—a $20,000 advertisement read by 10,000,000 people.

The cars shown on the opposite page speak for themselves. Make your own study and comparisons.

Where will you find equal values?

From a selling point of view consider that behind these marvelous cars are the largest factories in the industry, a liberal and far sighted sales organization, and an advertising campaign which will lead the field. To both owner and dealer the Studebaker policy is one of thorough co-operation.

Complete List of Studebaker Cars

The cars here announced are **additions** to our line. We shall continue to manufacture the famous Studebaker (E-M-F) "30" and Studebaker (Flanders) "20," than which no better cars of their class were ever built.

"SIX"	Touring Car	$1550
	Roadster	$1550
	Limousine	$2500
"35"	Touring Car	$1290
	Sedan Type	$2050
	Coupe	$1850
"30"	Touring Car	$1190
"25"	Touring Car	$885
"20"	Roadster	$835
	Touring Car	$885
	Delivery Car	$800

All prices for cars fully equipped, f. o. b. Detroit.

The Six Passenger body on the "35" and "Six" is the important body design of the year. Four passengers, the average touring car load, are here made far more comfortable than in the ordinary five passenger car. Yet, if you choose, **six passengers** ride with ease in the new Studebaker cars. It gives an owner more than a moderate priced car ever did before.

The motor design with valves enclosed, and pump and magneto on cross shaft in front of the cylinders, gives easy access to every part of the motor. It embodies the most advanced engineering practice.

The three motors are all exceedingly quiet and with the long stroke crank shaft develop power considerably in excess of their rating.

Notice how complete is the equipment. The same care has been exercised in every detail of construction.

In their extraordinary value we are certain that the announcement of these cars will mark another mile-stone in the advance of the industry. Our year's production will be 50,000 cars, but the present demand is running proportionately far beyond that. Early buyers will be fortunate.

The name Studebaker is on these cars and explains, as no other name can, their remarkable value, and the confidence which every buyer may well place in them.

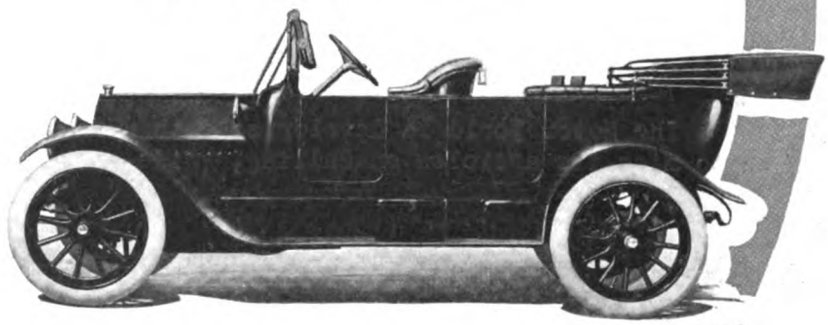
"The Great Announcement of the Year"

The $885
Studebaker "25"

Specifications

Five passenger, four cylinders, long stroke, 3½ inch bore x 5 inch stroke, 102 inch wheelbase.

30 x 3½ inch GOODRICH TIRES.
Stewart & Clark Speedometer.
Acetylene gas primer.
Studebaker Jiffy curtains.
Electric horn.
Prest-O-Lite tank.
Silk mohair top.
Full elliptic springs.
Rich upholstery, ample cushions.
Ventilating windshield.
Demountable rims.
Robe rail.
Tire holders.
Full set of tools.
Tire repair kit.
Tool box.
Extra rim.

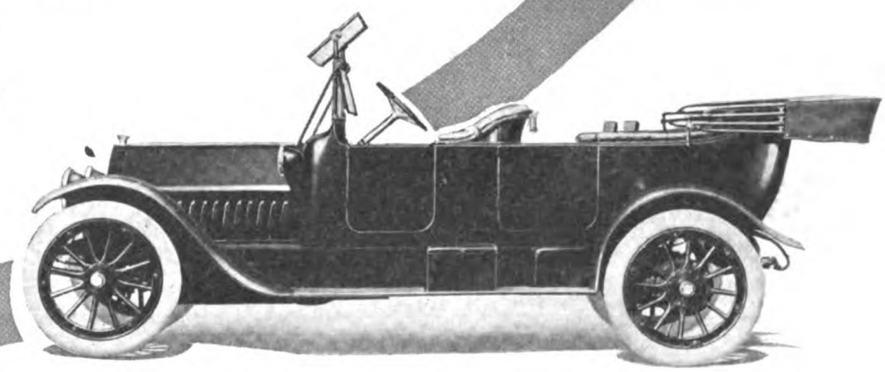


Specifications "35"

Four cylinders, 4⅛ inch bore x 5 inch stroke, 116 inch wheelbase.

Six-passenger body.
34 x 4 inch GOODRICH TIRES.
Luxurious upholstery.
Full floating rear axle.
Clear vision, ventilating windshield, rain-vision type.
Electric self-starter.
Electric lights.
Electric horn.
Deep cushions.
Silk mohair top.
Studebaker Jiffy curtains.
Detachable, demountable rims.
Stewart & Clark Speedometer.
Three-quarter elliptic springs.
Crowned fenders.
Extra rim.
Tire holders.
Full set of tools.
Wide tool box.

The $1290
Studebaker "35"



Specifications "SIX"

Six cylinders, 3½ inch bore x 5 inch stroke, 121 inch wheelbase.

Electric self-starter.
Electric lights.
Electric horn.
Full floating rear axle.
Clear vision ventilating windshield, rain vision type.
Six-passenger body.
Studebaker Jiffy curtains.
34 x 4 inch GOODRICH TIRES.
Detachable demountable rims.
Luxurious upholstery.
Three-quarter elliptic springs.
Deep cushions.
Crowned fenders.
Stewart & Clark Speedometer.
Silk mohair top.
Extra rim.
Tire holders.
Special tool box.
Full set of tools.

HYATT ROLLER BEARINGS

THE RESPONSIBILITY for the use of proper material in motor car construction rests with the engineer and his ability to determine its quality. This is especially true of those parts subject to excessive strain or wear.

In adopting the Hyatt Roller Bearing, uncertainty is eliminated by the standardization of all materials under the supervision of a competent metallurgist, who has at his command fully equipped physical and chemical laboratories.

Samples are systematically taken from each lot of incoming material and carefully tested before acceptance. A complete set of records is made for reference and study. All heat treating is under the same scientific supervision. Nothing is left to chance.

This care in determining proper standards, and their maintenance, when once established, together with a constant study of results, means not only protection to the car builder but continual improvement in quality.

HYATT ROLLER BEARING CO.

The *Rudge-Whitworth Wire Wheel* has been subjected to gruelling destruction tests and has been proved stronger and lighter than any artillery wheel ever used.

It was also found that the use of this wire wheel meant less tire wear, the absorption of shocks, and added beauty to the car. Adapted to any axle.

The Standard Roller Bearing Company, of Philadelphia, will manufacture RUDGE-WHITWORTH WIRE WHEELS under RUDGE-WHITWORTH patents and according to RUDGE-WHITWORTH standards. They will be equipped with the Houk Q. D. Rims for the American trade.

George W. Houk Co.

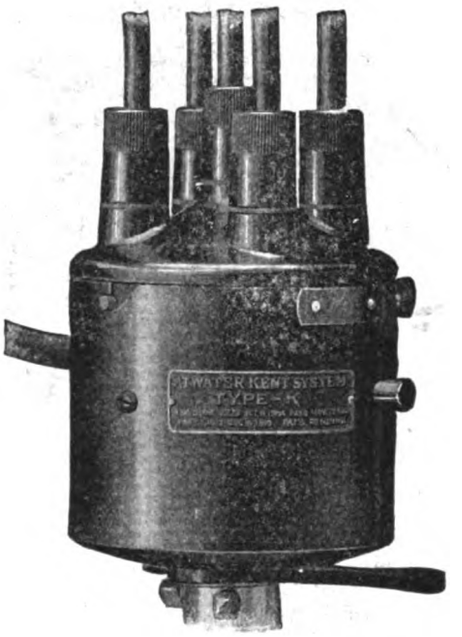
The Atwater Kent Ignition System

THE present demand for self-starting and lighting equipment has created a demand for an ignition system capable of producing a hot, dynamic spark independent of the engine speed.

This demand is being successfully met by the



Atwater Kent Ignition System

the starting button of which produces, not a few weak sparks, but a single heavy flame-like spark, thus insuring at all times the perfect ignition of any mixture that will burn.

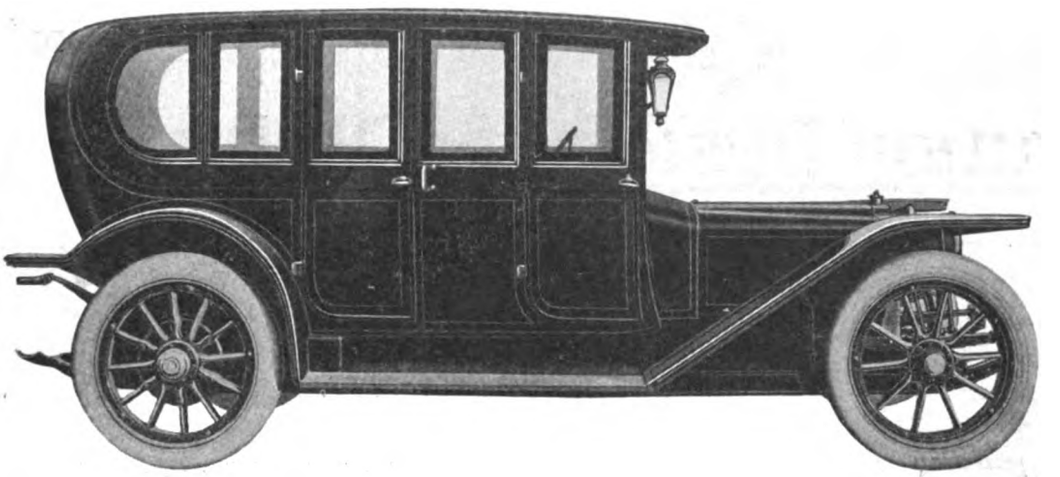
Other salient features of the Atwater Kent System are the extreme simplicity of mechanism, only three moving parts, one contact, one adjustment and one non-vibrating coil.

While the Atwater Kent System is high in value and reputation, it is not

high in price. In fact, it will cost less than half as much as a good magneto and will give superior results at a much less cost of upkeep.

We can now furnish two types of the Atwater Kent System for use on cars as sole ignition in place of the magneto, in conjunction with lighting and starting equipment.

***Type "F"* without Automatic Spark Control.**



***Type "K"* with Automatic Spark Control and insulated primary circuit.**

No matter what the requirements, the Atwater Kent System of Ignition affords ideal ignition.

Write today for detailed information and illustrated booklet "D."

The "American Traveler" Limousine

A Car Embodying True Colonial Design

THE "American Traveler" Limousine marks the ultimate in closed car designing. Possessing distinctive Colonial dignity and richness, a long sweeping wheel base and large wheels, it is surpassed by no town or country closed car. In fact, there is no other equippage like it; no other car in which is expressed so emphatically that indefinable tone of refinement.

AMERICAN UNDERSLUNG

This newest "American Underslung" type is electrically lighted and electrically started. There is complete control from the vestibuled driver's compartment. Carburetor adjustment is provided for on the dash.

The car's mechanical operation is from the center and the drive from the left.

For the "American Traveler" Limousine a selection of any finish or upholstering shade is permitted. The interior finishings are of the finest qualities of goat skin and taffeta.

The spacious coach compartment permits four to ride in utmost comfort. There are two unusually comfortable auxiliary seats. The car's complement of passengers is five besides the driver.

To the most minute details the "American Traveler" Limousine excels. There are two glazed electrical dome lights, an electrical enunciator registering on the dash, a speaking tube, electric cigar lighter, toilet case, card case and flower vase. There are Colonial pillar lamps on the vestibule.

The "American Traveler" Limousine — which is of 50-horse power—is priced at $6,000, complete.

We will make only a limited number of this type of "American Underslung" cars. It is imperative that you make a reservation immediately. You should see the nearest American dealer at once. A postcard will bring his address.

We also want you to have our fine new catalogue, prepared in colors by well known artists. It is descriptive of the entire "American Underslung" enclosed line.

"The Horn that's Made for the Discriminating"

TUTO HORN

THE TWO TONE HORN

Tuto Acts Instantly.

THE value of an electric warning signal lies in its ability to give instant response when the button is pressed.

¶ The TUTO horn button may be manipulated to give a low distinct sound, or with further pressure on the same button, a signal note of increased volume and penetrating power.

¶ There can be no confusion as to which signal to use, for the same button is employed and it is natural for the driver to go to the loud signal by increasing the pressure on the button when an emergency arises.

¶ There is no inertia of revolving parts or undue friction to overcome, and the TUTO mechanism springs into instant action at its full volume, whether it be the low or loud note, without any appreciable lag.

¶ This is why the TUTO horn clears the way easily and surely, without making an extremely loud or objectional noise.

¶ By acting instantly, the horn can be sounded at close range, the signal being directed only to those immediately in the path of the car and not disturbing everyone in the neighborhood.

¶ The actual service-giving qualities of the TUTO have caused its rapid adoption and a rapidly increasing demand for the horn.

¶ Where the bulb horn is abandoned, the TUTO horn is the only device which will do all your signalling in a positive and unobjectionable manner.

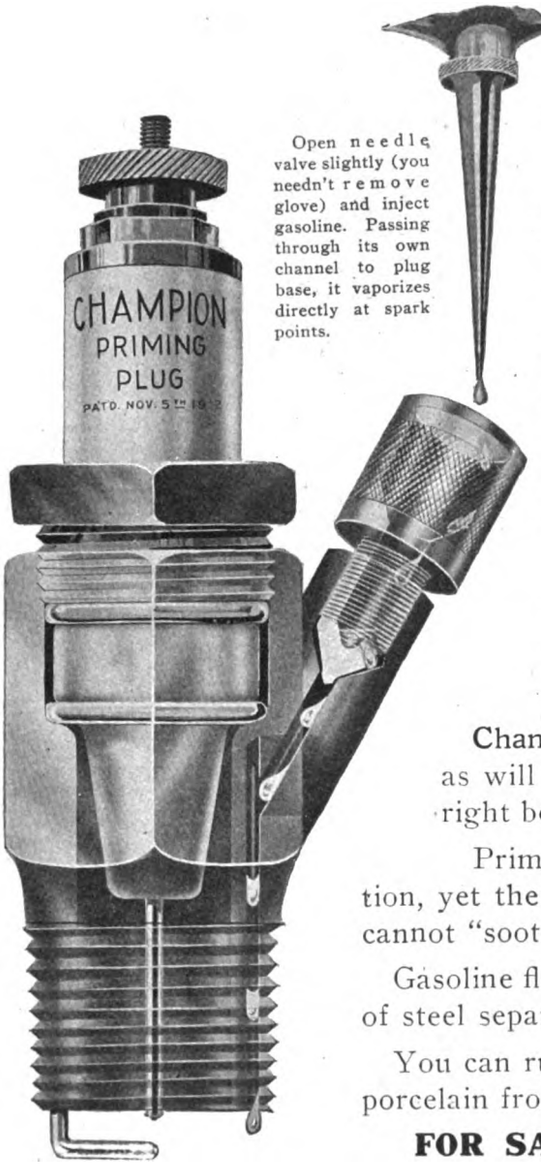
1913 Pullman 1913

Here is shown one of the best reasons that Pullman dealers are successful money makers—one of the best reasons why the Pullman agency is really a substantial, lasting, money-making business.

Pullman cars sell to motor wise purchasers because of their honest value and honest performance. They make good, consequently they make sales.

This illustration shows the six cylinder motor, built in our own plant—built with care and precision unsurpassed in any plant anywhere. This engine develops its rated horsepower at 1300 r. p. m. The magneto and pump are placed on opposite sides. The oil level adjustment is placed on top of the crank case so it is very easy to change the oil level. The timing gears run in oil rather than grease. The fly wheel fan works independent of the regular fan in front. All valves are enclosed. The valves are extremely large, 2⅛ inches in diameter. Electric motor starting device is included as regular equipment.



Perhaps your territory is not closed yet. If there is a chance for you to get this agency, you certainly want to avail yourself of it. At least get all the information you can about our proposition by writing today.

PULLMAN MOTOR CAR COMPANY, York, Pa.

Every Car Owner Needs This Prime-r

It Starts Any Motor on First Quarter Turn

Open needle valve slightly (you needn't remove glove) and inject gasoline. Passing through its own channel to plug base, it vaporizes directly at spark points.

Mr. Dealer, you know that there are thousands of cars which cannot be started in cold weather without priming.

Champion Priming Plugs are absolute winter necessities on cars without priming cocks, and they are often wanted badly on cars that have such devices.

Champion Priming Plugs — new this season — splendidly supplement our standard line, which already is regular equipment on 60 per cent. of the automobiles in America.

Champion Priming Plugs, devised to fill a special field, have no rival in point of efficiency or workmanship.

Priming is readily done—just turn needle valve back a few threads by hand; inject a few drops of gasoline and close again without removing your gloves.

Champion Priming Plugs are both sure and safe, because, as will be seen by the illustration, they create vaporization right beside the spark points.

Priming cocks cannot be placed in as advantageous a position, yet the gasoline is kept away from the porcelain so that it cannot "soot-up."

Gasoline flows down to the plug base in its own channel; a shell of steel separates it from the porcelain and the electrodes.

You can run with the needle valve open without danger to the porcelain from a hot exhaust blast.

FOR SALE EVERYWHERE AT $1.25 PER PLUG

Trial Set of Four Champion Priming Plugs, Fully Guaranteed, Prepaid to Any Car Owner for $5. Give Name of Car and Year of Make—Also Name of Your Dealer.

All jobbers and most dealers are already supplied. Write today. Liberal trade discount to dealers. Be ready to supply your trade in advance of our big advertising campaign in the great national weeklies.

SHELDON STEEL WHEEL

"Guaranteed to Outlast a Score of Cars"

Even if the SHELDON Steel Wheel were no stronger, lighter or more durable than the wooden wheel, the fact remains that the proposition would still be most attractive from a manufacturer's viewpoint.

The car manufacturer who uses this wheel as part of his equipment commands the situation entirely. He is not dependent for delivery of wood wheels before he can ship the chassis, and mighty few men in this line of business have not been more or less "up against" the wheel delivery proposition.

Sheldon Steel Wheels Are Ready and Deliveries Are Made on Dates Promised—This Without Fail

These wheels cost a trifle more than the wooden wheel but this will more than even up in the added prestige they will give to the car so equipped—a prestige that will command higher prices on the finished vehicle because the ultimate user is securing an imperishable, money-saving wheel for this increase in price—add to this the fact that SHELDON Steel Wheels give an engineer's finish to a vehicle—another characteristic greatly enhancing the value of the car.

Considering that the day of the wood wheel is about over, it is pretty clearly up to truck manufacturers to get at the basic facts back of the design and construction of steel wheels. These facts will be an added asset, available with every truck building organization that is keeping up with the refinements of the day.

Sell just one or two Warm Hand Wheels in your locality—they'll sell dozens more for you without effort on your part.

¶ With the refining of motor cars—as now demanded by a discriminating public that must be sold—naturally comes the question of heating the driver and the car.

¶ With this question comes the Warm Hand Wheel as the solution of the problem of keeping the person driving the car warm and comfortable, six months of the year.

¶ The Warm Hand Wheel is a device or steering wheel heated by the electricity supplied either by a storage battery or electric lighting or starting outfit. It can be put on any car with the greatest of ease and at the slight cost of $15 retail.

¶ On Ford cars this Warm Hand Wheel is operated by the magneto inbuilt in Ford fly wheels. It operates perfectly with this source of current without affecting in any way the magneto in the performance of the functions for which it is built.

¶ Really you can sell a raft of these Warm Hand Wheels in your territory right now. Remember they are necessary in most of the country for six months out of twelve—that is during both fall and spring as well as in the hard winter weather. Maybe your territory isn't closed yet. Write today and find out.

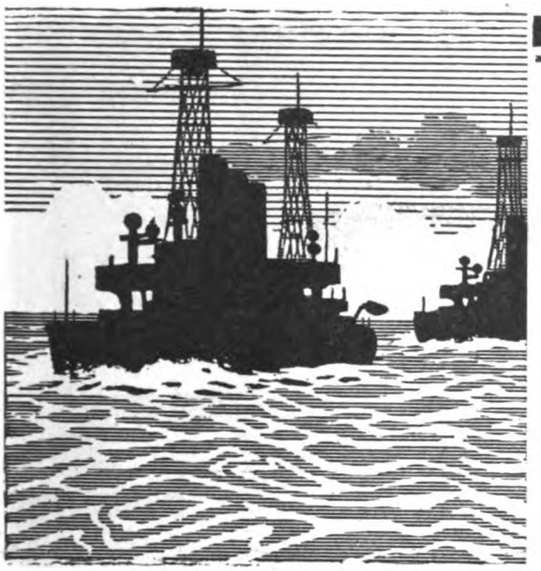
SPRINGFIELD
CONVERTIBLE BODIES

Springfield Convertible Bodies are the embodiment of refinement in the matter of lines, material, finish and ease of adjustment.

The runabout convertible body shown here illustrates one extreme of a line that goes on up to the highest grade limousine, landaulet and town car.

Even this faithful reproduction cannot approximate the beauty and convenience of the equipments as they actually appear. They must be seen to be fully appreciated.



The ease of operation is remarkable; the tops are rapidly raised into position, the doors are opened, the hinged glass swung up into position, the remaining windows are removed from a box in the back of the front seat and buttoned into position, completely enclosing the car in less time than an ordinary top can be erected and the curtains adjusted.

Write for brochure of reproduced photographs.

THIS IS THE BEST SYSTEM

THE Ward Leonard System of control has caused two distinct demands in the automobile industry:

1. The universal use of electricity for the lighting and starting systems.

2. A system that year in and year out for the life of the car shall need no attention. The system must be *automatic*—must be an *electrical* control of the electric circuit, not a mechanical control of the electric circuit.

Roosevelt witnessed this test

The turret guns, weighing many tons, on the United States dreadnoughts are operated, raised, aimed and lowered by a Ward Leonard system of control.

The value of the Ward Leonard System of control was demonstrated in battle during the Spanish-American war, where it was used upon the "Brooklyn." Prior to that time it had been installed experimentally upon the "Brooklyn," but a controversy had developed between the line and staff officers as to the advisability of using electricity for that purpose.

Theodore Roosevelt was then Assistant Secretary of the Navy, and in his presence the United States armored cruiser "Brooklyn" was thoroughly tested with one turret operated by the old method and one by the Ward Leonard system, which resulted in the general adoption of the Ward Leonard System in the United States Navy. The immense superiority of the Ward Leonard control was shown when the "Brooklyn" was in battle. A turret equipped with the Ward Leonard System can be so accurately controlled that a shot fired at an object 2,000 yards away can be moved only two inches in either direction.

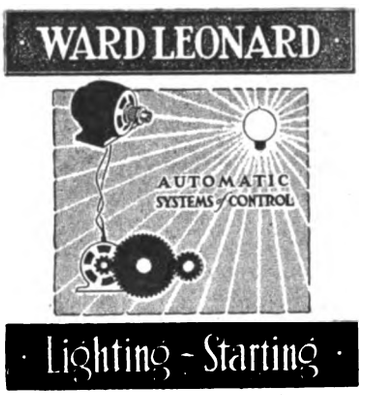
Since the Spanish War the Ward Leonard System has been generally adopted by the United States Navy and all the ships are equipped with it, with a few unimportant exceptions.

Here is one place above all others where there is no room for a system of control that is not perfect in every detail of design and of the maximum efficiency in operation.

The same engineering service giving "systems of control" that is found good enough for the leading navies of the world "is not too good for the leading automobiles of this country."

It's a great step forward when automobile engineers reach a government standard of quality and service in the electrical field.

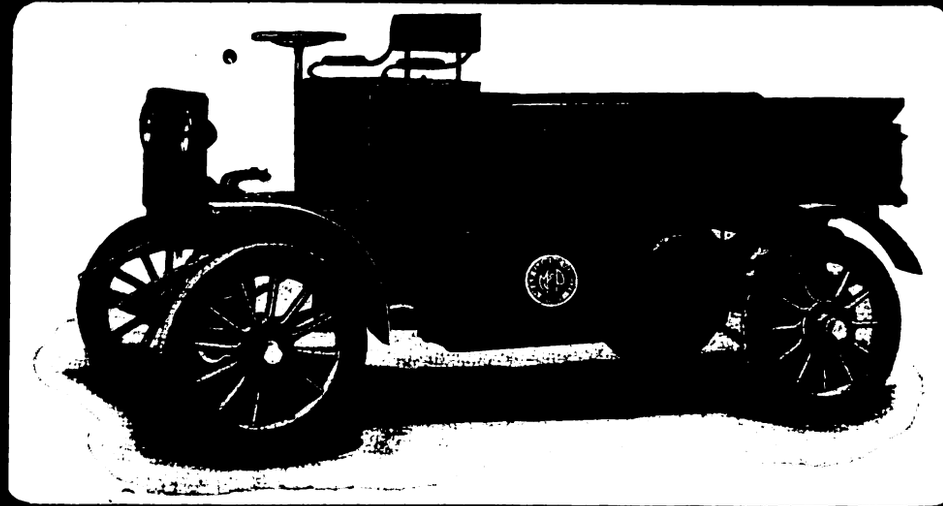
No adjustments necessary



But the advantages of the Ward Leonard System do not stop with automatic control and thorough reliability. Its simplicity and the absence of any adjustments will make it valuable to the car owner as well as to the car manufacturer.

There are no unnecessary parts—nothing to puzzle the operator, and any chauffeur can easily understand the construction and performance of the dynamo and the entire system.

Automatic control the feature



The Ward Leonard System is automatically perfect. That a control be truly automatic, it must be made of such parts and materials as shall not change in their capacity to carry electricity. They shall not wear, they shall not be altered in any way due to heat, cold, vibration, etc. Only in that way can be obviated the necessity of resetting and adjusting. So to be truly automatic, the control shall need no attention whatever by the user.

Day does not follow night with any more certainty than the electrically operated switch controls the charging amperes in the Ward Leonard System regardless of the speed of the motor.

The M & P One Thousand Pound Electric Truck Comes to Your Customer, Mr. Dealer, With an Iron-Clad Guarantee Back of It.

This guarantee covers every possible angle, protecting you and the buyer in the matters of reliability and economy of operation.

The M & P One Thousand Pound Electric Truck is the first electric truck of its quality to be sold at M & P prices. And because of long experience, and low overhead we are producing a vehicle which will positively give more and better service at lower cost of operation than can any other electric truck selling for as high as $2,200.

Comparison with the gasoline truck is unnecessary. We are selling electric trucks whose advantages are obvious.

A Truck That Makes Good at a Price That Sells It

The M & P Truck is the acme of simplicity—strong, sturdy, reliable and economical. In a word, it is properly designed and properly built. It is "Made to make good and it does." Tests prove that the cost of operation is twenty-five to thirty-three per cent less than that of a similar powered gasoline car.

A point that will also appeal to your trade is the price. It puts the high grade electric delivery wagon within the reach of the average retail merchant, who is, at present, utilizing horse-drawn vehicles for transportation purposes. We have the facts and data to prove to you and to such a merchant that the "M & P" can save him a surprisingly large amount of money.

You, Mr. Dealer, have studied the electric commercial proposition—you know that the trade is hungry for it. You don't have to go to the big manufacturer to sell this truck. You have but to present it to the dry goods merchant, the hardware man, or any other merchant with a delivery problem, to prove there is a waiting market.

Get the facts and figures covering this proposition, including complete description of the M & P and our liberal commission to you. Find out how and why it will pay you to get busy now.

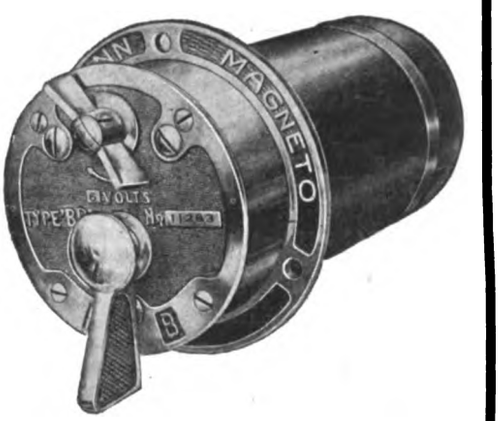
EISEMANN

Eisemann products add distinction as well as efficiency. Eisemann equipment on any car carries with it the general idea that the manufacturer thereof is honestly supplying his product with the finest ignition system that money and brains can produce—with an ignition system back of which is the labor and experience of the pioneer ignition systems for internal combustion engines.

All of the unexcelled points of efficiency in Eisemann products are the logical result of step by step development from the crude systems first used in 1903. Nothing is freakish or uncertain. Everything is mechanical and electric onward progress. That's one reason why no ignition system today is so efficient, so durable, so simple and so accessible as the Eisemann systems of ignition.



The new Type E. B. High Tension System with separate transformer coil (illustrated herewith) places upon the market an ignition system that is low in cost yet remarkably high in efficiency—but up to the Eisemenn standard in every respect. This system, which is simply an addition to our now complete line of ignition systems, consists of a magneto in which only the primary current is generated and a separate transformer coil in which the current is stepped up to its high tension.

Prest-O-Starter

Starts your engine (old or new) quickly and easily in coldest weather.

For Four Cylinders $20

For Six Cylinders $25

$1.50 extra for two-way valve necessary when the same tank is used for both starting and lighting.

Here's a starter that adds practically no weight to your car, is perfectly simple and is as durable as the engine itself. Easily applied to any engine, old or new, very economical in the use of gas, and requires no expert repairing.

How Prest-O-Starter Works

The principle of starting a motor with Prest-O-Starter is the same as "starting on compression." A measure of acetylene, at low pressure, is pumped from your Prest-O-Lite Tank into the cylinders.

Touch your spark—your engine starts.

Unlike "gasoline priming" it is not affected by heat or cold. It is certain.

In cool weather, by opening a valve on the dash, you can feed gas at low pressure into the intake manifold. This allows your engine to run on acetylene until it is warm enough to run on gasoline.

If the Prest-O-Starter did no more than prime your engine in this way during cold weather, this convenience would be well worth the price.

But Prest-O-Starter is more than a primer. When installed properly, it will start your engine, summer or winter, almost invariably without recourse to the crank.

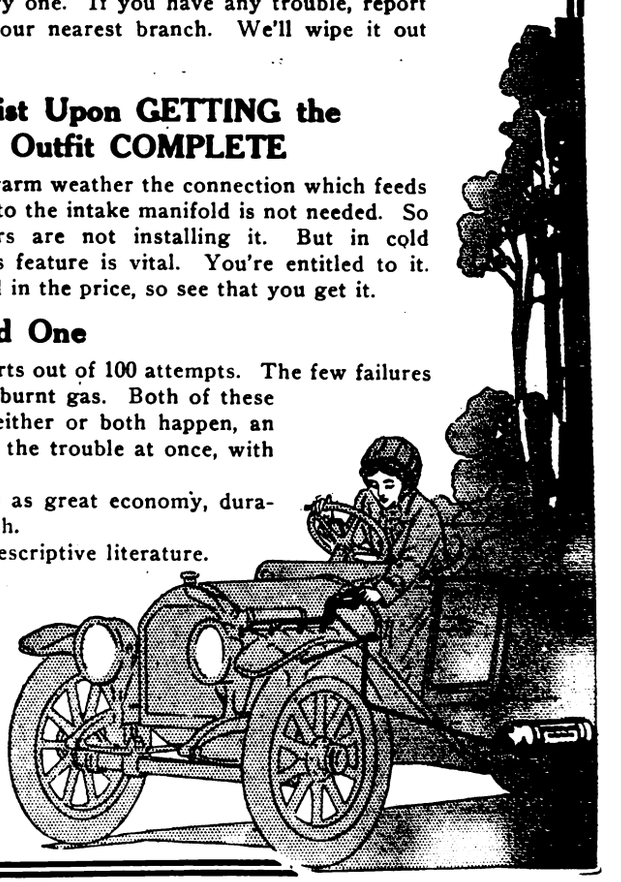
Make Sure Your Starter is Installed CORRECTLY—Look It Over

The Prest-O-Starter is easy to install correctly. In fact, it's so very easy to install that some good factories and garages install it with utter carelessness, overlooking the one or two simple features vital to success in operation. Fortunately this is an easy matter for the car owner to correct, even if he isn't a mechanic.

Our literature tells you exactly how the Prest-O-Starter is installed, and how to adjust it. Anyone can give it the slight attention it may need or quickly tell a dealer where the trouble lies.

Every Prest-O-Starter is sold with the assurance of satisfactory service. The entire Prest-O-Lite Organization is back of every one. If you have any trouble, report it to us or our nearest branch. We'll wipe it out quickly.

Insist Upon GETTING the Outfit COMPLETE



During warm weather the connection which feeds acetylene into the intake manifold is not needed. So some dealers are not installing it. But in cold weather this feature is vital. You're entitled to it. It's included in the price, so see that you get it.

Now More Than Ever You Need One

Your Prest-O-Starter, properly installed, will average better than 95 starts out of 100 attempts. The few failures are caused by your motor stopping on dead center, or cylinders filled with burnt gas. Both of these conditions can be easily avoided when stopping your motor. But should either or both happen, an eighth or quarter turn of the crank, with the switch at neutral, will remedy the trouble at once, with all of the danger and labor of cranking eliminated.

Rest assured that no other starter can give you as high efficiency with as great economy, durability and freedom from mechanical trouble. The price is within easy reach.

Get in touch with any of our branches—or your dealer—or write us for descriptive literature.

Send This Dealer Application

No matter what cars you *now* handle—get the Franklin Dealer Proposition. Franklin is now the third largest selling high priced car, and gaining rapidly on second.

Franklin cars are easy to sell because they (1) use less gasoline, averaging 20% to 35% more mileage per gallon; (2) use less oil, averaging 400 to 600 miles per gallon, without smoke; (3) use fewer tires, averaging 8,967 miles per set, the 1911 record; (4) travel faster in the long run, owners thinking little of making 200, 250 and 300 miles and more per day, without fatigue; (5) ride easier, bowling along so smoothly and comfortably, without jolt or jar, that driver and occupants do not realize that they are steadily traveling 30, 35, and 40 miles per hour; (6) and wear longer than other cars, many Franklin cars giving their owners continuous satisfactory service for 5, 6, 7 and 8 years.

We will send full particulars of the Franklin Dealer Proposition to any automobile dealer, garage owner or automobile owners financially capable and with the business experience to become a successful dealer, provided he will mail us this "dealer application" immediately.

The sending of this application does not obligate the sender or us. It is merely a convenient way to get at the facts.

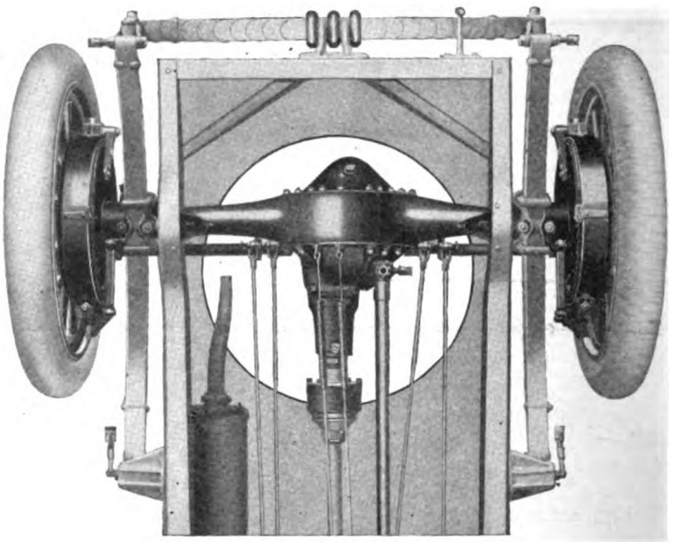
Don't be Satisfied with Half-Way Knowledge of Your Motor-Car

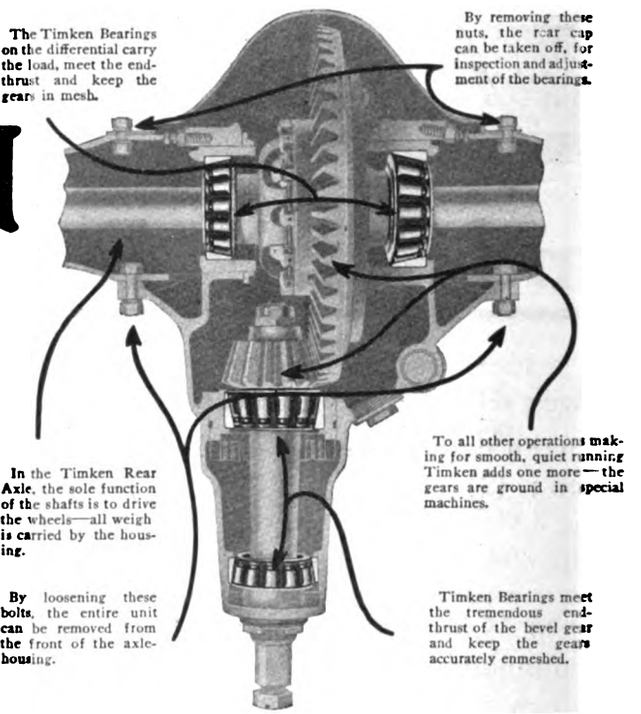
First, get at the fundamentals—the big, construction features that mean strength, safety, speed, power.

Here's one of the big things you ought to know about:



The Power-Transmiting Unit of a Timken-Detroit Rear Axle.

It's shown at the right just as you see it when the body of the car is removed and you look down on the chassis—lower on the page you see it in detail.



Study it—read the description carefully.

It's one of the great Timken contributions to good axle construction.

And it includes the most important single contribution to American motor-car manufacture:—Timken Tapered Roller Bearings.

Above is a picture of a Timken-Detroit Rear Axle, showing the position of the Power-Transmitting Unit illustrated in detail below.

TIMKEN
BEARINGS & AXLES

In a Timken Rear Axle all the gears—pinion, driving and differential gears—form a unit.

This unit is completely assembled and tested before it is put into the axle.

It is bolted to the front of the housing and is easily removable.

The large removable rear cap of the housing permits convenient inspection and adjustment from the rear.

The quiet running and high efficiency of Timken gears is partly due to this unit construction—proper relation of all parts is assured *before* the axle is assembled.

It is partly due to the grinding of the gears by a special Timken-built machine—*the one gear-grinding machine made* that corrects all the microscopic inaccuracies left by even the finest gear cutters.

It is lastly and largely due to the Perfect Service given by Timken Tapered Roller Bearings.

The Power-Transmitting Unit is carried by these bearings.

They keep shafts in line and gears accurately in mesh, *saving power* and insuring quiet running.

They do this because of three great principles of Timken Tapered Roller Bearing construction.

1. A greater load capacity than balls because they carry the load along their whole length instead of on points only.
2. Greater ability to meet force from the end as well as the side—because the rollers are tapered.
3. Perfect adjustability for wear—due to the tapered construction.

Good Axle Construction Demands Human Integrity and Efficiency

It isn't merely one, or even all of its notable features that makes the Timken-Detroit Rear Axle.

It's really the human equation back of the whole.

An organization that began before the motor-car industry was dreamed of.

That for years has been devoted exclusively to building motor-car axles—and to nothing else.

Whose product represents the whole sum—not a part—of motor-car axle knowledge and experience: American and European.

The Timken story requires many chapters—this advertisement is only one.

Look for the others and read them—they will give you a new understanding of the modern motor-car.

You can get the whole story of axle and bearing importance and construction by writing to either address below for the Timken Primers, T-9 "On the Care and Character of Bearings," and T-10 "On the Anatomy of Automobile Axles."

FEDERAL

"EXTRA SERVICE"

TIRES

DURABILITY proves the *quality* of automobile tires—it is a sure gauge.

Federal Tires will outwear the inferior kinds every time. Because of better construction and the use of carefully selected materials Federal Tires are capable of standing the severe strain and wear (both inside and outside) to which tires are naturally subjected. Unusual quality is the explanation of the *durability* of Federal Tires. *Investigate* them.

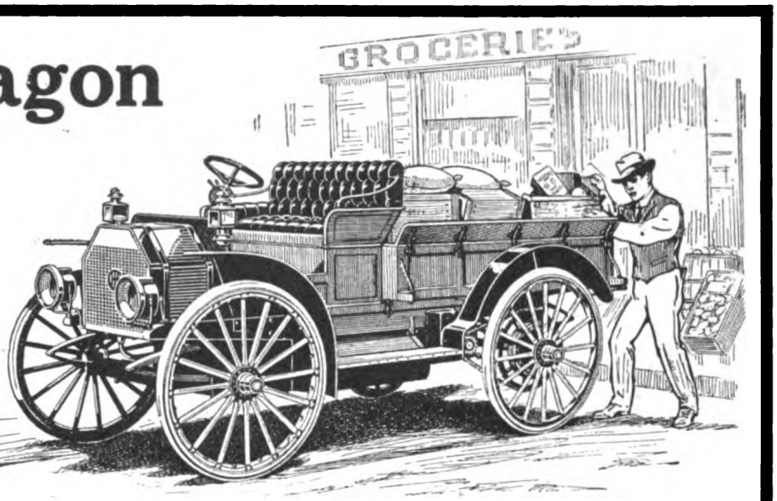
We want *your* verdict

There is one sure way to find out the difference between Federal Tires and the inferior kinds, and that is to personally try these tires on your own car—learn first-hand why we call them *"Extra Service"* tires.

The next time you are in the market for tires, remember the extraordinary claims we make for Federal Tires—you will find they will last longer and prove more satisfactory than any tire equipment you have ever used.

ANOTHER POINT—Federal Tires cost no more than other high grade tires.

Made in all types for all standard rims.



Federal Tires are supplied through leading dealers everywhere. An interesting tire book mailed to all who write.

The guarantee on Federal Tires is withdrawn when tires are filled with any substitute for air

The Delivery Wagon of the Future

In selling motor cars for quick deliveries or light hauling the point to drive home is: ***"This car is the best on the market for your purpose. It pays larger dividends on the money invested than any other car,"*** and of no motor delivery car on the market today is that statement so true as it is of the

International Commercial Car

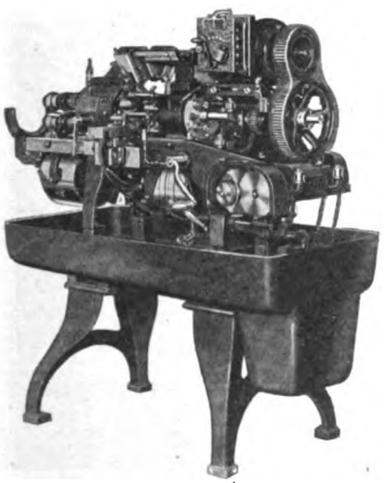
More than 6,000 of these cars in daily use by business men in city, town and country prove the usefulness of the car for quick deliveries and light hauling. More than 1,000 repeat orders this year prove that the car extends the business of its users.

The International Commercial Car, designed and built for business purposes only, is worthy the consideration of every vehicle dealer who reads this magazine. Here are a few of its advantages:

It interferes in no way with sales of pleasure cars. In fact, every pleasure car owner is a better prospect for an International Commercial Car because he owns an auto.

The machine is so simple that any man of average intelligence can learn quickly how to manage it.

Its capacity for work is equal to that of at least two teams.



Its first cost is reasonable—less than that of the horses required to do the same work.

There are seventeen other reasons why you should have the agency for the International Commercial Car in your town.

Write for our co-operative selling plan and any desired information about the car.

International Harvester Company of America
(INCORPORATED)
155 Harvester Building, Chicago, U.S.A.

Better and More Rapid Production of Duplicate Parts

The Acme Automatic

WHAT does it cost you to produce milled work by your present method? Figure it up and see if your duplicate work is not costing you too much. Acme Automatics complete milled work in one-half to one-quarter the time required by ordinary methods. Moreover every piece is accurate.

The Acme Method

THIS is accomplished by working as many as eight or nine tools on four bars of stock at one time, and completes the piece in one operation. Side drilling, side and end milling, etc., are completed without extra time and machinery. Compare this with the method you are now using.

The "Acme Method" Booklet explains the principle of the Acme Automatic producing parts in duplicate. Ask for it.

Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

Warner Quality
Steering Gears

ANYBODY can claim quality—but a record of eight years use on the better class of cars is indisputable proof. That proof is back of Warner Steering Gears.

The prime features of Warner Gears are: accessibility; complete interchangeability; use of eccentric sleeves; adjustable angle of column; large bearing and contact surfaces specially hardened and ground, assuring ease of motion and durability.

The Warner line includes a wide range in both pleasure and commercial types.

We guarantee dependable deliveries.

Get acquainted with Warner Quality—make it another selling argument.

We modify our designs to meet your detail requirements, or build on approved designs on seasons quantity specifications.

Stewart
Delivery Trucks

Money-Savers
Time-Savers
Trade-Bringers

Sell Stewart Trucks in Winter Months

No let-up in business for the dealer who handles Stewart Delivery Trucks. Cold weather only increases the need for motor delivery. Merchants are already worrying over their holiday deliveries. They know that their horse equipment will be inadequate during the cold, snowy days and the rush and long hours of the Xmas trade and special sales.

We can guarantee prompt deliveries of Stewart Delivery Trucks in time for the winter business. We can furnish dealers their demonstrators almost immediately. Now is the time to go out and get this desirable business. Merchants are looking for the right car; one that is scientifically designed for hard delivery service. You can get their orders for Stewart Trucks now. Write for our literature and liberal proposition to dealers.

THE NEW PROCESS RAW HIDE CO.

INTERLOCK INNER TIRES
Stop Tire Troubles

The one weak point of the automobile is that you cannot depend on the tires. Thousands of motorists have solved their tire problem by discarding inner shoes, reliners, fillers and other makeshifts and equipping their tires with **Interlock Inner Tires.**

Interlocks are complete inner tires (not inner shoes) placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They double the mileage of new tires and add 1,000 to 5,000 miles to old ones—save half your tire expense—and make tires trouble proof.

Dealers and Motorists—Investigate Interlocks

Don't delay—write now for booklets, data, prices, testimonials of users, road tests, etc. Mention size and kind of tires you use.

The Motor Lamps with Distinctive Features

There are no other motor lamps on the market with the advantages of Solar Lamps. Solars are always exclusive in style and in quality. They are the strongest lamps as well as the most effective.

In no other lamps can you obtain the Solar Special Short Focus Lead Glass Lens Mirror Reflector—the patented system of double ray light projection which gives two distinct fields of light for town and country use—or the new and exclusive black finish with a metallic lustre which is unaffected by heat or moisture. All of these features are exclusively "Solar."

Do not equip your car or specify equipment to the maker until you have seen all of the Solar advantages. See Solars at any live dealer's or write for the catalog.

Solars are made in all styles for oil, electricity, gas and in combinations.

Weed Chains

The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires
Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

Recommended and sold by all reputable dealers

1908 to 1912
21st St. and Fairmount Ave., Philadelphia, Pa.

This quality is due partly to the patented slotless design, which prevents damage arising from end thrust and misalignment, and partly to the high grade of materials and workmanship used.

The causes of HESS-BRIGHT **success** are found in the enduring **quality** of the bearings themselves.

Be Sure Your Cars Are

EQUIPPED

With

R.I.V. Bearings Presuppose Car Quality

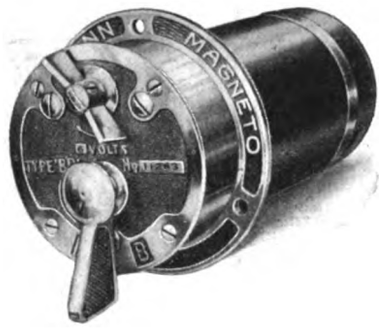
R.I.V. Equipped is a Strong Selling Argument

In the making of any automobile part (including ball bearings) quality of material is a minor consideration as it affects the integrity of the completed device.

Every ball bearing made in this and other countries has high grade *crude* steel and other metals as its birthright—but at this point comes the parting of the ways.

The net worth (or lack of it) can only be predetermined by the amount of gold and silver that goes into the pay envelopes of the chemists who increase the hardness and tensile strength of the steel—the engineers who design to get the most and best out of it—the machinists who tool and assemble the parts, and the experts who test them in every process of evolution.

R. I.V. Ball Bearings are made in a factory where a premium is put on brains—and that is why these bearings are exclusive in quality and price—and why they ought to be on the cars you sell.



R.I.V. COMPANY IMPORTED SINCE 1904 1771 Broadway, New York

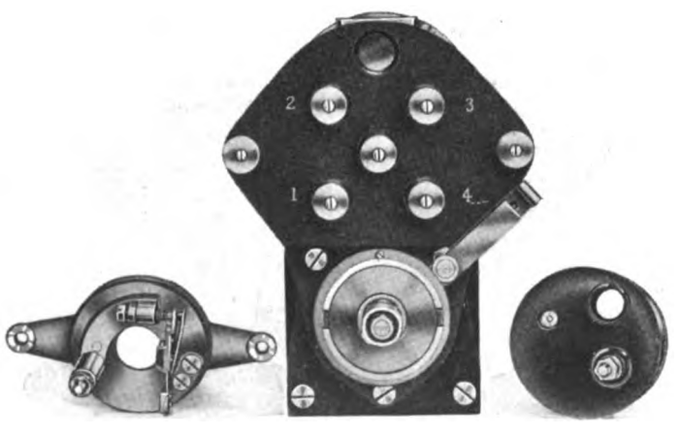
EISEMANN

Much of the success of the new Eisemann Type E. B. High Tension System with separate transformer coil is due to the extreme simplicity and remarkably great efficiency of the contact breaker which is illustrated at the bottom of the page.

Simply looking at this contact breaker conveys immediately its remarkable simplicity. There is almost nothing to it and yet a more efficient piece of mechanism has never been devised. This breaker device is tested out at 4,500 r. p. m. and must accurately and perfectly make and break the current running at that speed before the magneto is turned out. This test is maintained at more than double the speed ever attained by the magneto in operation on a four cylinder car.



The coil which is used in this Type E. B. High Tension System with separate transformer coil and which is illustrated herewith, is placed through the dash and it includes a switch and mechanical device for starting on the spark.

A Blow Out Costs Money

and still it is an avoidable accident, nine times out of ten.

If you have a good tire, keep it good by watching for the little injuries and healing them before they become big and serious—and show your customers how easily and profitably this can be done.

GILMER TIRE REPAIR PLIERS

will do repair work easily and thoroughly, and the operation is simple. All you have to do is insert the prongs of the pliers into the cut, distend the cut and snap the lever to hold it open. Then cleanse the wound and insert pure rubber gum. Remove pliers and the tire is as good as new.

Dealers Look Into This

You need Gilmer Repair Pliers in your business. You also need them to sell. Every car owner will catch the idea the moment you demonstrate the work.

Get your order in early—we are rushed with orders but we can still give you prompt delivery—**only don't delay.**

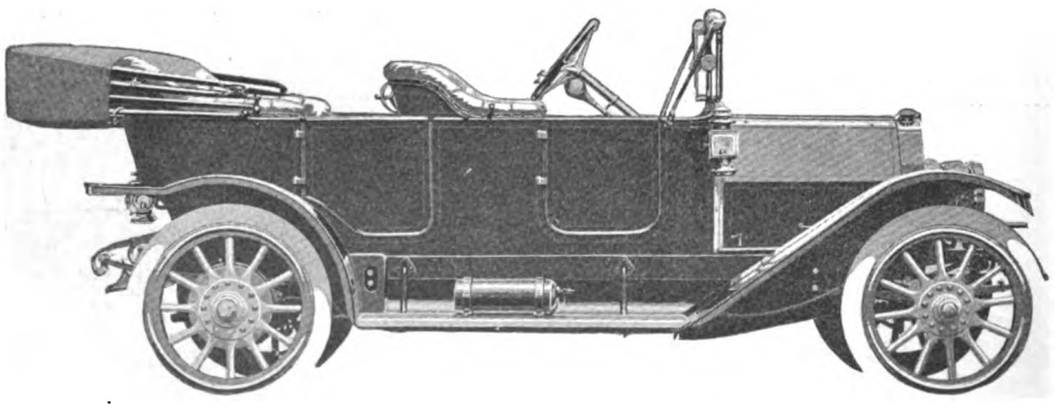
High-priced feature No. 4



Overland Model 69T brakes are as large as those on $1500 cars. Look up the specifications of the latter; see for yourself.

There are two sets of the drum type, internal expanding and external contracting. The pressed steel drums are 2¼ inches wide and 13 inches in diameter. Full control of your car is guaranteed —no matter what the road conditions.

We use heat-proof, wire-woven asbestos for brake lining; we make special provision for the prevention of dragging; sand, mud, dust and water are defied by close fitting guards.

A catalogue for the asking. Please address Dept. 50.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, November 21, 1912 No. 9

NASH SUCCEEDS NEAL AS HEAD OF GENERAL MOTORS

Neal, However, Remains a Director—Two Vice-Presidencies Abolished but Durant Retained on Board —Few Changes Made.

After successfully having guided the General Motors Co. out of the hot water which surrounded it when he assumed the reins at the time of its reorganization in December, 1910, Thomas Neal, of Detroit, on Tuesday last, 19th inst., declined re-election and relinquished the presidency to C. W. Nash, who is general manager of the Buick Motor Co., which constitutes the largest unit of the General Motors organization. Neal, however, will not entirely divorce himself from General Motors affairs, as he was chosen chairman of the board of directors.

The annual meeting of the $40,000,000 corporation was held on that date at its legal office in Jersey City, N. J., at which time these other officers and directors were chosen: Emory W. Clark, vice-president; Standish Backus, secretary; James T. Shaw, treasurer; M. Alvord, comptroller. Board of directors: Thomas Neal, chairman; Joseph Boyer, M. J. Murphy, A. N. Brady, Emory W. Clark, James T. Storrow, W. C. Durant, Albert Strauss, Andrew H. Green, Jr., N. L. Tilney, J. H. McClement, Charles W. Nash, Edwin D. Metcalf and Jacob Wertheim. Finance committee: James J. Storrow, chairman; Emory W. Clark, M. J. Murphy, W. C. Durant, Thomas Neal, Andrew H. Green, Jr., Edwin D. Metcalf and Albert Strauss.

C. W. Nash, the new president, has been identified with the Durant-Dort and Buick interests for many years and several months since became a member of the General Motors "inner circle," when he was elected vice-president to succeed W. J. Mead.

Heretofore the General Motors Co. has had three vice-presidencies, but on Tuesday two of them were abolished. Until that time, W. C. Durant, who promoted the General Motors enterprise, served as one of the vice-presidents, despite the fact that for more than a year past he has been engaged in forming a competitive undertaking of his own, which only recently took form in the shape of the Republic Motors Co., capitalized at $65,000,000. Durant, however, was retained as a director and also as a member of the finance committee, the only changes effected at the annual meeting on Tuesday being the elcetion of Nash to succeed Neal as president, and James M. Wallace's retirement from the directorate.

Warren Undergoes Reorganization.

What practically amounts to a reorganization of the Warren Motor Car Co., of Detroit, was effected at a meeting of the directors and creditors which occurred on Tuesday last, 19th inst., and which grew out of a conference held the week before, at which the condition of the company frankly was disclosed and safeguards discussed. It was agreed to extend all notes and other obligations until June 1, 1913, and it also was arranged that the board of directors be enlarged to permit of the election of six representatives of the creditors.

They are as follows: Harry Bissett and H. J. Mallory, of the Weston-Mott Co.; F. H. Lewis, Lewis Spring & Axle Co.; M. Jencks, Port Huron Engine Co.; J. W. Mowe, Firestone Tire & Rubber Co., and G. Jahn, Bosch Magneto Co. Of the old board, Homer Warren, C. H. Wilson and C. R. Wilson remain. Another meeting will be held today, at which the resignations of several of the present officers will be accepted and their successors chosen. The company's balance sheet shows liquid assets of about $375,000 and total liabilities of $350,000, of which $50,000 is a stationary liability against the plant. The factory has been working to full capacity, and now will continue to do so.

COURT FIXES DATE OF SALE OF U. S. MOTOR PROPERTIES

But Delayed Bankruptcy Petition May Complicate Matters — Terms of the Sale and Developments Likely to Follow.

Wednesday, January 8th, has been set as the date for the sale of the assets of the United States Motor Co. and its five subsidiaries, the Alden Sampson Mfg. Co. and the Brush Runabout Co., of Detroit, Mich.; Columbia Motor Car Co., Hartford, Conn.; Dayton Motor Car Co., Dayton, O., and the Maxwell-Briscoe Co., Tarrytown, N. Y.

Yesterday, however, there was filed in the Federal court in Trenton, N. J., a petition in bankruptcy, which may serve to delay or complicate matters.

The petitioning creditors are the Ditzel-Shaw Co., of Ohio, with a claim of $1,361; Horner & Smith Co., $1,356, and Amos Lint, $138, who alleges that the United States Motor Co. owes $12,000,000 and has assets of but $9,000,000.

The receivership was brought about by an action in equity as distinct from bankruptcy proceedings.

Roberts Walker, one of the receivers, said that so far as he was concerned the outcome was a conundrum, and being an officer of the court he was not in a position to discuss the matter. He referred the Motor World man to the receivers' attorneys, Rosenberg & Levis, who gave as their opinion that the filing of the bankruptcy petition does not in any way affect the administration of the property of the defendant by the present receivers. The United States court in New York has ordered the sale of the property and no application having been made to prevent the consummation of the order, the attorneys have no reason to believe that the sale will be postponed or interfered with.

Henry V. Poor, of Joline, Larkin & Rath-

Digitized by Google

bone, who represent the reorganization committee, said: "The petition in Trenton will be contested and we hope to secure its dismissal. I do not think it will interfere with the sale and reorganization in any way. In fact, I am informed that the United States Motor Co. is not indebted to Lint and that Horner & Smith have filed their claim with the creditors' committee."

Judge Hough, of the United States District Court, who set the date for the sale, stipulated that it should be held in room 47 of the Federal Building, in New York, at 11 o'clock in the morning, when the bids will be opened in his presence. Meanwhile, the receivers, W. E. S. Strong and Roberts Walker, were authorized to receive bids until 10 A. M. on January 8th at the office of the company, 61st street and Broadway.

According to the court's decree, the property will be offered for sale in six parcels, each parcel comprising one of the companies, and immediately thereafter the entire properties will be offered in a single lot. After the sale of the properties, bids will be received for the shares of the several companies held by the United States Motor Co. Bids must be accompanied by a certified check of $50,000 for each parcel and of $250,000 for the entire property.

The sale will be very much in the nature of a legal formality as, barring unexpected developments, it will be bid in by the Anthony N. Brady and Eugene Meyers interests, who were identified with the old company and who have been the moving spirits in formulating the plan of reorganization.

Walter E. Flanders, president of the Flanders Motor Co., who will become president and general manager of the reorganized United States Motor Co., already is inspecting the various plants, and it is generally understood that much of the Maxwell-Briscoe work which has been performed in the East, shortly will be taken over by the New Castle (Ind.) plant, and that the Flanders "six," which is the chief asset of the Flanders Motor Co., will be manufactured in the Brush runabout plant in Detroit, to which city the general offices of the United States Motor Co. will be removed. An office in New York, however, will be maintained.

Flanders already has issued a diplomatic announcement intimating that comparatively few of the employees and agents of the United States Motor Co. will be disturbed, on the principle that there always is room for good men, but as his own company maintains a large, complete and expensive staff, there is small doubt but that far-reaching changes will occur. In fact, W. F. McGuire already has been slated to become vice-president and assistant general manager, and W. M. Anthony, comptroller.

HESS RESIGNS PRESIDENCY AND LEAVES HESS-BRIGHT

Sells His Interests to German Ball Bearing Company—Bright Becomes President and Policy Not to Change.

Without intimation that anything of the sort was pending, Henry Hess, president of the Hess-Bright Mfg. Co., of Philadelphia, late last week disposed of his entire holdings in that company and resigned the presidency, which he has held since it was organized. He has been succeeded by his former partner, F. E. Bright, who previously was treasurer of the company. C. F. McCalla succeeds Bright as treasurer, and A. T. Bruegel has been elected secretary.

Hess's interests were purchased by the Deutsche Waffen-und Munitions Fabriken, which in 1904 conveyed to Hess the right to manufacture the DWF ball bearings in this country. It was during that year that the Hess-Bright Mfg. Co. was formed, starting with a small one-room office and gradually expanding until today it owns an imposing factory and 13 acres of land at Front street and Erie avenue, in Philadelphia. Mr. Hess's retirement will cause no change in the name or policy of the company.

De Schaum Out of Suburban Project.

William Andrew De Schaum, the exploiter, who early this year formed the Suburban Motor Car Co. in Ecorse, Mich., and who sketched a striking picture of the "model motor colony" which he proposed creating in that town, has ceased to be identified with the project. Temporarily the duties of general manager, which he filled, are being performed by W. H. Lankin, president of the company. Several other substantial men also have entered into its affairs and the undertaking now is entitled to more than respectful consideration. James A. Pratt, a Port Huron (Mich.) banker, and George E. Skelton, formerly connected with the Fletcher Hardware Co., of Detroit, are among the additions to the Suburban company's directorate. Its factory is in course of construction and ten Suburban cars already have been built and, according to the best accounts, are giving highly satisfactory results.

Metz Presents a Model at $395.

Motor cars at motorcycle prices, which often have been talked of, have been made realities by the launching, by the Metz Co., of Waltham, Mass., of the Metz "Special" at $395, a price which but a few years since was considered forever outside the realm of possibility. The new Metz, a two-passenger car, is priced at $100 less than the regular Metz model, but it includes many of the latter's features. It utilizes a 22½-horsepower, four-cylinder, air-cooled motor, has a Bosch magneto and is equipped with top, windshield, five lamps, gas generator, horn, pump, and the usual complement of tools, tire repair kit, etc.

Allens Finally Take on American Car.

After having handled imported cars since the teething days of the industry, Walter C. and Harry N. Allen, with N. Pohly Myers, have formed the A. M. A. Co., which will handle the Michigan "40" car in New York. The company has been incorporated with a nominal capital of $5,000 and will occupy a part of the premises 1934 Broadway, where the Allens are handling the Metallurgique car under the style Metallurgique Motor Co., with which the new account will not in any way interfere. Walter C. Allen is president of the A. M. A. Co., Harry N. Allen is vice-president and N. P. Myers secretary and treasurer

Canadian Dealer Gets Long Sentence.

Robert G. Larimer, president and treasurer of the Larimer Co., of Winnipeg, Manitoba, who suddenly disappeared from that city early in September last, after mortgaging his garage and leaving behind a trail of notes and other debts, will spend the next four years in a Canadian penitentiary. After his disappearance, he was trailed to Boston, Mass., where he was arrested and subsequently extradited by the Canadian authorities. At his trial in Winnipeg on Wednesday last, 14th inst., he was found guilty of embezzling $50,000, and was given a sentence of four years.

Lion Now Decides to Discontinue.

Despite the fact that after the fire on June 2nd last, which destroyed its plant in Adrian, Mich., it was stated that the Lion Motor Car Co. had secured another factory in that city and would continue operations, the company has decided to wind up its affairs and go out of business. The fire occurred at a most unfortunate time and so curtailed the Lion output, and otherwise interfered with its plans, that the selling season which just has closed practically went to waste.

Atlanta to Have a Tire Factory.

So far as known, the nearest approach to a real tire factory in the South is about to be established in Atlanta, Ga., by the Interstate Tire & Auto Co., which will produce a tire of that name. The necessary machinery now is being installed in a building that previously was employed in the manufacture of furniture.

DEALERS MUCH DISCUSSED AT DETROIT MEETING

Their Power and Importance Admitted and Their Problems and Welfare Considered at N. A. A. M. Convention—Views Expressed by Men of Prominence Cover Wide Range and Point Way to Better Things.

In many respects, the general meeting of the National Association of Automobile Manufacturers, which occurred in Detroit on Thursday and Friday last, 14th and 15th insts., was, if not the most memorable gathering of the organization, one of the most interesting and instructive. The meeting, which followed a regular gathering of the executive committee on the 13th, was punctuated by a banquet at the Pontchartrain Hotel on the evening of the 14th. The open meeting comprised sessions held on both days. It was of uncommon interest, because members of the N. A. A. M., to whom had been assigned certain subjects, really spoke out in meeting and said things that were of real interest to the whole trade, dealers included; in fact, the dealer looms large in most of what was said.

Dealers' Problems Seriously Discussed.

During the business sessions, and at the banquet itself, one other point was strongly emphasized: that of the freight car shortage and its injurious effect on the trade and the necessity for co-operation on the part of manufacturers, dealers and railroads in the effort to minimize the bad results.

While of necessity every manufacturer who is affiliated with the N. A. A. M. has given attention to the dealer and his problem, the subjects discussed, and the manner of their discussion, made plain that never before have dealers and their problems received so much and such serious consideration at the hands of manufacturers. In the course of his address George W. Bennett, vice-president of the Willys-Overland Co., practically went out of his way to say that hitherto dealers had not received enough of it.

Indispensability of the Dealer.

"The dealer," he said, "is inseparably connected with the industry, but his welfare has received less consideration, perhaps, at the hands of the manufacturer than any other detail of the business;" but recognizing his indispensability, Bennett remarked that the "dealer's future is largely in our hands and is entitled to our most careful consideration."

Hugh Chalmers, president of the Chalmers Motor Co.; Ernest R. Benson, sales manager of the Studebaker Corporation, and practically all of the other speakers likewise paid tribute to the power of the dealer, and made clear that he is being reckoned with, or will be reckoned with, as he deserves to be.

Dealing with the subject to which he had been assigned, "Multiplicity of Models," Mr. Bennett, among other things, said:

Bennett's Ideas of Future Models.

"Little doubt exists in my mind but that eventually the marked successes of the automobile business will lie in specializing, each plant making that which best fits its demand, and making that model in the quantities to which its place in the automobile market entitles it. Before this happens, I am afraid that many requiems will have been sung, and the old axiom, "The survival of the fittest," will be strongly in evidence.

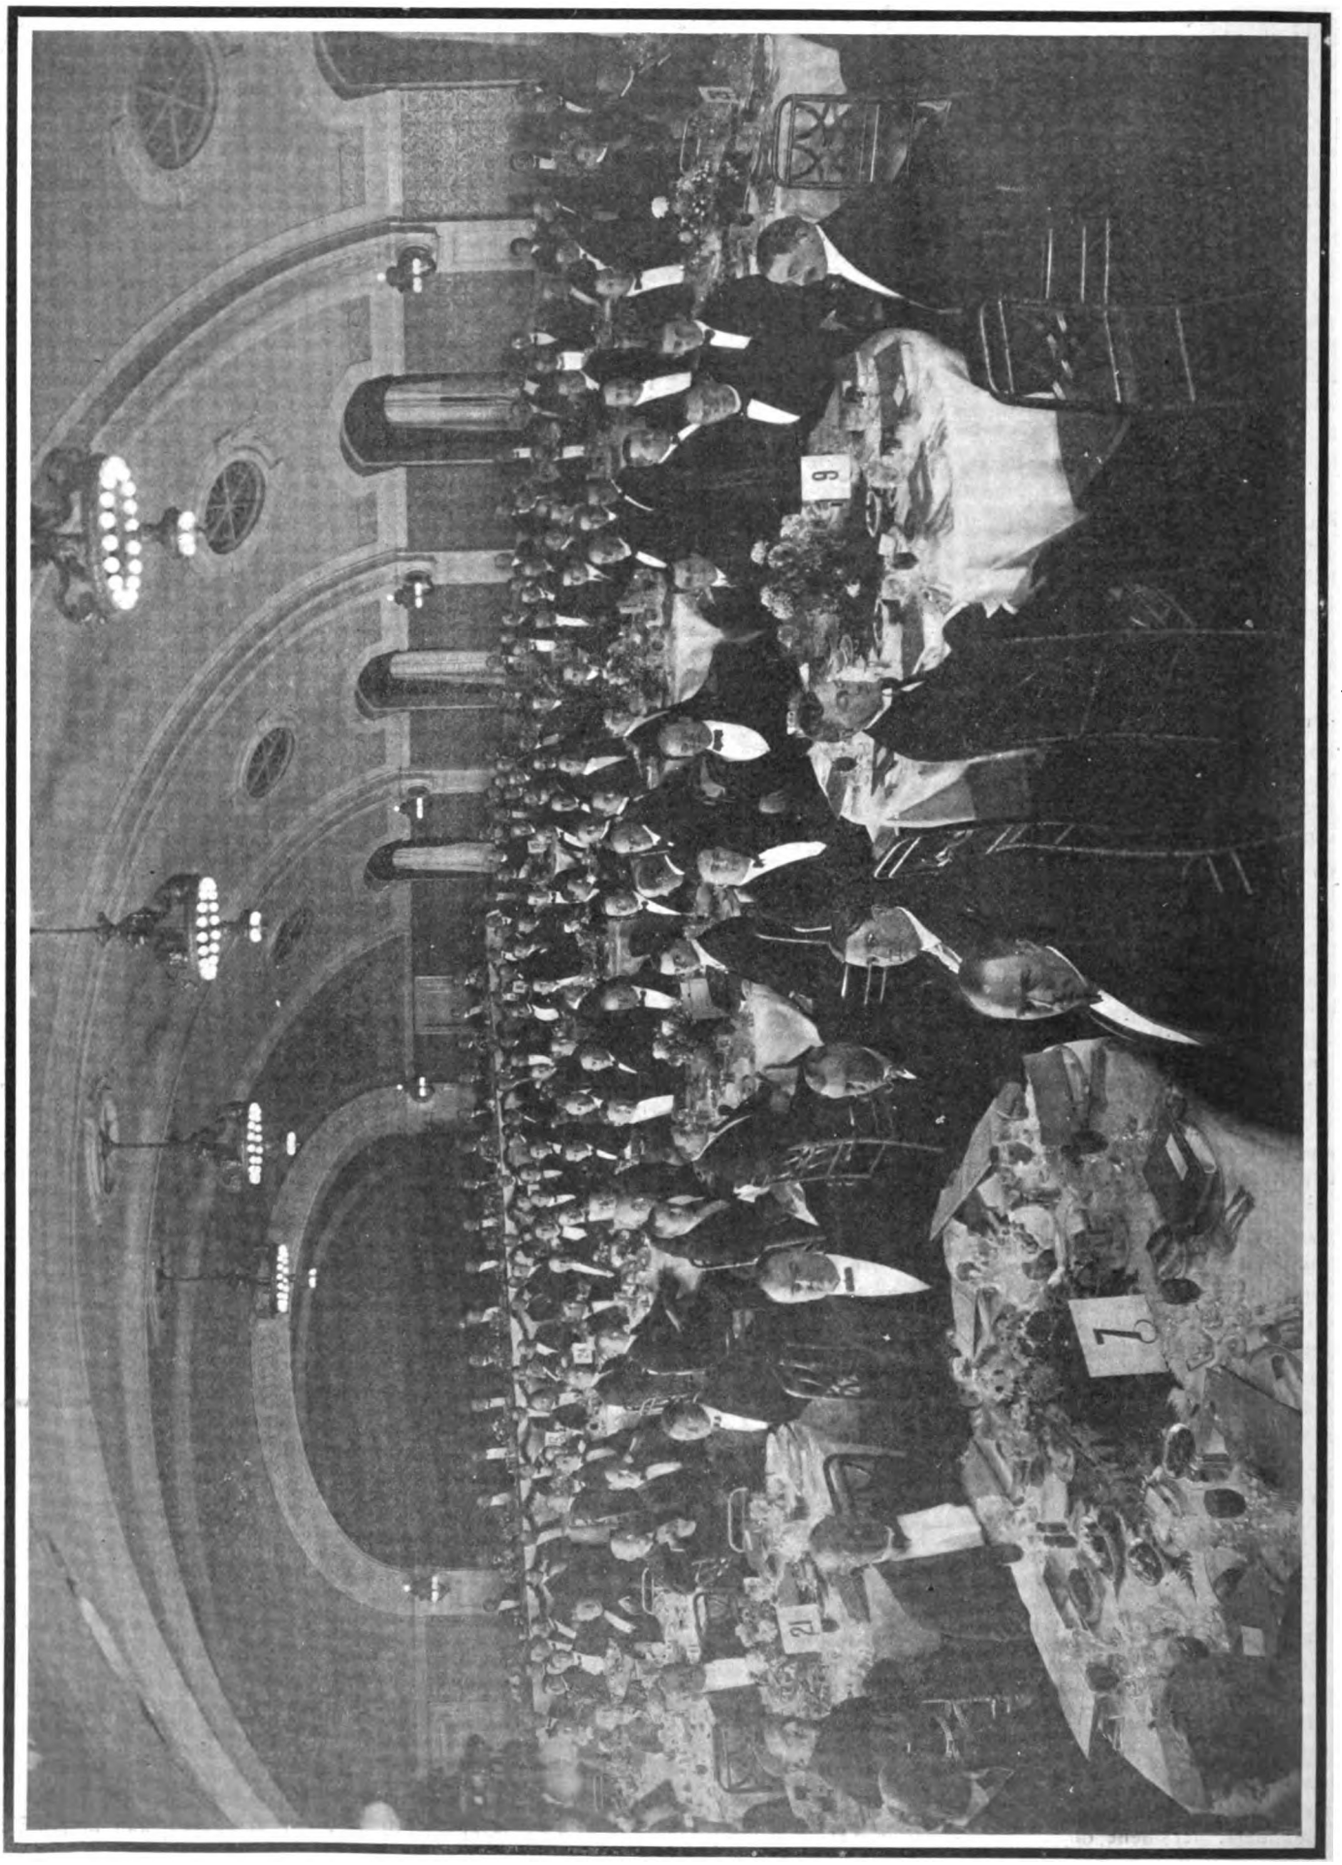
"The subject will not permit of thorough discussion without bringing into it the dealer's existence and welfare, past and present, and—what is more important—his future. All the pioneer manufacturers desired exclusive agents. To accomplish this it was necessary to supply each dealer with practically a complete line of cars. This custom on the part of some maufacturers largely continues, but I think it is in process of elimination. To make several models in a factory which is equipped to make not more than one satisfactorily, necessarily restricts the output of that plant, and divides the energies of its engineers, its operatives, and its selling force into several small channels, all of them considerably below par in efficiency because of such division. This division naturally extends to the advertising, and finally to the dealer, so that no individual in the organization—designing, making or selling—can conscientiously say, "We have the best there is in our class." If the statement is made of one model, it is at the expense of the other models, and obviously lacks the sincerity that would convince a buyer.

Tendency Toward Singling of Purposes.

"Experience has shown, however, that there exists a market for a certain number of cars at a certain price, each of a different class, and each appealing to a different grade of buyer. The growth of the industry shows that the most prominent manufacturers have realized this and are catering to the class they can best supply. I believe this development will become more marked, and that in a very few years each factory will limit its product to one model, with perhaps several styles of bodies interchangeable on the chassis.

"It may not always be possible for one manufacturer to profitably restrict himself to one chassis, but it will be possible, if more than one is considered necessary, to make a large number of the parts interchangeable, and only in this event would the production of two models be warranted or likely to be successful.

Harmful Effect of Many Models.



"I am fairly well satisfied there is no other equally large market available, the demands for cars of higher price being necessarily limited by the decreasing number of individuals whose incomes are sufficient to justify the greater expenditure. This decrease becomes more marked as the prices go up. . . . Obviously there are more manufacturers of automobiles than there are classes of purchasers, and the process of elimination, which it must be admitted is working fairly fast, must in the near future determine that ratio.

"Furthermore, the subject of subsequent service is involved so much that where more than one model is built, adequate service to the user is difficult, and consequently seldom satisfactory, and without that satisfaction complete success is impossible.

Limitations of Restricted Agreements.

"Dealers who are limited by their agreements with manufacturers to sell only the one line, are necessarily restricted in their markets and in their earnings. This course invites competition among dealers, adds to their number many who are irresponsible, and the final result is that but few of them at the end of the year show any profit. With the idea of concentration carried out by manufacturers, it would necessarily follow along to the dealers, and would result in each dealer having a line, no two models of which would be competitive in price, or similar in general detail, and which would enable him to cater to more than one of the

FLASHLIGHT OF N. A. A. M. BANQUET IN HOTEL PONTCHARTRAIN, DETROIT, NOVEMBER 14

Digitized by Google

markets in his territory; to speak enthusiastically of the merits of each of the cars he represents, and to finish each year with a substantial profit.

"The manufacturer cannot be successful unless his dealers are successful, and their interests are so interwoven as to be identical, and absolutely dependent each upon the other. I venture to assert that this phase will receive considerably more thought in the future than it has in the past."

"What Is a Sale?" Asks Chalmers.

"Some Selling Problems," was the topic handled by Hugh Chalmers, and it was handled in masterly fashion, too. It covered a wide range, touching the dealer and his problems, and the matters of over-production, used cars, weather effects and advertising. Mr. Chalmers said, in part:

"We are led to the first problem worth our while to consider by the question, 'What is selling?' What constitutes a sale?

"It seems to me that selling—selling a motor car, for instance—is something more than simply exchanging a motor car for a check or for so much cash. This may be merely a friendly transaction; or an exchange, fair or unfair, or perhaps a bit of charity or philanthropy. Selling, real selling, is the disposal of goods at a profit. Anybody can give goods away, but selling things at a profit is a job for good salesmen and good business men. Let us keep this point in mind.

Good Dealers Hard to Secure.

"Most of us do business through dealers, and most of us doubtless will continue to do business that way, in large part at least, for a long time to come. The dealer, then, and some of his problems represent our first big problem. It seems to me that automobile dealers are of more vital importance to both the manufacturer and the buyer than is the dealer in nearly any other line of business. The right sort of automobile dealer is harder to get than a good dealer in other lines—that is why he is so vital to the manufacturer. And, again, an automobile dealer is needed more by the buyer after the purchase than is the dealer in any other line—that is the public's vital interest. Both the manufacturer and the buyer, therefore, are anxious to have a good dealer and to have him remain so. A good dealer won't remain good very long unless he can make some money; unless his business will show a net profit. Either he will get out of the business, or he will simply drift along for a time, only to fail entirely in the end. How, then, can we help our dealers make money?

(Continued on page 32.)

N. A. A. M. FIXES NEW SCALE OF DEMONSTRATION CHARGES

Truck Body Weight Allowances Also Revised—Will Open Traffic Office in Detroit—Considers the Support of Racing.

Preceding the general meeting of the National Association of Automobile Manufacturers, held at Detroit, Mich., occurred on November 13th a session of the executive committee of that organization at which the principal topics brought up for discussion were the scale of charges for motor truck demonstrations under service conditions, and the schedule of body weight allowances for trucks of various standard capacities. As a result, the schedule of demonstration charge rates, adopted at the March, 1912, meeting of the N. A. A. M., and the schedule of body weight allowances, adopted at the June meeting, were revised and resolutions were adopted embodying the new scales.

Three new members were added to the roll—the Lippard-Stewart Motor Car Co., of Buffalo, N. Y.; General Vehicle Co., Long Island City, N. Y., and the Lauth-Juergens Motor Co., of Fremont, O.

The association also decided to establish a branch of its traffic department in Detroit, with a view of facilitating shipments from the Michigan factories and thereby assist in relieving the car shortage situation.

The executive committee also paved the way for the active entry of the N. A. A. M. into the realm of sport by agreeing to appoint a committee to meet a similar committee from the American Automobile Association with a view of taking over the work heretofore handled by the Manufacturers' Contest Association.

In drawing up the new scale of charges for demonstrations, the figures were based on the theory that the cost, per ton of load, of motor trucking should decrease coincidently with the increase of capacity of the truck; that charges made for demonstration work should bear a definite relation to the actual cost of maintenance and operation; and that such charges should be so fixed that, while they will be in excess of the actual cost of maintenance and operation of the machines, they will be less than the cost of doing the same work with horses and wagons.

Both the old and the new scales of charges for truck demonstrations start with the same figures, $10 per day for the use of 1,000-pound and 1-ton trucks. For all machines of larger capacity, however, the new list shows a reduction that increases with the capacity of the truck. Thus, the charges for a 2-ton truck under the old and the new lists, respectively, are $13 and $15; for a 3-ton truck, $15 and $20; for a 4-ton truck, $17 and $25; for a 5-ton truck, $19 and $30; for an 8-ton truck, $23 and $35, and for a 10-ton truck, $25 and $40. The charges for intermediate sizes are worked out in the same proportion. The approximate average daily operating costs per day, upon which the schedue prices are based, are, for the sizes referred to, as follows: For a 1-ton truck, $8.50; 2-ton truck, $10.50; 3-ton truck, $12.25; 4-ton truck, $14; 5-ton truck, $15.50; 8-ton truck, $17.75; 10-ton truck, $18.50.

As a means for conveniently obtaining figures on trucks of any size, and, conversely, for finding the size of truck capable of being operated within given figures, a series of curves was plotted, showing the operating costs and the rates to be charged under the new schedule.

The scale of allowances for body weights on trucks underwent considerable revision. The schedule is based on bodies of the stake type. The object of the schedule is to specify the weight that may be added to the total weight of the truck without decreasing the load capacity. For instance, a body allowance of 1,800 pounds is made for a truck having a carrying capacity of 10,000 pounds, which means that the total load carried by the chassis will be 11,800 pounds. If the body weight exceeds the scheduled amount, however, the load must be cut down correspondingly, so that the permissible gross weight will not be exceeded.

The schedule adopted and the old list are as follows:

Load Capacity (pounds)	New Body Weight Allowance (pounds)	Former Body Weight Allowance (pounds)
1,000	600	500
1,500	750	...
2,000	900	600
2,500	1,000	...
3,000	1,050	700
4,000	1,200	800
5,000	1,350	900
6,000	1,500	1,000
7,000	1,600	1,100
8,000	1,700	1,200
9,000	1,750	1,300
10,000	1,800	1,400
12,000	1,900	1,600
14,000	2,000	1,800
16,000	2,100	2,000
18,000	2,200	2,200
20,000	2,300	2,400

Disputants Adjust Tire Bill Suit.

After having disagreed so long that the Automobile Tire Co. went into the New York City Court with a bill of some $1,500 against the Times Square Automobile Co., both of New York City, the disputants found a means of adjustment. The suit was discontinued this week with the statement that the difference had been settled and the bill paid.

BRITISH "GAS" TRUST TO INVADE AMERICAN MARKET

Shell Interests Buy California Company and Plan to Compete More Strongly With Standard Oil—$5,000,000 Involved.

Advices from California state that after years of effort the Shell interests, of England, whose Shell spirit dominates the "petrol" situation in Great Britain, practically have consummated negotiations whereby they will become more than ever a competitor of the Standard Oil Co., particularly in foreign fields. It is stated that the Shell interests virtually have completed a deal whereby they will take over the Union Oil Co. of California, and the output of the General Petroleum Co. and all or most of the other independent oil producers on the coast, the transaction, it is said, involving a consideration of $5,000,000.

Most of the Shell oil fields are located in Borneo and Sumatra, and though it is given out that the deal for the Pacific Coast fields will enable the British company to better combat the Standard Oil Co. in the struggle for Asiatic and European trade, other advices appear to make plain that the Shell spirit also may become a factor in the American market. Reports from several points on the Pacific Coast say that the American Gasolene Co. is handling the Shell spirit and is placing agencies, some of them with men hitherto affiliated with the automobile industry.

Changes Among Prominent Tradesmen.

George M. Davis, for several years advertising manager of the Pierce-Arrow Motor Car Co., of Buffalo, has resigned that office.

R. H. Losey has been transferred from the management of the Buick Motor Co.'s Indianapolis branch to the management of the branch in Atlanta, Ga. In his new capacity, he will have charge of the states of Georgia, Florida, Tennessee and parts of South and North Carolina.

Wallace Hood, former sales manager of the Everitt Motor Car Co., who, it was stated, purposed entering the retail trade in Boston, Mass., finally has decided to remain attached to the manufacturing end of the business. He has become sales manager of the Westcott Motor Car Co., of Richmond, Ind.

John B. Maus, who recently resigned the management of the Goodyear Tire & Rubber Co.'s branch in New York, has joined the United States Tire Co.'s staff in the capacity of special assistant to O. S. Tweedy, eastern district manager. New York will be his headquarters, but he will spend considerable time visiting United States branches in the eastern district.

E. A. Welch has been appointed sales manager of the Michigan Motor Car Co., of Kalamazoo, for the middle and southestern states—all of those east of a line drawn from Chicago to New Orleans. He will spend most of his time visiting the Michigan agents in his territory. While his new connection marks his entry into the automobile business, Welch has had ripe experience in other industries.

Palmer-Moore Acquires Plant for Trucks.

After having fully perfected its two-cycle variable-port motor, and, as the Motor World stated several months since, undertaken the application of the engine to motor trucks, the Palmer-Moore Co., of Syracuse, N. Y., has purchased the former plant of the Syracuse Stove Works in that city and at once will enter the truck trade in real earnest.

To permit of its enlarged operation, the company has increased its capital from $100,000 to $200,000. T. G. Meachem remains president of the corporation, T. W. Meachem vice-president and Charles L. Palmer secretary-treasurer.

The vehicle they will produce will be a 1,500-pound wagon, styled the Moore. The plant acquired is located on North Geddes street and comprises two main buildings, one 158 x 54 feet, the other 110 x 50 feet. In addition there is a power house 78 x 33 feet, a foundry 135 x 80 feet, with a wing 100 x 80 feet, and two smaller buildings.

Accident Causes Salesman's Death.

While endeavoring to make room for a farm wagon to pass on a highway near Lynchburg, Va., Thursday last, 14th inst., the car in which L. E. Hoffman, Southern district manager for the Franklin Automobile Co., was driving ran too near the edge of an embankment, toppled over and caused Hoffman's death; investigation disclosed the fact that his neck had been broken. His remains were interred in Cleveland, his former home, although he had resided for some time in Southampton, Pa. Hoffman was connected with the bicycle trade when it was at its height and was interested in the organization of the Royal Tourist Car Co., of Cleveland, O.

Detroiters to Market Reason Inner Tube.

Frank D. Hendrick and George Smith have formed the H. & S Sales Co. in Detroit and located at 541 Woodward avenue. Their chief account will be the Reason "compound pneumatic puncture-proof non-blowout inner tube," which recently was invented by Walter Reason of Pontiac, Mich.

BANKRUPTCY PROCEEDINGS BEGUN AGAINST TIRE CORE

Three Creditors Allege Fraudulent Transfer of Property and Preferential Payments — Declare Assets Are but $1,500.

Alleging that the Tire Core Co. of America, distributer of Dahl tire filler, located at Broadway and West 59th street, New York City, has assets of but $1,500 and within the past four months has "conveyed and transferred its property to persons unknown to the petitioners with intent to hinder, delay and defraud its creditors," three creditors yesterday, 20th inst., filed a petition in bankruptcy against the Tire Core concern in the Federal Court in New York City.

The petitioning creditors are the Wyckoff Advertising Co., of Buffalo, N. Y., with a bill of $1,890.55 for advertising incurred during June and July of this year; Vought & Williams, an iron and machinery firm, of New York City, with a claim of $252.51 for machinery; and Strauss & Co., Inc., of New York City, which recently secured a judgment of $71.51 in the Municipal Court for goods sold and delivered. The total is $2,214.57. The creditors also claim that the Tire Core company has "made preferential payments to parties unknown to the petitioners with intent to prefer such persons as creditors over its other creditors." The Wyckoff company some time ago commenced a suit in the Supreme Court for New York county for its claim.

When the Dahl Punctureless Tire Co. of America, which manufactures the Dahl product, reorganized about September 1 last and increased its capital from $100,000 to $6,000,000, several men in the Tire Core concern, which has the Metropolitan, New Jersey and New England rights, entered the Dahl corporation, and since great things were promised by the parent business it was assumed that the New York distributing house would follow in its path, but apparently its plans or prospects went awry.

Twitchell Discontinues Allen Suit.

Having disposed of his tire pressure gauge patent, No. 927,298, to A. Schrader's Son, Inc., of New York, Charles R. Twitchell this week discontinued his suit for infringement against the Allen Auto Specialty Co., of New York City, which was instituted October 26, 1911, in the United States District Court for the Southern District of New York. By arrangement with Schrader's Son, the Allen company will continue to manufacture its gauges under the Twitchell patent.

The Week's Incorporations

Cincinnati, Ohio—Stern Auto Co., under Ohio laws, with $25,000 capital; to deal in motor cars.

Nashville, Tenn.—Southern Zilio Co., under Tennessee laws, with $100,000 capital; to deal in tire fillers.

Rochester, Ind.—Rochester Garage and Machine Co., under Indiana laws, with $15,000 capital; to operate a garage and machine shop.

Cleveland, Ohio—Auto Mart Co., under Ohio laws, with $10,000 capital; to deal in motor cars. Corporators — Edwin C. Piletz and others.

Cedar Rapids, Ia.—Barton Motor Car Co., under Iowa laws, with $10,000 capital; to deal in motor cars. Corporators—L. M. Ford and others.

New Orleans, La.—J. A. Landry Motor Car Co., under Louisiana laws, with $25,000 capital; to deal in motor cars Corporators —J. A. Landry and others.

Dallas, Tex.—Southwestern Motor Sales Co., under Texas laws, with $500,000 capital; to deal in motor cars. Corporators—L. A. Boli, C. C. Jones and others.

Petersburg, Fla.—Ramm's Garage, under Florida laws, with $100,000 capital; to deal in motor cars and operate a garage. Corporators—F. W. Ramm and others.

Birmingham, Ala.—Alabama Tire Repair Co., under Alabama laws, with $15,000 capital; to deal in and repair motor car tires. Corporators—P. B. Brown and others.

Chicago, Ill.—Bland Electric Garage Co., under Illinois laws, with $1,500 capital; to operate a garage. Corporators — Robert Bland, F. B. McClaughry, L. B. Norton.

Keeton, Ill.—Keeton Motor Co. of Illinois, under Illinois laws, with $60,000 capital; to deal in motor cars. Corporators—L. C. Roberts K. R. Roberts, W. C. Spenny.

Chicago, Ill.—Mollitor Tire Co., under Illinois laws, with $100,000 capital; to manufacture motor car tires. Corporators—B. S. Lippnicott, B. D. Towns, W. J. Higgins.

Cliffside, N. J.—Motor Express Co., under New Jersey laws, with $125,000 capital; to operate a motor delivery. Corporators—R. Dwiggins, O. M. Dwiggins, E. Dwiggins.

Chicago, Ill.—Hanway Starter Co., under Illinois laws, with $75,000 capital; to manufacture motor car accessories. Corporators —J. D. Rourke, R. C. Nicholson, I. Goldstein.

Chicago, Ill. — Electric Vehicle Battery Co., under Illinois laws, with $2,000 capital; to manufacture batteries. Corporators—Elbert C. Ferguson, Guy L. Eames, Ella O. O'Neil.

Gloucester City, N. J.—Auto Tire Repair & Supply Co., under New Jersey laws, with $100,000 capital; to deal in and repair motor car tires. Corporators—T. G. Golden and others.

Cleveland, Ohio—Hall-Miller Auto Co., under Ohio laws, with $5,000 capital; to deal in motor cars. Corporators—Joseph A. Freund, L. D. Greenfield, Charles Kovanda, J. A. Freund.

Wilmington, Del. — Macandaruba Tire Filler Co., under Delaware laws, with $1,500,000 capital; to manufacture tire filler. Corporators—H. Ralph Ewart, C. J. Jacobs, H. W. Davis.

Dover, Del.—Gasolene Safety Appliance Co., under Delaware laws, with $150,000 capital; to manufacture automobile devices. Corporators—J. J. Pheelan, W. Kaempffert, H. C. Sparks.

Chicago, Ill.—E. C. Demountable Wheel Co., under Illinois laws, with $2,500 capital; to manufacture motor car devices. Corporators—George A. Oleson, Victor G. Kropf, Sidney S. Gorham.

Chicago, Ill —Grove Auto-Truck Garage Co., under Illinois laws, with $25,000 capital; to operate a garage. Corporators—Thomas E. McNeil, Harry Lee McCurdy, William H. Neterer.

Cleveland, Ohio—Hupp Oil Co., under Ohio laws, with $25,000 capital; to deal in lubricants. Corporators—S. G. Kerruish, W. S. Kerruish, G. E. Hartshorn, George W. Spooner, N. B. Alford.

Cleveland, Ohio—Northern Ohio Motor Co., under Ohio laws, with $25,000 capital; to deal in motor cars. Corporators—Herbert W. Bell, E. L. Bennings, F. C Anselm, E. P. Eirich, C. L. Guthrie.

Ft. Wayne, Ind.—Eureka Garage Co., under Indiana laws, with $10,000 capital; to operate a garage. Corporators—E. C. Smith, Charles J. Buehr, T. B. Adams, A. C. Hobrock, H. D. Alderman.

New York, N. Y.—A. M. A. Co., under New York laws, with $5,000 capital; to deal in motors. Corporators—N. Pohly Myers, 16 West 71st street; Walter C. Allen, Harry N. Allen, 140 West 55th street.

Mt. Eaton, Ohio—Mt. Eaton Supply Co., under Ohio laws, with $60,000 capital; to deal in motor cars and supplies. Corporators—J. A. Yohn, F. B. Schlafly, Robert Kenwell, Albert Pfister and others.

Cleveland, Ohio—Motor Mechanism Co., under Ohio laws, with $25,000 capital; to manufacture motor cars and parts. Corporators—E. Younger, F. Castle. H. O. Evans, H. E. Gray, S. E. Sackerman.

New Brunswick, N. J.—Middlesex County Garage & Sales Co., under New Jersey laws, with $100,000 capital; to deal in motor cars and operate a garage. Corporators—H. A. Boyd, J. Mershon, C. A. Oliver.

New York, N. Y. — Tuxedo Tire Co., under New York laws, with $8,000 capital; to deal in motor car tires. Corporators—Augusta Horrmann, 429 East 157th street; Emilie Waltenberg, Adolph Waltenberg, 558 Mott avenue.

New York, N. Y.—Foreign & Domestic Automobile Repair Co., under New York laws, with $10,000 capital; to repair motor cars. Corporators—L. O. Rothchild, 251 West 138th street; Max Kaplan, 133 Amsterdam avenue; Otto A. Deffaa, 3013 Third avenue.

New York, N. Y.—Miller-Brisben Co., Inc., under New York laws, with $25,000 capital; to deal in motor cars. Corporators —Warren A. Miller, 30 West 63rd street; Irving Jaffe, 1402 Broadway; John M. Brisben, Port Richmond, N. Y.

Brooklyn, N. Y.—H. J. & S., Inc., under New York laws, with $1,000 capital; to manufacture and deal in rubber goods. Corporators—Joseph Mattison, 162 East 66th street; Henry Jacobsen, 440 88th street; Siegfried Glass, 1367 47th street.

New York, N. Y.—Reliable Auto Parts Co., Inc., under New York laws, with $2,000 capital; to deal in motor car parts. Corporators—Adolph J. Lunde, 150 Vermillyea avenue; Hubert Hansen, 2080 Ryder avenue; Adolph Sachroff, 4001 3d avenue.

New York, N. Y.—Seager's Garage, Inc., under New York laws, with $1,000 capital; to deal in motor cars. Corporators—James

H. Seager, 287 Myrtle avenue, Flushing; Albert Seeley, 465 Fulton street, Brooklyn; Henry B. Ecerson, 255 Sanford avenue.

Chicago, Ill.—Hanway Starter Co., under Illinois laws, with $75,000 capital; to manufacture motor starters. Corporators—John D. Rourke, Isadore Goldstein, Robert S. Nicholson.

New York, N. Y.—Stegman Motor Truck Co. of New York, Inc., under New York laws, with $25,000 capital; to deal in motor vehicles. Corporators—John G. Anderson, 780 Elton avenue; James G. Smith, 615 West 162nd street; John A. Kent, 140 West 104th street.

Brooklyn, N. Y.—Brooklyn Auto Top & Supply Co., under New York laws, with $5,000 capital; to manufacture motor car tops and covers. Corporators—Beatrice H. Matton, 442 Halsey street; Jacob Seigel, 23 First avenue; Edgar E. E. Chinock, Jr., 116 Monroe street.

New York, N. Y.—Snowden Rubber Co., under New York laws, with $1,000 capital; to manufacture and deal in tires. Corporators—Wesley T. Snowden, 15 St. John's Place, Brooklyn; Edward J. Landgraff, 213 Court street, Brooklyn; A. Bidley Galitzka, 135 Neptune avenue, Brooklyn.

Recent Losses by Fire.

Harvard, Ill.—Manly Bros., garage destroyed. Loss unknown.

Springfield, Ill.—Capitol Auto Co., South 4th street, garage and 17 cars destroyed. Loss, $50,000.

Kansas City Mo.—Searchlight Gas Co., plant destroyed by gas explosion and fire. Loss, $40,000.

Detroit, Mich. — Rock's Automobile School, 1300 Woodward avenue, garage damaged. Loss, $6,000.

Philadelphia, Pa.—Morris Goldstein, 1413 Race street, garage and repairshop destroyed. Loss unknown.

Pittsburgh, Pa.—Pioneer Motor Car Co., 5864-66 Baum street, damaged. Loss, $30,000. Iron City Tire & Repair Co., 5868 Baum street, smoke and water damage. Loss, $500. Eddie Bald Automobile Co., slightly damaged.

Changes of Capitalization.

Detroit, Mich. — Williams Bros. from $150,000 to $300,000.

Detroit, Mich.—Monroe Body Co. from $500,000 to $420,000.

Chicago, Ill.—Radal Auto & Garage Co. from $1,000 to $100,000.

Davenport, Ia.—Iowa Auto & Tire Co. from $25,000 to $100,000.

Chicago, Ill.—Chicago Bearing Metal Co. from $500,000 to $1,000,000.

DURANT FINALLY SETS $1250 AS PRICE OF LITTLE "SIX"

Not So Low as First Anticipated but Still Lowest on Market—Specifications of the New Comer Are Impressive.

Although the price of the Little "six" is not to be "$1,000, fully equipped," as was announced soon after the advent of the Little "four," its price is to be so very little more than that sum as to cause more than one person to sit up and take notice; it will sell for $1,250, and the equipment will include, in addition to a top and windshield, a Gray & Davis electric lighting system and an engine starter. The Little "six" is virtually a smaller edition of the smallest Chevrolet "six" and is produced by the Little Motor Car Co. of Flint, Mich., under the direct supervision of W. C. Durant, who also controls the destinies of the Chevrolet Motor Co., these two companies forming the nucleus of his $65,000,000 Republic Motors Co. of Delaware, which still is in active process of formation.

The Little "six" is quite different from its immediate predecessor, the Little "four," and will be built in but one style—a five-passenger touring car of exceptionally modish lines. It will mount an L-head motor measuring 3¼ x 5 inches, with the cylinders cast in two blocks of three each and the transmission elements will include a leather faced cone clutch, three-speed selectively operated Covert combined gearset and rear axle and three-quarters platform rear springs; double internal expanding brakes are mounted on rear wheel drums. The wheels are shod with 32 x 4 inch tires mounted on demountable rims.

Dealer Drawn into Ownership Fight.

Names of high social connections figure in the action of Dr. Fred H. Humphries against the Pope-Hartford Auto Co., of New York City, which was discontinued last week immediately after the argument in the case had been made and it was ready to go to the jury in the Supreme Court for New York county. The decision to discontinue was made following a conference of the attorneys and the judge.

The action was to establish the ownership of an automobile. It had been turned over in exchange to the Pope-Hartford company by Charles Lee Bole, president of the Inward Farms, of Beal Beach, N. J., and after this transaction Dr. Humphries, who resides in Morristown, N. J., and is known as the concocter of "Dr. Humphries' Specific," said the car belonged to him. He replevined it and then, to establish ownership, was compelled to bring the action. His decision to discontinue the fight automatically cancels his claim on the car in dispute.

General Vehicle With $10,000,000.

To facilitate far-reaching plans which are afoot, the General Vehicle Co., of Long Island City, N. Y., has been dissolved and has been succeeded by The General Vehicle Co., Inc., which was incorporated this week, under the laws of New York, with an authorized capital of $10,000,000. The new corporation, of course, will take over the property of the old company, and, so far as can be learned, there will be no change of officers or policies. The company now is erecting two additions to its plant in Long Island City, which will cost approximately $750,000, and it is known that it has in view a very considerable enlargement of its branch house system.

Dealers at Law Over Stock Transfer.

Disagreement over a stock deal is the basis of a legal action instituted in Duluth, Minn., by William Buchanan against the Duluth Automobile Co. Buchanan asks for $412.25, claiming that he transferred 30 shares of the company's stock to the company on January 29 last, for which he was promised $2,000. Part of the payment, he states, was to be the assumption of an obligation of $1,487.75, due before August 1, and the remainder to be in cash. He claims to have received but $100 in money.

Ward to Represent Father in King.

Artemus Ward, Jr., of New York, whose father recently purchased the assets of the King Motor Car Co., of Detroit, will directly represent the Ward family in the management of the company. The other department heads are as follows: J. G. Bayerline, manager; T. A. Bollinger, factory manager; T. P. Chase, engineer; J. B. Siegfried, purchasing agent; W. L. Daly, sales department; J. Mohardt, division superintendent.

Whitesides Seeks Support for "Ironsides."

V. F. Whitesides, designer and superintendent of the Whitesides Commercial Car Co., of New Castle, Ind., has relinquished all connection with that company and is seeking to enlist Indianapolis capital in a new truck which he has designed. He already has chosen a name for it—"Ironsides."

Michelin Adding 46,000 Feet to Factory.

To take care of its ever increasing trade, the Michelin Tire Co. is adding a concrete wing to its already immense plant in Milltown, N. J. The addition will afford 46,540 square feet of floor space.

STATISTICS THAT MAKE FOR MISCHIEF.

He was a wise man who declared that there are lies, damned lies, and statistics. Usually statistics serve more useful purposes than the other varieties but frequently they are more far-reaching in their mischievous effects. However that may be, statistics bearing on the number of automobiles in use long have proved a fruitful field for the ready reckoners.

For instance, one of our esteemed contemporaries, which is much given to that sort of thing, has compiled what may pass as a census, which shows that on October 1st last there were in use in the United States no less than 990,738 automobiles. It devotes four pages to a more or less interesting array of charts to support its assertions.

Cars of Which No Account Is Taken.

Despite the formidable presentment, however, the statistics are as undependable as most of those that previously had seen the light. For little or no account is taken of cars registered by non-residents, or of the large number of used cars which pass to new owners in the course of a season, nor of the motorcycles which are included in the registrations of several States, Indiana, among them.

In New York, for example, 103,000 cars, in round figures, had been registered up to October 1st. But even in New York, which is conspicuously and generously lax in the enforcement of non-resident requirements, there were no less than 3,900 registered plates issued for such "foreign" cars, and the number of duplicate registrations representing used cars is beyond estimate.

Records Do Not Permit Correct Estimates.

In Massachusetts, which was credited with approximately 49,000 cars, 900 are represented by non-residents and, according to a semi-official estimate, 7,000 by used cars which had changed owners. In New Jersey—which is keen for non-residents' dollars—in Rhode Island, Connecticut and Pennsylvania, to cite other instances, the public records are not kept in such a manner as to permit even the authorities to estimate the number of non-resident or other duplicate registrations that are carried on their books.

Taking all things into consideration, however, it is fairly safe to say that the estimate of 990,738 cars, which, according to the ready reckoners, represents a total of 226,670 new registrations during the first nine months of 1912, is between 100,000 and 200,000 outside the truth.

Wide Elasticity of Factory Outputs.

Even more pernicious than these figures, however, is the estimate of the 1913 output, compiled and widely heralded by a publication which styles itself an "automobile trade journal." These statistics, which scarcely are worthy of the designation, place the output at the staggering total of 627,650 cars, which, according to the publication responsible, will represent an increase of more than 300,000 cars.

Although it is notorious that factory outputs are almost as elastic as are the circulations of many publications, the statistician apparently has accepted as gospel truth figures that had been supplied by factory romancers. Without citing specific instances, it is well known that in the case of several manufacturers whose names are given, the estimates are from 33 1-3 to 50 per cent. higher than those represented by contracts placed for material or equipment. In several cases, the factories named are of such proportions that not by the wildest stretch of the imagination could they produce the number of cars credited to them, and in at least one instance a factory which is set down as preparing to produce 3,000 cars next year, actually is preparing to go out of business.

Enormous Outputs Cause for Grave Concern.

Some of these things are so apparent on their face, and others are so readily learned by those in real touch with the trade, that the guess of an output of 627,000 cars is so wild and so exaggerated that the wonder is that any publication should be ready to stand sponsor for it. If such an enormous output really was in prospect, or was possible, the industry would have cause for grave concern. Happily, the production is not likely to more than approximate two-thirds of the exaggerated estimate. To the unknowing, such statistics may appear wise, but their effect on the trade itself is most mischievous. Not only do they furnish food for dreamers and schemers, but they are likely to throw off their balance the more guileless manufacturers of parts and accessories who share the belief that figures do not lie, and thereby cause needless over-production in certain branches of the industry; and over-production is the disease most to be dreaded in any commercial pursuit.

PROPOSE ASSOCIATION TO BACK AUTOMOBILE RACING

New York Dealers Endeavoring to "Save" the Sport in Vicinity of Metropolis—$10,000 Corporation Under Way.

Whether or no automobile manufacturers' support of racing eventually is withdrawn entirely, which, in view of present conditions, seems not unlikely, the sport in and around New York City at least is not likely to suffer very seriously, for the dealers themselves have stepped into the breach and have thrown out a life line to keep the sport alive; which sort of local support is, in the opinion of many persons, the truly logical solution of the situation.

The life line, figuratively speaking, is a dealers' association which it is proposed to form in order to keep the automobile conspicuously in the public eye and, not without reason, racing and other forms of contests have been chosen as the best means to the end. According to "feelers" tried out by the Motor Dealers' Exhibit Co., in the form of the two last racemeets held on the Brighton Beach race track in Brooklyn, the public not only is interested in automobile racing as a sport but is anxious for it, and for this reason it is proposed that the dealers revive it in such a way that the profits accruing to the promoters will be merely incidental to the benefit derived from the publicity gained.

The association which it is proposed to form, for which purpose a meeting was held at George Rector's hostelry yesterday (Wednesday) afternoon, is virtually an outgrowth of the Motor Dealers' Exhibit company, which comprises George Robertson, W. C. Poertner and Ed. McShane, and which was formed for the specific purpose of promoting racemeets within the Metropolitan district. At the meeting were gathered about 30 prominent New York dealers and at times enthusiasm ran high.

According to tentative plans, there will be formed a stock company with $10,000 capital divided into 100 shares valued at $100 each, no one make of car or accessory to be represented by more than three shares: a fixed percentage of all profits will be placed in a reserve fund and the balance disbursed from time to time in the form of dividends. The meeting, at which J. C. Wetmore presided, was called primarily to discuss ways and means, and substantially the only business that was conducted consisted in the appointment of a committee of seven, the duties of the committee to be the drafting of a constitution and by-laws. The committee appointed consists of Geo. Robertson, W. C. Poertner, Ed McShane, Burton Brown, J. C. Nichols, E. Lascaris and I. M. Uppercu. The committee was instructed to report on Monday afternoon next at 3:30, when it is expected that the association formally will be launched.

Little Known Features of Well Known Cars

As a rule, it is only when a prolonged journey is in prospect that the spare tire complement is increased to three spares; generally but two, or a single extra, are carried, and on most cars provision is made for carrying only two With the Columbia coupe shown in the photograph, however, provision has been made for carrying six

COLUMBIA TIRE CARRIERS.

spare tires, which means, if demountable rims are used, that even if the motorist should be so very unfortunate as to rupture all four shoes, but very little time need be lost, and the car still would be as well fortified against "tire luck" as the average car.

As can be readily gleaned from the illustration, the running board on either side is cut short and the metal which forms the rear mudguard is continued in a graceful inverted curve until it meets the shortened running board. Three tires fit snugly into this dip and are held in place by tire irons positioned on the body and on the mudguard. The tires are located far enough back to prevent interference with the door.

Exactly reversing the order of things, the Thomas B. Jeffery Co this week removed from West 62nd street, New York City, to 1759 Broadway, which previously was occupied by R. M. Owen & Co., the Reo distributers. Owen & Co. have removed to 19 West 62nd street.

November 16-23, Atlanta, Ga. — Second annual show of the Atlanta Automobile and Accessory Dealers' Association in the Auditorium and Taft Hall.

November 26-30, Grand Rapids, Mich.—Fourth annual show of the Grand Rapids Automobile Dealers' Association in the Klingman Exposition Building.

December 2-3, Chicago, Ill.—Annual meeting of the American Automobile Association in Auditorium.

December 7-22, Paris, France — Paris Salon.

January 4-11, Montreal, Can.—Annual automobile show in the Drill Hall and Armory, under the auspices of the Automobile Club of Canada.

January 6-11, Cleveland, Ohio—Cleveland Automobile Show Co.'s exhibit in the Central Armory.

January 11-18, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Pleasure cars only.

January 20-25, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the First and Third Regiment Armories.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

January 27-February 1, Detroit, Mich.—Detroit Automobile Dealers' Association's Show in the State Armory.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Pleasure cars only.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

February 10-15, Minneapolis, Minn.—Minneapolis Automobile Show Co.'s show in the National Guard Armory.

February 17-22, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in Convention Hall.

March 3-8, Pittsburgh, Pa. — Pittsburgh Automobile Dealers' Association's show in Duquesne Garden.

March 24-29, Indianapolis, Ind.—Indianapolis Automobile Trade Association's show.

Solutions of The Used Car Problem

In Competition For

Motor World's Cash Premiums of $50, $25, $15 and $10 For the Four Best Articles Dealing With the Subject.

By GEORGE K. WADSWORTH, Cleveland, O.

The solution of the used car problem will effectually end the greatest handicap to the automobile industry today. It cannot be denied that competition has become so keen and so many purchasers buy "propositions" instead of automobiles, that a dealer has no chance whatever to close a deal involving a "trade" unless he over-allows on the used car, and the one making the best allowance usually lands the order, regardless of merit.

In any community large enough to support representation of several cars, an ideal plan is suggested as follows:

A corporation is organized to engage in the business of buying and selling used cars, to be financed and controlled by the dealers and factory branches, doing a retail business in the community. This company is to be managed by a competent and disinterested man, who is capable of appraising the market value of any used car, and the capital stock to be an amount sufficient to conduct the business without embarrassment. The company would then be a "clearing house" operated for the mutual benefit of its stockholders.

The owner of a used car, negotiating for the purchase of a new car would be referred to the "clearing house," where a price would be set on his car and a credit memorandum for the amount issued to him, to be honored by any dealer or factory branch for a like amount, in part payment for a new car. The purchaser would then have the option of accepting the value or selling his car privately and paying cash for the new car.

Monthly settlements could be made to stockholders on cars sold, and quarterly or semi-annual dividends declared from profits.

The advantages of this plan are manifold:

1st. All competitive bidding on a used car will be abolished.

2nd. The practice of buying a "pile of junk" for the purpose of turning it in on a trade will be abolished.

3rd. Used cars will find ready sale because they will be priced according to actual value and not according to allowance, as at present.

4th. Salesmen can concentrate all their efforts on the sale of new cars, doing away with the necessity of making two sales for one.

5th. Dealers will make the full legitimate profit to which they are entitled on every sale.

Various modifications of this plan and details of operating it would have to be made to adapt it to local conditions. The automobile industry is of such dignity and proportion that it can well afford to give serious thought to the abolishment of its greatest evil—the "used car problem"—and the above plan affords an absolutely satisfactory solution of the same.

By ALBERT STRITMATTER, Norwood, O.

Used cars should be regarded as a means to the sale of new cars, not as an evil. We cannot expect to sell new cars to owners of old cars—except as we are able to see that some one else gets the old cars. The best buyers of used cars are men who cannot afford to pay the price of new cars, and the best buyers among these men are those who can used the used cars in their business, as, for instance, the young real estate agent.

If the dealer thinks certain lines of business—the real tstate business, for example—afford the best means for disposing of second-hand or used cars, he should circularize those businesses. Otherwise he should use lines or display ads. in local newspapers.

It is poor policy to display used cars in show windows, to the detriment of new cars, or to display them at all unless the used car is in good, presentable shape. "Trade in" value should be such as will permit resale at a profit. Used cars should not be a basis for cutting price on new cars.

THE SCIENTIFIC DEALER.

Study and Thought That Make for Better Buying as Well as Better Selling—— Cold-Bloodedness as an Asset.

Scientific management is a term you hear much about nowadays, and you are going to hear much more of it, because it is becoming more and more a factor in manufacturing and retailing operations. Competition, and the stern necessity for producing a better article at a lower price have brought it into being.

Orderly Classification of Facts.

To some merchants this talk about "scientific management" sounds like "highbrow" stuff. And yet some of the very men who allude to it in that way are employing scientific methods in their business, though they do not know they should be called scientific.

The science of anything is nothing more nor less than the orderly arrangement or classification of all the known facts in connection with the same. While that sounds simple you can see at once that it is a mighty big job but supremely worth while; because once you classify all the known facts in connection with your business and arrange them in orderly sequence you have accomplished something that brings you out from the ranks of guessers into the ranks of those who not only **know,** but know they know.

The automobile dealer who is working scientifically does not bump his head against a stone wall before he finds out that he is doing the wrong thing. He does not delude himself with dreams and hopes and other intangible things; he studies the facts and gets to the rockbottom of things. Every move he makes is based on knowledge.

Such a dealer will not, for example, take on a line of cars just because the salesman wants him to, or because some other dealers in his town are selling similar lines with success. He takes on a line only when he knows there is a market for it. He goes over his whole field. He studies the savings bank deposits per capita. He finds out the exact number of cars in his territory in use. He gets a line on the age of these cars. He doesn't carry this in his mind; he puts it on paper. He studies the industries of his locality; the tendencies of the people; their habits of spending, and makes his selection of a line and his investment in his buildings on the basis of known facts.

Factory Attitude a Big Factor.

The scientific dealer picks a car that he knows represents value. He satisfies himself not only of the ability of the factory to make deliveries when wanted, but he also investigates its method of handling its customers. Does it treat them right, or does it carry a chip on its shoulder for every dealer who visits the factory? Is its sole object to get rid of so many cars or are they sincerely and helpfully interested in him and his success? Are they so eager for business that they will let him take on the line when their own good sense tells them he is not the man? That he has not the facilities, nor the capital to handle it?

Concerning the Selection of Cars.

In other words, are they building permanent business relations or do they expect to do business with him merely for a season during which they will squeeze him dry while establishing the sale of their cars in his locality? What sort of sales help will the manufacturer give him? And last, greatest and most important of all, does the car represent real, tangible, dollar-for-dollar value? Is it built right? Are the "bugs" worked out of it? In other words, can he afford to put his good money and good name back of it, confident that it is not going to cost him all his sales profits to make good? If the car cannot answer every question, he won't touch it, even if all the other answers are satisfactory.

The scientific dealer knows that if the factory is not building the best kind of car that can be built for the money, and a good, reliable car at that, he cannot afford to sell it; further, he knows that salesmanship is nothing more nor less than the teaching of values; and how can he teach a customer that the dollar-for-dollar value is there unless it is there? True, he might "get away with it," but he knows that real success is built on fundamental honesty and therefore unless the value **is** there so that it can be seen and shown, he might just as well forget it.

Thus, while he concerns himself with the factory and its policies, so that he "knows where he is going to get off," he concerns himself most with making sure that the value is in the car.

Part Played by Imagination.

The scientific dealer is cold-blooded; he does not deal with sentiments; he deals with business facts. The factory salesman may tell him that a certain car would be a wonderful seller in his town, but that would not convince him. He has all the facts concerning his terrirtory tabulated; he knows fairly accurately what every other dealer is doing. Therefore he does not imagine he is going to do any bigger business than he knows he will do.

He uses imagination in his business, but does not let his imagination govern. He knows what the business possibilities are and he knows he will get only the share that his car and his efforts earn for him. He plans accordingly, but always along the line of known facts.

Looking Into Service Costs.

The scientific dealer knows in advance what his "service" is going to cost him. He does not wait until the end of the year only to discover that his free service has exceeded his sales profits and encroached on his income from oil and gasolene. He sets a free service limit and lives up to it. It is

Digitized by Google

enough properly to take care of the cars he sells, but not so much that it seriously impairs his profits.

He does not cut prices. He knows that cutting prices is throwing away profits that he absolutely must have in order to exist and take care of his trade. He knows that a cut price discounts every car he has on his floor or on order; he does not let others set his prices or his profits. He does not need to, because the value is present and he can prove it to his worst competitor.

Common Sense and Facts in Selling.

The scientific automobile dealer is not a business marvel; he is simply a man chuck full of common sense, who has a head and uses it. He does well and thoroughly what another man half does; he makes his moves on the basis of real information and facts instead of on the basis of "thinks." He knows that if he knows what he wants to know he can find it out; someone has the information and he can get it. If no one else has it he gathers it for himself.

But always the scientific dealer puts knowledge and sorting of facts first—and you cannot stop him from being successful. There are going to be more scientific dealers to-morrow than there are to-day. And that means that there are going to be still fewer near-successes retailing automobiles.

SOME WIDEAWAKE MAXIMS.

Most factory ads are good; but good ads are no good unless they appear in the papers.

If you think your competitor is making a sensation with his new line, don't worry. Get busy.

There are no "off" seasons for the dealer who works. Seed sown in winter can be harvested in spring.

Don't make announcements of new cars till you have at least one demonstrator. It's like inviting people to a feast and overlooking the food. No chance of cashing in.

SHOW WINDOW INVESTMENTS

Window Space Costs Money and Should Be Made to Yield a Return—Suggestions for Autumnal Decorations.

If a dealer contracted for space at the county fair he would not hesitate to spend at least a modest sum to render it attractive, and yet, it is more than likely that only a small portion of the fair attendance would be possible customers. Nevertheless it still would be good business to make such an investment, on the basis that "what is worth doing, is worth doing well."

Getting the Value of Show Windows.

It is wise, therefore, for the automobile dealer who occupies a store to consider that he is paying for the privilege of having a display window; in other words, that a display window actually represents a certain portion of his rent investment. As it costs money, why not use the window and make the exhibit as attractive as possible? And what will make it more attractive than a display a little out of the usual and in harmony with the spirit of the season?

With the arrival of Thanksgiving, for instance, comes an opportunity for making a special Thansgiving window display that should be seized eagerly by the alert, business-seeking automobile dealers.

Incorporating the Thanksgiving Spirit.

Here are two suggestions:

(1) Have windows washed and made spotlessly clean and decorate them with sheaves of corn, pumpkins, apples, etc., grouped artistically along base of window. Purchase colored tissue paper and cover electric light bulbs with it to give a soft, orange-yellow effect. Then move the car well up towards the window. If the car has electric lights all lamps can be covered inside with orange paper and the light turned on after nightfall. The effect will be striking. This is thinking and to use their imagination. Every dealer has not the same materials with which to work, consequently no suggestion can be made that will exactly meet all conditions, but there is no dealer who cannot do something, if he is but possessed of the will to do it.

Naturally, a neat, artistic sign stating that "All users of ——— cars are numbered among the thankful ones" or bearing some other thanksgiving thought would not be out of place.

"Autumn Hunting" Another Scheme.

(2) Secure the co-operation of the window dresser for the local clothier and make a combined hunting and Thanksgiving scene. Use corn sheaves for background, strew quantities of the material over the floor and distribute a few pumpkins here and there. Then have lay-figures dressed in clothing furnished by the local clothier, seated at wheel and in tonneau with guns conveniently placed, etc. Any good window dresser, if given a few automobile rides gratis, undoubtedly would be glad to cooperate with the local dealer towards getting up an artistic and well planned display.

The point is, that something out of the usual will attract more than usual attention, create comment and not unlikely secure notice in the local papers, all of which is good advertising.

WATCH THE WASH AND POLISH.

It is trite to say that it is "the little things that count," yet the truthfulness of the saying is its own eternal commendation.

A poor job of washing and polishing has driven many a car owner away from a garage, when a good job might have kept him there and ultimately led up to the sale of a car.

Perhaps washing and polishing doesn't pay, but it is certain that it pays least when indifferently done.

RIVALING DRYGOODS STORE IN WINDOW DISPLAY

Methods of "Touching Up" and Decorating That Draw in Other Lines Applicable in Automobile Salesroom—Dealer Who Attracted Attention to His Cars and How He Accomplished It.

ATTRACTIVE TREATMENT OF COMPARATIVELY SMALL WINDOW BY THE FRANKLIN REPRESENTATIVE IN CLEVELAND

Pushing a car into a front window and letting it stand for the inspection of those who care to stop to look is one form of window display; but almost any dealer will admit, if the matter is brought to his attention, that a little "fixing up" will make the display more attractive and cause many more people to look at it. Adding real effectiveness to display by the exercise of a little ingenuity and decorative skill, however, has been ably demonstrated by several dealers representing the Franklin Automobile Co. The accompanying illustration is a fair sample of the displays that have been worked out in a number of cities by these dealers.

The view shown represents the window of the Franklin Automobile Co., of Cleveland, O., of which C. H. Rockwell is manager. The window itself is not over large and the one car of itself would be little noticed; Rockwell, however, elevated the car to the level of the bottom of the glass and completely enclosed the window space on the top, bottom, sides and back with an inexpensive but neat white cloth, arranged in folds. Autumn leaves and tree branches with a fern or two were placed in just the position and quantity to add a touch of autumnal atmosphere to the scene. A vase of cut flowers and a bow of white ribbon placed on the running board at the front door served as an attractive break in the expanse of polished body and detracted nothing from the car's general appearance.

Viewed from the street, the entire effect was not unlike that of a large picture, and when the concealed window lights were turned on at night every detail stood out strongly against the white surroundings. The display was altered each week, a new car or a new arrangement preventing the loss of effectiveness because of monotony.

Exploding Tube Injures Two Men.

Two members of the Hartsdale (N. Y.) fire company were severely injured Monday last, 18th inst., while repairing an inner tube of the company's chemical engine. Walter Townsend and Harold Drury, the men in question, had repaired the tube, replaced the tire and blown it up and were putting on the rim when the tube exploded and the heavy rim was thrown with great force against the firemen. Drury's skull was fractured and Townsend was cut on the head and leg.

"KEEP POSTED ON TRADE DOINGS," SAYS REILLY

Meets New Salesman in Sales Manager's Office and Criticizes Former for Lack of Trade Knowledge—Declares Such Information Path to Higher Things and Its Lack Inexcusable.

"Say, Jim!—Hello, Reilly! How are you, Mr. Lawall?—What's the Leonard transmission patent?" questioned the impetuous Advertising Manager as he rushed into the Sales Manager's office and blurted forth this inquiry, interspersing it with salutations to Reilly and the new traveling representative, Mr. Lawall, who was about to enter the company's service in a hitherto not over productive terrirtory. The Sales Manager kept right on signing letters and answered, at the same time:

"WHERE'D YOU GET THAT ALLEGED AUTOMOBILE SALESMAN?" DEMANDED REILLY

"Leonard transmission patent? Why? What are you going to do—buy it?"

Advertising Man Seeks Trade Information.

"Hardly" answered the advertising man. "I got into an argument with one of the engineers as to the desirability of four-speed transmissions and told him I thought one would make our cars more popular than they are. He said a four-speed was good but that he wouldn't want to go too deep into it until the Leonard transmission patent had been adjudicated. I remember reading something about it in some trade paper, but can't recall just what or when."

"It's the patent that is claimed to cover a transmission with direct drive on an intermediate speed," explained the Sales Manager, "such as ordinarily is the case in present-day four-speed gearsets where there is an indirect drive above direct. A man named Leonard owns it; he is a manufacturer near New York City. He now has suits in the courts and is endeavoring to prove that his claims are good."

"Thanks; I knew you'd know," was the advertising man's comment, as he departed as quickly as he had entered.

"Is that patent any good?" asked the new traveling man, after the door had closed.

"Can't tell until its adjudicated," answered the Sales Manager.

"Dyer made good on his," interposed Reilly.

"Who's Dyer?" asked Lawall.

"Oh, that's a long story," explained Reilly, "but his patent covers the sliding transmission that we are using. And about the Leonard—that story was published only recently." As he talked he had been looking through a pile of trade papers on the Sales Manager's table, and after a moment he handed Lawall a Motor World of Sepember 19, the first news page exposed. There in large type was the head: "Leonard's Transmission Patent Assumes Increased Importance."

Lawall read it without comment. Then he looked through the paper, tarrying for a glance at several other pages.

Knowledge Mine Revealed to Salesman.

"Pretty good stuff!" he at length exclaimed. "It makes me think of something I want to ask the Advertising Manager; pardon my leaving," and laying down the paper, he went to interview the advertising man.

"Where'd you get that alleged automobile salesman?" demanded Reilly, as soon as the lessening sound of footsteps indicated that this question might safely be asked.

"Why? Don't you know him?" asked the Sales Manager. "He has been with the Link company, but wants to get outside. We needed a man, and I thought he could do the work."

"Did you try to find out whether he was capable before you hired him? Did you ask him any questions about the trade, or did you just take his word for it?"

"He's all right," defended the Sales Manager. "He's been pretty busy closing up over there and probably skipped a few issues of the trade papers."

"Skipped a few is good!" ejaculated the little dealer. "I'll bet I can pick out any paper in the stack and stick him on something on the first page of any one of them."

"Well, what if you can?" was the Sales Manager's challenge, as he flipped the last letter into the mail basket, leaned back in his chair and, with his pipe in hand, began to mine tobacco with one finger from the bottom of a tin box.

Reilly Criticizes Unposted Tradesmen.

"I don't know that it would get me anything if I did stick him," replied Reilly, "but I guess it would give you some insight into his interest in the trade. So many alleged salesmen and managers drift into my place who don't know what's going on in their own business that I get irritated when I try to talk to them. I've often wondered how some of them hold their jobs. Several years ago a man who had made his pile and who had retired told me that before he

Digitized by Google

hired men he always asked a few questions to discover what trade papers they read and how well posted they were concerning their business. He said it was an unfailing measure of their interest and enthusiasm, and I believe it. If two men are after any job I ever may have to fill, I'll give it to the man who proves that his interest in the business is real and not limited to the catalog or salary-grabbing sort. And how can a man learn more about his trade than by reading his trade papers?"

"Pretty Good" and "Real Good" Types.

"That's all right," agreed the Sales Manager. "I read them; but lots of pretty good men don't."

"You've sounded the right note there," retorted Reilly. "'Pretty good' just about

"BUT I DO SAY THAT ANY MAN'S A BETTER MAN IF HE KEEPS POSTED"

classifies that type. That's why they are only 'pretty good' and never get to be 'real good.' Don't you know that this 'pretty good' man is kicking away the ladder on which he could mount to a higher level? Don't you know that he can't be of full value to himself or to his employer, unless he follows the doings and opinions and suggestions of the trade? And don't you know that the only way such knowledge can be obtained to-day is through the trade papers? Here is Lawall, getting I don't know how much a year and hoping to get more some day, while all the time he is overlooking his one best bet. He thinks he's too busy; they all say that.

Examining the "Too Busy" Excuse.

"How some men get time to eat or sleep is a mystery to me. I'll bet that Lawall, if you asked him why he doesn't read the trade papers, will trot out a string of good excuses a mile long and the burden of every one will be 'too busy.' He doesn't stop to think that reading them is as much his duty as are half of the other things he does in the course of a day. He can't even offer the excuse that he doesn't want to pay for them, for they are practically thrust under his nose by his employers, and every good dealer he runs across in his territory has one. One evening a week, that he probaby spends reading fiction or playing pinochle, would give him a wealth of trade information—even one hour would help him; but this 'busy man' puts fiction above business.

"It certainly gets me going to see the attitude some men take. They are like some students in a lecture course in school; they can get past with a minimum effort and attention to what is going on and believe they are getting along as well as the man who studies. Some day, however, they will be called upon to wonder why the other man, with whom they traveled side by side, suddenly forged ahead. The reason is that he was onto his job and took advantage of the opportunities offered. With the man who keeps informed on his trade or profession, opportunity doesn't have to kick at the door.

"I don't mean that a man should take every trade paper and read every line in it; that's too much, and some of them aren't worth reading. They're nothing but a bush that some enterprising chap plants on which to raise a crop of advertising. The good ones are worth looking over, and even if a man doesn't have time to read everything in every one of them, he can gather the gist of what they contain and read the parts he should read at any sacrifice.

"Take that Leonard transmission patent story: it's a sure thing you've got an engineer who reads the trade papers. And I'll bet you one large 'highball' that he will get along; I don't even know who he is, either. Lawall ought to know as much about such things as any engineer should know. The moment he ran through the paper, you noticed it gave him an idea or reminded him of something he ought to do or might do. Doesn't that prove something?

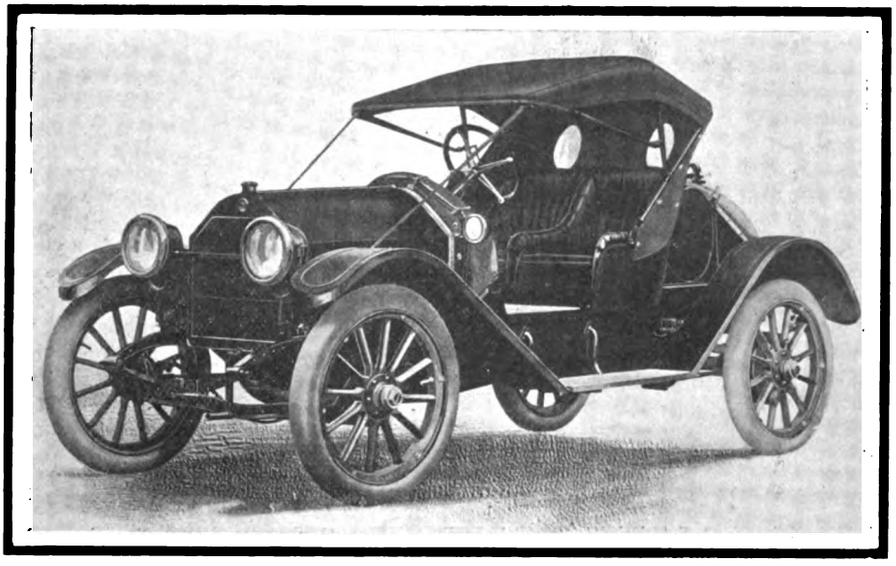
Interest That Lies in Trade Papers.

"I have a lot of old friends in the trade and I keep pretty good track of them through the trade papers. You'll be surprised how well acquainted you'll get with people you never knew before and never saw. New dealers that I know or know of bob up right along, and quite often I read where one of my old-time friends has been pushed off the boards. The big patent litigation suits are interesting, and some of them will surprise you. This Leonard story gave me a jolt. I always supposed anybody that wanted to could build a four-speed transmission, but it seems that some of them are in for a little trouble before it is settled. There's this about it, too: when you find a trade paper that contains the stories of other men, as to how they conduct their business, read these stories; the interchange of ideas is valuable. Your own idea generator will develop amazingly. I am not yelling for any particular paper or urging a man to subscribe for a bunch of them, but I do say, and say it out loud, that any man's a better manager, or salesman, or dealer for the reading of any of the good ones.

Made Employe Study Trade News.

"Oh, I mean it, Jim," interjected Reilly, as the Sales Manager looked at him quizzically. "I haven't a damned bit of patience with the fellows who set up the 'I haven't time' cry. They are—well, never mind. They are not truly interested or enthusiastic about their business, anyway. That goes! I don't care how good they are or how much money they draw."

"But what would you have me do—set Lawall down at a desk and tell him to read trade papers for an hour?" interrupted the Sales Manager.



"I don't know what you'd do," was Reilly's final statement, "but I'll tell you what I do. When my salesman first came to work for me I used to tell him the trade papers were his catechism and told him reading them was a part of his job. I used to ask him questions, too, just to see if he was studying his catechism. It wasn't long before I had a pupil that studied for the love of it."

INCREASE OF EQUIPMENT CHIEF CHANGE IN MARION

Same Chassis and Same Three Models Constitute the Line—Marion Cars Now in Their Tenth Year.

For the coming season the products of the Marion Motor Car Co. of Indianapolis, Ind., will consist of three body styles mounted on two chassis which are powered with four-cylinder motors rated at 40 and 48 horsepower, respectively. As heretofore, the three models are a moderate priced, medium sized touring car and the roadster which at the time of its introduction last year was styled the Bobcat, both being mounted on the smaller chassis, and a large touring car, which is mounted on the 48-horsepower chassis.

MARION "BOBCAT" ROADSTER WHICH SELLS FOR $1,425

In common with so many other manufacturers whose products have proven eminently successful over a long term of years—Marion cars are in their tenth year—the Marion company has found little reason for altering designs to any great extent and, instead, has contented itself with materially increasing equipment, which, in latter day automobile language, may be taken to mean the addition of electric lights and engine starters, and making a few more or less minor changes calculated to increase smoothness of operation and render easier the action of the cars in general.

Thus, for instance, body lines have been slightly altered in order to produce a more harmonious exterior appearance, which has been enhanced in no small way by the addition of a deep cowl over the dash; the tool boxes have been taken off the running board and placed in a less conspicuous position; the chassis has been lowered 1¼ inches, permitting easier entrance to the tonneau and increasing stability; new English steel springs have been substituted for the older style, thereby increasing the easy riding qualities of the cars; the brake cams have been enlarged to increase the efficiency of the brakes; the wood trimmings now are mahogany; and the steering wheel is fluted, of the positive grip type, with friction instead of ratchet controlled spark advance and throttle levers. Briefly, these are the only changes which have been made in the three models.

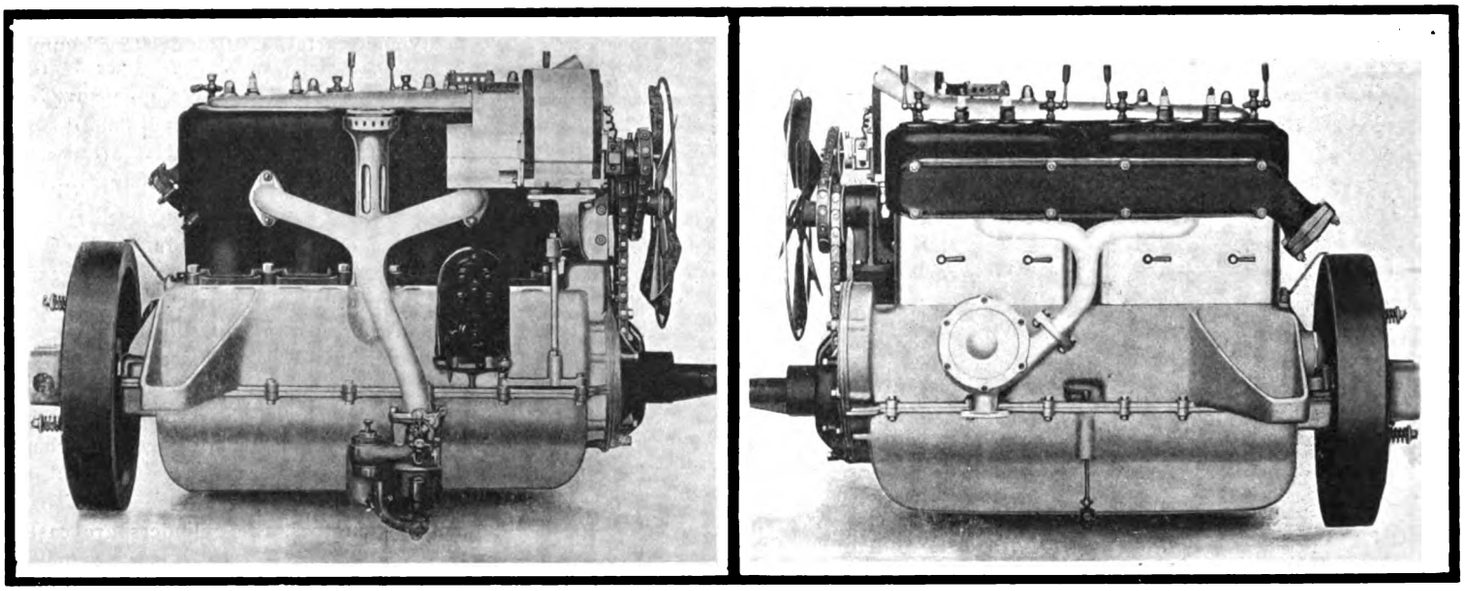
Except for a slight difference in size commensurate with the difference in power, the two touring car models are quite similar in appearance. Model 37A, which is a five-passenger car mounted on the 40-horsepower chassis, is a straight-line creation in which the lines are unmarred by unsightly projections; door handles and latches are inside and the spare tires, carried on demountable rims, are relegated to a position of comparative obscurity at the back of the tonneau. The finish is in Brewster green with nickel plated trimmings. Model 48A, as its designation serves to indicate, is the 48-horsepower touring car. Like the other, it accommodates five passengers quite easily, with plenty of elbow and knee room. Its lines are almost exactly the same is the lines of the smaller car. The Bobcat roadster is designated model 36A and has been designed to fill the demand for a speedy two-passenger car with the maximum of comfort consistent with lightness, substantial construction and speed. It is geared slightly higher than the model 37A touring car, though otherwise exactly like it in chassis details, and is capable of a speed of more than a mile a minute. Like the others, its trimmings are in nickel plate.

All three models are listed completely equipped, the smaller touring car at $1,475, the larger one at $1,850 and the Bobcat roadster at $1,425. In addition to the usual complement of top with envelope and side curtains, ventilating windshield, Warner speedometer, demountable rims, foot rail, robe rail, tire irons, tools and tire repair kit, pump and jack, the larger touring car is equipped with a complete dynamo electric lighting and engine starting system and an electric horn. The equipment of the other two models is the same, except that the electric horn is missing and the place of the electric starter is taken by a Disco acetylene starter. All models are equipped with storage batteries, the capacity of the battery supplied with model 48 being 120 ampere hours and the capacity of the batteries supplied with the other models being 80 ampere hours. The two smaller models carry Prest-O-Lite tanks, as well. In the larger model the electric starter drives the gasolene engine through flywheel gearing and a positive quick-acting clutching mechanism, the operation of starting being controlled from the driver's seat.

The motors in the two chassis are identical, except for a difference in bore and stroke. As a matter of fact, the chassis themselves are very nearly identical, the only difference being in the size of parts. In both motors, the cylinders are cast in pairs, with the valves all on the same side and carefully enclosed by means of light, removable metal covers. The bore and stroke of the smaller engine is 4 x 5 inches and of the larger one 4⅛ x 5¼ inches, from which it may be appreciated that both belong properly in the long-stroke class.

In working out the carburation scheme, cognizance has been taken of the desirability of supplying a slightly heated mixture, and to this end the valve ports have been cast with liberal heating pockets. The carburetter is attached at the opposite side to the valves with the intake manifold passing between the cylinders. Consequently, some of the heat from the cylinders is absorbed and goes to warm the gas in this way. Dual ignition is provided by magneto and batteries with a combined switch and barrel transformer coil mounted on the dash.

The lubrication system is of the constant level pump-over splash type, in which the oil is maintained in constant circulation and therefore can be used for considerable periods without replenishment or attention. Circulation is effected by a gear pump, the oil being pumped into troughs beneath the connecting rod big end bearings, whence it is splashed over the cylinder walls and auxiliary bearings. Cooling is effected by



Digitized by Google

means of a centrifugal pump, liberal water jackets and a cellular honeycomb type radiator.

Both motors are supported on the chassis at three points and incorporate the clutch, which is of the leather faced cone type with spring inserts to ensure smooth action, in a singel unit. All of the transmission elements are combined in another unit which is firmly bolted to the rear axle. Change gearsets provide three speeds forward and reverse, selectively obtained by means of the usual hand lever placed in the center of the footboard. In the larger touring model, the rear axle is of the full-floating type; in the smaller models it is of the semi-floating type.

Throughout the construction of all the models, extensive use is made of ball and roller bearings, very nearly every rotating shaft being monuted in either one or the other style of anti-friction bearing. The fan, for instance, is carried in ball bearings; in the clutch there is one annular thrust ball bearing and one plain bronze bearing; the gearsets are mounted in four New Departure double row annular ball bearings; in the 36A and 37A rear axles there are Hyatt roller bearings in the wheels and Timken roller bearings in the differential ends of the driving shafts. In the model 48A, Timken bearings are used in the wheels as well as in the shafts; the front wheels of the two smaller models run on ball bearings and those of the larger touring car are mounted on Timken rollers.

The springs in each case are semi-elliptic in rear, the wheelbases of the three models being 120 inches for the 48A and 112 inches for the 37A and the roadster. Brakes, of which each car is fitted with two sets, all are of the internal expanding variety and operate on drums 14 inches in diameter and 1¼ inches in width. The larger touring car is mounted on 36 x 4 inch tires and the two smaller ones are shod with 34 x 4 inch tires, demountable rims being standard equipment with all.

INTAKE AND EXHAUST SIDES OF MARION MOTOR SHOWING GENERATOR AND MAGNETO POSITIONS

"Heating Plug" that Assists Starting.

The application of heat to a cold motor in order to facilitate starting usually is a disagreeable process; under some circumstances it cannot be done. There is no question as to its efficacy, however, and advantage has been taken of the principle involved—that of giving the mixture sufficient heat so that it will not condense in the cylinders—in the construction of the Stalit heating plug, which just has been placed on the market by George Staats & Co., of 252 Lorimer street, Brooklyn, N. Y.

The Stalit heating plug is much like an ordinary spark plug in appearance, except that the insulating core is extended for a considerable length. In this extension is contained a heating unit which becomes hot when a suitable current of electricity is passed through it. The plug is screwed into the intake manifold, preferably an inch or two above the carburetter, and wired to the ignition or any other battery that may be on the car. By switching on the current for half a minute or a mniute before starting up, according to the chilliness of the engine, the pipe and the air in it are well warmed and a real, live, readily ignited mixture is sent to the cylinder when the crank is turned. The plugs are regularly made for 6-volt circuits.

Melted Lead for Tempering Tools.

A simple method of heating small tools and irregularly shaped articles for hardening is to immerse them in molten lead. Before they are placed in the lead, however, they should be pre-heated to approximately 800 degrees and should not be permitted to remain in the lead an instant longer than is absolutely necessary to bring them to the proper temperature.

Fine Abrasive for Contact Points.

Cuttlefish paper, which is a product similar to sandpaper save that the grain is very much finer than the finest grained sand paper, is very efficient for use in cleaning contact points of ignition apparatus, or the surface of a commutator on a starting motor or lighting dynamo. While the material is not regularly carried in stock by hardware dealers, it always can be obtained at dental supply stores.

When Small Pieces Get into Crankcase.

In case of the failure of a connecting rod bearing, or of any other trouble which is apt to result in the dropping of small particles of metal into the bottom of the crankcase, there is a possibility of the small pieces getting into the oil pump, if one is used, and interfering with the action of the check valves. The screens necessarily are of rather coarse mesh and good-sized particles can pass through. Draining out the oil and washing the case is advisable.

Gasolene for Detection of Leaks.

Owing to the peculiar facility with which gasolene will pass through openings that seem too restricted for heavier liquids, it is extremely usetul for testing for leakage. A crack that is quite impervious to water will pass gasolene, and a valve which will not leak the insidious fluid will hold compression well.

DRESSING THE WINDOWS TO SUIT THE SEASONS

How the Time, the Place and the Goods May Be Made to Attract the Man and the Money and Quicken the Market—Keeping the Window Display Ahead of the Times by Enlisting Services of the Weather Bureau.

It is an axiom of the business of selling that if the right thing is presented to the right man at the right time a sale is practically assured, without the exercise of any of the arts that enable a salesman to do business under less favorable conditions. Given this much-to-be-desired triumvirate of fortunate circumstances, and it is more than likely that the "right man" will go out of his way to buy. And one of the inferences that may be drawn from these premises is that if the right man happens to see the right thing attractively displayed in a show window or properly exploited in an advertisement at the right time, there is a strong probability that he will walk right in and buy it.

The Problem of Window Display.

The problem of the man behind the window is to pick out the right things and put them in his window at the right time. The third condition must be left to chance; but there are so many "chances" in a busy street that it is well worth while to make sure that the goods and the time are right. In other words, the window display should be suited to the season, being made up of the things most likely to appeal to a man at the time.

There is considerable evidence to prove that this matter is not given due consideration in all cases. For instance, a set of fur robes forming the most conspicuous feature of a window display on a broiling August day hardly is calculated to start a man's hand in the direction of the pocket where he keeps his money; yet it has not been necessary to stray from New York's Broadway to see such things.

Profiting by Daily Weather Changes.

Keeping glaringly unseasonable goods out of the window is not all that is necessary, by any means. As a matter of fact, the dealers in automobile accessories and supplies might very well cast observing eyes on the window display methods of the dry-goods people, for instance. Not only are unseasonable displays of such commodities practically unheard of, but they frequently keep pace, to some extent, at least, with the variations of the weather; when the rains descend, umbrellas and garments that are waterproof—more or less—are in evidence, only to be whisked out of sight when the sun shines. A tour of inspection of a dozen representative automobile accessory and supply stores, on the other hand, will reveal that most of them have their windows filled with goods that cannot exactly be called unseasonable, because they are for the most part such as are of use all the year round, but there is an absence of any distinct recognition of the current season. Also the windows are overcrowded and the variety of goods so great that nothing "stands out."

With the approach or arrival of winter there are many things that can very well be featured in window dressing, and it is a pretty safe assertion that many an old customer will be induced to enter and buy because he sees something in a window and remembers that he needs it just at this season, whereas he would pass by with an unjogged memory if he saw merely the conventional conglomeration of tools, lamps, goggles, spark plugs and cans of oil.

An Effective Instance Illustrated.

The frequent changing of a window dressing of course entails thought and labor; but window space and frontage cost money—a substantial proportion of the rent—and ought to be made to pay for themselves. There are many "pegs" upon which frequent changes could be hung, so to speak, and which would not only call attention to the momentary display, but would get people into the habit of looking into that particular window. For instance, a big, plain placard, in the center of the window space, might be inscribed as follows:

THE WEATHER.

For New York and vicinity, colder, with rain followed by snow or sleet. Sunday, fair and cold.

Looking at such a sign, one is inevitably caused to think of slippery, skiddy streets, driving sleet, chilled hands and feet and a whole train of equally disagreeable conditions. And surrounding the sign, there is an assortment of goods calculated to catch the eye, the thought and the business of one who may need anti-skid tires, covers or chains, warmly lined waterproof clothing, windshields, side curtains and other things designed to keep out the prognosticated inclemency and guard the car from its effects. The exercise of a little ingenuity will permit separate displays of each of these articles, and usually more striking effects can be obtained by such displays than by conglomerate exhibits. There also are such comforts as foot warmers, lap robes and foot robes. And as when one is chilled from a long ride in the cold there is nothing more conducive to comfort than a hot drink—whether soft or hard—the suggestion of vacuum bottles is inevitable.

What to do When Weather Fails.

As the daily weather prophecies are changed in the window the display can be changed to suit, and if the conditions are such as to give an opportunity to display goods especially suited to the weather expected, so much the better. If there is nothing in the weather that suggests anything in particular, there always are the standard general winter goods, and by daily exchanges of the combination the window can be kept interesting and free from monotony. The feature of this particular scheme is that it not only keeps pace with the weather but keeps a little ahead of it and offers buyers a chance to prepare.

Cold snaps very appropriately can be prepared for by investing in anti-freezing solutions, radiator protectors — either the kind that prevent over-cooling when running or those which retain heat and prevent freezing when standing—lighter oils and greases for the engine and the gearcase, devices for keeping the hands warm when steering, caps, mufflers, ear-laps, gauntlets, wind deflectors and the like. All of these things should be advertised or displayed, or, better still, both.

Cold Weather Motor Accessories.

There is another group of accessories that may be featured when the weather man hangs out the signal for arctic weather conditions. Carburation is apt to become unsatisfactory when the thermometer is reaching for the zero mark, and this gives an excellent opening for the introduction of carburetter warming devices, hot air intakes, auxiliary air valves with hot air supply, etc.

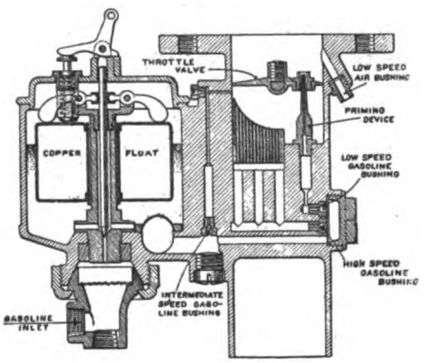
Digitized by Google

And the difficulty of starting a thoroughly chilled motor will be suggested by priming cocks, priming spark plugs, priming squirt-cans, very light gasolene for priming and ether mixtures, all intended for the same purpose.

The dealer ought to make use of the knowledge he possesses—or should possess—of practical automobile operating, and make window suggestions accordingly. For example, he knows that the lubricating systems in some cars will not feed cold and consequently abnormally heavy oil as freely as if the oil was at normal temperature. Therefore there is a chance of starving the engine before the body of oil becomes warm and comparatively thin. Suitable placards used as reminders may be of benefit to both parties concerned, and may even be of some little educational value by calling owners' attention to matters to which they had given no consideration, through ignorance. There are numerous opportunities for condensed dissertations on anti-freezing solutions, various ways of keeping warm, good hot drinks to carry in vacuum bottles, and other matters of more or less general interest, to say nothing of occasional hints pertaining to particular types or makes of cars.

Garage that Covers Acre and a Half.

Whether it is the largest of its kind would be difficult of determination, but the garage which is being erected on East 13th street, near Euclid avenue, in Cleveland, O., by the Wigmore Co. is claimed to be the largest, and undoubtedly ranks with the largest, having an acre and a half of floor space, which is spread over one tract of land. The building has a frontage of 242 feet on East 13th street and is 260 feet deep, computation showing a total of 62,920 square feet of floor. It has three times as much floor space as the Central armory in that city, and the usefulness of a structure of such size to the owners and the trade in general is indicated by the fact that the Cleveland automobile show will be staged in this building, opening January 4. This, also, will mark the opening of the garage. The structure will cost approximately $200,000



Square Files for Heavy Service.

For very heavy filing, where much metal has to be removed, there is nothing more effective than a large, coarse-cut square file. The somewhat narrow cutting surfaces go right into the metal and cut it out rapidly. A very heavy man, who can put a great deal of weight on a file without excessive exertion, can perhaps do greater execution with a flat file, but for a man of average weight there is nothing better than the square tool.

SIXTEEN SPRAY NOZZLES IN MAXI CARBURETTER

Jets Are Arranged to be Opened Successively as Throttle Opens—Insures Proper Mixtures for All Speeds.

If the multiple jet principle, upon which not a few carburetters giving efficient service operate, is the correct principle for the production of a mixture of constant proportions of carburetted gasolene and air at all of the different engine speeds, it appears reasonable that the greater the number of jets, always provided that they are correctly proportioned and designed to open or to be opened at the proper time, the more constant will be the resulting mixture. It was by adherence to this logic that Arthur J. Weiss, of West Orange, N. J., was enabled

MAXI CARBURETTER IN SECTION

to hit upon the principle which is embraced in the Maxi carburetter, which is now being made at 216-228 High street, Newark, N. J., the factory of the Maxi Co., which expects to have carburetters ready for the market by the end of the present month.

The design of the Maxi instrument, as shown in the accompanying sketch, embraces the use of a float chamber separate from the mixing chamber, and provided with the orthodox copper float and lever-operated needle check valve, the combined action of which parts insures constant fuel level. The air passage is a simple, straight passage which is obstructed only by the metallic cross member which contains all save one of the 16 jets which come into play according to the prevailing conditions under which the motor is operating, and the extent of the opening of the throttle.

When the throttle is fully closed, but a single jet, known as the priming jet, and which is made so long as to be enabled to project through a small opening in the butterfly valve, is in communication with the inlet manifold and with the motor cylinders As the valve closes quite tightly, with a consequent minimum of leakage around it, a separate air passage for low speed operation leads at an angle through the wall of the mixing chamber above the throttle. As the throttle is opened, the butterfly itself uncovers first the intermediate speed jet which leads through the mixing chamber wall, and then in succession the 14 remaining jets which are carried on the cross member, the upper contour of which is concave so that the butterfly valve follows the arc as it is opened.

Adjustments, after the apparatus has been installed, and working parts other than the float mechanism and the throttle absolutely are done away with by virtue of the construction. When the carburetter first is attached, trials are necessary to secure bushings of the proper bore for insertion in the ducts which lead to both the high speed and the low speed jets and the low speed air passage whereby the proper amount of fuel is passed for the functioning of the motor; the bushing for the intermediate speed duct is adjusted at the factory, and needs no attention.

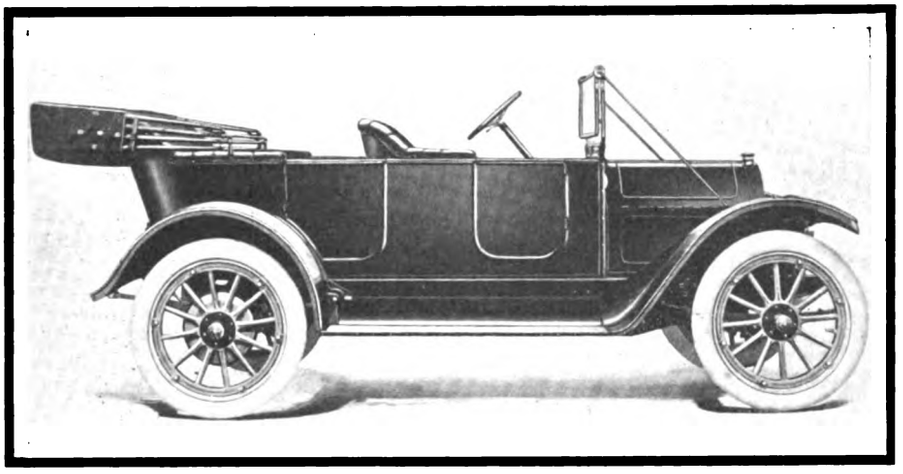
Rosin to Prevent Slipping Brakes.

The friction producing qualities of rosin are useful in emergencies, but whether it is a slipping clutch, brakes that refuse to hold or a slipping belt in the shop, rosin should not be used if it can be avoided, for after a short time the slipping becomes as bad as ever and the surfaces are filled with the stuff, which is to some extent injurious to leather and always is difficult to get off. For leather clutches or leather belts, the only really good cure for slipping is to have things properly tightened and the leather surface in good condition, and perhaps treated with a little good belt dressing or castor oil. A clean and properly adjusted brake certainly needs no rosin to make it hold.

Screw Driver for Heavy Work.

An extremely useful tool for removing large machine screws is a screw driver of heavy construction with a square shank to which a wrench can be applied to give extra leverage. In using such a tool it is necessary to be rather cautious, for unless the screw is a big, heavy one the head is rather easily broken, and drilling probably will be necessary in order to get the screw out.

Skins that Must be Taken off Tools.



The outer skin or scale which forms when tool steel is annealed prior to hardening always should be removed before the operation is completed. Otherwise the outside will be comparatively soft. A safe rule is to remove at least five per cent. of the thickness of the bar.

REO'S DESIGNER DECIDES TO LET WELL ENOUGH ALONE

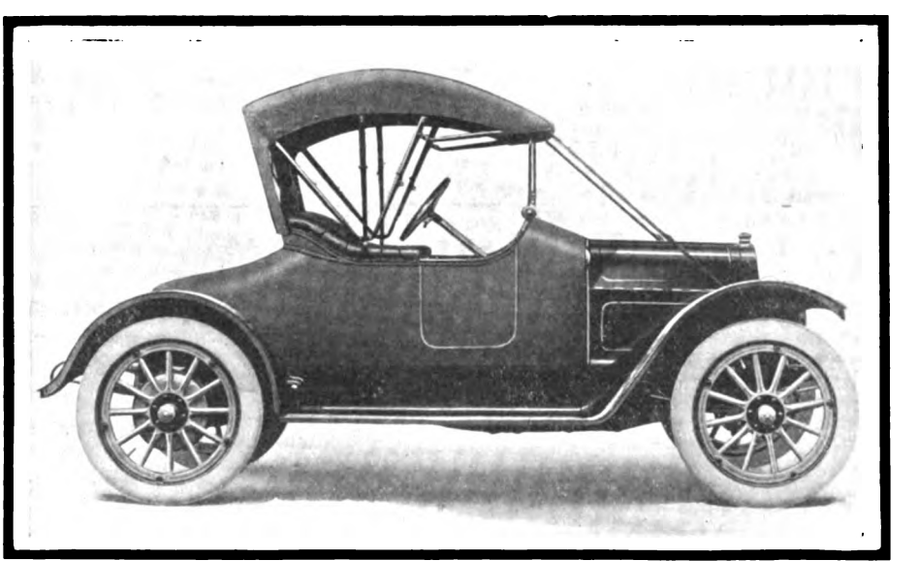
No New Features and Little Change in Old Ones—More Steel, More Rubber and More Rollers the Whole Story.

When the Reo Motor Car Co., of Lansing, Mich., brought out its last car, styling it Reo the fifth, the claim was made that the car was as good as its designer and builders knew how to produce and that material changes of any kind were not likely to be made. That the manufacturers have discovered no good reason for not adhering to this opinion is plainly indicated by the fact that the latest Reos are identical with the first of their type in all material respects.

REO "THE FIFTH" IN FIVE-PASSENGER TOURING CAR FORM

The number of drop forgings used in the construction of the chassis has been increased from 160 to 190—that is to say, 30 of the component parts that formerly were made of other materials now are of drop forged steel, with a resultant increase in strength for weight. Roller bearings have been substituted for some of the plain bearings formerly used; the increase simply tends to still further increase efficiency and smooth running. The lighting plant of all models now includes three electric lights—two side lights and a tail light—with a storage battery to supply the current, and two gas headlights with gas tank.

Four-inch tires have been substituted for the 3½-inch tires with which the wheels of the preceding series were shod. This increase in the carrying capacity of the tires has a marked ecect on the tire mileage and consequently the tire expense is decreased—to say nothing of the fact that the comfort of the passengers is materially enhanced.



Add a slight enlargement in body dimensions, and the list of improvements is complete, except for those little touches that constantly are being added—an improved fastening here and a larger bolt there and a stronger bracket or brace somewhere else.

Three Reo models are built, the line consisting of a two-passenger roadster, a five-passenger touring car and a six-passenger limousine. All are mounted on exactly the same chassis, which is practically indistinguishable from earlier Reo the fifth chassis. The motor, which is rated at 30-35 horsepower, has four cylinders cast in pairs with a bore of 4 inches and a 4½-inch stroke; the valves, which are of liberal size, are in the cylinder heads and the exhaust valve, which because of its exposure to the exhaust gases, is brought to a very high temperature when the motor is running, is in the path of the cooling water as it enters the jackets on returning from the radiator. One of the features of the Reo engine is its accessibility, and an example of this is found in the fact that the main bearings of the crankshaft, which is of the three-bearing type, are adjustable from the exterior, without taking down the crankcase; it is claimed that these bearings can be adjusted in the short time of 30 minutes. The connecting rods are adjustable through hand-holes in the crankcase. Lubrication is by a force-feed return system.

The cooling system of the Reo includes a large centrifugal pump, which ensures an active circulation of the water, and a tubular radiator with cooling flanges so disposed as to give the appearance of a cellular radiator. In order that the carburetter may be efficient and reliable in operation, even with the low grades of gasolene that now are commonly supplied, it is heated both by hot air and hot water. Ignition current is supplied by a low-tension magneto, with a battery as an auxiliary source of electrical energy.

The first link in the mechanical chain which transmits the power of the engine to the rear wheels is a multiple disc clutch, a feature of which is a positive release which prevents dragging of the discs upon each other when the clutch pedal is in the release position. The change-speed gearset of the selective type provides for three forward speeds and the conventional reverse, all controlled by a single cane-handled lever mounted centrally and swinging on the top of the gearcase; the lever has a very short swing in four directions, and gear changes are effected with great ease. The rear axle is of the semi-floating variety; the wheels are mounted on high-duty roller bearings.

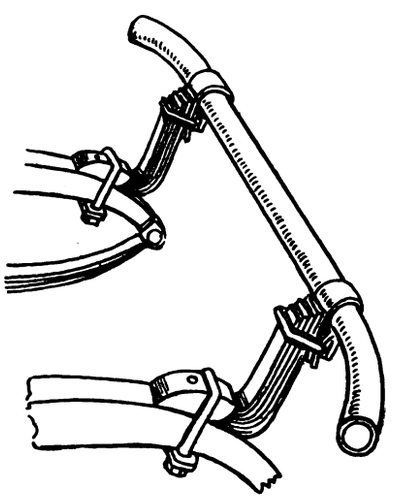
The chassis frame is of the usual pressed steel construction, amply heavy to possess the stiffness necessary to withstand stresses without sagging. The frame is carried on semi-elliptic front and three-quarter elliptic rear springs two inches wide; the rear

REO 30-35 HORSEPOWER ROADSTER WHICH LISTS AT $1,095

Digitized by Google

springs are 46 inches long and the front springs 38 inches, and all have seven leaves. Particular care has been exercised in the making of these springs, the steel of which they are forged is from the centers of the ingots, the ends, which are liable to contain imperfections, being discarded.

Both sets of brakes are operated by pedals and in both the leverage is such that the application does not require much strength. The brakes hold equally well forward or backward. Connection between the brake pedals and the brakes is through steel cables, the object being the elimination of rods, with their possibilities in the way of rattling. The elimination of the usual emergency brake lever results in a very clean-looking footboard, there being only the gearshift lever in addition to the pedals.



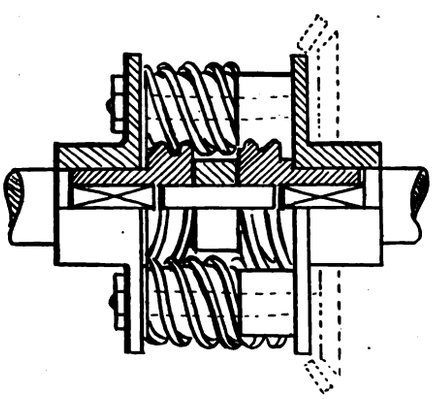
Front and rear wheels are of the same diameter, 34 inches, with 4-inch tires, and all run on roller bearings. The front axle is of I-beam cross-section and is of an alloy steel of which the Reo company is especially proud—and with reason, for the statement is made that of all the Reo the fifth cars that have been turned out not a single case of a broken axle has been reported. The wheelbase is 112 inches.

The steering wheel is placed on the left side of the car and, with the centrally-placed gearshift lever and the pedal control of both brakes, forms a system that has found no small degree of favor. The finish of the body-work has been improved by the addition of no less than five coats of paint.

The regular equipment of all models includes the electric lighting system already referred to, as well as gas headlights, gas tank and the usual tools, jack, and so on. With standard equipment, the touring car and the roadster list at the same price, $1,095, and the limousine at $1,600. For an extra consideration of $100 the open models are fitted with mohair top with side curtains, windshield, ventilator, speedometer and gas motor starter. A starter is installed in the limousine for an extra $10.

Leaf Springs in Hartford's Bumper.

Indicative of the steadily growing demand for a simple and easily attached device for protecting the radiator and lamps as well as the remaining "forward works" of the car from injury, the Hartford Suspension Co., of Jersey City, N. J., which heretofore has confined its operations to the production of Truffault-Hartford shock absorbers, Hartford jacks and the Hartford electric lighting and starting system, has entered the "bumper" field with a device which, it is asserted, is as effective as it is simple.



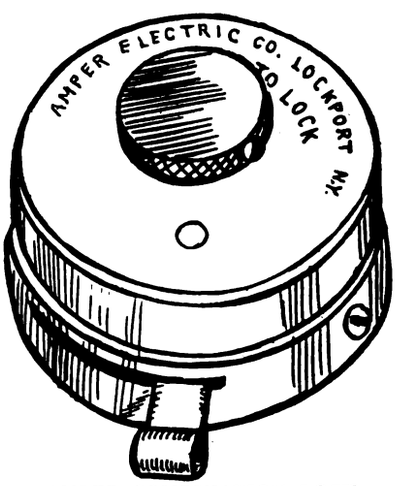
HARTFORD SPRING BUMPER

In its simplest aspect, the device consists of a pair of built-up springs of right angular form, which are provided at one end with clamps which serve for attachment to the side members of the car frame. The latter is accomplished without the necessity of drilling holes or using tools other than a common monkey wrench for turning the nuts on the "U" bolts which serve to keep the device in place and, once tightened, the clamps are prevented from working loose and rattling by virtue of nut locking devices which are provided.

Naturally, the flexibility of the spring serves to deaden the shock when the bumper is brought into action, but undue spring play is obviated by the rubbing friction of the spring leaves upon each other, which can be made greater or less, as need be, by tightening or loosening the clamp bolts.

Here's the Worm Gear Differential.

Although the use of the worm gear in place of the orthodox bevel gear as a final drive for motor vehicles no longer attracts more than passing notice, the use of the device in the formation of the differential gear is sufficiently radical to make one "sit up and take notice," so to speak. Of British origin, the worm driven differential is patterned after its time-honored prototype, the spur gear differential. As shown in the accompanying sketch, the orthodox main drive pinions and the planetary spur gears which transmit the power from the large bevel gear all are present but in helical gear form. The operation of the device is said to be rendered more smooth and the wear reduced by the use of helical gears.



WORM GEAR DIFFERENTIAL

Sand Blast for Cleaning Files.

Files that are somewhat worn and clogged up with dirt may be given a temporary biting ability by sand-blasting, which cleans out the teeth and to some extent sharpens them up.

Combination Lock Workable in Dark.

Interrupting the ignition circuit so that the motor cannot get the vital spark long has been a favorite method of rendering the car an inert thing and so preventing its use by those whose consciences and whose right to the machine are equally inconsequential.

AMPER COMBINATION LOCK

One of the newest of these spark-interrupting devices is the Amper Auto lock, which is shown in the accompanying illustration, the product of the Amper Electric Co., of Lockport, N. Y. In its construction particular consideration has been bestowed upon the thieving fraternity, so to speak, by incorporating in the switch lock a combination device which, like the combination of a safe, requires no key, being operated by a milled knob. By means of audible clicks it is a simple matter to work the combination in the dark. There is no key or plug to lose or to fumble for with heavy gloves on. The switch can be locked in either the "off" or the "on" position.

When the combination is locked the cover of the switch is locked on, and the screws which secure the device to the dashboard are covered and inaccessible. The combination can be changed at will.

TRUTH-TELLING AND WHAT IT MAY ACCOMPLISH

Garageman-Dealer in New Jersey Town Has Won Profitable Trade Through Inherent Principles—Methods He Employs, Results He Has Obtained and a Few Illustrative Incidents.

Just how many garagemen there are who are liars there probably is no way to determine; the certainty is that their number is large enough to be a detriment to the trade, but there is evidence of a more or less general awakening that promises better things. The garageman who does not tell the truth and otherwise play fair with his patrons gradually will become a diminishing factor.

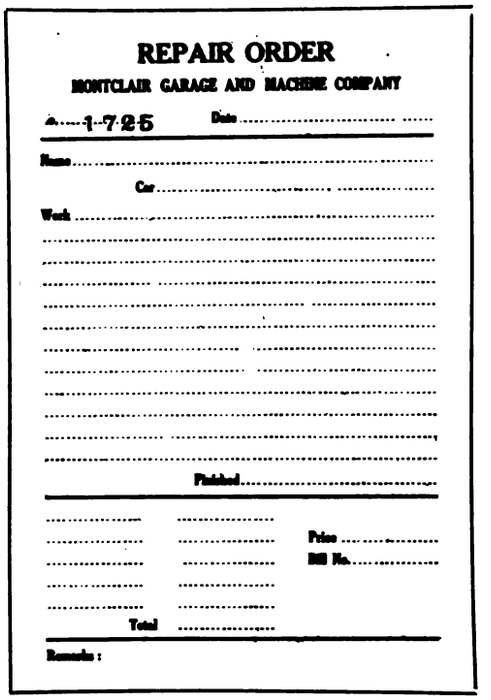
The hurly-burly of early automobile days, when prices and conditions were greatly unsettled, developed the "highway robber" type of garageman, and as a result the honest class realizes that it will be some time before the stigma can be entirely removed from the business. It, however, is becoming much more frequent than it formerly was, for an automobile owner to be agreeably surprised by finding himself treated like a man and by a man in a garage.

Uplift of Trade Jacobus's Object.

One who is working hard for the uplift of the trade is C. E. Jacobus, who is about all there is to the Montclair Garage & Machine Co., of Montclair, N. J. He used to be an insurance salesman and, having the principles of true salesmanship at heart, he is making money in his establishment, combining garage work with the sale of cars.

Although Jacobus in telling a Motor World man of the business did not lay emphasis upon the fact, it was evident within a few minutes that truth telling was a fundamental principle with him; he appeared to have been telling the truth for so long that it has become a fixed habit.

As Jacobus and the Motor World man stood in the former's office talking and at the same time watching the cars pass—for it is a busy avenue of travel—a heavyweight motorist appeared at the door, dressed in a warm overcoat, for it was a chilly day for touring, even if the sun was bright.



"Jacobus," he said, "I'd like to have my car fixed; one spring is broken. Can I get it this afternoon?"

"I can fix it," answered the garageman, "but I won't say I'll give it to you this afternoon."

"But I want it badly. Can't I have it by five o'clock?"

"I don't know," declared Jacobus. "I don't want to say I'll give it to you and then have to disappoint you. I'll tell you what we'll do; come into the repair shop and we'll see if we can find a man to do it; they're all pretty busy."

The two went to the shop and soon returned, the owner happy. A workman had been found who would finish the job in hand within an hour, which would give him ample time to repair the spring before five o'clock.

Remarks:

CARD THAT ACCOMPANIES CAR

But before Jacobus made sure he could turn the work out in that length of time, the owner had appeared persistent in his attempt to get a promise for five o'clock. Apparently he knew the truth-telling principles of the establishment and seemed satisfield that if he could extract the promise he could get the car when he wanted it.

Where Veracity Satisfied a Customer.

This man was hardly out of the place when an employe rushed into the office. "Mrs. ——— says she is sure she had an inner tube in her car, and it's gone," he blurted. "She thinks someone in the garage stole it. What'll I do?"

"Oh," and Jacobus smiled, "I stole it. I had to have one the other night and could not find the right kind, so I remembered she had one in her car, and I took it out." He reached to the shelves on which tubes were stored and, taking down one, said, "Here give her this one."

"What'll I tell her—that someone made a mistake?

"No," admonished the garageman, "tell her I took it. Tell her just how it happened. I took it and forgot to put it back. What's the use of telling her something that isn't so. The truth is better than any excuse you can think of."

The employe took the tube and departed. He explained how it had been taken from the lady's car and she was satisfied.

"I know we garagemen have a bad name," remarked Jacobus, "and sometimes I've been tempted to quit the business, but I'm getting aong fairly well now, and as long as I remain here the business will be honestly conducted. What's the use of telling a customer something that isn't so? It does no good whatever. The customer is dissatisfied and you hurt your business, whereas the customer would rather have a poor promise kept than a good one broken."

Flag on Roof Brings Much Business.

The experience of the Motor World man is illustrative of how many motorists are led to this Montclair establishment. He had a general idea as to where Jacobus's place was located, but after leaving the end of the railroad which terminates at Montclair he had walked several blocks in search of the garage and was about convinced that he was on the wrong street, when far ahead, high in the air, as effective as an electric sign at night, was seen a flag fluttering in the breeze. It was yellow and black, and in plain and loftv letters was the word "Garage." "Montclair Garage & Machine Co." would have taken too much room, and the letters would have been too small; the proprietor's instinct had told him that the one big word, readable a half mile away, was sufficient. The flag can be seen far in either direction, and more than one traveler on this east and west highway across New Jersey has left money at the garage, having been drawn there by the yellow flag. In fact, the Motor World man, on his way back, discovered that he had passed and hardly noticed another garage, the yellow flag being the central attraction for a seeker

Digitized by Google

for garages. Jacobus has many tales to tell of the flag's attracting powers.

Revenue, its Source and Volume.

But the flag does not constitute the main source of revenue; it is merely an example of the proprietor's methods of attracting and holding trade. Selling new cars, repairing and storage are the principal sources of income. The company has the agencies for Marmon, Ford and Moon cars and does a good business in these lines. One salesman is employed and Jacobus himself handles many sales. Last year some thirty cars were disposed of, a record not surpassed by many, if any, of the other dealers in that territory. Jacobus, however, is far from satisfied, and insists that if he were so situated that he could rid himself of the burden of detail he could double this figure.

How New Buyers Are Secured.

Information as to prospective buyers is secured from people who now are using cars sold by Jacobus, from the factories to which inquiries are sent, from those who inquire at the garage, a probable result of local newspaper advertising, and from leads thought out by Jacobus himself. To the prospect a letter is sent and with it a return postal card which the recipient is requested to fill out and drop in a letter box. This card, if returned, at once designates the prospect as a positive or negative quantity, so far as car buying is concerned. Among other things, it tells the capacity and price of the car he intends buying and also tells what car he owns. The effective feature of this card is that it bears a stamp for mailing and relieves the prospect of the trouble and expenes of finding a one-cent stamp.

In connection with the agencies, he attempts to give the word service its true definition—taking care of the owner is buiding trade for him. Those Montclair residents who have bought of him drive into the shop whenever they believe their cars are not performing properly and a free investigation results. Little things are not recorded by the bookkeeper, and if repairs are made the car owner is shown just what was done and how long was taken to do it.

Every car that goes into the repair shop is given a card marked "Repair Order." Among other things, this contains space for entries of different work done, the workman who did it, the time taken on each separate part of the overhauling or repair, and a reasonable charge therefor. At the same time each workman operates under a daily time card system and is directed to enter upon the card the work he has done each day and how long he took on each job.

"I tell them," declared Jacobus, "to account for every minute of the day. If the man sits on the bench and kills time I tell him to mark up so much time 'sitting on the bench,' but under no circumstances to charge time against a job on a car unless work actually was done on the car. Charging for idle time is responsible for many of the overcharges that have made the public sore on the garage trade. If a man puts in a half hour sweeping the floor, it goes down on the card, 'Sweeping floor—4:30 to 5,' or whatever the time was. I might stand for a man sitting on the bench, but I won't stand for a man robbing a customer by making him pay for that time."

Storage Rates and Gasolene Sales.

The painting for the garage is done on the second floor of the building, but is not done by garage employes. The proprietor rents space to a painter, who takes the garage work and exacts his own charges for it. This relieves Jacobus of the responsibility for this part of the labor, and at the same time assures satisfactory work, for the contractor-painter knows that it must be satisfactory or it will not be accepted.

The garage has capacity for 40 cars in storage, but the average number is 25. The rates range from $15 for small models to $25 and $30 for the large cars and limousines. Considerable of the storage is "dead."

Gasolene is retailed at 20 cents and is purchased for 15½. The monthly bill to the oil company is about $800, and the inroads into the gasolene trade by the small crossroads garages in the country are shown by the fact that when gasolene was 9½ cents a gallon wholesale and the small landscape-dotting supply stations were not so numerous the bill was about $1,000. That means gasolene sales have been cut in half.

I intend buying a .....passenger car at about $.....00.00. Any literature or information regarding such a car will be appreciated.

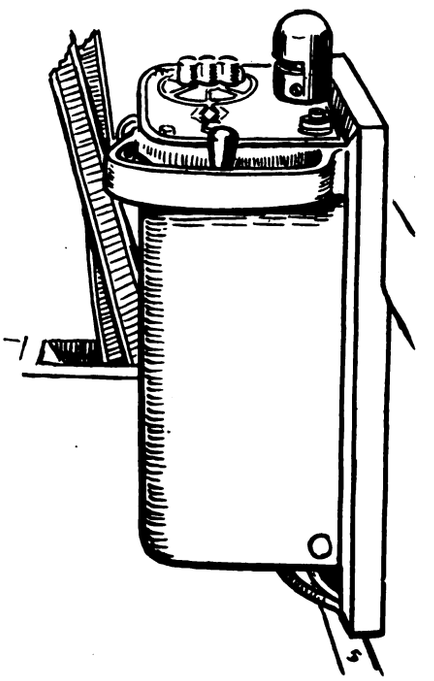
COMBINING THE ELECTRIC LIGHTER AND STARTER

How the Motor Is Cranked and the Car Illuminated by a Single System—Two "Light-and-Power" Plants Explained and Their Real Simplicity Emphasized—How Best to Care for Them and Where to Look for Trouble.

(This is the ninth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by the dealer and owner alike.)

It is one of the well known advantages of electricity that it may be applied to a wide diversity of uses. Wherever electricity is used and the vendor is alive to the possibilities and advantages of extensive advertising, twinkling signs blaze forth the information (only it is not information to most persons) that it may be used for "light, heat and power." And, needless to add, it is just as much its wide applicability to these three essentials of industry, and life, as it is its convenience and its comparative simplicity that makes it so highly desirable and so valuable an adjunct to an existence which otherwise would prove mediocre.



Of course, every one who knows anything at all about automobiles knows at least something about electricity; ignition systems have brought that about. Electric lighting is too well known to require any long dissertation upon its merits, and the electric automobile long since has made familiar at least one application of electricity to power. Electric heaters also are familiar, or, at least, they ought to be familiar, to those who ride in trolley cars. Latterly, the simplicity, cleanliness and dependability of the electric heater has served to draw attention to its applicability to a variety of other uses.

Power Required to "Spin" a Motor.

Heating, however, is what may be termed a side issue; it is supplementary to lighting and power systems. Given a lighting or a power system, and it is a very simple matter to add a heater or two at little expense and without any increase in complexity whatsoever. Heating is supplementary also in the sense that it may be dispensed with —not without discomfort in some cases— whereas power in an automobile, and lights, both are absolutely essential, as everyone knows. There is no call to explain the necessity for lights, nor is it necessary to point out why power is required. But it may not be quite so plain to the average person that something between one-half and one horsepower is required to "turn over" a very ordinary automobile engine of approximately 30 horsepower. Anyway, comparatively recent and authoritative tests have proven that it may not be as easy as it looks to "spin" a motor—that the expenditure of energy equivalent to one-half horsepower at least is necessary in most cases.

Value of Electricity's Manifold Uses.

The generation of such power—when it is represented by other than the muscle of th driver's good right arm—of course must be supplementary to the generation of the

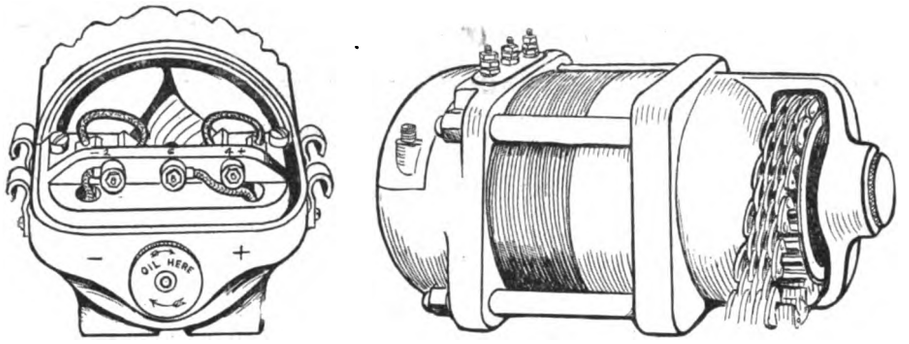
APLCO CONTROLLER UNIT

power that drives the car. And in this connection there are few sources of energy available for the purpose that are more convenient or simpler, or, last but not least, more dependable than electricity. It is here that the value of its applicability for the combined functions of lighting, heating and powering become most apparent.

Steady Growth of Starting Gear.

Long before commercially practical so-called "self-starting" engines became available, electric lights were not only practical but were so firmly entrenched in the realm of things commercial that they rapidly became a necessity rather than a luxury. Today, electric lights are no more a luxury than is the "self-starting" engine; both are necessities. The early use of electric lights, of course, was due to the perfection of the storage battery, but though such systems were efficient after a manner and were highly desirable they were deficient in that there was danger of failure at unexpected moments due to exhaustion of the battery. In other words, no provision was made for maintaining the battery in a charged condition automatically.

It was not long, of course, before this condition of affairs was remedied by the commercial perfection of the small dynamo. But it was not until the small self-regulating dynamo was perfected that the manifold advantages of electricity in its application to heating and power loomed really large. With a practically inexhaustible source of current available, it was not very long before the possibilities for power became to be realized in their true light, and as a result the electric engine starter sprang into prominence almost over night. Now, there are very few automobiles listed without electric light equipment, and the number on which complete electric lighting and engine starting systems are installed steadily is increasing.



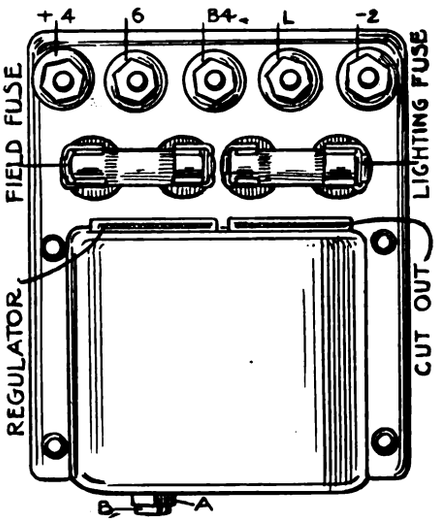
Combinations that Lack Complexity.

Contrary to expectations, the combination of an electric lighting and engine starting system does not necessarily add complexity to the automobile. All such combine' lighting and starting systems are as simple as are the plain lighting systems which have been described in detail in the last eight issues of Motor World. In fact, an intimate knowledge of almost any one lighting system is almost sufficient to instil an understanding of all such systems, whether they be lighting systems pure and simple or combined lighting and engine starting systems. The principles behind them all are so nearly identical that elaboration of individual systems is necessary only to bring out and make plain their individualities. No two are exactly the same in every respect and no single system, regardless of its apparent complexity, is the slightest bit too difficult for the average dealer or owner to understand, provided there is the will to make the slight application necessary.

The several different combined electric lighting and engine starting systems on the market can be divided into two general classes: Those in which the electric generator and the motor are separate units and

Digitized by Google

those in which a single unit serves as both dynamo and motor. In the latter, advantage is taken of the fact that any dynamo will run as a motor or any motor will generate current when the armature is rotated.



APLCO GENERATOR SHOWING CONNECTIONS AND DRIVE

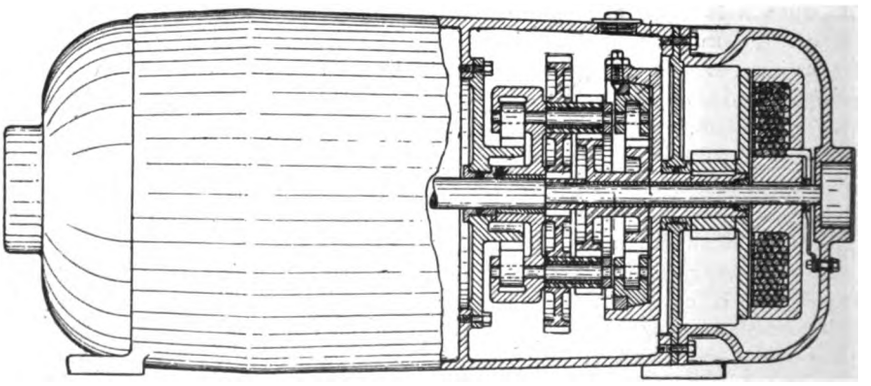
This does not obtain, however, in the case of alternating current generators and motors, but as all automobile lighting and starting systems operate on direct current alternating current machines can be put one side and forgotten. Those systems in which the generator and the motor are combined in the same machine are further sub-divided into two classes: Those in which the motor generator takes the place of the engine flywheel, thereby eliminating all gear drives, and those which are geared in some manner to the engine, either through the timing gear train, which is the preferred method, or through a "silent" chain to the engine or to some part of the transmission mechanism.

Regulating With a Pile of Carbon Disks.

The Aplco lighting and starting system, which is manufactured by the Apple Electric Co. of Dayton, O., is of the latter type, the generator and motor being combined in a singe unit. The method of drive may be either through the timing gear train, by means of the pump or magneto shaft, for instance, or by means of a silent chain to any convenient rotating shaft, the disposition of the unit making no difference to its efficiency, provided only that it is properly mounted and driven at the proper speed.

As a generator, the machine is a plain shunt wound one and is automatically self-regulating as to current output. It is positively driven and its speed varies as the speed of the engine. The latter feature is essential, of course, in view of the fact that it operates alternately as a generator and as a motor. In order to obtain current regulation, the varying resistance of a pile of carbon discs on which the pressure is electrically varied, is employed. It is a simple, automatic field rheostat. When the armature is rotating slowly the carbon discs are pressed tightly together under the action of a spring. As the armature speed increases, pressure on the spring is released by an electro-magnetic device placed in series with the field, and as the carbon discs separate slightly their resistance to the passage of current increases, thereby reducing the field strength and consequently the output of the dynamo. When the armature speed decreases, the magnetic pull decreases, permitting the carbon discs to be pressed more tightly together.

APLCO DASH PANEL



The automatic cut-out which disconnects the dynamo from the battery when the engine is stopped is an electro-magnetic device of the conventional form and the battery is a 15-cell unit so arranged that the charging rate is 6 volts, when the cells are connected in multiple, and the discharge rate through the motor-generator for starting the engine is 30 volts with the cells connected in series. The remainder of the system includes an automatic controller and a dash volt-ammeter.

Operation of Automatic Controller.

The purposes of the controller, which is illustrated herewith, are manifold. In order to start the gasolene engine, the spark advance lever must first be placed in the full retard position. Then if the controller handle is placed in the starting position it first connects the storage cells in series to deliver 30 volts and closes the ignition switch, and in the same operation connects the battery to the motor-generator, which for the time becomes a motor and "turns over" the engine. Immediately the engine picks up its own cycle of operations, the controller handle is returned to the running position much as an ignition switch is turned from battery to magneto after the engine has commenced to fire. Placing the controller handle in the running position automatically rearranges the cells in multiple to be charged at the rate of 6 volts. Thus all of the mechanism is completely enclosed and protected. The battery generally is carried in a tray beneath the floor of the tonneau.

Care That Is Required in Operation.

In caring for the system, there is little that will require attention other than the brushes and the commutator. The automatic regulator is so constructed that it will never require to be touched from one year's end to the next. There are no contacts in it, and the very slight movement of the arm which controls the spring pressure on the carbon discs precludes the possibility of wear or sticking. Nevertheless, it can do no harm from time to time to make sure that it is operating properly by watching lamps carefully as the engine is speeded up. If they exhibit signs of flickering, wiring connections should be gone over carefully to make certain that there are

PARTLY SECTIONED VIEW OF PARIS MOTOR-GENERATOR SHOWING GEARING

Digitized by Google

no loose or broken wires. The automatic cut-out is another device which is best let severely alone unless it gives evidence of serious derangement. The contacts of the cut-out should be cleaned at least once a season, though there is little reason for touching them oftener unless the device gives trouble, which is unlikely.

What To Do When the Lights Grow Dim.

If the lights gradually dim when the engine is stopped, it is practically certain that the cut-out is not performing its functions properly and is permitting the battery current to pass back through the dynamo. Though it is not a likely occurrence, the contacts might stick together, in which case they should be separated and cleaned before the machine is again put in operation. Much the same trouble (lamps gradually dimming) would be experienced if the cut-out should fail to make the connection between the battery and the dynamo, for the battery then would exhaust itself, there being no current put back into it for the current drawn out. In either case the remedy is simple and self-evident.

The controller box contains nothing but rugged switches, and as there is nothing in it to get out of order even under the most severe usage, it will never require to be touched after it is once installed. A volt-ammeter is supplied with the system and serves to indicate the charging rate of the dynamo when the engine is running. If, with the engine running, the meter fails to indicate, it means either that the generator is not generating or that a wire has become broken or loosened. Broken wires quite naturally can be found only by searching for them.

Trouble That Lurks in the Commutator.

Failure to generate can be traced in the majority of cases to a dirty commutator or to worn or dirty brushes. In the Aplco generator the brushes are formed of a self-lubricating compound and should run for an indefinite period without attention. Despite elaborate precautions to prevent the ingress of dust, foreign matter will find its way in, and it must be removed periodically if the machine is to operate at maximum efficiency. The brushes and brush holding mechanism is enclosed by means of a hinged cover which may be removed quite easily, exposing the wiring. Occasionally the brushes should be taken out and cleaned. Before they are replaced, the commutator should be examined to make sure that it does not harbor an accumulation of grease and dust. If it appears unusually dirty it should be cleaned with a cloth dampened but not wet with gasolene. If, however, it exhibits a glazed, brownish appearance, which is altogether likely, it should not be touched, for it is then in the best of condition. If it is scratched or burned it should be smoothed down by holding a piece of No. 00 sandpaper against it while the machine is running, the brushes first having been removed.

Combined with the controller box is a rotary lighting switch for switching on the various lamps, any lamps or any combination of lamps being easily obtainable by simpy rotating the switch handle. One of the peculiarities of the system is the locking device, by means of which it is possible to lock the controller handle or the lighting switch in any position. Once locked, it is impossible to start the engine or stop it, as the case may be, or turn on or off any of the lamps.

Eliminating Trouble by Testing Circuits.

The regulating mechanism is contained in a panel which attaches to the dash of the car, the same panel serving also as a distributing block and a fuse block. When the car is running at about 15 mles an hour the volt-ammeter should indicate that the dynamo is charging the battery If the hand remains at zero the field fuse should be examined first to make sure that it has not blown out. If is has blown out a new one should be inserted. If the trouble remains the tension of the brush springs may be slightly increased by turning the screws marked A and B in the accompanying illustration. If the trouble is not cured, loosen the locknut A shown in the picture of the panel and screw in or out on the adjusting nut B about one-quarter turn. Screwing in increases the output at a given speed; screwing out decreases it. If the trouble still remains, temporarily short circuit the regulator panel by attaching a wire between + 4 and 6. If the hand of the ammeter then indicates charging there is some defect in the regulator panel, in which case it is recommended by the manufacturer that it be removed and returned to the factory for adjustment.

How to Adjust the Cut-Out Mechanism.

If, however, the hand of the meter still stands at zero, short circuit both the regulator and the cut-out by connecting + 4 and B 4 with a wire, leaving + 4 and 6 connected. If the meter hand now swings to the discharge side, the trouble is in the generator, which should be returned to the manufacturer, provided the trouble is not with the brushes or the commutator and cannot be remedied.

If, with the panel short circuited as stated, the meter hand swings over to the charge side, it indicates that the generator is charging, but that the tension on the cut-out spring is so great as to prevent that device from performing its functions. To decrease the tension, remove the cut-out housing and with a small screwdriver take out the locking screw which is under the cap. Under the locking screw there is an adjusting screw which, when turned to the right, increases the tension, and when turned to the left decreases the tension. If the tension is only slightly too great, this fact will be made plain in oscillations of the meter hand as the cut-out connects and disconnects the battery and the dynamo.

Shifting Gears With a Magnetic Clutch.

The Paris electric lighting and engine starting system which is manufactured by the Paris Electric Starter Co., of Chicago, Ill., is similar to the Aplco system in that it employs a combination motor generator unit. The unit itself, however, is quite different and is driven and drives through an automatically controlled set of gears which permit the armature shaft to be driven by the engine at three times crankshaft speed, while a reduction of 30 to 1 is automatically obtained when the unit is employed as a motor to start the engine. The arrangement of the gearing is illustrated in the accompanying picture, which shows the motor-generator partly sectioned. The operation of the gearing is entirely automatic, gears being shifted by means of an electro-magnetic clutch. Pressure on the starting button first shifts the gears to permit a driving ratio of 30 to 1, and then switches on the battery current, thereby causing the motor to start the engine. When the engine starts the gears are automaticaly shifted, and while the motor-generator is operating as a generator the gears are locked solidly, so that they act much as a flywheel and do not move upon themselves.

Variable Voltage Automatically Obtained.

As is the case with so many other systems, the regulation is electrically obtained. the regulating mechanism being contained with the cut-out, which also is an electro-mechanical device. Both are contained within the dynamo itself, particular pains having been taken to place them out of the reach of prying fingers. Both devices are simple in construction and positive in action, and as they are completely enclosed should give no trouble whatsoever. The care of the brushes and commutator made plain for every other system is the same in this case and is embraced in keeping the brushes clean and the commutator in the condition where it exhibits a glazed, brownish appearance. The voltage of the Paris system is 6 volts for lighting and charging and 24 volts for starting, the necessary alterations in the battery connections being automatically made when the starting button switch is operated.

DEALERS MUCH DISCUSSED AT DETROIT MEETING

(Continued from page 9.)

"Well, first of all, we can impress upon the dealer's mind the thought that he is in business to make money, and that he should conduct his business with an eye to the net profit. Once he has got this idea, it should be pointed out to him that he has little chance to make a profit unless he gets the list price. I am thoroughly convinced that we, as manufacturers, should take a firm stand for the list price.

"Establishing a list price and getting it is, first of all, a matter of setting our prices as low as we can, considering conditions of competition and consistent with our own profit; and then fixing a fair and not too long dealer's discount. I believe heartily in a liberal discount to the dealer. He is entitled to a margin that will give him a fair chance to make money. But my observation and experience teach me that fictitious pricing and unusually long discounts are wrong policies. They may produce results that seem satisfactory for a time, but in the end they lead to trouble and usually to failure. . . . .

Seeking to Avoid Over-Production.

"This leads us to the conclusion that over-production — or, rather, how not to over-produce — is another of our selling problems. I am not one of those who think there are no limits to the number of cars than can be sold if produced.

"The way to be surest of selling your entire output at a profit is by being sure that output will come within a normal demand. Forced selling is rarely, if ever, profitable. There is bound to be a time reached when this country's market for new cars is going to be very much smaller than it has been in the past, and if we are thoroughly alive to our own best interests we will study conditions very carefully and base our production schedules on what we actually know and can intelligently foresee, rather than on guess work, or on what over-enthusiastic distributors think they can sell.

"The number of cars a dealer can sell in your office is often quite different from the number he can actually sell in his territory. We will have enough selling problems always without over-production, so let's under-produce rather than over-produce.

When Buyers Out-Sell Dealers.

"Another of the great problems of our business is that of handling second-hand cars. No doubt it is a common occurrence with all of you to have your dealers complaining that an ever-increasing percentage of their sales involve trades. It means usually the making of two sales in order to earn one profit, and unless a dealer is very careful and a shrewd trader, it is apt to mean two sales without any profit. No end of automobile dealers have traded themselves out of business. Automobile selling very often just gets down to a question of whether the man with a used car is a better salesman than the dealer who is trying to sell him a new car, and it not infrequently happens that the owner proves to be the better salesman, selling his old car to the dealer at a better profit than the dealer makes in selling the new car to the owner of the old one.

Committee to Consider Used Cars.

"All dealers say that this trading and second-hand problem is one of their biggest ones and that it is getting bigger all the time. Yet when you ask them what can be done about it, or what suggestions they have, most of them are unable to offer anything encouraging. . . . In other words, there seems to be just a hopeless feeling among automobile dealers on this question, a feeling that it is one which is always going to be troublesome and about which nothing can really be done. I am by no means convinced that something cannot be done. I have the following suggestion to offer: It seems to me that some of our problems, and especially this problem of second-hand cars, are analogous to the national problems of the railroads and the tariff. May I suggest, therefore, the advisability of considering the appointment of a committee from our members to go into this whole subject very thoroughly; to study it in a careful way, so that we may know whether it is possible to adopt any policies or measures that will help all of us and all of our dealers in the handling of this problem.

Influence of Weather on Sales.

"The greatest obstacle to the sale of automobiles is a natural obstacle, and one which we can never entirely overcome. This greatest obstacle is bad weather. We cannot change the weather, but we can take measures which will minimize the effect of fall and winter weather on our business. The first thing I believe we should do is to change our own seasons. I am one of those who believe in yearly models, but I am coming to believe that we have picked out the wrong time of the year to announce our yearly models. . . .

"Next to the very car itself, the greatest selling force we have is warm weather and sunshine. Our sales curve should be a semi-circle, with its apex in July, which, by reason of the weather, is logically the best season for selling automobiles. But it is not. The reason our sales curve is a camel back is that our production curve is that way.

Story Told by Production Curves.

"Our production plans are wrong. Look at your curve of production. You will find it also has two bumps—one in the spring and one in the late summer and early fall. It is at its lowest point in midsummer when it should be highest, because we end our season then and start on new models, which always come slowly at first. In other words, we get our maximum production in the poorest selling season, and our minimum production when sales should be highest. When the weather is most favorable to big sales, we are engrossed with the new models.

Favors January Instead of July.

"These conditions are not right. It is to our interests and certainly to the interests of our dealers to make our biggest deliveries in the heaviest selling season. I think it is time for us to consider very seriously whether we ought not to announce our models just before January first, rather than in July. . . . This plan also would revive interest in the shows. The shows would then return to their original purpose —namely, that of displaying new models for the first time to the public. The production of a new model is always slow getting under way. This unavoidable slowness would not make so much difference in December or January as it does in July and August.

"There would be less storing of cars. We would have a long, uninterrupted season of production and selling. We would get under way gradually and our production curve would reach its highest point in the same months the selling curve naturally would reach its highest point. We would not have to put on tremendous force for a few months, only to let down when the cold weather comes on. We would start our campaigns in the cold weather and gradually build up as the season naturally opened.

Harm of Exaggerated Advertisements.

"Another problem of selling in which I believe we are all vitally interested is that of advertising. Advertising is not the answer to all business problems, as many advertising agents whose tongues are more eloquent than their brains are logical, would have us believe. Some splendid business successes are still built up without advertising. It is true they are rare, but there will probably not come a time when this condition will not be true. Automobile advertising has suffered from mediocrity, just like other kinds of advertising—whether more or less, it would be hard to say. What automobile advertising has suf-

Digitized by Google

fered from most, however, is exaggeration. Perhaps some of it has suffered from more than exaggeration.

Honest Advertising Is Essential.

"Of nothing am I so thoroughly convinced as that the greatest single factor in successful advertising is absolute honesty and sincerity of statement. I question whether we like the advertisement which exaggerates, any better than we like the person who exaggerates. I question whether we like the advertisement that brags and blusters and blows, any more than we like the person who has these undesirable traits. I question whether we like the advertisement which is egotistical and uselessly wordy any more than we like the person who is that way.

"Advertising is the expression of the character of a business It is simply a business standing up and expressing itself to the people. Why should the rules of what is proper in an advertisement be different from the rules of what is proper and admirable in a person? The public gets its impression of the automobile business, as a whole, very largely from our advertisements, and therefore, it seems to me to be of the utmost importance that we try, all of us all of the time, to put out advertising that has the qualities of honesty and sincerity and simplicity."

Benson's Views on Territory Allotment.

E. R. Benson, sales manager of the Studebaker Corporation, discussed the subjects "Territory and Discounts," and threw light on the factors that decide not merely the allotment of territory but the side of discounts that may be quoted, although he did not deal with actual figures.

"Formerly there were two distinct views on territory," said Benson, "and they often seemed to be diametrically opposed. One was the manufacturer's view and the other one was the dealer's. It was the manufacturer's idea, to some extent, to confine the dealer as much as possible in territory; and it was the dealer's idea that he should have all the territory that he could possibly get from the manufacturer. Both the manufacturer and the dealer have altered their views during the past few seasons, and now they are much nearer together than they have ever been before. The manufacturer knows that dealers, to be satisfactory, must conduct a profitable business, and that sufficient territory must be given out of which to get a good business and make it profitable. The dealer knows that he cannot handle a large territory profitably without a sufficient amount of money, putting quite a large capital into his business, and supporting a large organization. In the division of territory there are many things that must be considered, and one thing of great importance is to find the trend of the market, i. e., where the people buy . . . .

"It is obvious also that it would be a very difficult matter for a dealer to maintain himself in one corner of a district while the natural trading point would be in another center. It would cause the dealer extra expense and trade would get away from him which would go to the dealer who might be located in the genuine trade center. This is to be watched with extreme care, as it has a great deal to do with the sale of motor cars. . . . One of the hardest problems in connection with territory is finding ways and means to keep the dealer energetically, wisely and thoroughly working the district assigned to him. This, in some ways, is a greater problem than the division of the territory itself. . . .

Difficulty of Adjusting Discounts.

"Discounts must essentially be weighed from many angles, as manufacturers' interests lie so widely apart—one manufacturer producing a very large number of cars at a low price; another, a very much smaller number at a much higher price; and another, a large number of cars at a medium price. All these conditions demand different terms, both on territory and discounts. The discounts are naturally segregated into several classes. . . . In considering discounts to dealers, it is necessary to take into account the amount of stock which the dealer is able to carry (this would apply both to cars and parts), and the season of the year when he may accept his deliveries. We are always looking for the ideal dealer who will take a specified number of cars each month the year around and pay cash for them, and in addition will always keep on hand a good stock of parts so that service will be given to his patrons in an ideal way. These dealers are increasing in number as they are becoming cognizant of the fact everywhere that this is the best way to conduct the motor car business."

Pope Advocates Standard Guaranty.

"Why All Manufacturers Should Use a Standard Warranty" was the subject of a paper by A. L. Pope, president of the Pope Mfg. Co., which, in Mr. Pope's absence, was read by L. H. Kittridge, of the Peerless Motor Co. As the title implies, it was an argument or plea for the general adoption of the N. A. A. M. guaranty, the advantage of which was strongly pointed out.

H. O. Smith, president of the Premier Motor Mfg. Co., discussed "Yearly Models," R. D. Chapin talked of "Good Roads" and M. L. Pulcher, of the Federal Motor Truck Co., to whom had been assigned the topic "Injudicious Methods of Selling Commercial Vehicles," pointed out the abuses which had arisen. He intelligently discussed the demonstration and service problems and decried the cut-throat species of competition with which the truck trade is too greatly afflicted. Pulcher, in substance, stated that there was ample room for all truck makers and that no sound reason existed why they should "knock" or otherwise seek to tear down each other.

Miles on the N. A. A. M.'s Performance.

Samuel A. Miles, general manager of the N. A. A. M., made more than usually good use of the apparently dry subject, "The N. A. A. M.—What it has Accomplished and What May be Accomplished." He traced the work of the organization, with which he has been so closely linked, and brought sharply home to those present that it had been a more potent factor than many of them had considered was the case. He also outlined the avenues for future endeavor and of the better results that could be obtained if there was but one national organization in existence, plainly indicating his sympathy for the proposed amalgamation of the Automobile Board of Trade with the N. A. A. M. which has been hanging fire for nearly a twelvemonth.

"Traffic" was discussed by J. S. Marvin, traffic manager of the N. A. A. M., and, as always, it was ably discussed. Marvin pointed out in plain terms the crists that will ensue if the freight car shortage becomes more acute and indicated some of the means by which the danger may be averted; he, of course, urged the co-operation of everyone connected with the trade to the end of prompt loading and unloading of all freight cars with which they may have to do.

Dealers and Freight Overcharges.

Marvin also pointed out that the amount of freight charges and shipments from automobile factories to automobile dealers approximates not less than $6,000,000 or $8,000,000 per year, most of which is paid by dealers, who, in very many instances, are overcharged without their knowledge and through clerical errors. Since the N. A. A. M. volunteered to check up all freight bills forwarded by dealers many overcharges have been discovered. In the case of one factory alone, 19 dealers who had forwarded freight bills were found to have been overcharged $1,100. Marvin pointed out how overcharges may occur when trucks may be billed as "automobiles," or when bodies may constitute part of a shipment, and also how the size of freight cars may influence minimum rates which may be charged. He called attention anew to the fact that the N. A. A. M., without charge, is willing to audit all freight bills which may be forwarded by dealers and

Digitized by Google

hoped that the practice would become general.

Beecroft Discusses Truck Delays.

David Beecroft, editor of Motor Age, treated the subject of "Transportation Delays at Railroad and Dock City Terminals," and laid great stress on the inefficiency of the average horsed vehicle and introduced statistics to show that in a great many cases motor trucks were compelled to wait nearly twice as long during loading and unloading operations as was required to make a round trip between destinations. These long waits, he pointed out, were due in many cases to the inveterate laziness of drivers of horsed vehicles, who had become accustomed to slow speed and who have been known wilfully to precipitate traffic blockades that have lasted from five minutes to more than an hour in order that they might adhere to their schedule of not more than three loads a day. One instance was cited in which a recent blockade in Chicago involving between 155 and 175 vehicles, mostly drawn by horses, lasted one hour and twenty minutes and finally was broken up only by mutual agreement between the drivers. It required less than five minutes to break the blockade.

That such conditions can be ameliorated, he explained, is made plain by the fact that the special facilities which are provided for the handling of perishable goods reduce the time required in handling by at least 75 per cent. Already a number of freight handlers have realized this fact and have instituted remedial measures evident in the payment of stipulated salaries to employees, supplemented by bonuses which are offered as a reward for performing more than the stipulated amount of work in a given time.

Inadequate Clerical Force an Evil.

Another source of delay to which he drew attention lay in the inadequate force of clerks provided at many terminals. Often, he pointed out, as many as 40 motor trucks have been lined up from minutes to hours while their drivers patiently waited for their bills of lading. Whereas the owners and drivers of horse-drawn vehicles are not adverse to such delays, but rather welcome them for the reason that their draught animals must be rested periodically, they represent a specific loss to the motor truck owner.

Talking to no set topic but voicing a subject which is near to his heart, John C. Wetmore, of the New York Evening Mail, made a strong appeal to manufacturers for the support of sport. He stated that there is practically nothing else which permits of so much newspaper publicity and of conspicuously keeping the automobile in the public eye.

N. A. A. M. BANQUET PROVES A SPLENDID JOLLIFICATION

More Merriment Than Oratory Marks the Occasion — Clever Skit on Freight Car Shortage to Impress Railroad Men.

The banquet at the Pontchartrain on Thursday night, which punctuated the N. A. A. M. convention, was a more than ordinarily enjoyable function. The set pieces of oratory were few and far between, professional entertainers providing most of the merriment. Several character sketches and songs were rendered and a "little German band" furnished music, in which the diners joined. Not to mention a "turn" on an Italian hand-organ performed by W. E. Metzger, president of the N. A. A. M., the hit of the evening was made by a quartette garbed as railroad employes which enacted a farce written by H. W. Ford, chairman of the Detroit banquet committee, in collaboration with Traffic Commissioner Arthur T. Waterfall of the Board of Commerce, which detailed with considerable effectiveness some of the experiences manufacturers have had with railroad men in their efforts to obtain a sufficient number of freight cars and to obtain them at the proper times for the prevention of delayed shipments.

Proceeding to the speakers' table, the quartet beseeched E. B. Boyd, assistant vice-president of the Missouri Pacific Railroad, and Nat Duke, assistant traffic manager of the Delaware & Lackawanna Railroad, to help them out in their quest for wide door automobile cars, which these officials promised to do.

About 200 were present at the banquet. Abner E. Larned, as toastmaster, facetiously welcomed them in the name of the Wayne county grand jury, of which he is chairman.

Among the speakers were: President William E. Metzger, L. W. Goodenough, John C. Wetmore, Hal H. Smith, George T. Moody and James Keena. Others at the speakers' table were E. B. Boyd, Nat Duke, Henry Ford, Hugh Chalmers, Henry B. Joy, Thomas Henderson, L. H. Kittridge, R. E. Olds and H. O. Smith.

Among the special guests were: Edsel B. Ford, A. B. Atwater, assistant to president, Grand Trunk Railroad; J. S. Bartle, assistant traffic manager, Atchison, Topeka & Santa Fe Railroad; W. C. Rowley, general freight agent, Michigan Central Railroad.

The several business sessions were largely attended, practically every manufacturer in the trade being represented by one or more officials, while the banquet was even more largely attended, plates for nearly 200 being set.

Court Upholds Laciar's Attachment.

Although the Appellate Division of the Supreme Court of New York, First Department, reduced from $15,000 to $4,000 the amount of the attachment that Robert J. Laciar secured against the Jackson Motor Co., of New York City, at the beginning of a lawsuit, the higher court last week refused to dismiss the attachment and the writ which was placed upon the company's bank account and several cars still stands as modified. Laciar asked $15,000 following his discharge as sales manager, which he claimed was unjustified, as he had made exceptionally good and sold many cars. Part of Laciar's claim is not represented by actual monetary damages which can be put down on paper as such, and the court cut the figure to this tangible amount, consisting of commissions, etc. The Jackson company sought the vacating of the attachment.

Two Years' Inactivity Ends Incorporation.

The New York State statute which, as is not generally known, states that a corporation which does not organize and begin operations within two years of the date of its incorporation ceases to exist, has been upheld by Judge Goff in the Supreme Court for New York county in overruling the demurrer to the complaint in the case of the attorney general against Arthur Stilwell and others, the case, however, having no direct bearing on the automobile industry. The decision, rendered Monday last, 28th inst., was to the effect that since Stilwell and his three co-incorporators had failed to organize and begin operations within the two years specified the complaint of the State, asking for dissolution, was good and sufficient and not to be successfully demurred to.

Pittsfield to Lose Another Factory.

The Specialty Mfg. Co., of Pittsfield, which produces several automobile accessories and of which Wiliam P. Wood is treasurer, is preparing to remove to Hoosick Falls, N. Y., whose chamber of commerce has placed a factory at its disposal and provided other advantages. According to the agreement, the removal must be completed before the end of the year.

Moon Declares Another 10 Per Cent.

The Moon Motor Car Co., of St. Louis, has declared a 10 per cent. cash dividend, payable from its surplus. It represents the second dividend declared this year and is the fourth consecutive distribution of 10 per cent.

STOPPING THE LEAKS IN REPAIR SHOP PROFITS

Principle of Orderliness and the Right Way of Doing Things, Which Is the Basis of System, Applicable to Little Repair Shops as Well as Big Factories—Practical Conditions That Must Be Considered.

From the point of view of the man who is interested in the engineering side of the motor car industry, there is nothing connected with the business that is more striking than the absolutely systematic methods which prevail in large manufacturing establishments, in factories of moderate capacity and in most of the large garages and repair shops. It has been found that a certain degree of system is necessary in order to keep a large business running at all, and that a still more elaborate system is conducive to all-round cost reduction, when properly applied.

What is Meant by System.

System consists largely in finding the best possible methods of doing certain things, and seeing that such methods are followed out. System not only covers the mechanical processes by which machines are manufactured or repaired and the methods of keeping track of parts during manufacture or repair and of the time of the men doing the work, but also embraces such important matters as shop lay-out, lighting, the location of machine tools, benches, etc., and the general shop conditions under which the work is done. It is a matter of common knowledge that the establishment of conditions which are conducive to the comfort and welfare of the men and which make the work as easy as possible, are conducive also to increased production, cheaper production and better production.

All this has come to be axiomatic; no manufacturer would think of establishing a factory with a view to its profitable operation without giving the closest attention to the systematizing of everything in connection with his business. And yet one hardly can throw a stone, so to speak, without hitting a repair shop or a garage that is run —or, rather, that runs itself—without pretence of system of any kind.

Guessing that is Unprofitable.

The idea seems to be that a small shop, which is dominated by a single man, perhaps, has no need of system, and that things can be run haphazard just as well as any other way. A dozen different shop or garage proprietors probably would express this idea in a dozen different ways; but the basic notion always is the same. Certain men are capable of doing certain work; they are supposed to do it regardless of shop conditions. A lathe or a drill press must be used on certain jobs; the machines are installed without regard for the appropriateness of their positions to the work they are to do. Space is required for cars under repair; any space at all will do, regardless of lighting, drainage or convenience to machines or benches. The proprietor estimates that a given job will require a given time for its completion; if his estimate is wrong he has no means of checking up to find out what upset his calculations, except perhaps the mechanic's recollection of about how long he was engaged on each part of the work—and, needless to say, this is anything but a reliable check. The original estimate is a guess; the cost of doing the work is a guess; the amount of the bill rendered is a guess; and the amount of the proprietor's profit at the end of the month is a guess—tempered somewhat by the probability that the figures will be less than the proprietor expects.

Small Size No Excuse for "Sloppiness."

The principles which apply to the laying out and management of a big shop apply also to the laying out and management of a small shop. It must be obvious that if the best of conditions are required for the production of the best results in large shops, the same holds true for smaller establishments; the size of the shop does not alter the principle.

The two worst enemies of system are mistaken ideas of economy and what is expressively referred to the vernacular as "sloppiness." The best possible definition of the term is obtained by a survey of the dingy, disorderly jumble that characterizes the average small shop devoted wholly or in part to the execution of automobile repair work. The first impression received upon entering such a place is one of darkness. It is not always possible to provide plenty of windows—in fact, sometimes it is impossible; but it always is possible to wash windows. The amount of light that can be excluded by a film of dust is simply astonishing. The shop should be fitted and equipped with a view to making the best possible use of the available sources of illumination, and as the hues imparted by dust and grime are capable of absorbing a great deal of light, the walls, ceilings, posts and everything that can be so treated should be coated with white and the coating renewed as often as it shows a tendency to become gray.

Natural and Artificial Lighting.

As light is required in reasonable abundance, it stands to reason that if it cannot be obtained through glass from the natural source of illumination, artificial methods should be resorted to. And it may be added that white walls and ceilings are as valuable in the conservation of artificial light as of natural light. Lights should not be placed until the layout of the shop has been decided upon, so that each lamp can be located to the best advantage. It is economy in the long run to use good, strong lights and provide easy means for turning off those not in actual use. A little system in this matter of handling of lights, a distinct understanding as to what is to be done, will keep the lighting bills far below the figure they are sure to reach if there is no strictly enforced rule against the waste of light. It should be borne in mind, however, that there is a vast difference between using plenty of light for legitimate purposes and wasting it; stinting light on a job means loss of money in time and the quality of work. To give a single example, it is not very difficult to appreciate that a man's efficiency is considerably reduced, if he has to work with one hand while holding an inconvenient light in the other, or if he has to waste time rigging a light so that it will shine where he wants it to, or if another man, no matter how low his wages, has to act as a lamp holder.

Illumination of the Machine Tools.

Machine tools and benches should be located where they will receive their share of light and, as far as possible, should be so placed as to entail the minimum movement of parts. A workman is earning no money when he is walking about the shop carrying work to or from the machines or benches. This matter of location also has an influence on the size of the lighting bills. For example, a bench vise is used for a far larger proportion of the time than a lathe in a small shop, and, for this reason if for

Digitized by Google

no other, the bench should be placed near a window. Thus the light most used will be the light that costs nothing, while the light that has to be paid for will be used only as occasion demands. On the same principle, much-used machines should be placed where they will utilize the cheapest light.

Cutting Out Work that is Unnecessary.

Nine times out of ten a job will go to a bench before it will go to a machine; therefore a bench should be closer to the car from which parts are taken than the machines. The principle is the same as that involved in the "routing" of parts in a big factory—that is to say, everything is planned so that each part will travel the shortest possible distance during the various processes of manufacture. It is well to avoid, if possible, the awkward and yet not uncommon layout in which there is a row of benches against a wall, a row of machines parallel with the benches, and outside of the machines an open space for the cars under repair. This arrangement necessitates lugging parts from the cars around the machines to the benches and often back by the same route to the cars without stopping at the machines. It is, of course, impossible to advise just how such things can best be done, for everything depends upon the many variables of shop form, window locations, the running of shafting, position of doors and a score of other things. But with the principles in mind there should be little difficulty in arranging everything so as to avoid conspicuous inconveniences at least, even if the very best possible arrangement is not hit upon immediately.

Taking Care of the Shop Tools.

One of the most familiar sights in small shops—to say nothing of some shops that are distinctly big—is that of a motor or transmission lying on the floor and a couple of men working squatted down or bent double over it. In either case they are incapable of working efficiently, because they are in awkward and inconvenient positions and tire easily. There should be low, heavy stands for such things, so that heavy car parts can be conveniently examined and worked on from all sides, and such stands, if not built as bench extensions, should be close to benches or else mounted on heavy castors so that the least possible time will be wasted running to and fro.

Part of the system of every shop, no matter how small, should consist in a method of looking after such tools as are not the personal property of the men employed. For instance, taps and dies, pipe-cutters, reamers, special wrenches, gauges, lathe tools, drills, and so on, belong to the shop. In a large establishment these things usually are looked after with the utmost care. Each item is made to give the greatest possible service in proportion to its cost and every piece is accounted for. There are few small shops, on the other hand, where it is not rather easy for things to get lost or broken, by no one in particular, of course.

While it is unnecessary and impracticable in a shop where there are very few men to make use of an elaborate tool checking system, there should be at least some understood method of procedure. For instance, all shop tools of the kind that are occasionally used—such as taps and dies, reamers and the like, as opposed to lathe tools and drills—should have their own particular places, and a man who takes out a tool should return it to its place as soon as he has finished with it, and if anyone else needs it he should take it from its place and not from some other man.

Everybody's Business is Nobody's.

This may savor somewhat of red tape for small shop purposes; but it is not likely that a shop can run for many weeks without the occurrence of something that will justify the small amount of extra trouble—even if only in the ease with which everything is found when it is wanted. Moreover, if a man takes out a tool and finds it broken or otherwise in bad condition, it is far easier to locate the responsibility than if the tool was found on a bench or on the floor, with no one accepting responsibility for its condition.

System should prevail in keeping shop tools in condition. This does not mean that there sholud be a hard-and-fast time for overhauling the tools, as there might be in a big shop, but that it ought to be the business of some one man to do whatever work is necessary and to do it whenever it may become necessary. What is everybody's business is nobody's business, and nobody's responsible.

The Junk Pile on the Lathe Bed.

The commonest way of taking care of a set of lathe tools, and the way that is most favored, apparently, in shops of the "sloppy" variety, is to lay them out on the bed of the lathe back of the tailstock, because that part of the bed seldom is used and makes a convenient place to throw things. Sometimes the shears are protected by a board and sometimes they are not, and it is needless to say that in the latter case the accurately finished surfaces are sure to be more or less nicked and marked in time. When a long job comes along the tools usually are piled up on the floor or some nearby bench, and when they are returned after the completion of the job the lathe man does not know for certain whether or not he is putting back all the stuff he took away from the machine, and, moreover, he loses time in the double transfer. It is by no means an expensive or a difficult matter to arrange a rack for such tools, consisting of a vertical boards with hooks, pegs or even nails to receive the tools.

What is Gained by Knowing Things.

The man who runs a small shop is, or ought to be, just as desirous of knowing where he stands, financially, at any given time, as the stock company that operates an extensive factory. In a shop that is run with no regard whatever for system—just because it is considered so small that a system would be worse than useless—it is a safe assertion that the proprietor never knows the state of his finances until he can actually compare the amount of cash in his pocket with the bills on the spike on his desk. Of course, he can guess at the proceeds of the work in progress in the shop, at the probable amount of time and material that each job has absorbed and at the probable amount he will have to put on the bill in order to show a profit. But, as has been indicated already, all these things will be guesses, and in very many cases decidedly bad guesses. Except in a very general and more or less vague way, the boss does not know which of his men are the most profitable, what jobs are capable of yielding the best returns, what work he can do a little cheaper without losing much profit, or what he must charge a little more for in order to make it pay—in short, he only knows that at the end of the month, when the bills ocme in, he has made so much more than he has to spend, or the reverse, as the case may be.

Things To Be Considered.

In order to keep this matter of finances quite straight, it is necessary that the work should be done under a system that will take cognizance of every detail of each job.

In doing a piece of work on a car there are two items to be considered—namely, the actual time required to do the work and the amount of material used. It is not enough to know that the car has been in the shop for a certain length of time; it is not even enough to know that so many men have worked on it for so many hours. It is necessary to know how much time each man spent on each part of the work.

There is real value in the knowledge that it took a certain man so many hours to take down the gearset of a car, renew the bushings and replace it, for it gives a line on the cost of doing this particular part of the work, whereas the knowledge thath it took so many hours to overhaul the whole car would give no inkling of such details. A system that keeps "tabs" on such matters, therefore, is of value in other respects than that of enabling the proprietor to figure his monetary financial status.

In the RETAIL WORLD

O. B. Jones has purchased the interest of Dr. H. W. Hall in the garage business of Heintz & Hall, San Bernardino, Cal.

Charles Leigan and Detlef Tiedje have entered the trade in Atlantic, Ia., under the style Essenkay Sales Co. As the name indicates, they will sell tire filler.

D. Levy & Sons of Baltimore, Md., are to build a one-story garage, 80 x 112 feet, on Colvin street, near Exeter; the plans call for an expenditure of $30,000.

John Preston has bought the Fannin County Garage in Bonham, Tex. H. Seay and Fern Everheart, the former owners, have retired from the business.

John A. Thomas has purchased an interest in the firm of Trachte & Woerpel, in Dodgeville, Wis. The style hereafter will be Iowa County Automobile Co.

Fred Linzy of Auburn, N. Y., has bought the interest of his partner, Floyd Selover, in the Empire Garage, on Water street; Linzy will continue the business.

Having been reorganized, the Iowa Auto & Tire Co., of Davenport, Ia., hereafter will be known as the Iowa Taxicab Co. It will handle the Pierce-Arrow line.

W. G. Huffman of Mason City, Ia., has entered the garage and automobile livery trade in Charles City, in the same state; he has leased a building for five years.

Ernest Tonjes, of Brooklyn, N. Y., is preparing to build a one-story garage, 35 x 50 feet, at 56th street and 14th avenue; it will represent an expenditure of $4,500.

Neil Olsen, of Manitowoc, Wis., has taken over the Ford agency for that town. Frank Planski, who formerly had the agency, has relinquished it because of ill health.

Gorst & King are about to open a garage in North Bend, Ore. They have leased for five years the building which formerly was used by the North Bend Furniture Co.

Swanson Bros., of Clay Center, Neb., have purchased the Bahr Bros. Garage in Hastings, in the same state; they have the Maxwell agency for Western Nebraska.

J. R. Harris of Bloomington, Ill., has purchased the Normal (Ill.) Garage of E. C. Trott; Harris, at the same time, sold his interests in the Bloomington Garage.

Joseph Smithson, formery of Olean, N. Y., has entered the garage field in Detroit, Mich. He has opened up on Jefferson avenue under the style Smithson & Aleying.

Permission has been granted to Thomas Scoble to build a two-story brick garage at 32-36 West 12th street, San Francisco, Cal. The application named the cost as $6,000.

The Guarantee Motors Co., of Des Moines, Ia., just has moved into a new garage at 408-10-12 West 12th street; Abbott-Detroit cars and Chase trucks are handled.

Jackson Auto Sales Co. is the style of a new business in Peoria, Ill. The organizers are Charles Hines of that city, J. H. Sheehan and A. Murphy, both of Dunlap, in the same state.

Harry Burton of Chino, Cal., has sold his interests in the Burton & Crabb Garage; the firm style hereafter will be Crabb & Johnson. Burton, however, will continue as Krit dealer.

C. E. Miller, of Cordele, Ga., has purchased the garage business of Dr. A. B. McQueen in Tarbon Springs, Fla. Miller for some time has operated a machine shop in Cordele.

Fred J. Fitzgerald and R. G. McLaughlin have opened an automobile livery business in Chicago at 35th street and Michigan avenue; the initial equipment consists of ten cars and cabs.

F. O. Bowen and H. L. Matthews have bought C. L. Omohundro's interest in the Omohundro Auto Co., in Little Rock, Ark. The style hereafter will be Bowen & Matthews Auto Co.

The John J. Radel Co., undertakers, in Cincinnati, O., are entering the garage field; a two-story reinforced concrete garage is being erected for them at 652 State avenue. It will cost $25,000.

Olsen & Juergens Co. is the style of a new selling organization in Chicago; Lauth-Juergens trucks will be stocked. A service department has been established at 905 West North avenue.

A. Riley Crittenden, of Howell, Mich., plans to inaugurate an automobile transportation between that town and Fenton, in the same State; he will open up in the spring with 12 buses.

Charles J. Moody just has opened a garage at 56-58 River street, Elgin, Ill. He formerly operated a garage across the street from this location. The equipment includes a machine shop.

Carl B. and Lyman Spitzer are about to erect a one-story garage, 85x100 feet, in Toledo, O., on 31st street, near Madison; the plans call for an expenditure of $12,860.

Under the style of Price Hill Auto & Garage Co., John J. Radel has established a new business in Cincinnati, O. Radel also conducts a livery and undertaking business in various parts of the city.

Merritt Osborne, a dealer in St. Paul, Minn., has leased the Seymour Bently Garage at 468 Selby avenue and will remodel it as an electric service station; he handles Whites and Detroit electrics.

The Belt Garage of Fredonia, Kan., has been leased by Roy Gillett and Joseph Belt; the former owner, P. P. Belt, will devote his time to the sale of new cars in a salesroom adjoining the garage.

O. S. Johnson and Henry Rohde, of Bryan, Tex., have purchased the Imperial Garage from H. A. Saunders; this garage and one heretofore operated by Johnson and Rohde, will be consolidated.

The Clark-Summers Auto Co., which formerly did business in a Nebraska town, has entered the trade in Sioux Falls, S. D., at 228-30 North Main avenue; Cartercar, Metz and Lambert cars will be stocked.

Wesley Cock, who heretofore has operated a garage at 119 South Main street, Mitchell, S. D., has purchased an interest in the Dakota Auto Machine Shop, at 219 West 1st street; he will remove his Main street business to the new location.

J. C. Ebzine has leased for five years a two-story garage, salesroom and repair shop, 55 x 180 feet, which is to be erected in Marshalltown, Ia., by Mrs. E. V. Wixcel, of Chicago. The cost will be $12,000.

Kenneth Ellis, formerly a bank teller, W. R. Simpkin, formerly of Chicago, and M. L. Thompson, formerly of Vermillion, S. D., have organized an agency in Sioux City, Ia. They will handle Haynes cars.

C. B. Wyckoff, a member of the trade in East Orange, N. J., has organized the Ford Sales Agency of the Oranges, which has located at 490 East Main street; in addition to Ford cars, Overland and Cutting cars will be stocked.

Indianapolis, Ind., is soon to be possessed

Digitized by Google

of a new building which will contain room for four selling agencies; Mrs. Laura B. Elder will erect it at Capitol avenue and Vermont street at a cost of $37,000. The site is 135 x 95 feet.

The Neustadt Auto Suppy Co., which for many years has been engaged in the accessory business in St. Louis, Mo., finally has "taken on" automobiles. It has secured the Marion representation for the eastern half of Missouri and southern Illinois.

Henry E. Riker & Co., a new entry into the field in Cleveland, O., has been made Ohio distributer for the Stewart Motor Corporation; a service station will be maintained on Euclid avenue. Riker formerly was general auditor for the Firestone Tire & Rubber Co.

Crowe Automobile Co. is the style under which L. E. Crowe, formerly of Portland, Ore., has opened a business in Los Angeles, Cal., at 1228 South Flower street; Crowe, who handled the Marion line in Portland for five years, will act as distributer for that line in Southern California.

The Auburn Garage & Auto Co. has been formed in Fort Wayne, Ind., wth a capitalization of $20,000 to take over the Auburn Garage, located on West Washington street; the company will continue to handle the Auburn line. The officers are: President, Fred Eckart; vice-president, Adolph Schultz; secretary, Ray McAdams; manager, Louis Watson.

The Campbell-Collins Co. has been organized in San Jose, Cal., by E. E. Campbell and Hugh Collins and will distribute accessories and automobile supplies over a considerable territory; the location is 241 South 1st street. C. E. Smith, a former Fisk tire man, and R. H. McIntosh, who has been in the trade in that State for a number of years, are connected with the business.

Robert C. Cornelius and Herman F. Hohly are about to enter the trade in Toledo, O., under the style Cornelius-Hohly Auto Co. They will handle the Imperial line at 1011 Jefferson avenue. Cornelius, for eight years, has been connected with the Eckhart Carriage Co., maker of Auburn cars; Hohly formerly was a druggist in Toledo but for seven years past has been in the employ of the Toledo Rubber Co.

To handle Maxwell cars in St. Louis, Mo., and adjacent territory, the Maxwell Motor Sales Co. has been formed in that city. The officers are: President, B. R. Ford; vice-president, Charles E. Darrow; treasurer, John F. Fillo. The new company has located at 304-306 North 12th street, previously occupied by the United Motor St. Louis Co., which has removed to 1215 Chestnut street, where it will conduct a purely wholesale business.

TWO HALLS REQUIRED FOR ATLANTA AUTOMOBILE SHOW

Twenty-five Dealers Display Forty-two Makes of Cars in Brightly Lighted Buildings—Exhibitors and Exhibits.

That electric lights and a building suitably large to house the affair as a unit, are not necessary for the production of a ninteresting and withal successful motor car exhibit, amply is being demonstrated at Atlanta, Ga., at the second annual show of the Atlanta Automobile & Accessory Dealers' Association, which opened on Saturday evening last, 16th inst., and which is to have a seven days' run.

But provision for electric illumination not having been made by the constructors of the Auditorium-Armory and of Taft Hall, which houses the overflow from the larger building, the "blaze of glory" nevertheless is there, light from the myriad incandescent gas lamps with which the chandeliers are provided, and from the globular lights which top the columns which serve to separate the various booths, supplying the needful glow. And were other means of making the buildings brighter necessary, they are amply supplied by the liberal use of light draperies, in pink and white, emblematic of the Atlanta Automobile Club, which serve to cover both ceiling and walls, that is, all of the walls save that portion which supports a huge scene done in oil by a local artist and which depicts a pass through a sylvan dell. Smilax and bay and flowers are freely used in the decoration of the booths of the exhibitors.

The show boasts of 42 different makes of pleasure and commercial cars, which are shown by 25 dealers; while accessory row is filled to overflowing with the varied wares of some 13 exhibitors. Although very much that is radical scarcely could be expected, just a touch of individuality is lent to the show by the appearance of the Corbitt car, which very rarely is seen north of the Mason and Dixon line and which is shown by the Sigma Engineering Co. The car is the product of the Corbitt Automobile Co., of Henderson, N. C., and is built along conventional lines. Interest is added to the display of accessories, too, by the appearance of the Seaton Spring Wheel Co.'s resilient wheel and the Regan motor, both of which are native products. The motor, which is the invention of Ralph Ragan, is said to function on the four-cycle principle, although valves either of the poppet or sliding sleeve variety are entirely lacking.

Among the exhibitors of motor vehicles are: Ford Motor Co., Ford; R. C. H. Corporation, R. C. H. and Hupp-Yeats electric; Firestone-Columbus Southern Co., Firestone-Columbus and Columbus electric; H. B. Odell, Packard, Regal and Rauch & Lang electric; Michigan Georgia Motor Car Co., Michigan; International Harvester Co., International; Southern Dorris Co., Dorris; F. B. Stearns Co., Stearns; Buick Motor Car Co., Buick; American Motors Co., American and Marion; Johnson Motor Car Co., Stevens-Duryea and Chase commercial; Fulton Auto Supply Co., Marmon, Hudson and Peerless; Studebaker Corporation, Studebaker; Locomobile Co. of America, Locomobile; L. S. Crane, Pope-Hartford; Sigma Engineering Co., Lozier, Haynes, Corbitt and Standard electric; Overland Motor Car Co., Overland; Oakland Motor Co., Oakland; Cole Motor Co. of Georgia, Cole and Federal and Alco trucks; Mitchell Motor Co. of Atlanta, Mitchell; John M. Smith, Pierce-Arrow, Chalmers; Atlanta Auto Sales Co., National, Henderson and Flanders electric; Velie Motor Vehicle Co., Velie; Premier Sales Co., Premier and Baker electric; Steinhauer & Wight, Cadillac.

Accessories are shown by Reed Oil Co., Wayne Oil Tank and Pump Co., Alexander-Seewald Co., Seaton Spring Wheel Co., Ralph Ragan, Frederick W. Brown, Charles E. Miller, Whitman Auto Sales Co., R. J. Slear, Elyea-Austell Co., Motor Supplies Co., Johnson-Gewinner Co., Atlanta Top and Trimming Co.

Minor Business Troubles.

Creditors have filed a petition in bankruptcy against the F. K. B. Co., of 1010-12 14th street, northwest, Washington, D. C. The concern dealt in automobile supplies.

The Urwick Motor Car Co., Brook street and Broadway, Louisville, Ky., is in process of liquidation; settlement is voluntary on the part of the stockholders. The capitalization is $15,000 The company handled Marmon and Baker electric cars.

The Westfield (Mass.) Motor Truck Co., manufacturer of motor trucks, has filed a petition in bankruptcy; there are about 150 unsecured creditors. The liabilities amount to $20,617, of which $57 is for taxes, $270 for wages, $900 is preferred, $7,519 is unsecured, $11,371 is for notes and $10,500 is for accommodation paper. Assets are $4,079.

Following a disagreement among the stockholders, the Dayton (O.) Automobile Co. has been placed in the hands of a receiver; the petitioners were T. J. Weakley, the vice-president, and other stockholders. William Miller, the bookkeeper, was named receiver and it was announced that business would be continued pending the dissolution of the concern and the sale of its assets.

LID PUT ON SUNDAY RACING BY HOT SPRINGS CHURCHMEN

It is Lifted by Waiving Admission Fees, but "Passing Hat" Nets Little—Sloan's Troupe Entertains Arkansas.

As a revenue producer, the racemeet that was run at Hot Springs, Ark., on Sunday last, 17th inst., in connection with the State Fair, with the A. J. Sloan troupe as the headliners, was not a very gorgeous or glittering success. Not that the crowd was lacking or the purse strings bound tight, but interference was offered by a religious association which would not brook Sunday racing, and which was backed up by Governor Donaghey and General Green of the State Militia, who not only helped to voice the protest against the contest but threatened interference provided an admission fee was charged. Consequently and necessarily that formality was waived. Some slight recompense for the large expenditure resulted from a "passing the hat" procedure, but the donations received were somewhat meagre.

William Endicott (Case) made the best showing of the day, and took three of the competitive numbers on the program and finished second to Nikrent (Case) in the free-for-all handicap; he also made the best time in the single mile trials at 57 seconds. His victories included a three-mile and a five-mile match race with Louis Disbrow (Case) and Joe Nikrent (Case), respectively, and a five-mile contest for cars with displacements of under 451 inches. A ten-mile amateur event went to H. C. Alexander (Studebaker), who completed the distance in 13:05⅗. Nikrent, with a five seconds handicap over Endicott, won the five-mile free-for-all handicap in 5:30⅖. A two-mile exhibition, driven by Louis Disbrow in the Simplex, completed the program. The summary:

One mile, time trials—William Endicott (Case), time, 0:57; Joe Nikrent (Case), time, 0:61.

Ten miles, match race for amateur drivers—Won by H. C. Alexander (Studebaker 20); second, A. C. Gibbs (Ford). Time, 13:05⅗.

Five miles, for cars with displacements of under 451 inches—Won by William Endicott (Case); second, Joe Nikrent (Case). Time, 3:25.

Two miles, time trial—Louis Disbrow (Simplex). Time, 1:53.

Five miles, match race—William Endirott (Case); second, Joe Nikrent (Case). Time, 5:24⅕.

Three miles, match race—Won by William Endicott (Case); second, Louis Disbrow (Case). Time, 3:32.

Five miles, free-for-all handicap — Won by Joe Nikrent (Case), 5 seconds; second, William Endicott (Case), scratch; third, Alexander (Studebaker), 40 seconds. Time, 5:30⅖.

Law Grows Out of Test of Horns.

As a result of a test by the Police Department, the city of Los Angeles has just enacted an ordinance directed against the use of the bulb horn as an automobile warning signal. The test was conducted secretly and, so far as is known, was the first of its kind ever made. Members of the traffic squad went up and down the various streets where the parking of automobiles is permitted and blew the bulb horns attached to some 400 cars. Of this number but two were found which gave what they termed an adequate warning — one that could be heard 50 feet ahead. The others emitted so slight a sound that it could scarcely be heard at all. In every case it was impossible to obtain anything but an inaudible wheeze when the bulb was grasped quickly, thus demonstrating the uselessness of the bulb horn as an emergency.

The test was instigated for the purpose of gaining first hand information as to the cause of automobile accidents. It was shown, for instance, that of the number of these resulting from the failure to hear horns, 77 per cent. occurred at the intersections of streets where the noise of traffic is such as to make an efficient signal absolutely necessary.

The new ordinance requires the use of a signal capable of producing an "abrupt note, sufficiently loud to serve as an adequate warning"—that is, sufficiently loud to be heard under all conditions of traffic. Provision has also been made for the elimination of unnecessary noise by prohibiting the use of such a signal except in its true function—as a warning of danger.

Five Months in Jail for "Joy-Rider."

The ever-present individual who seeks recreation by purloining a car and enjoying himself therein to the detriment of the vehicle and at the cost of the owner, received somewhat of a setback in Los Angeles last week when Louis Hyer, a chauffeur, received a sentence of 150 days in the city prison. Hyer formerly was employed as a chauffeur by Major E. W. Jones and was found guilty of taking the car without permission the night of November 9 and wrecking it in the course of his escapade. The case was of unusual interest in that it was prosecuted under the direction and at the expense of the Automobile Club of Southern California.

OLDFIELD MANAGES MEET BUT EARL COOPER STARS

Veteran Driver's Troupe Appears in San Jose and Californian Scores Heavily—Oldfield Takes What's Left.

Although Barney Oldfield, piloting a front-wheel drive Christie, made the best time of the day during the mile trials—47⅗ seconds—Earl Cooper was the real star at the six-event meet which was run on the mile track at San Jose, Cal., Tuesday, November 12th, under Oldfield's management. Driving a Stutz, Cooper took the two major competitive numbers on the program, a five-mile free-for-all, which he completed in 4:43½, and a similar event which went for 25 miles and was won in 23:54⅖. The other competitive event went to Oldfield, who crossed the tape in 4:34¼. Gaston Maurice and Fred Melaun also won places, although neither appeared among the winners. Melaun took three thirds, while Maurice was second in two time trials. The summary:

Five miles, for cars with displacements of under 451 inches—Won by Barney Oldfield (Benz); second, Earl Cooper (Stutz); third, Fred Melaun (Cino). Time, 4:43¼.

One mile, time trials — Barney Oldfield (Christie), time, 0:47⅗; Gaston Maurice (Renault), time, 1:02⅛.

Five miles, free-for-all—Won by Earl Cooper (Stutz); second, Oldfield (Benz); third, F. Melaun (Cino). Time, 4:43½.

Two miles, time trials—Barney Oldleld (Christie), time, 1:37; Gaston Maurice (Renault), time, 2·03.

One mile, time trial—Earl Cooper (Stutz), time, 0:54.

25 miles, free-for-all — Won by Earl Cooper (Stutz); second, Barney Oldfield (Benz); third, Melaun (Cino). Time, 23:54⅖.

Prison Inmates Build Motor Truck.

Those automobile factories the annual output of which is at all limited generally do not lay much stress upon their building capacity, but there is one establishment the output of which is the minimum and the factory is proud of its accomplishment; this is Sing Sing prison, New York State's chief "hostelry." The convicts have constructed a complete motor truck, which is believed to be the first motor vehicle built within prison walls. Having built it, the prison authorities are determined to sell it and have offered the vehicle to Street Cleaning Commissioner Edwards of New York City for $5,000. He will inspect the truck at the penitentiary before saying "Aye."

1,018,179. Link for Cross-Chains of Anti-Skid Devices. Frank Averill Fox, Brooklyn, N. Y. Filed Dec. 6, 1911. Serial No. 664,-218.

1. A link for cross chains of anti-skid devices comprising a body portion having a recess in its back or bottom face, a tongue extending from one end of the body portion having its end portion adapted to fit the recess in the body portion and having opposite recesses formed in its end portion near but not extending to its end, and oppositely arranged lugs on the body portion adapted to be turned down into and to fit the recesses in the end portion of the tongue.

1,018,185. Tire Case for Automobiles. Lewis Grimm, Pittsburgh, Pa. Filed Oct. 12, 1910. Serial No. 586,734.

1. A tire case comprising a receptacle in the form of an annulus, including a stationary and a hinged section, one of said sections seated in and overlapped by the other section when the receptacle is closed, means for maintaining the sections closed, a segment-shaped shoe secured to the lower portion of the stationary section and having its inner portion off-set, a segment-shaped shoe fixed to the lower portion of the hinged section and pivotally connected to the off-set portion of the other shoe, and means for connecting that shoe provided with the off-set portion to a support.

1,018,206. Tire Chain and Guard. Ole J. Mikelson, Ferryville, Wis. Filed Nov. 6, 1911. Serial No. 658,770.

1. In combination with a tire, the guard or chain consisting of the series of gripping members, links flexibly connecting the members, and means for connecting the meeting ends of the chain and securing the chain upon the tire, said means consisting of a pair of links having hooks at one end to engage one set of end members, a loop connected to said links to engage the tire rim, and a pair of levers fulcrumed to the other end of said links and having open recesses to engage pins on the other member of the chain at the meeting end.

1,018,219. Variable Speed Power Transmission Mechanism. Willard Irving Twombly, New York, N. Y., assignor, by mesne assignments, to Twombly Motors Company, New York, N. Y., a Corporation of New York. Filed Mar. 12, 1910. Serial No. 548,-776.

1. In a variable speed power transmission mechanism, the combination of a drive shaft; a roller pinion fixed thereto, said pinion also constituting one member of a clutch; a driven shaft coaxial with the drive shaft; a roller pinion mounted on the driven shaft to rotate therewith and having sliding movement thereon, said pinion also constituting one member of a clutch; an intermediate gear the axis of which is transverse to the axes of the drive and driven shafts, comprising a wheel having a plurality of concentric circles of pins; means operative to throw and lock the said wheel into mesh with the pinions on the drive and driven shafts, and to permit it to drop out of mesh with the pinions; and means to throw and lock the pinion on the driven shaft into and out of mesh with either circles of pins on the intermediate wheel to transmit different forward and reverse velocities to the driven shaft, or to throw the clutch portion of said pinion into engagement with the clutch portion of the drive-shaft pinion for direct drive, and simultaneously with the throwing of the clutch portions of the pinions into engagement operating the means to lock the intermediate wheel out of mesh with the pinions.

1,018,236. Implement for Automobile Engines. John J. Cooper, Providence, R. I. Filed Sept. 12, 1911. Serial No. 648,980.

1. In a portable device or tool of the general character described, the combination of a manually controlled operating lever member having one end bifurcated and adapted, when in use, to engage with and compress the spring of a self-closing valve, a suitable fulcrum screw adjustably engageable with said forked or bifurcated end of the lever, a nut mounted to move longitudinally on said screw, and a bent hook-shaped rod having one end thereof hinged to said nut and the other or free end adapted to engage the valve of an engine when the valve-bonnet or cap is removed.

1,018,250. Vehicle Spring. Michael M. McIntyre, Cleveland, Ohio, assignor to The Perfection Spring Company, Cleveland, Ohio, a Corporation of Ohio. Filed Aug. 28, 1909. Serial No. 515,117.

1. The combination, with a multiple leaf spring having leaves provided each with a central projection within the lateral edges thereof and a complementary recess, whereby said leaves may be centered with the projection of one leaf nesting within the recess of an adjacent leaf, of a spring seat having a surface conforming to the deflected portion of the adjacent spring leaf, and clips securing said spring to the seat.

1,018,259. Spring Wheel. William T. Murray, Baldwin, Kan. Filed June 6, 1911. Serial No. 631,624.

1. A device of the class described comprising an interior wheel member and a rim member spaced from the periphery of the wheel, a plurality of guide spokes carried by the rim, retaining portions carried by the wheel receiving the spokes for longitudinal and lateral sliding movement, resilient devices carried by the wheel, and divergent flexible connections between the resilient devices and the rim.

1,018,262. Carburetter for Internal Combustion Engines. Henry Andrews Neal, Richmond, England. Filed Mar. 7, 1910. Serial No. 547,797.

1. In a carburetter for an internal combustion engine, the combination of a mixing chamber having an air inlet channel and a mixture outlet, a carburetting chamber communicating with the mixing chamber, a valve adapted to vary the dimension of the opening between the carburetting and mixing chambers, a second valve for varying the extent of opening of the air inlet channel to the mixing chamber, and a suction-operated throttle controlling the outlet from the mixing chamber.

1,018,276. Fuel Injector. Edward M. Smith, Fall River, Mass. Filed July 20, 1909. Serial No. 508,668.

The combination of a cylinder having a piston therein, an air passage communicating with the cylinder and with a source of air supply, a fuel injector comprising a body having a threaded plug at its inner end adapted to be screwed into a wall of the air passage, said body being provided with a needle valve passage extending longitudinally therethrough, a valve in the passage, a fuel passage communicating with the valve passage, a cup on the inner end of said screw plug into which the valve discharges, and a deflector comprising a vertical wall spaced from and extending across the outer side of said cup, an inclined wall curved inwardly and downwardly from the upper edge of said vertical wall and overhanging said cup, said deflector being provided with end portions secured to the inner end of said screw plug.

1,018,292. Wheel Tire. Herman Leo Biener, New York, N. Y., assignor, by direct and mesne assignments, to Auto Sectional Leather Tire Company, New York, N. Y., a Corporation of New York. Filed July 14, 1910. Serial No. 571,945.

1. A wheel tire made in sections arranged around the rim of the wheel, each section comprising a rim plate, a tread plate, a coil spring interposed between the said rim plate and the said tread plate at the middle thereof, a flexible inelastic connection between the rim and tread plates at the center of the plates, said connection extending through the spring, flexible inelastic connections between the ends of the said rim plate and tread plate, and means carried by the rim plate for detachably securing the section to the rim of a wheel.

1,018,303. Metallic Vehicle Wheel. Hedley John Donahoe, Chicago, Ill., assignor of one-half to Theodore C. Tiedebohl, Chicago, Ill. Filed Oct. 9, 1911. Serial No. 653,-559.

A vehicle wheel formed entirely of one piece of cast metal, comprising, a fixed rim or tread, a double series of spokes, and a central hub, one series of said spokes being curved in one direction and the other series of spokes being curved in the opposite direction, said spokes intersecting one another at a multiplicity of points, said spokes slightly overlapping each other at the hub and then gradually merging into each other and finally all terminating at the rim in the same plane, whereby said spokes are integrally connected to each other at each intersecting point, there being at the angles of the intersecting spokes punctured lugs constructed to receive removable attachments, as described.

1,018,307. Resilient Wheel. John Wood Enright, New Orleans, La. Filed Nov. 26, 1910. Serial No. 594,284.

1. In a resilient wheel, an outer and an inner rim, pairs of lugs projecting from each of said rims, spaced-apart elliptical springs disposed between said rims and between the lugs of each pair, said springs comprising upper and lower leaves, a pin connection hinging said leaves together at their outer ends, whereby said pin may be withdrawn to disconnect said leaves.

1,018,330. Speed Recorder. Aubry H. Martin, Short Hills, N. Y., assignor to Recording Speedometer Company, Newark, N. J., a Corporation of New Jersey. Filed Nov. 7, 1911. Serial No. 658,965.

1. A speed recorder for recording the

Five Passenger Touring Car, One of Five Models, Improved Series V

Announcement of National Improved Series V

Do not compare the NATIONAL with any car except those costing $5000 or more. You have studied the 1913 announcements of other high-grade cars, and now without wasting words on superlatives we invite your candid reasoning—we can prove the NATIONAL offers you in Quality, Utility, Luxury, Reputation and Intrinsic Worth as much or more than any $5000 car for

$2750 to $3400

FIVE MODELS

Write us at once for our dealers' proposition and advance catalog

Compare these features with the very highest priced 1913 cars and you realize why we claim to offer you the greatest value on the market today

Long Stroke (4¾ × 6), flexible and noiseless Motor, with enclosed valves.
Left Side drive.
Center control.
Gray & Davis Electric Starter.
Gray & Davis Dynamo Electric Lighting System.
Bosch double dual Magneto.
Multiple jet Carbureter.
12-inch Turkish Upholstery.
Full heavy nickel Trimmings.
Electric Horn.
Adequate baggage carrying Compartment concealed in body but easily accessible.
Powerful and reliable Brakes.
Spacious interior.
Tire Pump, integral part of the motor.
128-inch wheel base.
Adjustable ventilating and rain vision Wind Shield.
Hoffecker Speedometer.
Tire Carrier in rear.
Silk Mohair Top, Cover and Curtains.
Full floating Rear Axle.
Resilient springs; ¾ elliptic in rear; semi-elliptic in front.
Large gasoline pressure-feed Tank with Gauge in rear.
Robe rail, foot rest, and foot mat in running board.
Plain, continuous, enclosed Metal Guards.
Easy riding qualities, unexcelled.
Oiling System, demonstrated to be perfect.

movements of a member driven automatically from a vehicle, including a device for feeding tape in predetermined amounts past said member and a clock-work for operating the tape-feeding device, said tape-feeding device consisting of a storage device for the tape, a roll adapted as it revolves to wind the tape thereon, a rotary table intermediate of the storage device and the winding roll, a disk having a circumference equal to the predetermined amount of tape to be fed and provided on its periphery with a surface adapted to grip the tape, and means for maintaining said roll and the tape thereon, in operative relation with said disk; substantially as described.

1,018,372. Internal Combustion Engine of the Tandem Type. Thomas Rigby, Dumfries, Scotland. Filed Oct. 16, 1911. Serial No. 654,943.

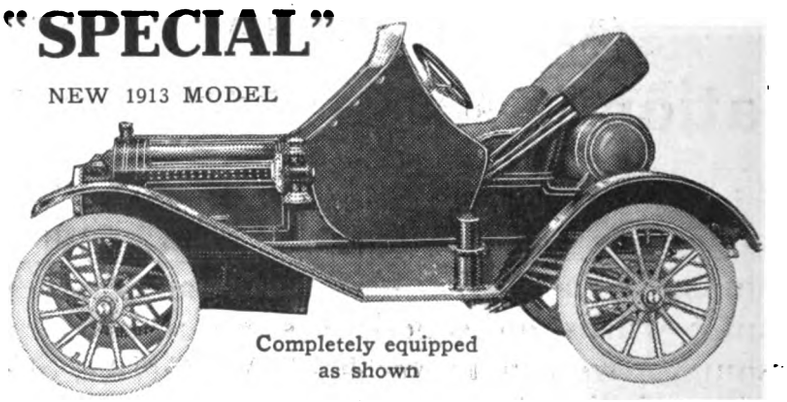
1. In an internal combustion engine comprising working cylinders in tandem, a piston in each cylinder, a rigid connection between the pistons, a compression chamber being formed at the inner end of the outermost cylinder, means for admitting combustible fluid to said cylinders, means for admitting a supplementary charge of combustible fluid to the said compression chamber, means for conducting the charge from the said chamber in alternation to the working cylinders, and means adapted to be controlled from a governor for controlling the admission of the supplementary charge to the engine.

1,018,383. Sparking Plug. George S. Walker, Boston, Mass., assignor of one-half to Edward J. Chadbourne, Wakefield, Mass. Filed Dec. 13, 1910. Serial No. 597,158.

1. A sparking-plug comprising, in combination, an electrical connected metal tubular shell, exteriorly screw-threaded and at its opposite end-portions open and of different internal diameters joined by a circular running shoulder, and at its larger open end internally screw-threaded and at its smaller open end having a circular radial flange projecting inwardly, constituting an electrode, a gland exteriorly screw-threaded and screwing into said screw-threaded end of said shell, and at one end having an internal circular running flange or shoulder and at its opposite and open end having a removable sleeve closely fitting and terminating therewithin and projecting therefrom, an insulated cylindrical and tubular plug having an external running collar lying between said internal flange of, and the end of said sleeve within said gland, and at one end-portion extending into and along and spaced from the smaller tubular end-portion of said shell and said sleeve of the gland and at its opposite end-portion projecting from said gland, a cylindrical metal stem electrically connected and extending lengthwise through and projecting from the opposite ends of said plug, a screw-threaded nut on one of the projecting ends, and a spherical shaped head, constituting an electrode on the other opposite projecting end of said stem, and said head lying within and spaced from said electrode of said shell, all substantially as described, and for the several purpose sspecified.

1,018,428. Pneumatic Wheel Hub. Fred J. Koch., East St. Louis, Ill. Filed Mar. 19, 1910. Serial No. 550,460.

In a vehicle wheel, an axle, a bushing thereon, a pair of castings provided with annular bearing rims non-rotatably mounted on opposite ends of the bushings, a spoke receiving member, the inner portion thereof fitting between the castings and the outer portion projecting there-beyond, pneumatic tires mounted in the bearing rims of the castings, bearing rings attached to opposite sides of the spoke receiving member and engaging the tread portion of said tires, said rings extending entirely around the wheel and a bearing ring in the spoke receiving member for the inner ends of the spokes.



Reissues.

13,370. Speedometer. Louis A. Greenleaf, Dorchester, Mass. Filed Jan. 4, 1912. Serial No. 669,987. Original No. 1,011,051, dated Dec. 5, 1911. Serial No. 566,034.

1. A speedometer, comprising an inclosure, a continuous hollow cylindrical member therein, means for holding said member in spaced apart relation to the walls thereof to leave an open annular space, air current producing means wholly within said cylindrical member, a driving connection thereto, and means also wholly within said cylindrical member responsive to an air current and having connected thereto a device to indicate the force thereof, said parts being constructed and arranged to produce a closed circulation of air in one direction through the interior of said cylindrical member, returning in the opposite direction through said upobstructed open annular space.

METZ "SPECIAL"

NEW 1913 MODEL

Completely equipped as shown

They Have Said All Along:

"It Can't Be Done"

But HERE IT IS

The Best Roadster Car in the World

$395.00

IN presenting to the public the METZ "SPECIAL" at this phenomenally low price we wish particularly to emphasize the fact that this innovation has not been brought about by slashing car quality or depreciating value, but purely as the result of scientific, economical manufacturing, in conjunction with what is probably the lowest possible percentage of overhead cost.

The question has been repeatedly asked: "Who will be the FIRST to give the people of this country a Strong, Reliable, Sane, REALLY LOW-PRICED CAR?"

And today the METZ COMPANY, in placing on the market the METZ "SPECIAL" at $395.00, answers this question so effectively and so emphatically that it is bound to make an indellible impression upon the automobile industry of the entire world.

The METZ "SPECIAL" is a strictly high-grade, guaranteed car. 22½ horse power, four-cylinder motor, water cooled, high tension ignition system, with Bosch magneto. Equipped with standard artillery wheels, best quality clincher tires, extension top, wind shield, five lamps, gas generator, horn, pump, tools, etc. Makes from five to fifty miles per hour on high gear, will climb hills as fast as ANY stock car made, and is the MOST ECONOMICAL CAR on the market to operate.

WRITE FOR ILLUSTRATED CATALOG, BOOK B.

DEALERS—This is the biggest proposition that has yet been presented to you. Send for particulars.

DIRECTIONS

For Starting a Gasoline Engine In Cold Weather

One Way

Crank a while, then tickle carburetter. Crank some more. Open petcock in all cylinders and drop a little gasoline into each. Tickle carburetter and spin engine violently for five minutes.

Next, drain off anti-freeze mixture and fill tank with boiling water, then crank again. If engine starts, replace anti-freeze. If not, wrap a flannel cloth tightly around carburetter, saturate with hot water and crank a while, always remembering that if you crank long enough friction will warm up your engine.

Should engine remain stubborn, waste saturated with gasoline and plugged into air intake may help. Now try cranking. Do it again. If too tired to keep at it, probably some by-stander will volunteer—let him go to it—it will rest you and afford you some amusement.

If engine hasn't started, examine your switch—perhaps it wasn't turned on. Crank some more—stand and look at machine—cuss a little—that may help.

Now if it won't start, 'phone a garage and take a trolley to business.

Another Way

The
Simplest and Best

Use an

Electric Self Cranker

Operated from an

GLBA

Storage Battery

It will eliminate your cold weather cranking troubles, crank your engine at any time, any place, instantly and surely, just by a push of a button.

Use the Class A GLBA with an Electric Lighting Generator
Use the Class B GLBA with an Electric Self-Starter

Write us for full information.

"The Horn that's Made for the Discriminating"

TUTO HORN

THE TWO TONE HORN

Results Vs. Argument.

THE TUTO horn has won out. Its service-giving features have withstood every conceivable form of adverse criticism which has been advanced by makers of other types of warning devices.

¶ This fact alone should demonstrate to the motor car manufacturer and to the individual user, that the TUTO horn is best for standard equipment where the bulb horn is to be displaced.

¶ The TUTO is the only warning signal which has the dual service of a low note for regular purposes and the loud emergency note, both notes being operated from one button in a natural and non-confusing manner.

¶ These features are exclusive Dean property, protected by our issued patents and pending applications.

¶ Then the TUTO horn is so perfectly designed and carefully made that it can be guaranteed indefinitely, and will give active service during the life of the best car.

¶ We know that automobile owners transfer TUTO horns to their new cars when the TUTO is not included in the regular equipment furnished by the manufacturer.

¶ Every user of the TUTO horn becomes an enthusiastic advocate and driving the car is made extremely easy with complete safety assured.

¶ Mere arguments can never outweigh the practical and beneficial results which are obtained by having a TUTO horn on the car.

A Permanent Business Connection Because the Car Is Built to Last

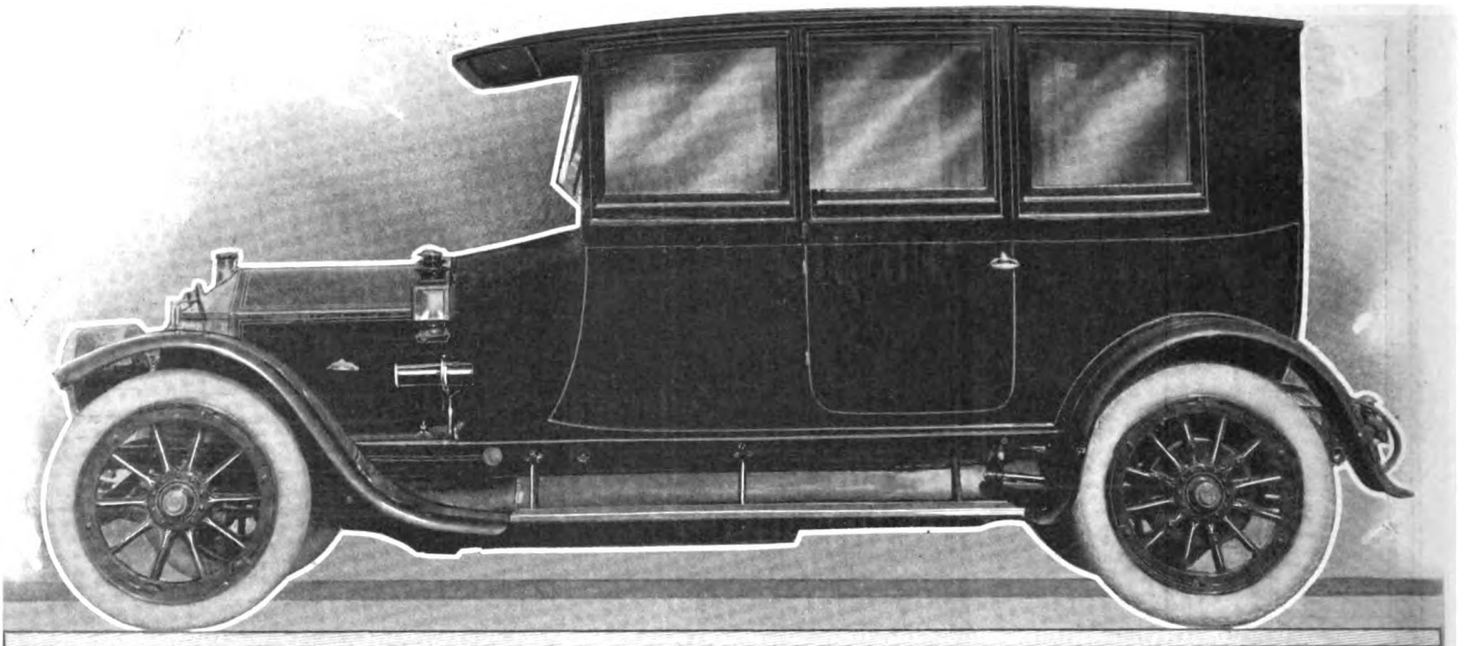
The Dorris is as good a car as money can make. After eight years of constant use, the first automobiles we put on the road are still hard at it, day after day. Every car we have made has been a good car; has made friends. Every Dorris dealer in our hitherto confined territory has made a success and a big one. We built our business as we build our cars—to last—and our reputation is precious to us.

We believe that there is one high grade automobile dealer in every town, who will appreciate this frank talk and will be willing to be shown what we have to offer. We want to show that dealer just two things:

(1) That his business can never be permanent unless he handles a car that is itself a permanent thing, both in construction and in the firm behind it.

(2) That the Dorris car is such a car and offers the safest, soundest proposition ever put up to an honest man by an honest manufacturer.

If you, the reader of this, are a dealer such as we have tried to appeal to in this little talk—able to handle a high grade car in a high grade way—write us immediately for further details.



We manufacture a complete line of both pleasure and commercial cars:

PLEASURE CARS	COMMERCIAL CARS
$2500 to $3600	1500 Lb. Delivery Wagon $2100
Electrically Self-started and Lighted	2 Ton Truck $2500

Specifications and complete description furnished on request

WE WANT MORE DEALERS TO SELL

METALLURGIQUE

THE ARISTOCRAT OF EUROPE

The Car of Royalty

For Exclusive Americans

The Metallurgique propaganda is growing faster than we had anticipated—prejudice against the foreign car, just because it *is* foreign is disappearing, and our dealers are finding out that real European supremacy in matters of design, materials and lines is appreciated —and sought after.

Now, Mr. Dealer, we will be perfectly frank: The Metallurgique is the rich man's car. It is an automobile for the classes—for men of wealth and ability to discern the real difference in cash value between this swagger car of service and the very best American products.

It's just a question of steel versus steel—design versus design and appearance versus appearance. If you want strong, telling arguments on this controversy, write and we will put information into your possession that will help you sell the Metallurgique.

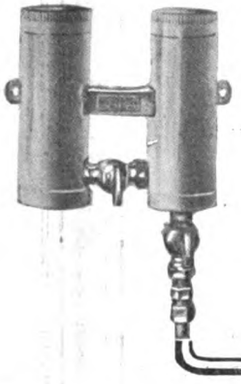
At The Point of PERFECTION

and the last work of inventive genius exemplified in this common sense economizer and engine saver.

It is an acknowledged fact that no carburetor, however perfect, can get full power and service out of a given quantity of gasoline.

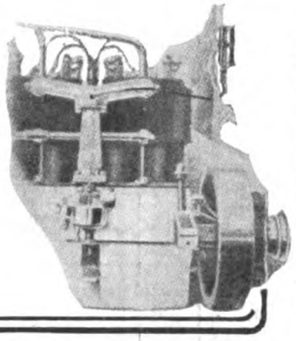
Your customers know this—you know it—and here we show the only real way to get maximum power from fuel, regardless of the efficiency of the carburetor in this particular.

The National Compound Mixer and Primer, a small, compact, little instrument, located on the dash, admits air to the manifold, breaking up every drop of gasoline before it enters the engine.



With it perfect mixture and perfect combustion is assured—

Saving From 10 Per Cent. to 40 Per Cent. Gasoline



Increasing Power From 10 Per Cent. to 40 Per Cent.

Doing Away with Carbon

The Primer will instantly prime all cylinders with a rich mixture—NOT with pure gasoline—and can always be used to clean the engine in a very easy way.

THE NATIONAL COMPOUND MIXER & PRIMER

EVERY DEALER

will find a ready sale for the National Compound Mixer and Primer—it is a money saving, power conserving convenience and the price will put it within reach of every car owner in every locality.

It's only a question of your getting this agency FIRST, while the field is virgin and sales and liberal commissions big.

You, Mr. Dealer, can get in on the ground floor if you will respond to the advertisement.

NOW—will you do it?

National Manufacturing Co., Kalamazoo, Mich.

TIMKEN
AXLES & BEARINGS

Getting Maximum Power from Engine to Wheels

It isn't only the size or rated horse-power of your engine—
It's how *much* of that power gets to the *wheels*.
Right here is where good gears count—and count mighty strong.

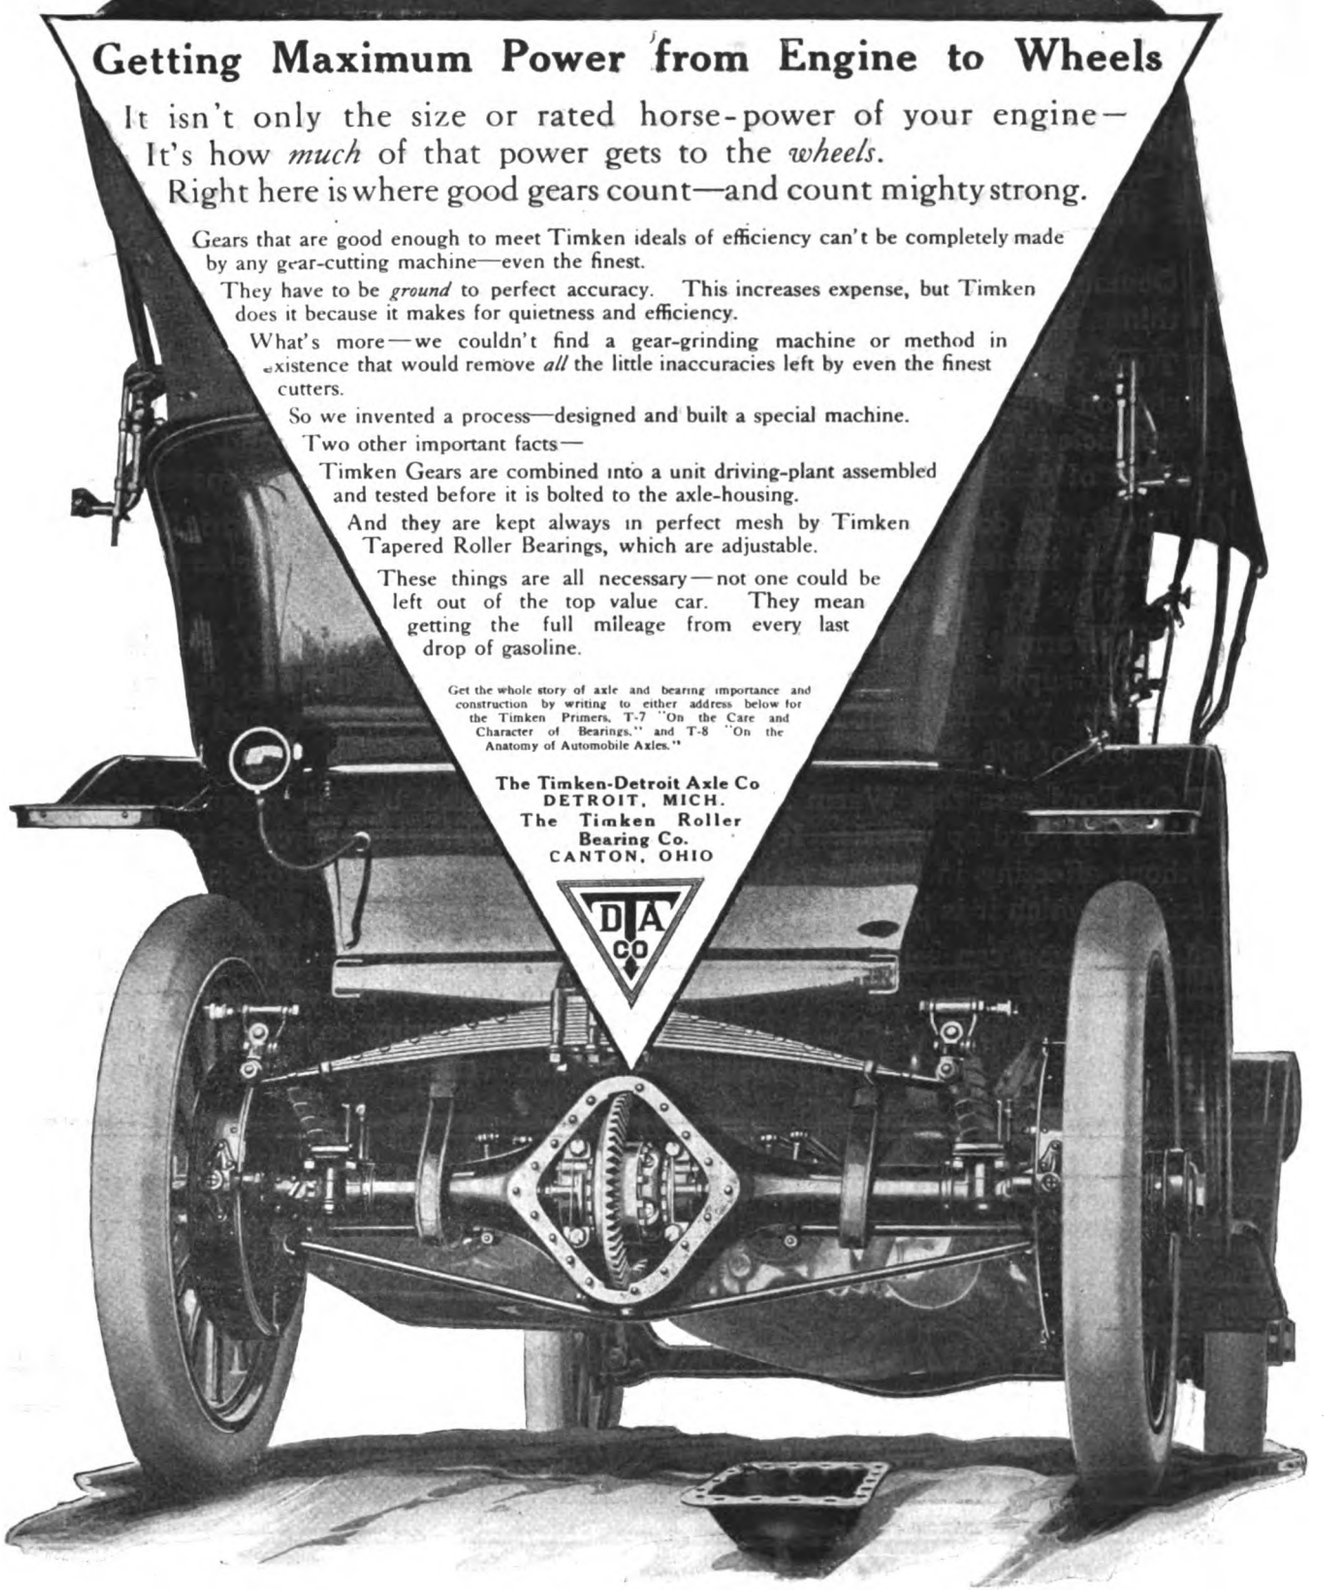
Gears that are good enough to meet Timken ideals of efficiency can't be completely made by any gear-cutting machine—even the finest.

They have to be *ground* to perfect accuracy. This increases expense, but Timken does it because it makes for quietness and efficiency.

What's more—we couldn't find a gear-grinding machine or method in existence that would remove *all* the little inaccuracies left by even the finest cutters.

So we invented a process—designed and built a special machine.

Two other important facts—



Timken Gears are combined into a unit driving-plant assembled and tested before it is bolted to the axle-housing.

And they are kept always in perfect mesh by Timken Tapered Roller Bearings, which are adjustable.

These things are all necessary—not one could be left out of the top value car. They mean getting the full mileage from every last drop of gasoline.

Get the whole story of axle and bearing importance and construction by writing to either address below for the Timken Primers, T-7 "On the Care and Character of Bearings," and T-8 "On the Anatomy of Automobile Axles."

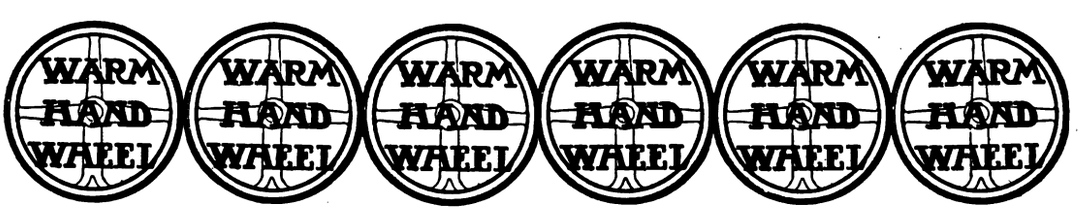
Can You Imagine a More Practical Necessity on an Automobile Than This Warm Hand Wheel?

¶ Obviously your answer is, "No." "No," because in the very nature of things one insists upon his body being warm during cold weather.

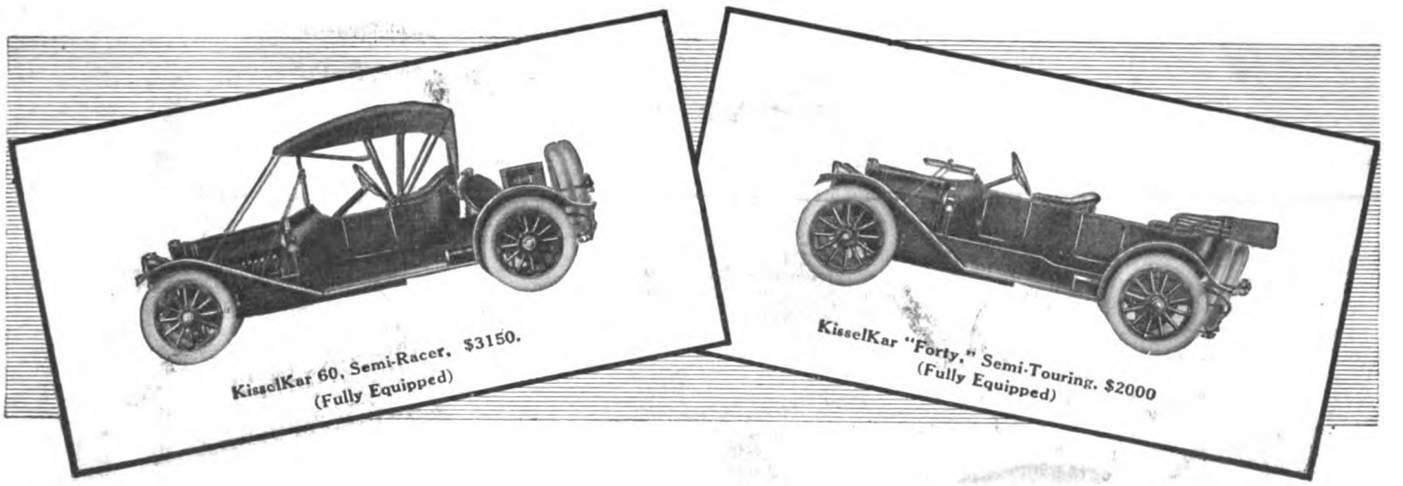
¶ Then, obviously again, if the Warm Hand Wheel is a most practical necessity on every automobile, the question of selling them is solved inherently. If an article is a necessity it does not require the creating of a demand. If the question of demand is solved the problem of selling is the simplest possible.

¶ Then why don't you get in line and stock up with these Warm Hand Wheels immediately? Our argument is solid and correct. We've done our work. Now it's up to you.



¶ The Warm Hand Wheel is a device or steering wheel heated by the electricity supplied either by a storage battery or electric lighting or starting outfit. It can be put on any car with the greatest of ease and at the slight cost of $15 retail.

¶ On Ford cars this Warm Hand Wheel is operated by the magneto inbuilt in Ford fly wheels. It operates perfectly with this source of current without affecting in any way the magneto in the performance of the functions for which it is built.



¶ Really you can sell a raft of these Warm Hand Wheels in your territory right now. Remember they are necessary in most of the country for six months out of twelve—that is during both fall and spring as well as in the hard winter weather. Maybe your territory isn't closed yet. Write today and find out.

Warm Hand Steering Wheel Company

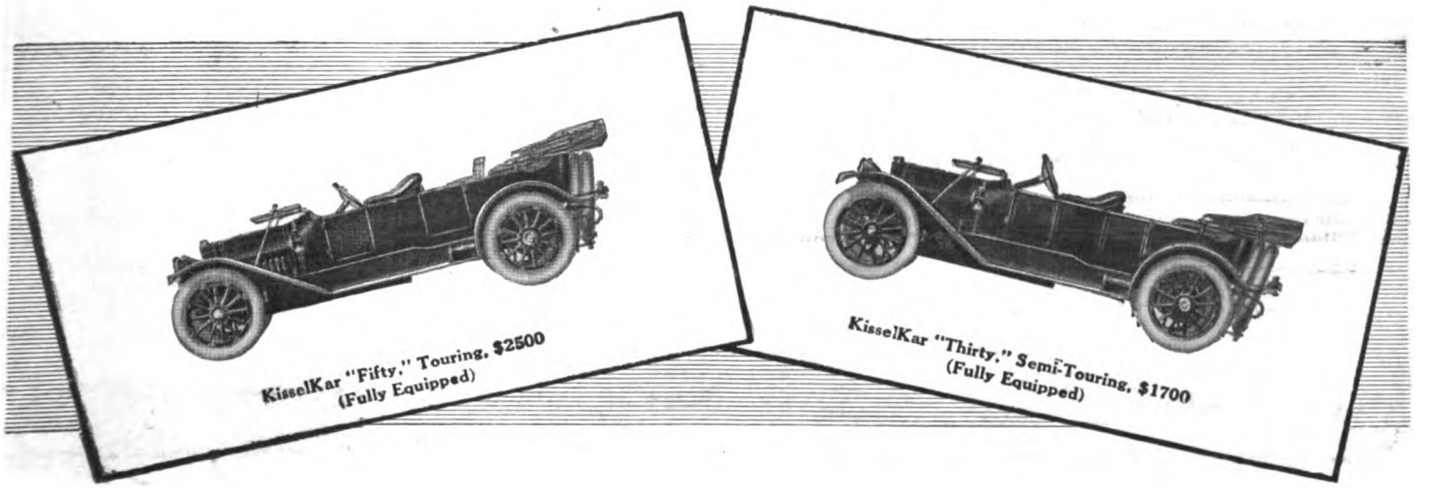
Compare the KisselKar with any car at any price

The riding comfort of the KisselKar surpassed every previous idea of car comfort. The extra liberal wheelbase, big wheels, big tires, shock absorbers, and eleven inches of the most resilient upholstery ever put into an automobile completely eliminate road vibration—the unusual depth of seats permits a quarter-reclining position, making it needless for occupants to brace against side-sway or lurches of the car on rough roads. KisselKar comfort is unapproached—it is a KisselKar quality exclusively—and the proof is in the riding.

Any KisselKar agency will give you the fullest opportunity to demonstrate the road capabilities of the KisselKar—and you are welcome to compare it with any car at any price—such comparisons are advantageous to the KisselKar. Write for 1913 KisselKar catalog—it is a valuable aid in judging car values.

KISSELKAR



"Thirty" $1700 "Forty" $2000 "Fifty" $2500 60 H. P. "Six" $3150

1913 Pullman 1913

No operation in the Pullman factory is a hurried one. While the Pullman factory is thoroughly equipped with the most up to date labor saving devices, ample time is spent on every operation and in every test to insure positively the most certain and most dependable results. Every Pullman car must be up to the standard of excellence that has placed Pullman cars in their present enviable position. Pullman manufacturing policy is that of making all the cars right, that we can make, rather than to make all the cars we could rush through. That's one reason why we so frequently have been way oversold.

One very important point in Pullman motor construction is the fact that the bearings are all extremely large in diameter and narrow in width. This means a stiff and sturdy crankshaft. Also the crankshaft is remarkably accurate as to size. The bearing shape and sizes reduce the vibration in the crankshaft to the minimum, not only after the car is made and running, but during the machining of the crankshaft itself. Naturally this makes for a superior product.

In the assembly of the motor all Pullman bearings are hand scraped. Of course this takes more time but it produces a superior motor. In the machining operations all Pullman crankshafts must come to size even under the microscope. There is absolutely no variation allowed on the size of the pins.

The Pullman line is a complete one. Every model is built just as carefully as every other. The variation is in size and complement only. If you want a line for this year and the next and the next—a line that increases in value day by day—tell us to get in touch with you.

Knox
MARTIN TRACTOR

Maximum Carrying Capacity
Minimum First Cost
Minimum Maintenance
Minimum Turning Radius

What It Is

Not a Theory But a Proven Success in a Year's Gruelling Work. Many in Successful Operation. 5 to 10 Ton Capacity. Full Details Explained in Tractor Catalog. Send Today.

A motor unit that may be attached to any heavy vehicle designed to be drawn by horses; the combination making a five-wheeled motor-drawn vehicle.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE COST OF RUBBER TIRES. Wagons have been doing good work for many years on steel tires and there is no reason why they will not continue to do so when drawn by the tractor; the heaviest part of the load is always carried on steel tires.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE VIBRATION ON STIFF SPRINGS. All working parts of the tractor are carried on springs as resilient as those of a pleasure car.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO SUDDEN STARTING OR STOPPING OF HEAVY LOADS. The cushioning of the shock between the engine and the load is one of the most important advantages gained, (fully explained in catalog).

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO NEGLECT ON ACCOUNT OF INACCESSIBILITY OF PARTS—all parts of the tractor being more accessible than on a touring car.

IT SAVES HEAVY MAINTENANCE CHARGES due to frame twist. The tractor accommodates itself to all road unevenness.

The single front wheel can be turned at 80 degrees angle, enabling the driver to back to any position or turn completely around in a narrow street.

Send for further information and prices

Clear Vision Brougham

Model 42, $3000
F. o. b., Detroit

Isn't Your Line Incomplete Without an Electric, Mr. Dealer?

THERE is a real business opportunity for the right dealer in every town of 10,000 or over in which the Detroit Electric is not now represented

In its present highly developed state the Detroit Electric, if properly handled by you, means increased business with comparatively little additional overhead expense. We would be glad to give you special information and practical assistance. We desire only permanent connections that will be mutually satisfactory.

Remember that the Detroit line is absolutely complete, including eight models in pleasure cars and a full line of electric trucks. All are made in our own factories and guaranteed by this company.

The new Detroit Electric Clear Vision Brougham, as announced in the October magazines and exhibited at our various branches, has met with the instant approval of the public. We have in the past introduced many notable improvements in the development of the electric automobile, but none has met with more approbation than the Clear Vision features of this car, which permit a clear view in all directions—in front, both sides and at the rear.

The seating arrangement of this car is not only unique, but logical for driving in congested traffic. All seats face forward. Note the central location of the forward seats, from one of which the car is driven; and yet there is plenty of room between the front and rear seats. The car has a well-balanced, pleasing appearance whether occupied by one or more persons.

We shall be pleased to hear from live dealers. Our 1913 catalog is now ready.

SHELDON STEEL WHEEL

"Guaranteed to Outlast a Score of Cars"

SHELDON Steel Wheels Lighter Than Wood

These wheels are one piece construction. The hub is bored to receive the bearings, of which you have several options. The rim is turned to size, saving the cost of S. A. E. Bands, which are unnecessary. There are no flange bolts to come loose—a defect in wood wheels often causing much trouble and annoyance.

The economic disposition of material makes SHELDON STEEL WHEELS counteract tremendous side pressures. Lighter than wood, SHELDON STEEL WHEELS permit quick acceleration, which means fuel economy. Light weight and the rapid heat radiating capacity of steel increases the life of tires 100 per cent. Does this saving increase the value of your car?

SHELDON STEEL WHEELS make a quality truck still better and build a reputation for such a truck that is bound to make more and more business for its manufacturer. Comparative cost considered, the difference will come back in tenfold measure.

This company is now prepared to make delivery of steel wheels for one ton trucks, other sizes to follow. This should appeal to truck manufacturers who have been subject to annoying delays incident to receipt of wood wheels. Were the steel product no more valuable from an engineering standpoint than the wooden wheels this one item of convenience should appeal. Get your axles and wheels from one source, save trouble and freight.

Manufacturers, engineers, and others can get additional information that is bound to turn them into customers.

Get All You Can This Year in a "40"

This is a year of fierce competition in 40-horsepower cars.

There are 72 makers of Forties. For men are demanding in motor cars now reasonable power and room.

Scores of these makers try to outdo each other. This war of the "40's" has cut prices in two. And some "40's" today are the best-equipped, most luxurious cars on the market.

It is up to you buyers to get all you can out of this Forty fight.

What to Get

Get electric lights with dynamo. You are bound to want them, and they cost as an extra $125.

Get four forward speeds, like the costliest cars. Get oversize tires—4½ inches wide—for that means immense economy.

Get 14-inch Turkish cushions for comfort. Get wide, long springs. Get wide seats and long wheel base.

Get big brakes for safety. Get driving parts sufficient for a 60-h.p car.

Get hand-buffed leather upholstering, nickel trimmings, and a body finish of 22 coats.

These are points where makers skimp. Be sure you get them all.

Then get a price which underbids all others for the things you seek.

All for $1,585

In the Michigan "40" you get all these perfections for $1,585.

You get a car built by W. H. Cameron, who has built 100,000 successful cars.

You get a body designed by John A. Campbell, who has designed for kings.

You get a car in which, in four years, we have worked out 300 improvements.

Because of enormous production, and this model factory, you get a "40" which leads this whole class at $1,585.

Go make your comparisons. Watch each specification. Look out for the differences which cut down the value.

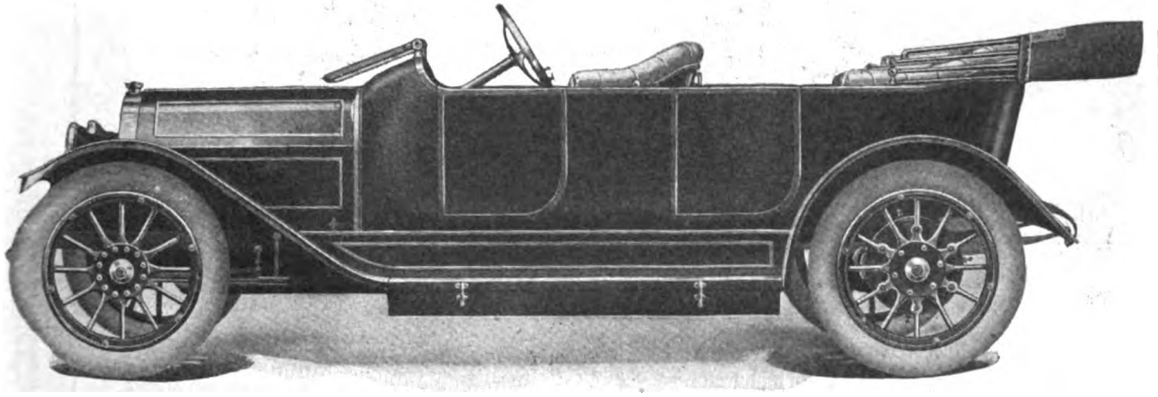
See if any car in the whole Forty class gives what the Michigan gives for the money. For this is a war, and with 72 rivals you can get amazing values.

Send this coupon for our catalog. It pictures every detail, and helps you make comparisons. It shows the various bodies. Send the coupon today, and we will tell you where to see this car.

Michigan "40"

$1,585

With All These Special Features:



Four forward speeds, like all leading foreign cars.
Electric lights with dynamo.
Oversize tires—35 x 4½ in.
40 to 46 horsepower.
Wheel base, 118 inches.
Rear seat, 50 in. inside.
Turkish cushions, 14 inches deep.
Central control.
Left side drive.
Drive shaft sufficient for 60 horsepower.
Brakes — extra efficiency—drums 16 x 2¼ inches.
Springs, 2¼ in wide, 37 and 50 in. long.
Demountable rims.
Extra rim.
Steering post, clutch and brake pedals all adjustable to fit any driver.
Shortsville wheels.
Hand-buffed leather.
Best curled hair.
Body finish 22 coats.
Nickel mountings.
Electric headlights, very powerful, 12½ in. diameter.
Sidelights flush with dash.
Windshield built in.
Mohair top, side curtains and envelope.
Electric horn.
$50 Speedometer.
Foot rail—robe rail.
Rear tire irons.
Tool chest under the running boards, out of the way.
Over-capacity. Every driving part made sufficient for a 60-horsepower car.

Self-Starter

Either gas or electric, furnished at moderate extra price. We do not include it because men differ about the type they want.

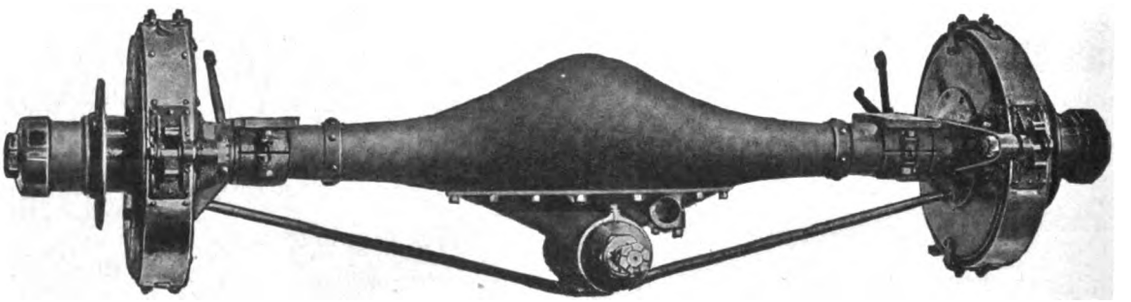
American

American Axles

American

Insure Maximum Mileage from Your Car's Batteries



You cannot increase your battery charge, but you can make that charge carry you to its fullest extent if your car has *American Axles*.

The mileage question can only be judged fairly by including the axle problem.

If you do not know that there is an axle problem, you are ignoring the element upon which—more than any other—the general efficiency of your electric depends.

The solution of the axle problem is to be found in *American Axles*, which have the least friction because of their exclusive, patented features in combination with the perfection of their manufacture.

The *American Axles* line offers the option of Bevel driven gears—made first by us for any electric—or the Lanchester-Daimler Worm gear; the superb English type of gear to which we hold the sole American rights as axle manufacturers, through the Warner Gear Co., of Muncie, Ind.

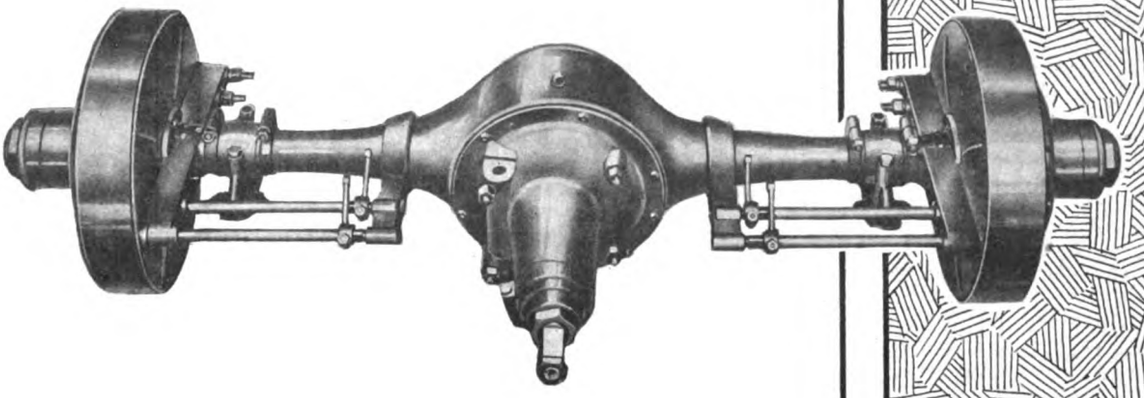
McCUE WIRE WHEELS

Remember our warning, Mr. Dealer—that it is merely a question of when you'll be selling cars equipped with wire wheels—for every day adds new converts to this greatest of all tire saving equipments. It's simply a question of whether you'll insist upon your cars being equipped with wire wheels immediately or whether you'll wait and be forced into it after your competitors have reaped the reward of progressiveness.



As in every other business there are some shortsighted automobile manufacturers who do not hear the call—and who need to be prodded to come to a full realization of the fact that they must adopt wire wheels. It is of these we are warning you, Mr. Dealer. Get after your manufacturer if he hasn't awakened yet. It's to your interest in every way to sell wire wheel equipped cars. Act at once.

Herewith is shown the first electric convert to wire wheels—the Model 29 Buffalo Electric—built primarily for the business and professional man who wants a speedy and powerful electric car. Wire wheels add both speed and power while they save tires and weight (consequently they increase the life of the batteries).

Digitized by Google

McCue Wire Wheels are furnished with Q. D. rims—with the most practical and most efficient Q. D. rim ever invented. Not only is this rim adaptable to either clincher or straight side tires but it is so constructed that the tire does not come in contact with the spoke nipples.

McCue axles are not an absolute necessity to the use of wire wheels, but McCue axles plus McCue wire wheels form a most ideal manufacturing combination. McCue axles are the finest production known to the axle designing and making world. McCue axles must sell on this fact for they are never sold on price. No rear axle ever designed possesses more points of merit than the McCue rear axle, and the McCue front axle stands pre-eminently alone the admitted leader in the field. McCue axles are so made as to admit of the use of either wire or wooden wheels on the same spindle.

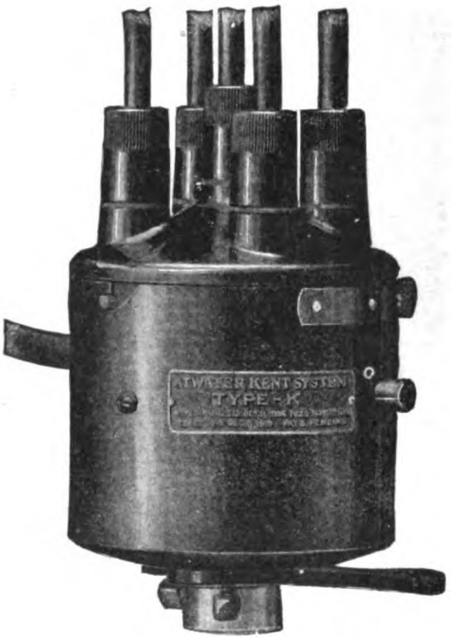
Digitized by Google

THE present demand for self-starting and lighting equipment has created a demand for an ignition system capable of producing a hot, dynamic spark independent of the engine speed.

This demand is being successfully met by



The Atwater Kent Ignition System

the starting button of which produces, not a few weak sparks, but a single heavy flame-like spark, thus insuring at all times the perfect ignition of any mixture that will burn.

Other salient features of the Atwater Kent System are the extreme simplicity of mechanism, only three moving parts, one contact, one adjustment and one non-vibrating coil.

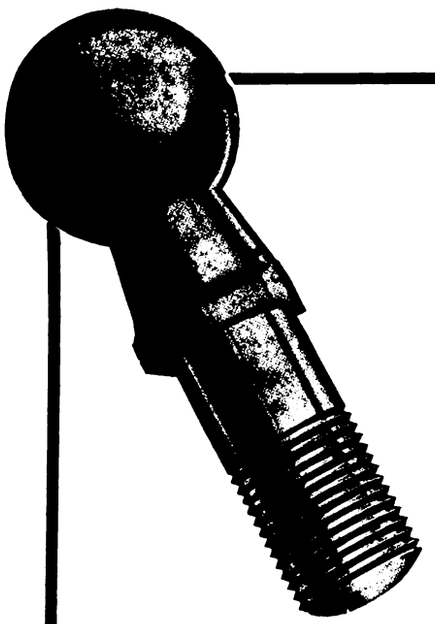
While the Atwater Kent System is high in value and reputation, it is not high in price. In fact, it will cost less

than half as much as a good magneto and will give superior results at a much less cost of upkeep.

We can now furnish two types of the Atwater Kent System for use on cars as sole ignition in place of the magneto, in conjunction with lighting and starting equipment.

Type "F" without Automatic Spark Control.

Type "K" with Automatic Spark Control and insulated primary circuit.



No matter what the requirements, the Atwater Kent System of Ignition affords ideal ignition.

Write today for detailed information and illustrated booklet "D."

NAMCO Milled Parts Meet Exacting Demands

Automobile companies buying screw machine parts demand not only accurate work, but uniform smoothness of finish.

That NAMCO Product shows no tool marks, no flat spots on rounded surfaces, scarcely noticeable cut off burrs, is due to the fact that our equipment is exceptionally fit for particular screw machine work. Our operators, through long experience, know the high standard to be maintained in automobile work and make light the duty of your inspector.

Our estimate department has the results of thousands of pieces made in the past on which to base their quotation. Let us have your samples. They may be similar in design to parts we have made, and the price will be right.

When you send in your samples ask for the "Special Milled Product" booklet.

The National-Acme Manufacturing Co.
Automatic Screw Machines and Their Products
CLEVELAND, OHIO

"In Exchange for your empty tank, accept only a genuine Prest-O-Lite Tank, filled with genuine Prest-O-Lite Gas."

This is the message that is going to Prest-O-Lite users everywhere.

In it there is a hint for the wise dealer, as well.

You know that no imitator of the Prest-O-Lite Tank has ever successfully imitated Prest-O-Lite Service.

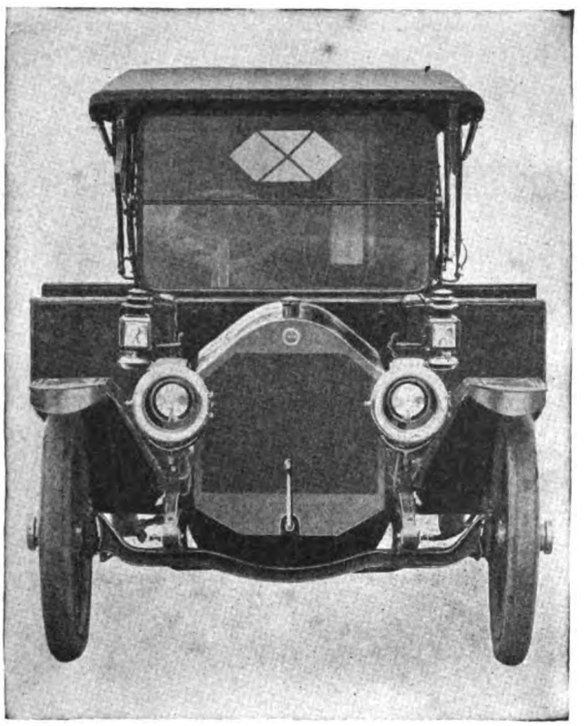
You also know that no imitator ever made good the large claim "more gas and better gas than Prest-O-Lite.

So does your customer.

Imitations are getting harder and harder to sell. There are now mighty few dealers trying it.

Most of those who yielded to the old but ever tempting claim "More Profits" have come back home.

To the dealer who is still trying to force imitations on people who won't have them, perhaps because he has money tied up in them, we can only say:



"The sooner you resume earning your good old Prest-O-Lite profit, the sooner you will make your income what it used to be."

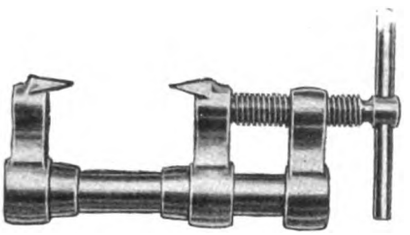
Kelly-Springfield
Automobile Tires

As a matter of fact, dependable tires are the basis of real automobile usefulness.

Kelly-Springfield road mileage is a few thousand miles higher than the average. That reduces the cost of the tire.



The easy resiliency of Kelly-Springfield Tires is one phase of our argument. But staunchness and durability, born of the best rubber composition, skill and the incentive to make good tires better, offer a reason even more convincing—wear.

When you buy Kelly-Springfield Tires you are not experimenting. We have done that for you.

THINK THIS OVER, very carefully and read it twice, if necessary.

Is there any part of an automobile engine, or any other gas engine, that is more important to its efficiency than a Valve?

Your engine leaves the factory running smoothly and sweetly—tuned up to its highest power. Perhaps the valves pit—warp—go out of shape—fail to hold compression. Then the power diminishes, and what can be more aggravating to the driver, who has known the fullness of the pulling power of his motor, than to have it grow less and less?

You cannot slight this part by putting in an inferior product—valves that will give trouble, or even break from inexperience in their manufacture—valves of unsuitable material, not suitably heat treated.

Too much is at stake, and a slight extra cost at the outset, which is the exception, may save you many times over a probable later expense.

This Company, with the experience of many years as a guarantee, will furnish you with properly made valves, of the materials best adapted to your requirements.

Not only QUALITY, but efficient SERVICE is a factor—surely there is a satisfaction in getting the kind of work you want—when you want it.

Glide

In 1917—Five Years Hence

the 1913 GLIDE will still be a **modern,** serviceable car. Why? Because the present GLIDE leaves but very little that can possibly be improved upon.

It is far ahead of many 1913 cars—and **no** car is **leading** the GLIDE in high-class materials, construction and all of the newest equipment.

The 1913 GLIDE is **electric lighted**—simply turn a button and all lamps are on!

The GLIDE Motor-Driven Tire Pump eliminates drudgery. Also **saves your tires** by keeping them fully inflated at all times to any desired pressure.

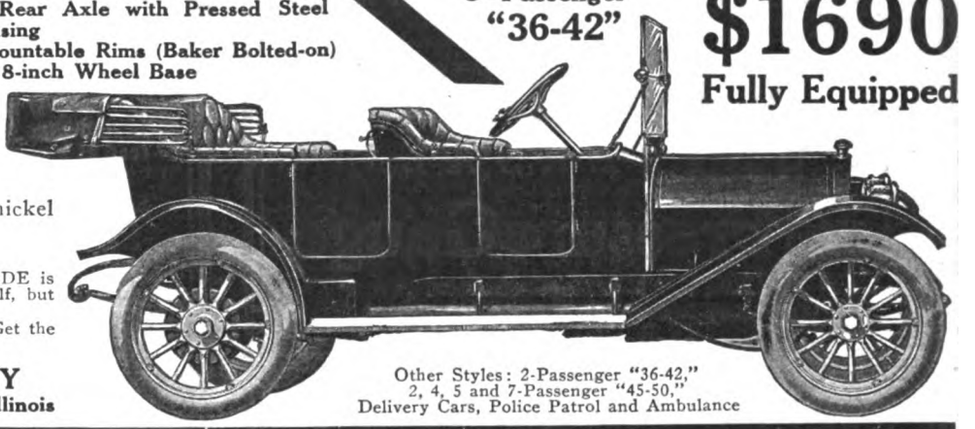
Electric **Bull's Eye** Side Lamps are **sunk in dash,** eliminating rattling, minimizing breakage and adding to the classy appearance.

The GLIDE Self-Starter is **sure** of a spark—**investigate** and learn **why** the GLIDE starter is **efficient.**

Simple center control, left side drive, demountable rims, irreversible steering gear—and in fact all the newest features of known worth—establish the "class" of the 1913 GLIDE.

Make a memo—right now—to write us for detailed description of the entire GLIDE line.

"36-42" Features



Automatic Dynamo Lighting System
Motor-Driven Tire Pump
Unit Power Plant
Long Stroke Motor with *enclosed valves*
Center control
Left Side Drive
Bull's Eye* Electric Side Lamps *Sunk in Dash
Electric Headlights and Tail Lamp
An *Efficient* Self-Starter
Floating Rear Axle with Pressed Steel Housing
Demountable Rims (Baker Bolted-on)
118-inch Wheel Base

You can't get GLIDE quality, equipment and service **in any other car** at the GLIDE price. Make us prove it! You can pay **more** and get **less.**

Our price includes complete equipment, as follows: Dynamo, Mechanical Tire Pump, Self-Starter, Mohair Top, Top Boot, Glass Front, Electric Headlights, Side Lamps and Tail Lamp, Demountable Rims and One Spare Rim, Model B Stewart Speedometer with Grade Indicator, Spare Tire Carrier. Full quota of tools and jack, all nickel trimmings.

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

INTERLOCK INNER TIRES
Stop Tire Troubles

The one weak point of the automobile is that you cannot depend on the tires. Thousands of motorists have solved their tire problem by discarding inner shoes, reliners, fillers and other makeshifts and equipping their tires with **Interlock Inner Tires.**

Interlocks are complete inner tires (not inner shoes) placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They double the mileage of new tires and add 1,000 to 5,000 miles to old ones—save half your tire expense—and make tires trouble proof.

Dealers and Motorists—Investigate Interlocks

Don't delay—write now for booklets, data, prices, testimonials of users, road tests, etc. Mention size and kind of tires you use.

DOUBLE FABRIC TIRE CO. 600 W. 9th Street, Auburn, Indiana

Stewart
Delivery Trucks

Money-Savers
Time-Savers
Trade-Bringers
Sell Stewart Trucks In Winter Months

No let-up in business for the dealer who handles Stewart Delivery Trucks. Cold weather only increases the need for motor delivery. Merchants are already worrying over their holiday deliveries. They know that their horse equipment will be inadequate during the cold, snowy days and the rush and long hours of the Xmas trade and special sales.

We can guarantee prompt deliveries of Stewart Delivery Trucks in time for the winter business. We can furnish dealers their demonstrators almost immediately. Now is the time to go out and get this desirable business. Merchants are looking for the right car; one that is scientifically designed for hard delivery service. You can get their orders for Stewart Trucks now. Write for our literature and liberal proposition to dealers.

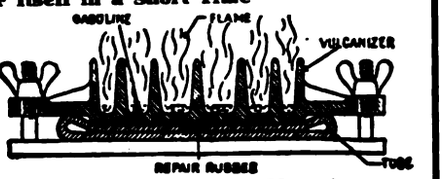
If You Need Motor Lamps
You Need This Catalog

We want you to write for the Solar Catalog before you decide on your motor lamps, for this is the most complete line of lamps on the market. Solar Lamps have been preferred by most motorists for the past fourteen years because of their brilliancy, their style, their strength and their several exclusive advantages—their special short focus lead glass lens mirror reflectors—the patented double ray light projection (in the Solarclipse), giving two distinct fields of light, for city and country use—the new black finish, the only such finish that's proof against heat and moisture—and other features that other lamps lack.



To fail to see Solars before you buy is to fail to include in your consideration the very finest lamps in existence. Solars are made for oil, electricity, gas and in combination, for pleasure cars, motor trucks, carriages, motor boats and airships. Write for catalog now—while you think of it. (136)

Kenosha, Wis. **BADGER BRASS MFG. CO.** New York City

-DEALERS-
Europe's Leading Car
Lancia
sells at
AMERICAN PRICES

Town Coupe.
30 H.P.
Price $5500

The average would-be owner of a foreign car associates out-of-ordinary quality with prices beyond reason. He, in common with the majority of those who understand car value, wants such a car; but the prices of European products are prohibitive.

Lancia cars with all of the swing, dash and exclusive design, that only foreign designers and artizans can make possible, sell at American prices.

Lancia cars, made from steel that only Europe can turn out and with engineering features that America cannot touch, sell for American prices.

You, Mr. Dealer, have a market place for the Lancia, the car of durability, silence, flexibility, speed and rakish design. We will help you make your sales. Write and get our plan and proposition.

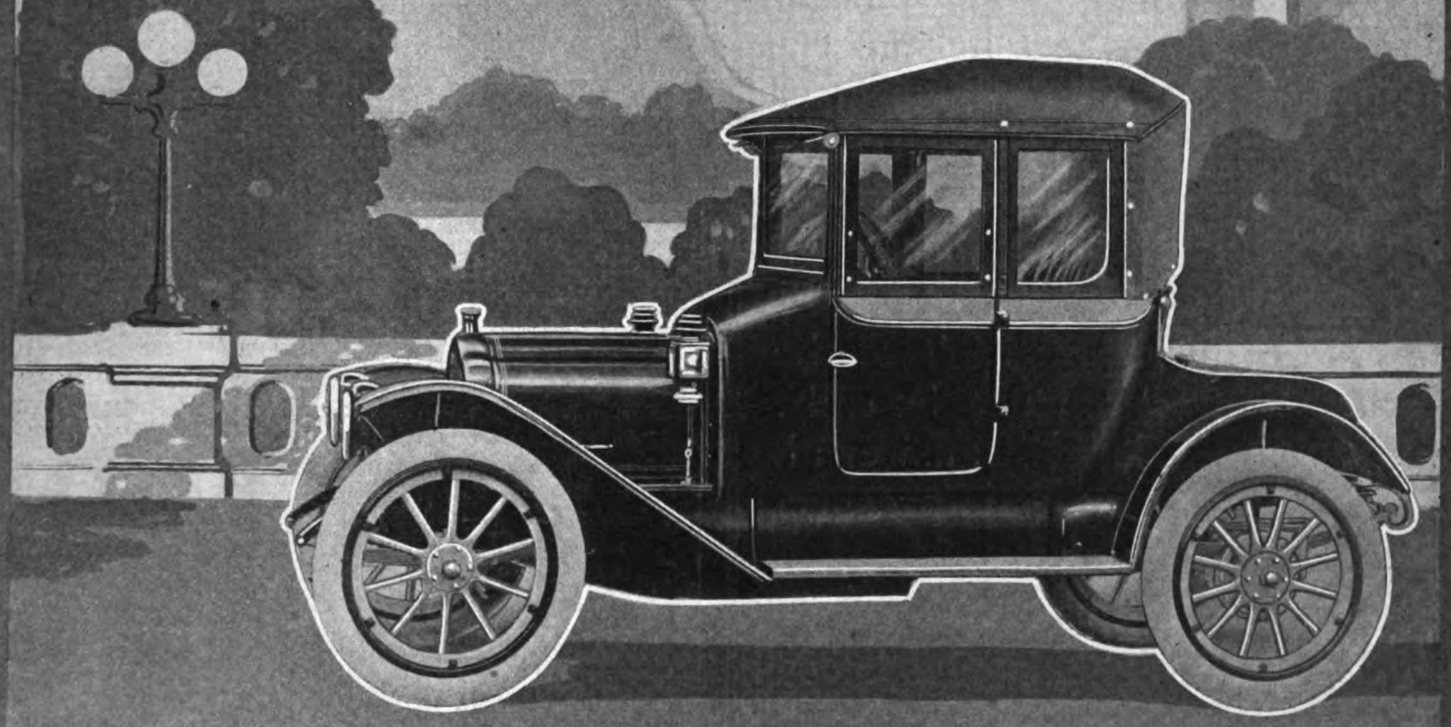
SPRINGFIELD
CONVERTIBLE BODIES

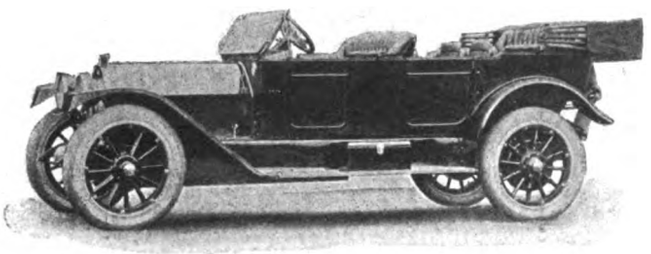
Springfield Convertible Bodies are the embodiment of refinement in the matter of lines, material, finish and ease of adjustment.



The runabout convertible body shown here illustrates one extreme of a line that goes on up to the highest grade limousine, landaulet and town car.

Even this faithful reproduction cannot approximate the beauty and convenience of the equipments as they actually appear. They must be seen to be fully appreciated.

The ease of operation is remarkable; the tops are rapidly raised into position, the doors are opened, the hinged glass swung up into position, the remaining windows are removed from a box in the back of the front seat and buttoned into position, completely enclosing the car in less time than an ordinary top can be erected and the curtains adjusted.



Write for brochure of reproduced photographs.

"Service and Silence"

Kline Kar Model 6-60, Touring, $3500

DEALERS

YOUR experience with other cars should tell you that it does not pay to handle a line that constantly worries the life out of you with complaints from the user, who has trouble with the machine. This user knows now that he is better off when he buys a car of quality in the first place, even though he must pay a little more for it, and he will soon begin to demand such a car of his dealer.

It is up to you to have the car in your line when he calls. The Kline Kar will answer all the requirements this prospect may impose and more.

Prices $1850 to $3500
(Fully Equipped)

BOSCH Plugs

Like Bosch Magnetos

The winners use them—Of Course

Vanderbilt Cup Race
Grand Prize Race
Elgin Trophy Race
500 Mile Sweepstakes
Santa Monica Races
Road Racing Record
Most Speedway Records

The above is a partial list of 1912 races won by cars using Bosch Plugs—most of the "also rans" used them too.

When the majority of racing drivers and manufacturers entering cars in important races use one make of plug, you can be positive that there is reliability and efficiency in that plug.

Successful drivers do not use any plug before they are absolutely certain of its ability to stand the test—they have found Bosch superior to any other; they use Bosch exclusively.

If you own a car, Buy Bosch Plugs
If you sell cars, Specify Bosch : $1.00 Each

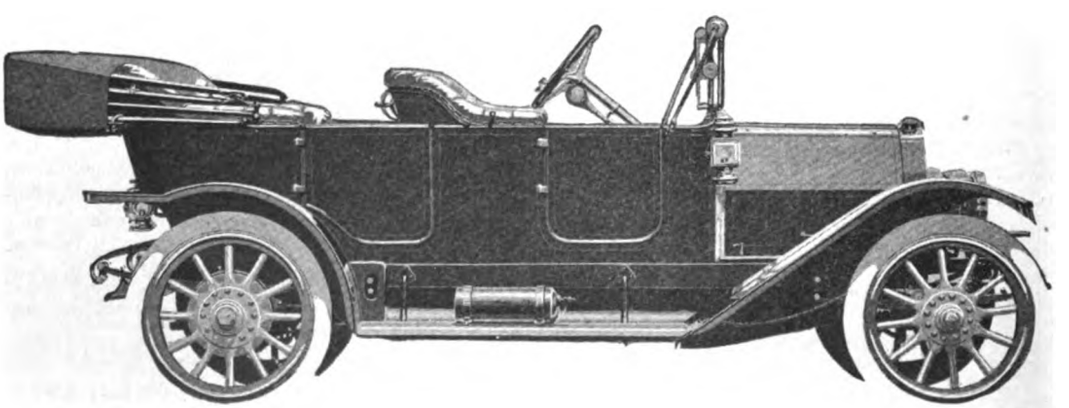
High-priced feature No. 5

We have put the very best and most expensive bearings—Timken and Hyatt—into the Overland Model 69T. They are the same brand as used in $5000 and $6000 cars.

The sturdy I-beam section, drop-forged Overland front axle is equipped with Timken bearings.



The three-quarter floating Overland rear axle is equipped with Hyatt bearings.

The Overland 69T motor possesses a five bearing crank shaft—not a three bearing. And the action of the Overland 69T transmission is secured by more high grade and expensive bearings.

Quantity production—40,000 cars yearly—alone permit these high priced features.

A post card will bring a catalogue, which explains the many high priced features on this moderate priced car. Please address Dept. 50.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, November 28, 1912 No. 10

DE SCHAUM OUT, PALMER RE-ENTERS MOTOR INDUSTRY

Cartercar's Organizer Enters Ecorse Enterprise Which Takes His Name —Project Finally Placed on Practical Basis.

Having separated itself from William Andrew De Schaum, the exploiter who promoted the Suburban Motor Car Co. in Ecorse, Mich., and who sketched for it plans and properties of a gigantic and picturesque character, developments in the reorganization of the company have followed quickly.

As Motor World of last week exclusively stated, W. H. Lankin, president of the Suburban company, temporarily took over De Schaum's duties as general manager, and on Saturday last the full meaning of the change of affairs became plain when R. A. Palmer entered the company as vice-president and general manager, and the name of the corporation changed to Palmer Motor Car Co.

Palmer was the organizer of the Cartercar Co. of Pontiac, Mich., of which he was general manager until about a year ago, when he resigned to engage in a banking business, in which he still retains his interest.

As the Suburban factory is nearing completion, and as the car which it will manufacture has been well tried out, with Palmer's knowledge and experience to guide it, its progress seems assured.

H. W. DuPuy Assumes Dual Duties.

Due to the fact that his duties as chairman of the board of directors of the Crucible Steel Co. of America have prevented him from taking an active part in the management of the Pennsylvania Rubber Co., of Jeannette, Pa., Herbert DuPuy relinquished that office at the annual meeting which occurred last week. H. Wilfred DuPuy, treasurer of the company, was chosen president and hereafter will fill both offices, Herbert DuPuy consenting to act as chairman of the board, which office was created for him. The other officers were re-elected as follows: Charles DuPuy, vice-president; Seneca G. Lewis, general manager; George W. Shively, secretary; Charles G. Morrill, assistant treasurer. According to reports rendered at the annual meeting, contracts in hand assure an increase of at least 100 per cent. over last season's business.

Ohio Motor Car Asks for Jury Trial.

Denying insolvency, the Ohio Motor Car Co., of Cincinnati, against which a petition in bankruptcy was filed on September 26th last, has asked the Federal Court in that state for a hearing before a jury. Meanwhile, Edward C. Schultz, receiver for the company, has received a formal bid of $65,000 for the property and the court has directed that the matter come up for a hearing on December 2nd. Unless a better offer is made before that date, the receiver states that he will recommend the acceptance of the $65,000 bid which, in his opinion, is better than offering the assets separately at auction.

White Disposes of British Interests.

Frederick Coleman, who, as managing director, has had charge of the White Co.'s branch in London since its establishment, has acquired the business, which hereafter will be conducted under the style White-Coleman Motors. White cars, of course, will continue to be his chief stock in trade, but it appears not impossible that he may enlarge his scope.

Change that Avoids Confusion of Ideals.

The Ideal Commercial Car Co. of Akron, O., has changed its name to the Akron Motor Car & Truck Co. The change will serve to prevent the Akron company's further confusion with the Ideal company of Indianapolis, which produces the Stutz motor car.

WILLYS-OVERLAND STOCK IS OFFERED TO THE PUBLIC

Offer, Limited to Preferred Shares, Discloses Remarkable Growth and Earnings—Profits Average $2,490,000 Per Annum.

Having completed its incorporation under the laws of Ohio, the new Willys-Overland Co., of Toledo, which succeeds the old company of the same name, now is offering for public subscription, through William Salomon & Co. of New York, its issue of $5,000,000 7 per cent. cumulative preferred stock.

The total authorized capital of the new company, as already is known, is $25,000,000, of which $5,000,000 is represented by preferred shares and $20,000,000 by common, the majority of the latter being closely held by John N. Willys and his associates.

The preferred shares are being offered for sale at par, $100, the dividend being payable quarterly, in January, April, July and October. They are redeemable, in whole or in part, at the option of the company at 110 and accrued dividends on 60 days' notice. The shares are preferred as to both assets and profits, but without vote or consent of at least three-quarters of the outstanding preferred stock the company cannot sell or dispose of its property or business, in their entirety, or any stock of any affiliated company, except to the Willys-Overland Co. itself or to some other affiliated company, or create any mortgage or other lien, or issue any stock having priority over or on a parity with the preferred stock, or issue or guarantee any bonds, notes or other evidences of indebtedness maturing later than one year from date of issue. The same requirements apply to the several subsidiary companies—namely, Kinsey Mfg. Co. of Toledo, Garford Co. of Elyria and Gramm Motor Truck

Digitized by Google

Co. of Lima, all of Ohio; the Morrow Mfg. Co. of Elmira, N. Y., and the Federal Motor Works of Indianapolis, Ind.

The preferred stock will have no voting power, but no dividends will be declared on the common stock unless the consolidated net quick assets of the company and its subsidiaries (of which the company owns at least 90 per cent. of the common stock) shall be equal to the par value of the preferred stock outstanding, and no dividends in excess of 6 per cent. per annum will be declared upon the common shares unless the consolidated net quick assets shall be equal to 120 per cent. of the preferred stock outstanding.

To redeem the preferred stock, it is provided that the Willys-Overland Co. shall establish a sinking fund by setting aside, out of its surplus profits, $250,000 on July 31, 1914, and in each year thereafter, and also on the 31st day of July, 1916, and each year thereafter, any amount by which 10 per cent. of the net earnings shall exceed $250,000. The money set aside for the sinking fund, however, will not be withdrawn from the business until its actual application for retirement of the preferred stock.

The new Willys-Overland Co. acquires all of the properties and business of all of its subsidiaries except that there remains outstanding $500,000 7 per cent Garford preferred stock, and $451,800 preferred and $230,000 common of the Gramm Motor Truck Co.; also $20,700 Morrow common.

The prospectus offering the Willys-Overland preferred for public subscription discloses some hitherto unknown or little known facts concerning the inception of the Willys business and its present condition.

It appears that the initial investment made by John N. Willys in the Spring of 1907 was $11,000, which it is no secret Willys had to borrow. During the five years that have intervened, the total net assets, which, be it noted, are exclusive of goodwill, patents, trademarks, etc., which so often figure so largely in stock offerings, have increased to more than $10,800,000.

The sales of the Willys-Overland Co. during the period have increased from 323 cars in 1907-1908 to 22,548 in 1911-1912, and already for the fiscal year beginning June 30 last the company has closed contracts for the sale of 38,300 cars, which in money value represents about $40,000,000 gross.

For the fiscal year ending June 30, last, the net profits of the Willys-Overland Co. and its subsidiaries amounted to $3,335,822. The consolidated net earnings for the past three years and two months, after making adequate allowance for depreciation, aggregated $7,892,055, an average of $2,492,228 per year. In the statement which accompanies the prospectus, John N. Willys, president of the company, estimates that the net earnings for the current fiscal year will exceed $5,000,000.

Application to list the shares on the New York Stock Exchange will be made. At present the preferred is held at par, $100, and the common at $70, which quotations on estimated earnings of $5,000,000 are equal to 100 per cent. on the preferred and 33.21 per cent. on the common.

As certified by the chartered accountants who conducted the audit of the company, its financial condition as of September 30, 1912, was as follows:

Real estate, buildings and equipment (based on appraisal)		$4,293,830.38
Investment in the Garford Co. and the Gramm Motor Truck Co. (valued on basis of net tangible assets)		1,303,828.67
Current assets:		
Inventories	$5,331,465.95	
Accounts and notes receivable	1,839,832.41	
Cash	1,102,674.33	
Total current assets	$8,273,972.69	
Less current liabilities after giving effect to the application of new cash to the reduction of current liabilities	3,045,325.47	
Net current assets		5,228,647.22
Net tangible assets (exclusive of good-will, trade marks, etc.)		$10,826,306.27

Five Dealers Form "Mutual Agencies."

Mutual Motor Agencies of California is the style under which five dealers in Northern California have banded themselves to serve better their needs, and more particularly with a view of securing the agency for a medium priced car for the entire northern half of the State.

The organization is due to the efforts of A. E. Hunter, of the A. E. Hunter Auto Co. of San Francisco, and in addition to the Hunter company includes the Osen & Hunter Auto Co., of Oakland; Skinner & Elliott, of Sacramento; J. C. Skinner, of Stockton, and the Cousins & Howland Auto Co. of Hanford. Messrs. Hunter, Elliott and Cousins are now in the East looking over the field and selecting a car which best meets their purposes.

The organization of the Mutual Agencies will not in any way affect the individual interests of the several companies involved, while it is not improbable that if favorable opportunities present themselves more than one make of car will be handled by the Agencies.

Stockholders and Creditor in Tug.

Former stockholders and creditors of the old Mais Motor Truck Co. are engaged in a tug of war for the possesison of $35,000 and a mortgage of $47,000, which is in the hands of the receiver, Franklin Vonnegut, intervening petitions in the case having been heard in the Superior Court in Indianapolis last week. It appears that previous to the appointment of the receiver the stockholders subscribed $75,000 to avert disaster, and they now are seeking to have their claims recognized as preferred claims, while the attorneys for the creditors are fighting for a distribution of the money. No decision has been rendered, but the proceedings in no way affect the present Mais company, which took over the property when it was offered for sale last summer.

New Men in Warren Company.

In accordance with the plans outlined two weeks ago, when the creditors extended a helping hand to the Warren Motor Car Co. of Detroit, the official make-up of the company underwent a change at a meeting held on Thursday last, when several of the officers tendered their resignations and were succeeded by men chosen by the creditors. Homer Warren and C. R. Wilson, of the old company, were retained in office, the former as president and the latter as vice-president. The other officers elected were L. M. Hamlin, treasurer; Fred T. Lewis, secretary, and R. W. Allen, assistant secretary-treasurer and general manager. In addition to Messrs. Warren, Wilson, Hamlin and Lewis, the latter of whom represents the Lewis Spring & Axle Co., the directors are C. Haines Wilson, of the Warren company; C. G. Jencks, Port Huron Engine Co.; Philip Jahn, Bosch Magneto Co.; John Mowe, Firestone Tire & Rubber Co., and Harry Bassett, Weston-Mott Co.

Rajah Sues for Insulator Infringement.

The Rajah Auto Supply Co., of Bloomfield, N. J., maker of the Rajah spark plug, has filed suit in the United States District Court for the Southern District of New York against the American Auto Supply Co., of 1697 Broadway, New York City, alleging infringement of patent No. 825,856. under which the Rajah product is manufactured. The particular claim is that the defendant sold infringing porcelain insulators, which form a renewable part of the Rajah plug, the complainants alleging that their business has thereby been greatly damaged.

Hupmobile Trio Sails to Paris Show.

C. D. Hastings, general manager; C. H. Dunlap, export manager, and E. A. Nelson, consulting engineer, all of the Hupp Motor Car Co. of Detroit, are booked to sail to Europe on November 30th. They will visit the Paris show, of course, and will also attend the conference of the Hupp company's European dealers which, under the auspices of John L. Poole, European export manager, will be held in Paris, in the Hotel Marjorie, on December 13th.

WYCKOFF SALE ARRANGED; BUYERS REMAIN SHROUDED

Offer of $150,000 for Property Accepted, but Mum's the Word—800 Creditors May Receive 28 Per Cent.

Interests represented by Chester Griswold and Attorneys Howard C. Dickerson and George A. Ellis will come into possession of the Wyckoff, Church & Partridge property on December 1st. Their bid of $150,000, on which the New York banking house of H. B. Hollins & Co. gave bond, was accepted by the referee in bankruptcy at a meeting held for the purpose on Friday last, 22nd inst.

The identity of the men represented by Messrs. Griswold, Dickerson and Ellis is, however, still shrouded in mystery. All of those concerned in the transaction are close-mouthed and will give absolutely no information. While it is generally understood that the business of manufacturing American Commer trucks and Guy Vaughan touring cars will be continued, how or when, by whom or under what name are subjects about which none, apparently, dare speak or care to speak.

The Griswold-Dickerson-Ellis purchase includes all of the Wyckoff, Church & Partridge assets, including the factory in Kingston, N. Y., and two leaseholds in New York City, but does not include the bankrupt company's claim against the Driggs-Seabury Ordinance Corp., of Sharon, Pa. The purchase price, $150,000, is to be paid in three installments of $50,000 each, in four, eight and twelve months. The property is appraised at approximately $171,000.

The cash received from the sale, in addition to $39,304, cash on hand, will, according to the receiver, John S. Shepard, permit a payment of about 28 cents on the dollar to the creditors, of whom there are about 800. The unsecured claims amount to about $575,000. The principal creditors are as follows: H. M. Swetland, $150,000; Driggs-Seabury Ordnance Corporation, $76,407; Commercial Trust Co., $62,601; Commercial Cars, Ltd., Luton, England, $52,005; Polack Tyre Co., $26,870; A. W. Church, $20,000; National Ulster County Bank, Kingston, $20,000; H. W. Johns, Ardsley, $15,500; C. F. Wyckoff, $10,290; Wyckoff Advertising Co., Buffalo, $10,140; Firestone Tire Co., Akron, O., $9,859, and G. W. Sheldon & Co., $6,124.

At the meeting before the referee in bankruptcy, at which the sale was authorized, Receiver Shepard was elected trustee in bankruptcy under a bond of $25,000. During the proceedings, it came out that among the many plans for disposing of the property which had been considered since its failure on March 14th last, was one whereby the assets would be taken over by the already tottering United States Motor Co., which, it was stated at last Friday's hearing, failed at about the time the contract was to be signed.

Creditors to Advise Pontiac Flanders.

In an effort to assist the Flanders Mfg. Co., of Pontiac, Mich., out of the financial rut into which it has fallen, its larger creditors held a meeting in Detroit last week, at which an advisory committee of seven was appointed. A sub-committee of three also was named, comprising George W. Rogers, of the Goodyear Tire & Rubber Co.; W. S. Thomas, of the Wagner Electric Co., and M. T. Douglas, an attorney representing several of the larger stockholders, which committee will delve deeper and submit recommendations.

Daniels Buys into Metalware Factory.

Smalley Daniels, who several months since removed from Boston to Detroit, where he organized the Smalley Daniels Co. of Michigan, has acquired an interest in the firm of G. F. Mitchell & Son, Cleveland, O., of which he will become sales manager. The firm manufactures metal tool boxes and later will produce drip pans, mufflers, funnels, etc.

Hydraulic Pressed Steel Buys Six Acres.

The Hydraulic Pressed Steel Co. of Cleveland, which is an extensive producer of automobile frames, among other things, has purchased a site of about six acres at East 55th street and Bellflower avenue, in that city. It is the company's intention immediately to erect a plant which will cover three of the six acres, the other three being reserved for future needs.

Mosler Prosecutes Sporting Goods House.

Claiming infringement of the Spit-Fire spark plug patents, Nos. 698,042 and 738,831, A. R. Mosler & Co., of New York City, has filed suit in the United States District Court for the Southern District of New York against the New York Sporting Goods Co. The infringement charged is similar to that of numerous other Mosler prosecutions—namely, price-cutting.

Morgan Truck Offers 15 Per Cent.

The Morgan Motor Truck Co., of Worcester, Mass., which failed on October 3rd last, has offered its creditors a settlement of 15 per cent., which, it is stated, has been accepted by a majority It is expected that a distribution will be ordered at a hearing ordered in the United States Court in Boston, which is fixed for December 3rd.

U. S. MOTOR REORGANIZERS TO OPPOSE BANKRUPTCY

Formidable Array of Counsel Will Contest Petition Filed in New Jersey—Claim Insufficiency and Predict Dismissal.

Appearing not at all worried over the petition in bankruptcy which, as stated exclusively in Motor World, was filed last week in the Federal Court in Trenton, N. J., by three small creditors against the Untied States Motor Co., the reorganizers and receivers are going ahead with their plans, and the latter state that next week advertisements of the sale, fixed by the Federal Court in New York City to occur January 8, will appear in various publications; the bankruptcy matter, it is stated, will be dismissed if present plans of the reorganization and creditors' committees do not miscarry.

The bankruptcy matter will be heard in Trenton next Monday, 1st prox., when a formidable array will greet the three petitioners. "The bankruptcy will be contested by the United States Motor Co.," said James N. Rosenberg, attorney for the receivers, "and it is my opinion that nothing will come of it. We do not think it can have any effect upon the decision of Judge Hough in this city. Henry V. Poor, attorney for the Reorganization Committee, will appear; the company's New Jersey counsel, Malcolm G. Buchanan, of Trenton, will be on hand, and a number of the largest creditors will be represented by counsel. We are informed that Amos Lint, the smallest of the petitioning creditors, has no valid claim at all and we believe the whole proceedings will be dismissed for insufficiency. The petitioners present no facts sufficient for an adjudication in bankruptcy."

One of the strongest points in the opposition to the bankruptcy petition is likely to be the appearance of the major creditors, whose desire that bankruptcy be avoided and a reorganization effected is considered as worthy of attention by the court.

Mosler Discontinues Spark Plug Suit.

Following the decision of the United States District Court for the Southern District of New York that the Canfield spark plug patent, No. 612,701, owned by A. R. Mosler & Co., of New York City, is not basic, the infringement action brought last year by Mosler against the Motor Car Equipment Co., of New York City, was discontinued Friday last, 22d inst. This was apart from the case against John Lurie, through which action the patent was adjudicated.

"HONEYCOMB" PATENT HELD VALID BY BRITISH COURT

Daimler Given Decision Over Fiat in Radiator Suit, but Appeal is Likely—American Makers Soon to be Sued.

According to present indications, it is not unlikely that the patent which covers the much-used type of honeycomb radiator soon will be given an airing in this country, additional strength having been given it last week by the Chancery Division of the British courts; Justice Joyce, who heard the evidence, gave judgment against the F. I. A. T. Motor Car Co. in an action brought by the Mercedes Daimler Motor Co., Ltd., for infringement of the Daimler company's patent on a radiator which is described in the patent specifications as "an assemblage of square tubes so arranged that the hot water from the cylinders is pumped into thin, flat chambers and there cooled by the chilled air rushing through the square tubes above and below."

The construction, briefly, is that of the familiar honeycomb radiator and is covered by the Americman patent No. 709,416, issued to Wilhelm Maybach on September 16, 1902, and assigned to the Daimler Mfg. Co., a New York corporation. It is under the latter patent that a number of suits likely will be started in the near future. As a matter of fact, it has been known for some time that the Daimler Mfg. Co. was preparing to sue a number of American manufacturers on this and several other patents, among which are the "gate change," the "fan flywheel," the "dished axle" and "water cooled brake," the first indication having been given about a year ago. The Daimler lawyer in New York on Tuesday last stated that the matter still is in hand, but just when the suits will be instituted has not been determined.

Action in the British case just decided against the Fiat company really hinged on whether, in view of what was known at the time the patent was issued, there was sufficient subject matter in the specifications to justify the patent. It is likely that the judgment will be appealed.

Daimler Import Files its Schedule.

Schedules in bankruptcy, filed Saturday last, 23d inst., in the Federal Court in New York City by the Daimler Import Co., show liabilities of $67,261.26 and assets of $4,626.54, all claims being unsecured. Those claims which are of four figures are: New Netherland Bank, judgments entered October 18, $17,060.55, and $6,218.34; Lawrence F. Braine, money advanced, $25,000; Daimler Mfg. Co., royalties and money loaned, $7,546.98; H. Content & Co., rent, $2,701.18; James A. G. Pennington, of Norfolk, Va., judgment on claim for deposit on an undelivered truck, $2,017.68; H. M. Henson, legal services, $1,000; Kiddle & Wendell, legal services, $2,558.25. Among the assets are: Cash on hand, $26.54; one bond, in hands of receivers, guaranteeing contract with W. H. Bertrand, $2,000; one used car, parts and one automobile fire engine of doubtful value, $600; accounts, $1,000; import rights, contract with General Vehicle Co., claim against Daimler Motoren Gesellshaft and claim against Boulevard Garage Co., of Philadelphia, Pa., the value of which are unknown.

Judgment Seeker Now Judgment Debtor.

As a result of having attempted to collect a claim of some $200 for goods sold and delivered to the Renault Freres Selling Branch, Inc., of New York City, the Republic Rubber Co., of Youngstown, O., was this week transformed into a debtor in the case when the Renault attorney filed in the New York county clerk's office a judgment for $17.17 costs. The $200 claim was disputed and the suit over it was decided adversely to the Republic company, which, of course, meant that costs must be met by it. Thereupon, while the Republic company was preparing to proceed further with the case, the attorney "stole a march" by filing a bill for costs, which likely will mean little in the event of the contemplated proceedings.

More Capital for Akron Tire Company.

A meeting of the stockholders of the American Tire & Rubber Co. of Akron, O., has been called to consider a proposed increase of the capital stock from $200,000 to $500,000. The company has been established for only about seven months, but it is said to be erecting an addition to its plant which will require more money to permit of expansion.

Machine Tools for the New York Show.

As a result of a conference with President Bullard, of the National Machine Tool Builders' Association, it has been decided to make a machine tool exhibit an added feature of the New York show. It will form a part of the second week's display, which will be devoted to commercial vehicles.

Cincinnati Leather Goods House Assigns.

The A. T. A. Nelson Co., manufacturers of leather goods for automobiles and carriages at 2528 Colerain avenue, Cincinnati, made an assignment to David Lorbach on Saturday last, 23rd inst. Its estimated assets are $13,700 and its liabilities $21,678.

SUED FOR $1000, NOBLEMAN REPLIES BY ASKING $10,000

Krit Company's Export Experience With Dutch Baron Proves Diverting—Their Assertions in Court Widely Disagree.

Baron Van Der Noot de Moorsel, Dutchman, diplomat and demonstrator, has filed an answer to the action recently brought against him by the Krit Motor Car Co., of Detroit, whose agent he once was supposed to be. The sum asked by the Krit company is $1,000 and, with the nobleman, Philip Breitmeyer was named as a co-defendant for alleged violation of contract. Breitmeyer was involved because he was a sort of surety for the more or less distinguished foreigner.

The Krit Motor Car Co. asserted in its petition that the baron was offered a large commission and the use of two cars for his services as European representative. He was to use one car for demonstration and exhibit the other at the show in Brussels in the hope of catching the fastidious eye of Belgian fashionables. He received the cars, but never tried to sell them or exhibit them in any way except as his personal equipage.

The Baron Von Der Noot de Moorsel retorts, however, that it is all a base canard and he deserves not only a vindication but $10,000 of American money. He admits having entered into the contract to demonstrate the cars but denies that he failed to keep his word. He says that he sold 48 cars and that on a commission basis of 22 per cent. there is due him $8,976, which sum remains unpaid. His sales were never confirmed, he says, because the company would not deliver the cars on his orders in spite of his pleadings and demands. His commissions due, his injured dignity and his efforts to keep faith entitle him, he declares, to $10,000.

Canadian Everitt Plant To Be Moved.

The Tudhope Motor Co., of Canada, which reproduces the Everitt (Flanders) car in the Dominion, has purchased a site of 10 acres in Windsor, Ont. When the necessary buildings are erected, it will remove from Orillia, Ont., where it now is located.

Victor Parts Acquires Large Addition.

The Victor Auto Parts Co, of Cincinnati, of which John Corcoran is president, has leased the five-story stone building at 134 West Second avenue, which adjoins its present plant, and immediately will equip it to increase its output. The addition provides 150,000 square feet of floor space.

The Week's Incorporations

Saginaw, Mich.—Garber-Buick Co., under Michigan laws, with $10,000 capital; to deal in motor cars.

Hagerstown, Md.—City Taxicab Co., under Maryland laws, with $10,000 capital; to operate taxicabs.

Danbury, Conn.—Fillow Auto Co., under Connecticut laws, with $10,000 capital; to deal in motor cars.

Chicago, Ill.—Metallurgique Motor Car Co., under Illinois laws, with $10,000 capital; to deal in motor cars.

Coldbrook, N. B.—Maritime Motor Co., under New Brunswick laws, with $250,000 capital; to deal in motor cars.

Montreal, Que.—Dominion Tire Co., under Quebec laws, with $1,000,000 capital; to manufacture motor car tires

Philadelphia, Pa.—Fortman Mfg. Co., under Delaware laws, with $100,000 capital; to manufacture and deal in motor vehicles.

Pen Argyl, Pa.—National Transportation Co., under Pennsylvania laws, with $100,000 capital; to operate a motor delivery.

Colonial Beach, Va.—Colonial Beach Motor Co., under Virginia laws, with $1,000 capital; to deal in motor cars. Corporators—F. W. Alexander and others.

Mobile, Ala.—Sessler Motor Co., under Alabama laws, with $3,000 capital; to deal in motor cars. Corporators—Wm. E. Clark and others.

Wilmington, Del.—Auto Poster Co., Inc., under Delaware laws, with $100,000 capital. Corporators—F. R. Hansell, G. B. Martin, S. C. Seymour.

Chicago, Ill.—Calumet Co., under Illinois laws, with $6,000 capital; to deal in motor cars. Corporators—J. B. Coambs, J. L. Mittenbuhler, C. A. Anglen.

Augusta, Me.—McTernen Rubber Mfg. Co., under Maine laws, with $1,000,000 capital; to manufacture rubber goods. Corporators—E. M. Leavitt, and others.

St. Louis, Mo.—Federal Truck Co., under Missouri laws, with $10,000 capital; to deal in motor trucks. Corporators—Allen Baker, M. B. Johnson, C. F. Prescott.

Racine, Wis.—Racine Auto Tire Co., under Wisconsin laws, with $75,000 capital; to manufacture tires. Corporators—L. J. Elliott, C. Wright, M. E. Walker.

Galesburg, Ill.—Martin-Matteson Auto Co., under Illinois laws, with $10,000 capital; to deal in motor cars. Corporators—W. P. Martin, W. Martin, S. D. Matterson.

Spokane, Wash.—Abbott-Detroit Garage Co., under Washington laws, with $100,000 capital; to operate a garage and deal in motor vehicles. Corporators—Fred S. Beokwith, Colin Campbell, and others.

San Antonio, Tex.—Knight Motor Car Co., under Texas laws, with $10,000 capital; to deal in motor cars. Corporators—H. L. Knight, A. H. Danforth, A. H. Elmore.

St. Louis, Mo.—Muehling Motor Car Co., under Missouri laws, with $5,000 capital; to deal in motor cars. Corporators—George H. Muelling, Gustav Blumenthal and others.

Newcastle, Ind.—Rose City Auto Co., under Indiana laws, with $10,000 capital; to deal in motor cars. Corporators—Frank E. Smith, Charles W. Mouch, William F. Burket.

Elgin, Ill.—Elgin Motor Co., under Illinois laws, with $20,000 capital; to manufacture motors. Corporators—Edward J. O'Beirne, E. G. Adamek, Charles G. Adamek.

Chicago, Ill.—Chandler Engine Valve Co., under Illinois laws, with $60,000 capital; to manufacture motors and parts. Corporators—G. A. Critton, N. B. Dearborn, E. S. Hoskin.

Newark, N. J.—Nyberg Automobile Co. of New Jersey, under New Jersey laws, with $25,000 capital; to deal in motor cars. Corporators—C. Hallock, F. F. Moore, A. E. Hartcorn.

Salt Lake City, Utah.—Cheesman Automobile Co., under Utah laws, with $10,000 capital; to deal in motor cars. Corporators—M. R. Cheesman, M. A. Cheesman, W. S. Cheesman.

Chicago, Ill.—Abbey Auto Livery Co., under Illinois laws, with $2,500 capital; to operate a motor car livery. Corporators—George E. Waterman, John K. Lenox, Clara A. Blackwell.

Wilmington, Del.—Zee-Zee Tire & Rubber Co., under Delaware laws, with $1,000,000 capital; to manufacture motor car tires. Corporators—E. C. Boyd, N. P. Crouch, P. L. Garrett.

Newark, N. J.—Van Deman & Wainwright, under New Jersey laws, with $100,000 capital; to deal in motor cars. Corporators—F. L. Van Deman, J. S. Wainwright, H. O. Ruckle.

Beloit, Wis.—Beloit Auto & Machinery Co., under Wisconsin laws, with $10,000 capital; to deal in and repair motor cars. Corporators—Jerome Davis, R. J. Davis, O. F. Brewer.

Camden, N. J.—Electric Tachometer Co., under New Jersey laws, with $750,000 capital; to manufacture measuring instruments. Corporators—F. A. Kuntz, F. S. Muzzey, F. S. Sauerman.

Boston, Mass.—Anderson Electric Car Co., under Massachusetts laws, with $10,000 capital; to deal in motor cars. Corporators—Albert Weatherby, Frank R. Keith, Alonzo E. Yont.

New York, N. Y.—Columbia Taxicab Co., under New York laws, with $5,000 capital; to operate taxicabs. Corporators—John Graham, James Pathe, Patrick Garrity, all of 2308 Broadway.

Nashville, Tenn.—White Motor Co., under Tennessee laws, with $10,000 capital; to deal in motor cars. Corporators—S. A. Craig, G. A. Puryear, W. H. Hyde, E. S. Craig, E. E. Wood.

Milwaukee, Wis.—Archambault Motor Sales Co., under Wisconsin laws, with $25,000 capital; to deal in motor cars. Corporators—E. J. Archambault, Willet M. Spooner, Louis Quarless.

Wilmington, Del.—Torkington Tires Co. of America, under Delaware laws, with $1,300,000 capital; to manufacture motor car tires. Corporators—I. Fogg, G. D. Hopkins, G. W. Dillman.

South Bend, Ind.—South Bend Motor Car Works, under Indiana laws, with $10,000 capital; to repair motor cars. Corporators—John D. J. Farneman, Alfred C. Mecklenburg, Hilton Hammond.

Dunkirk, N. Y.—Niagara Motors & Mfg. Co., under New York laws, with $275,000 capital; to manufacture motors and parts. Corporators—Edward J. West, Morris M. Hedden, Daniel W. Frey.

Passaic, N. J.—American European Rubber Co., under New Jersey laws, with $25,000 capital; to manufacture rubber goods. Corporators—H. H. Kreuger, Albert Kreuger, Edward G. Wilhelm.

Chicago, Ill.—Buckeye Tire & Repair Co., under Illinois laws, with $2,500 capital; to deal in and repair motor car tires. Corporators—Allen S. Sinsheimer, Harry I. Thompson, Max Guthman.

Mansfield, O.—Brucker Motor Car Co., under Ohio laws, with $5,000 capital; to deal in motor cars. Corporators—David G. Brucker, William F. Voegel, Jr., Louis Brucker, Arthur E. Courtney, J. E. Ottinger.

Toledo, Ohio.—Toledo Auto Shows Co., under Ohio laws, with $10,000 capital; to conduct motor car exhibits. Frank I. Mulholland, A. A. Atwood, H. W. Blevins, J. W. Banting, Guy R. Ford, Stanley Roberts.

New York, N. Y.—Peets-Homan Corp., under New York laws, with $2,000 capital; to deal in motors, etc. Corporators—John A. Bolles, 135 Hamilton place; Clifford S. Peets, Frank D. Homan, 10 West 62nd street.

Buffalo, N. Y.—American Kushion Kore Tire Co., under New York laws, with $10,000 capital; to manufacture motor car tires. Corporators—Chas. W. Taylor, Christopher M. Baldy, Karl E. Wilhelm, all of 558 Ellicott Square.

New York, N. Y.—Globe Tire Co., under New York laws, with $500 capital; to deal in motor car tires. Corporators—Ralph W. Morrison, 181 West 73rd street; R. D. Placak, 318 West 57th street; F. F. Nichols, 135 Broadway.

New York, N. Y.—Hallett Point Garage, Inc., under New York laws, with $5,000 capital; to operate a garage. Corporators—August Kiel, Jr., Milford, Pa.; Thomas D. Tompkins, Avon, N. J.; Gustav Rees, Jr., New York City.

New York, N. Y.—Twelfth Street Garage Co., under New York laws, with $60,000 capital; to operate a garage. Corporators—Douglas G. McOtter, 1080 Bryant avenue; William J. Devlin, Sr., 36 West 32nd street; George M. Hamilton, 4 Sheridan Square.

New York, N. Y.—Cahill Auto Works, Inc., under New York laws, with $6,000 capital; to deal in and repair motor cars. Corporators—Andrew J. Cahill, 352 West 49th street; Henry J. Cahill, 1700 Broadway; Charles E. Trainor, 54 West 139th street.

Brooklyn, N. Y.—Sea Gate Garage and Automobile Corporation, under New York laws, with $2,000 capital; to operate a garage and deal in motor cars. Corporators—Joseph F. Curtain, H. O. Coughlan, Thomas K. Mallaby, all of 34 Nassau street, N. Y.

Changes of Capitalization.

Detroit, Mich.—B. F. Goodrich Co. $10,000 to $500,000.

Springfield, Ohio—Victor Rubber Co. from $100,000 to $69,000.

Detroit, Mich.—Everitt-Metzger-Flanders Co. from $1,000,000 to $500,000

Galion, Ohio — Cleveland - Galion Motor Truck Co. from $300,000 to $1,000,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve To Place Many Workers In New Places—Few Leave the Industry.

C. M. Clement, former manager of the Weston-Mott Co., has been appointed production manager for the Metal Products Co. of Detroit, Mich.

T. A. Flaherty has been appointed manager of the Prest-O-Lite branch in Los Angeles. Previously he was identified with the home office in Indianapolis.

Carl J. Secoir, purchasing agent of the Havers Motor Car Co., of Port Huron, Mich., has resigned that position and become attached to the Studebaker Corporation, of Detroit.

F. C. Colwell has been appointed district manager of the Stevens-Duryea Co. for Southern Ohio, Southern Indiana, Kentucky and Tennessee. He will make his headquarters in Cincinnati.

Fred E. Moskovics will retire from the position of sales manager of the Remy Electric Co. on March 1st next. He will be succeeded by Fred J. Urburn, who has represented the company in Detroit and Chicago territory.

W .M. Jenkins, at one time sales manager for the Amplex Motor Car Co., of Mishawaka, Ind., has been appointed Pacific Coast sales manager of the Abbott Motor Co., of Detroit. He will make his headquarters in San Francisco.

A. L. Bennett has been appointed eastern district sales manager of the Abbott Motor Car Co., of Detroit. He will make his headquarters in Boston at the salesroom of the F. A. Dutton Motor Co., which handles the Abbott-Detroit car in that city.

Barry Cool has been appointed manager of the Pathfinder Motor Car Co.'s branch in San Francisco, the parent company maintaining headquarters in Los Angeles, Cal. Cool is well known on the Pacific Coast, where he has served with the Hudson, Cadillac and Lozier agencies.

G. D. Baker, factory manager of the Olds Motor Works, of Lansing, Mich., has resigned that office to become identified with the Diesel Engine Works of Ghent, Belgium. He has been succeeded by Edward Van Linden, former factory manager of one of the Buick plants.

Edward Leach has been appointed district manager of the Willys-Overland Co. for the State of Washington and British Columbia, with headquarters in Seattle. Previously Leach was connected with the H. L. Olive Co. of Spokane, which handles the Overland car in that vicinity.

E. E. Gregg, for three years sales manager of the Penn Motor Car Co. of New Castle, Pa., which recently became financially involved, has been appointed assistant sales manager of the Michigan Motor Car Co.'s branch in Pittsburgh. His territory embraces 10 States.

A. Gale Thompson, who for 16 years has represented the Jos. Dixon Crucible Co., of Jersey City, on the Pacific Coast, has been made sales manager for that company's automobile department in the East. His appointment carries with it the establishment of headquarters in New York City.

E. A. Nelson, chief engineer of the Hupp Motor Car Co. of Detroit, has relinquished the active duties of that office and assumed the title of consulting engineer. His assistant, F. E. Watts, became chief engineer. Don T. Hastings, a former Packard man, succeeds to the title assistant chief engineer.

Paul D. Beach, manager of the Kelly-Springfield Tire Co.'s New England branch, has been transferred to Los Angeles, where he will have charge of the company's depot in that city. The vacancy in Boston caused by his transfer has been filled by the appointment of Warren T. Walker, who for several years was identified with the Locomobile company.

Having concluded his work as director of advertising for the General Motors Co., F. W. Kurtz has resumed his connection with N. W. Ayer & Son advertising agency in Philadelphia, with which he had been associated for 12 years prior to his removal to Detroit. Each of the constituents of the General Motors Co., as already is well known, is now maintaining an advertising department of its own.

Russell T. Kingsford has resigned his connection with the Peerless Motor Car Co. to become chief engineer of the Rushmore Dynamo Works, Plainfield, N. J. Kingsford graduated in 1896 from Stephens Institute as electrical engineer, and for a number of years was associated with S. W. Rushmore at the time the latter was building large multi-voltage dynamos for street lighting and metallurgical work.

Due to the promotion of J. Wilbur Hobbs to the management of the Goodyear Tire & Rubber Co.'s branch in New York City. H. H. Mundy, previously in charge of the Syracuse branch, has been appointed district manager with headquarters in Buffalo. C. E. DeVire becoming local manager of the branch. The vacancy in Syracuse caused by Mundy's elevation has been filled by the appointment of W. C. Blake. of the Goodyear traveling staff.

In the RETAIL WORLD

Roche & Schooler are building a garage and machine shop in Winnemucca, Nev.

Henry Danhoff is about to open a garage in Cadillac, Mich.

S. G. Garrett is erecting a garage in Wallace, Ida. He is a Cole dealer.

I. Hoffman, of Parkersburg, Ia., is about to construct a garage, 40 x 66 feet.

The Whiteacre Automobile Co., of Wellsville, O., is building a new garage.

The Smith Auto Co., of Bishop, Cal., has let the contract for a new garage.

The Dahlen Auto Co. just has completed a new garage in Walla Walla, Wash.

Benjamin Spagnoli is about to build a garage, 36 x 112 feet, in Richmond, Cal.

Charles H. Abbott is about to build a garage in Troy, N. Y., near Second avenue.

George F. Robin has taken over the Water Street Garage in Port Huron, Mich.

C. W. Meeker is building a garage and machine shop on Bridge street, Union, N. Y.

Daniel R. Schnabel is about to establish salesrooms and a repair shop in Johnstown, Pa.

John Curtis has purchased the stock and business of the Eureka Auto Co., in Lone Tree, Ia.

The Highland Garage, in San Bernardino, Cal., has been purchased by A. A. True and N. Levering.

W. J. Caughey has opened a garage in Atchison, Kan. He also has secured the Ford agency.

McGreane, McGrath & Cline is the style of a new firm in Darlington, Wis. It has the R. C. H. line.

G. H. Kuiper has opened a garage in Grand Rapids, Mich., at Grand avenue and Michigan street.

George Middleton and C. C. Wilson have purchased the Algona Auto Garage in Emmetsburg, Ia.

Herman Von Engein is building a garage, 60 x 30 feet, in Beecher, Ill. It is located on Chicago road.

The Wood Garage, in Niles, Mich., has been leased by Bert Ringler, who will continue the business.

W. G. Flumerfelt and A. D. Mathven, of Detroit, have taken over the Monroe (Mich.) Garage Co.

S. L. Post is preparing to build a garage on Fourth street, San Antonio, Tex. The estimated cost is $2,500.

The Rose City Automobile Co. has been formed to take over the United Motor Newcastle Co., of Newcastle, Ind.

Harry Orr and O. H. Fox of Bartlett, Tex., have taken over the garage formerly operated by J. W. Hightower.

W. E. Callis, John Shaw and Tustin Nicoles are the proprietors of a garage which is being erected in Lompoc, Cal.

J. A. Ireton, of Lima, O., has secured permission to build a garage; the application names $4,300 as the cost.

Joseph H. Grandey is building a garage, 48 x 100 feet, in Grandvue, Pa. He has the Ford agency for Beaver county.

Charles K. Smith is about to build a garage in Philadelphia, Pa., at 9210 Germantown avenue; it will cost $4,500.

The Blackhawk Auto Co., of Waterloo, Ia., is building a new garage; it will be ready for occupancy December 1.

Corning, Cal., is soon to have a new garage; J. B. Beaumont, C. M. Kingsley and Floyd Beaumont will operate it.

Roy Maddrell has disposed of his interest in the Hokanson Auto Co., in Monroe, Wis.; he will enter other business.

A garage is about to be erected by Andrew M. Eastwick on North avenue, Baltimore, Md. The cost wil be $5,000.

C. A. Muller has established an automobile livery service in Berkeley, Cal. He also is proprietor of The Tire Shop.

The Birmingham (Ala.) Motor Co. plans to erect a garage, 140 x 100 feet, at Avenue C and 21st street; it will cost $10,000.

Googins & McNeill, who recently took over the McBride Garage in Walla Walla, Wash., are about to erect a new garage.

The W. L. Nolan Auto Co., of Rochester, Minn., has taken over the garage of W. H. Brown; the building will be remodeled.

P. R. Smith and T. S. Fenlon have taken over the Overland agency in Neola, Ia. It formerly was conducted by Joseph Barrier & Son.

Lee Rockwell asd L. D. Van Hof have opened the West Side Garage in Grand Rapids, Mich., at West Bridge and Scribner streets.

E. E. Gerlinger, of Portland, Ore., has entered the truck selling field; he represents the Standard line in Washington, Idaho and Oregon.

A new garage now being constructed in Springfield, Tenn., will be occupied by Dolen & Lewis when completed; the cost will be $6,000.

J. J. Carson is about to build a garage, 45 x 100 feet, in Lima, O. He recently secured the Mitchell and Paige-Detroit agencies.

Mackemer & Pinkerton, dealers in Peoria, Ill., are about to establish a branch in Galesburg, in the same State; they have the Ford line.

J. Harcleroad and Edward Bennett, of Lancaster, Wis., have sold their garage to G. G. Horton & Son of Patch Grove, in the same State.

Charles Bemen & Sons, of Cincinnati, O., are about to open a branch of their garage; it will be located on Rockdale avenue and will cost $10,000.

Perry M. Wolford and John Newman have organized the Piqua (O.) Taxicab Co. Wolford is president and secretary and Newman treasurer.

Owens & Work, formerly of Denver, Col., are about to enter the garage trade in Pomona, Cal. They have secured a location on Thomas street.

Permission has been granted to H. G. Scheldon of Allentown, Pa., for the erection of a one-story, brick garage at 11th and Maple streets.

Following a change in personnel, the title of the garage firm of Dann & Townsend, in Evansville, Wis., has been changed to Townsend & Hayne.

T. A. Jewell, of Norwich, N. Y., has gone into the retail automobile business; he is representing the Mitchell, R. C. H., Paterson and Moyer cars.

Permission has been granted to George P. Fisher to erect a garage, 36 x 50 feet, on Newberry street, Williamsport, Pa. The estimated cost is $2,000.

Centre Avenue Garage is the style of a new business in Reading, Pa. It is located at 934-36 Rose street and contains 8,000 square feet of floor space.

A. J. Lewis has sold his interest in the Alliance Motor & Supply Co., of Alliance,

Digitized by Google

O., to his partner, John F. Brannan; Lewis has removed to Clevelend.

Onsgard & Foss, Ford dealers in Spring Grove, Minn., have dissolved partnership; Oliver Onsgard retires and Edward Foss will continue the business.

Frank Funda of Schenectady, N. Y., has entered the trade and has located salesrooms on Church street; he has the Studebaker and Haynes agencies.

The Adams Garage, 306 Franklin street, Natchez, Miss., has been purchased by the Motor Repair Exchange; both will be combined at the Adams location.

The Hunter Motor Co. has opened up new salesrooms in Roanoke, Va., at Henry street and Luck avenue; the company carries Haynes and Regal cars.

B. F. Ellington has bought out his partner, C. C. Tanner, in the Northwest Auto Co., of St. Joseph, Mo. The concern will continue to handle Krit cars.

J. S. Brown of Redlands, Cal., is erecting a garage and machine shops at 346 Orange street; he will operate under the style Continental Garage and will stock several lines of cars.

George Saul has sold his interests in the Reinbeck Auto Co., of Grundy Center, Ia., to W. C. Runft; the remaining member is G. E. Hildebrand, who, with Runft, will enlarge the business.

Lynn C. Buxton, of 1226 South Olive street, Los Angeles, Cal., has admitted Arthur E. Childs to partnership; the new firm name is Buxton & Childs. The Moon agency is the firm's principal business.

J. O. Kendall and W. O. Connor, of Dallas, Tex., have let the contract for a two-story brick garage, 50 x 90 feet, to be erected on Commerce street; it will cost $15,000 and is scheduled to be completed February 1.

W. E. Sparks, who has conducted a Cutting agency at 825 South Olive street, Los Angeles, under the style Eastern Motor Car Co., has disposed of the business to George E. Kirkwood. Sparks contemplates an extended touring vacation.

A. W. Tyner, of Webster, and Frank Forbes and W. R. Bowen, of Aberdeen, both South Dakota towns, have formed the South Dakota Motor Car Co., with several dealerships in view; salesrooms will be conducted in Webster and Aberdeen.

Recent Losses by Fire.

Red Bank, N. J.—Charles E. Hendrickson, Front street, garage destroyed. Loss, not stated.

Chicago, Ill.—Nyberg Automobile Works, Inc., 2439 South Michigan avenue, gasolene explosion and fire; building damaged. Loss, $15,000

THEFT OF CHECK DOES NOT AVOID THE PAYMENT

Provided Paper Is Taken by Employe of Man to Whom Check Was Sent —Jury So Decides in New York Storage Case.

If a car owner sends a check to a garage keeper in payment of storage charges on the car, and if the checks are stolen by the bookeeper or some other employe of the garageman, the owner has paid the bill and cannot be held further responsible, according to the verdict rendered by a jury Monday last, 25th inst., in the Supreme Court for New York county.

In this instance, O. B. Thomas, an attorney, stored his car with the Belnord Automobile Storage & Supply Co. during the winter of 1910 and 1911 and sent a check each month in payment of his bill. In the spring he went to the garage to get his car, after having left it for some time in "dead" storage, and was informed that he owed for three months' storage. Thomas insisted he had sent checks in payment, but the garageman declared if such were the case they must have been stolen by the bookkeeper. Investigation showed this to be the case, the checks having returned to Thomas, endorsed and cashed by the employe.

Thomas replevined his car, but to establish the true ownership it then became necessary for him to sue the Belnord company for the vehicle and for damages for the time he had been prevented taking the automobile. The jury agreed with the car owner and, while Thomas will secure damages for the retention of his car, they will be more or less nominal, as he was without it but a short time.

Ham-Meix to Make Motor Starters.

The Ham-Meix Mfg. Co. of Indianapolis, Ind., which recently was incorporated under the laws of that State with an authorized capital of $150,000, has located in that city at West 11th street and Belt R. R., where it will take up the manufacture of motor starters and acetylene generators.

The incorporators, Harry W. Hamilton, Benjamin F. Meixall, Samuel B. Sutphin and Harold Taylor, all are Indianapolis men; Hamilton and Meixell, each of whom has given half his name to the company, are well known in automobile trade circles, having been connected with the industry for years. Sutphin is a large paper manufacturer and Taylor a well known attorney. The factory that has been secured has a floor space of 40,000 feet, and its capacity is said to be 300 complete lighting and starting outfits daily.

The starter which is to be manufactured is of the pressure type and is original in that it will utilize carbon dioxide which will be generated in a steel tank designed to be located on the rear of a car. A controlling valve regulates the pressure generated, the possible range of which is said to be from 5 to 500 pounds.

Jackson Agency in Trouble Over Notes.

Notes given to the Jackson Auto Sales Co. of Brooklyn by customers and others are the basis of two judgments filed this week in the New York county clerk's office by the Montauk Bank, the claim at trial having been that the Jackson company borrowed money from the bank on the notes and that the notes were not paid when due. The Jackson company and several individuals and endorsers are named as judgment debtors, as follows: Jackson Auto Sales Co. of Brooklyn, James E. Pearson and Bernard J. Roesler, Jr., $378.92; Jackson company, George V. Tonner, Ralph E. Hutcheson and James E. Pearson, $305.15. Pearson and Hutcheson are named as being connected with the company. The suits were tried in a municipal court in Brooklyn.

Lamb-Daniel Locates in Detroit.

Lamb-Daniel & Co. is the style of a new firm which has opened up in the Union Trust Building in Detroit as accessory manufacturers' representatives. Daniel at one time was connected with the service department of the Cartercar Co. and latterly with the Castle Lamp Co., while Lamb previously was a member of the Franklin Automobile Co.'s staff.

Frame Company Sues Palmer & Singer.

Alleging that the Palmer & Singer Mfg. Co., of Long Island City, N. Y., contracted for a number of frames and then declined to adhere to the contract, the Parish & Bingham Co., of Cleveland, O., is endeavoring to recover $7,000 in the Supreme Court for Kings County, Brooklyn. The Palmer & Singer company claims its action was justifiable and entered a defense.

Rubber Company a Judgment Debtor.

A claim of $168.92 for goods sold and delivered to the Central City Rubber Co. by the Noera Mfg. Co. of Waterbury, Conn., is the basis of a judgment filed this week in the New York county clerk's office by E. V. Harman & Co. The latter is a collection agency.

To further the sale of its trucks, the Universal Motor Truck Co., of Detroit, has adopted an installment plan. It, of course, requires a substantial first payment and complete payment within one year

PUTTING AN EDGE ON THE "DULL SEASON."

More than ever is it apparent that the motor car has ceased wholly to be considered a fair weather vehicle. The increased use of closed cars has become so great that the trend of the times is plain to all who have eyes to see and brains to comprehend. Little more than a year ago the closed car was considered essentially a "town car," but its numerous appearance far from the city's crowded streets is ample evidence that it now is recognized as a vehicle for all-around use.

The demand this fall has been so heavy as to embarrass not a few of the manufacturers who failed correctly to gauge the indications. One conspicuous and high-priced manufacturer estimates that he is losing at least two orders each day because of his inability to fill the unlooked for demand, and in one other almost equally conspicuous instance the manufacturer has been so hard put to it that he actually has been seeking to repurchase closed cars from those of his dealers whose estimates have been borne out by the proportions of the demand.

It is fairly clear, however, that the demand has not been evenly spread, but it is equally clear that no manufacturer and no dealer longer can afford not to reckon with the closed car and to include it in their stocks. The old belief that sunshine and warm weather are necessary for the sale of motor cars fast is being dissipated, which is to say that no dealer who is alive to his opportunities has license to complain of idleness during the winter months.

Lacking closed cars, and as another means of promoting winter business, the convertible bodies that are available, afford abundant room for the exercise of real salesmanship. There are comparatively few owners of touring cars who will close their ears to the suggestion of such bodies if they are but properly presented to them, while the combination offers of closed and open bodies, the latter for spring deliveries, is being turned to advantage in several directions. In fact, the conditions are such that whoever is possessed of his wits easily is enabled to put an edge on what once was considered the dull season.

ACCESSORIES THAT ASSIST CAR SALES.

Although the time never may come when the accessories that constitute the equipment of a car will of themselves sell cars, the fact remains that the item of equipment now is being made so much of, that he who does not turn it to advantage is permitting good "ammunition" to go to waste.

In many cases, the names of many of the devices which go to make up the equipment list are better known than the names of the cars themselves. Nor is it difficult to understand why a particular accessory should have become better known than the name of the car upon which it is mounted. The manufacturer of the device has widely advertised it and built up a reputation, and because it is a good device the manufacturer of the car and the dealer also advertise it—if they are wise—for they realize that in linking the name of a well-known and well-tried product with the name of their car a certain prestige thereby is added to the car. The automobile buying public has come to know that certain accessories have made names for themselves and it is but a step further to attach real importance to a car that carries one or more meritorious devices.

Horns and lamps and electric lighting systems and starters and a hundred and one other items of equipment which not so very long ago were listed as "extras"—all these serve as cases in point.

SIDE LIGHT GLARE SHOULD BE DIMMED.

The blinding white glare of the modern automobile headlight, with its often dangerous effects, has been eliminated from urban thoroughfares by ordinances calling for the softening of the lights within city limits, and this source of annoyance to other users of the streets has been practically brought to an end.

A new condition of the same class has arisen, however, with the growing use of very brilliant side lights, in which incandescent electric lamps with tungsten or other metallic filaments furnish the illumination. The sharp, brilliant points of light, backed by highly efficient reflectors, are almost as dazzling at short range as the larger headlights, and are further objectionable because in many cases the light is projected to both sides as well as ahead.

While the powers that be have not as yet cast officially disapproving eyes on this new and growing cause of annoyance—if nothing worse—it is unlikely that their inactivity in the matter will continue indefinitely, and it will be to the credit of lamp or car manufacturers if the remedy is applied, by frosting the bulbs or otherwise, before compulsory measures are adopted.

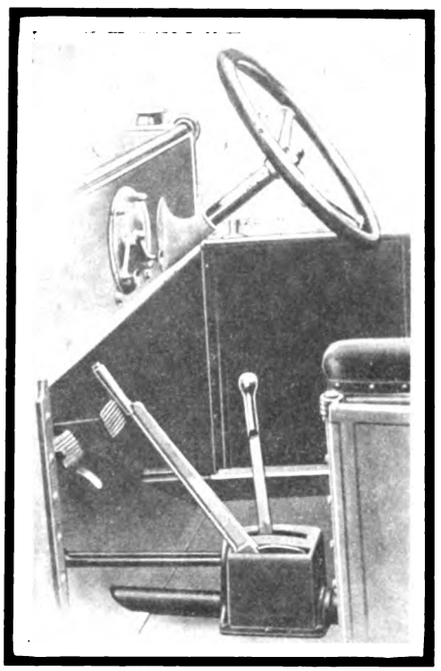
PLAN PAID OFFICERS AND PERMANENT HEADQUARTERS

New York City's Motor Truck Club to Broaden its Scope—Some of the Projects Under Consideration.

Having served a useful purpose for some time, in that it permitted its members to foregather at the dinner table preceding informal discussions concerning a great many phases of the commercial vehicle industry, the Motor Truck Club of New York City, at length is preparing to serve an even more useful purpose, steps having been taken at the last meeting which occurred on Wednesday evening, November 20th, to obtain permanent headquarters and to maintain a salaried staff to care for the club's business.

Heretofore, club members have met in a corner of the dining room of the Hotel Cumberland, though the quarters have not proven all that could be desired. Hereafter, however, they will meet at the new headquarters which have been established at 1485 Broadway in connection with George Rector's hostelry, where members will be encouraged to dine daily at the "round table." Following an informal dinner, the first business transacted at the last monthly meeting was the splitting of the position of secretary-treasurer, Charles E. Stone, who has held that position in the past, being made treasurer and Ellis L. Howland, automobile editor of the Journal of Commerce, being made secretary. As soon as possible, the new office of the club will be opened and equipped for the collection of data and material pertaining to commercial vehicles.



Among other things, it was suggested that a club bulletin be published, that a bureau of information be established, that a registry of motor truck drivers be kept, that a committee on contests be named for the purpose of gaining publicity through the medium of competitive events of various kinds and that the alteration of the annual truck parade to a mammoth demonstration be considered.

Price of "Petrol" May Cause Strike.

Taxicab chauffeurs in the city of London, who some time ago struck because of a difference with their employers over matters of remuneration, are on the verge of another walkout owing to the advanced price of "petrol." According to the custom in London, the chauffeurs are required to pay for whatever fuel they use while running the cabs, and as the price of gasolene has advanced about 70 per cent., the income of the drivers has undergone a considerable shrinkage. The average wage now is said to be about $3.90 a week, exclusive of "extras," of course.

Little Known Features of Well Known Cars

Probably no feature of a car is more important than the location of the control elements and no little time and forethought have been expended in the search for relative positions of the levers so as to render them effectual and reduce driving fatigue to a minimum. For a not inconsiderable time

HUPMOBILE CONTROL ELEMENTS

the top of the steering post location for the spark control lever and the throttle lever has been considered ideal, and if the added expense which attaches to the build-building up of the steering column is not sidered, the location certainly leaves little to be desired.

The advent of cars that really are worth while at prices which are reasonable, discloses many ways and means by which production costs are cut, and one of these means, one which is in evidence on the Hupmobile, is to change the orthodox location of the spark and gas levers to a dash location, whereby the steering column is shorn of rotatable sleeves and attachments and becomes a simple piece of shafting bearing the wheel. But though the more usual location does not obtain, the levers are positioned where they are readily accessible; on a cowl board supported by the dash and within easy reach of the driver, as shown by the accompanying illustration. The levers operate on a brass plate which serves to designate their respective functions.

November 26-30, Grand Rapids, Mich.—Fourth annual show of the Grand Rapids Automobile Dealers' Association in the Klingman Exposition Building.

December 2-3, Chicago, Ill.—Annual meeting of the American Automobile Association in Auditorium.

December 7-22, Paris, France—Paris Salon.

January 4-11, Montreal, Can.—Annual automobile show in the Drill Hall and Armory, under the auspices of the Automobile Club of Canada.

January 6-11, Cleveland, Ohio—Cleveland Automobile Show Co.'s exhibit in the Central Armory.

January 11-18, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Pleasure cars only.

January 20-25, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the First and Third Regiment Armories.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

January 27-February 1, Detroit, Mich.—Detroit Automobile Dealers' Association's Show in the State Armory.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Pleasure cars only.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

February 10-15, Minneapolis, Minn.—Minneapolis Automobile Show Co.'s show in the National Guard Armory.

February 17-22, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in Convention Hall.

March 3-8, Pittsburgh, Pa.—Pittsburgh Automobile Dealers' Association's show in Duquesne Garden.

March 24-29, Indianapolis, Ind.—Indianapolis Automobile Trade Association's show.

Solutions of The Used Car Problem

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Four Best Articles Dealing With the Subject.

By JOHN B. ORMAN, Indianapolis, Ind.

Ebenezer Carwise has an old automobile of the vintage of 1906 or thereabouts which Ebenezer Jr. says is quite impossible. The original price paid for the 1906 model was $1,500, but the Carwise family is in the market for something bigger and better—a high-powered, roomy, comfortable kind of a car costing possibly between $2,000 and $4,000.

Ebenezer knows his old boat is not worth more than $350, but he knows that the dealer is anxious to make a sale and therefore he carefully figures out that he should get an allowance for his old cast-off car equal to the original cost. The first Live Dealer who totes the Carwise family on numerous demonstrations may balk at these terms, but if he does so, old Ebenezer goes on a still hunt for the class of dealer who will stand for a little loss—and eventually he makes his trade.

Ebenezer Carwise has a new car and is ahead of the game, while the dealer, in his anxiety to make a sale, has moved a little nearer the bankruptcy court. This, in a vague, general way, is the sad tale of the automobile salesman in today's battle for supremacy in automobile auction.

Trading is a vital problem to every person interested in the automobile industry. For there will be trading always in the marketing of motor cars, just as there always has been in every other commodity where the investment is heavy and the changes frequent. The retailer may as well try to realize that fact now as well as at any other time and act accordingly. Trading will diminish on smaller cars, but will increase on the higher class cars, as there are naturally many more small cars sold to beginners who eventually want to possess larger and more powerful cars.

Some firms are meeting the proposition by placing exorbitant prices on their product for the sole purpose of making unheard of allowances for the used car. By this method, which is manifestly unfair to the man buying his first car, the manufacturer and the dealer get the actual value of the new car in the cash difference, so that the traded in car stands them nothing. This plan borders so closely on misrepresentation that it never will become popular practice.

Another attempted solution is that adopted by one of the large builders of a particularly sturdy, high class car, made in Indianapolis. This plan consists of the rebuilding of all their own makes which are traded in during the season into commercial wagons. This plan so far has proved very successful, but the changes necessary in making a pleasure car into a commercial wagon are many and require a good sized plant as well as considerable expense for operation. This would eliminate the plan as unprofitable for the average dealer, who has neither a plant at his disposal nor the inclination to shoulder the expense necessary in rebuilding and reselling.

With all the conditions clearly outlined, it seems as though the only sane possible solution of the difficulty is for the legitimate dealers of every community to get together and regulate the course of the used car. No more should be allowed for a car than can be gotten for it on a resale. It is an easy matter to put values on used cars, as every dealer knows, even almost to the dollar, what any used car will bring, when put on the market.

Now, while on the threshhold of a new and promising selling season, is the time for every live dealer in every city and town in the country to call together those who have the good of the automobile business at heart and find a way to guide the growth of that already husky little infant called "Trading."

By ERNEST WARREN, Wakefield, Ill.

The used car problem is encountered by every dealer in the United States, and the dealer's success depends upon a number of obstacles being overcome, the most important being the price allowed for the old car and the amount and character of territory available for its disposal.

It appears that the dealer in the cities of from 10,000 up can not dispose of used cars as successfully as the dealer in the smaller towns, which is due to the fact that the rural district will buy and use more used cars; especially is this true of cars from $1,500 down, and there are probably more of such cars for sale than of those listing at larger figures.

The used car dealers in the cities dispose of a great number of cars, but only a small part of them reach the rural districts, and the few that do so leave the buyer and all his friends in a frame of mind not calculated to induce future sales, as these cars are generally in poor shape.

I know a man who bought a used car of a very popular make and had it shipped to his address, and he was over a week getting the thing started; another person purchased a used car and it almost fell to pieces after 300 miles; it has never been started since. Again, I had a call for a cheap used speedometer and asked one of the largest dealers of used cars in St. Louis for a model 26 used Stewart speedometer, and after a while they found an old used model 24, for which they only wanted $19. These are fair instances of daily happenings, and as long as there is no better method so long will the rural districts hold aloof from the used car.

It seems to me, however, that the evil reputation of used cars could be removed and the situation relieved if a system could be worked out whereby all the legitimate dealers in a state would employ a competent man to oversee the sales of used cars, which they take in trade for new ones. This man could, by requiring a weekly card from all dealers, giving make, year, condition, price, etc., of each car, keep an accurate record of all and by good advertising could attract purchasers whose inquiries could be referred to the nearest dealer having the kind of car wanted. This man could also write to the prospect, telling him where he could find the kind of car we wanted, with the name of dealer and the price set on the car.

A dealer's first duty to himself is selling new cars, but there are times when dealers in small towns could co-operate with the state man and find places for many used cars, and while he would not make much profit, he would relieve the situation and incidentally sell more oils, greases and gasolene.

I do not believe that used cars placed in rural districts keep new cars from selling, for if they are sold right and are in good running order when sold, they will sell other cars; but they must be sold on the square, and inasmuch as the average rural district does not buy high priced new cars, why not provide a plan whereby the numerous used cars can be distributed beyond the present selling territory?

WHEREIN "AUTOMOBILE ROWS" ARE SADLY LACKING

The most striking feature of "automobile row" on Michigan Boulevard, Chicago, is the absence of real window displays. One can see scores of imposing stores handsomely and luxuriously furnished, but most of the managers and dealers overlook the window display opportunities.

Few Windows Reach for Business.

Chicago is a city celebrated for the enterprise of its merchants and their all-round aggressiveness, and because of the fact, the visitor believes that there will be found some of the most interesting and attractive window displays in the country. But he departs with the impression of having seen many beautiful and effective exteriors and promises of interior lavishness—handsome, polished plate glass windows on every side, parquetry floors, tiled floors, potted plants and flowers in the windows—but few real window displays that reach out for business.

Two of the most effective and business-like showings are those of the Rambler branch and the Inter-State and Paige-Detroit agencies.

Study from Standpoint of Outsider.

Chicago automobile dealers would do well to study their store fronts from the standpoint of the outsider and see how much added selling effectiveness can be put into window space. And what is true of Chicago, comes near to being true of New York and every other city large enough to be possessed of an "automobile row."

The more aggressively business is gone after and the more business-like and tempting the displays of cars the more surely will business be attracted and the less likely will be the observant customer to wonder how much of the store luxury and refinement he is expected to pay for when he buys a car.

The competition of real value is here now and those who face the issue clearly and squarely will reap the handsomest profits.

SALESMANSHIP OF THE CONVINCING SORT.

"That salesman is a crackerjack!" said a Cincinnati motorist after an interview with an automobile salesman. "He is such a plain, friendly, to-the-point talker. He does not worry about his competitors. He makes a point and rams it home. Then he makes another point and rams it home. Cleans up all along the line. Makes you fairly come along with him. Asks you questions once in a while to which you have absolutely got to say "yes" and leaves you no possible loophole for escape, and be honest with yourself.

Frankness as Oppposed to "Hot Air."

"I like him; his sincerity and business-like methods of talking have completely won me over. I am convinced that his car is just as good as he says it is, and I am going to give him the order. He did not ask for it—just said he wanted me to know about his car so I could make up my own mind, and then left in a friendly, frank sort of way. It's a wonder there are not more salesmen like him."

The honesty of purpose and apparent integrity and sincerity of the salesman had won him a customer. No "hot air." Simply plain statements that he could back up, and an appeal to the man's own judgment. Such methods rarely fail to appeal and generally win.

RESPONSIBILITIES OF EMPLOYER AND EMPLOYE.

It is not only proverbial but almost an axiom that the employe who serves his employer faithfully, honestly and intelligently is sure of advancement.

The dealer will win success by the same line of action. In a sense he is an employe of the great public; it is up to him to serve the public faithfully, honestly and intelligently. If he does so, results are certain.

There is a difference, however—and it is often this difference that causes the trouble. The employe has to be responsible only for his own acts. The employer is judged not only by what he himself does, but also by what his employes do. He has two chances or more to fall where the empolye has but one.

All of which means that the employer has not completely discharged his duty to the public when he himself has measured up to the standards He has only begun. He still has the responsibility for the acts of his employes, and that means he must see that they either measure up to his standards or get off the job. This means educating employes, and teaching them the fundamentals of business. Like many other things, it takes nothing but time and brains and brings big returns.

LOOK AT THINGS FROM THE OUTSIDE.

One of the best things an automobile dealer can do is to occasionally go out and view his establishment from the standpoint of an outsider.

Would you be satisfied and pleased with its appearance, with the way things are handled, with the treatment that is accorded? What can you do further to improve conditions?

SELLING PRICES, NOT CARS.

"They are selling prices, not cars, in that town," was the apt language in which a manager summed up a price-cutting situation. It is language that should be generally taken to heart. When merchants begin trading in figures and not in values or merchandise the end is not far removed.

AWAKE NDISING WORLD

GROWING NECESSITY FOR FIRST CLASS REPAIR SHOPS.

"Enterprise is a habit," says James Mott Wooley in the Saturday Evening Post. It is only another way of saying that the man who recognizes one opportunity is likely to know another when he sees it. Which suggests the thought that man sees only what he is trained to see. There are some things too small for the human eye to perceive; there are other things too large. There are sounds so faint we cannot hear them. There are opportunities, both small and great, in merchandising. Some men are both deaf and blind, but the man with the merchandising mind both hears and sees the opportunity and welcomes it.

Attributes of First Class Shops.

Among the opportunities that are worth heeding is the opportunity to establish first class automobile repair shops. In nearly every city there is a need for at least one such institution, operated independently from any garage; with workmen so good, supervision so competent and service and prices so consistent that every customer becomes a booster.

It requires not only these attributes, but brains, and first class equipment. It requires a place large enough to store a dozen cars; light enough to do good work. In a word, what is needed is a place where not only minor repairs but the big jobs, like overhauling and rebuilding cars—putting shaft drive axles in place of chain drive—and other important repairs can be made.

There will be a great deal more of such work than there has been, and it naturally can not and will not go to the factories because there will not be room there, and besides, there is little money in it for them, equipped as they are specially for building but not for repairing.

In many towns there are shops the entire effort of which is confined to a particular make of cars. If the car is not the brand the owners sell they will do nothing for it, and with increasing sales this condition will inevitably become more widespread. It creates a money making opportunity too big to be long overlooked.

OPPORTUNITIES FOR THE "NEIGHBORHOOD" GARAGEMAN.

In most large cities there are "neighborhood" garages—that is, garages situated in the residence section and the principal business of which is storing cars, selling gasolene and oil and doing odd repair jobs for the motorists in the neighborhood who have their own garages.

The man who keeps his car in his own garage does not usually do so because of its cheapness. He does it because of its evident convenience. If he owns his own home it is natural for him to erect a private garage.

Needs of Private Garage Owners.

During the season this type of owner is more likely than not to get well acquainted with the "neighborhood" garage. Equally likely, he opens a charge account, which offers the opportunity for the garageman to display his merchandising spirit. Why not sell this man all his oil, all his gasolene? Deliver it to him, if he wishes it, at his own garage, but why not sell him and make a profit?

The oil companies are selling hundreds—yes, thousands—of such individual owners. There is absolutely nothing to prevent the garageman from getting the business. With it he can build up his own volume and reduce his own costs. All he has to do is to reach the man by letter or 'phone, or personally when he is in the garage, and explain to him that "prices are right—quality guaranteed," and so forth.

There may be a cent or two difference per gallon in favor of the oil company, but if the private owner is using your free air and other facilities it will not take much work to get him in line. Why not have this business? Why not offer to sell him tires? In other words, why not start to build up a strong connection that will mean permanent business relations and permanent profits?

DISPLAYING CLOSED CARS TO THE BEST ADVANTAGE.

Giving goods every opportunity to sell themselves is one of the things that has been highly developed in the most successful retailing businesses and in this connection many automobile dealers overlook an important item in the displaying of cars, for a car, so shown that the prospective buyer's interest is aroused, has done much to sell itself.

The principle at this time of year may well be applied to the closed cars which are to be seen in many show windows. Every salesman knows that the luxuriousness of a limousine is one of its selling points and one which particularly impresses womankind but which is not apparent to the casual observer. This almost paramount feature of this type of car can be made to attract the passerby if the door of the limousine is swung open, exposing the comfortable and rich upholstery. If the light is not sufficient the turning on of a dome light in the car also will greatly help. Few things present a cozier appearance then the interior of a limousine when illuminated.

SOME WIDE-AWAKE MAXIMS.

Would you have your profits grow? Then make your sales grow.

Manufacturers are looking for live dealers; the better their line the more they need live ones.

Haste usually makes waste in the repair shop; lack of competent inspection is its twin brother. Together they are prolific sources of disputes, extra labor, overcharges and disgruntled customers.

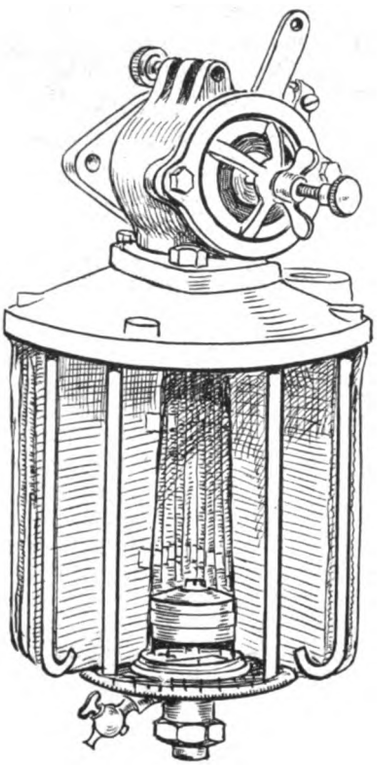
COMBINES WICK AND SPRAY PRINCIPLES TO ADVANTAGE



New Old Carburetter that Delivers "Dry Gas" and Thereby Saves "50 to 100 Per Cent."—Much Ingenuity Involved.

In appreciation of the fact that in principle the wick type of carburetter, which a few years ago was in considerable vogue, is not as good as the orthodox float feed spray type and that even the latter is not quite as perfect as it might be, the Triple Action Carburetor Co., of 711 East 11th street, New York City, has set about to correct the faults of both by the simple expedient of ingeniously combining the good principles of both in a single instrument. And so successful is the resulting device, it is claimed, that a saving of fuel of from 50 to 100 per cent. is not only possible but actual, and to back up the argument the company is offering to install carburetters under a contract whereby the recipient agrees to pay for them a monthly rental fee equivalent to one-half the amount actually saved on fuel bills. Unfortunately, however, there are no Triple Action carburetters on the market yet of a size suitable for automobile use, though it is hoped before long to supply them in all sizes. For the present, the manufacturers are confining their efforts strictly to the production of large sized models—3-inch inlets—suitable for use on heavy duty marine or tractor engines, but the smaller sizes are in hand and will be forthcoming in due course.

The device itself is not brand new in conception, but does not lack real interest because of the fact. It appeared in its original form some three years ago, but since then it has been very materially improved. Incidentally, the improvement has changed its shape from rectangular to cylindrical, as it shown by the accompanying illustration. The principal claim for the device, of course, is that it effects an actual saving of at least 50 per cent. in the amount of fuel ordinarily consumed, other claims being that it provides an absolutely dry gas, that it materially increases the power output of the engine to which it is attached, that it is "foolproof," that it cannot be clogged up by dirt or sediment in the gasolene and that it will always start a cold engine quickly and easily.

In its simplest aspect, the Triple Action carburetter consists of a large number of fine brass tubes—between 80 and 100 in a carburetter of a size suitable for an automobile engine—arranged concentrically around a central hole or well and attached at their upper ends to brass plate which forms the bottom of a mixing chamber. Between each of the brass tubes there is a thin sheet of brass covered on both sides with felt. The lower ends of the brass tubes are "hooked" and the float, which is arranged in the central well, is set so that the fuel just covers the "hooked" ends of the brass tubes.

The efficiency of action of the carburetter depends to a great extent on the temperature of the air which is mixed with the fuel. Therefore only hot air is admitted The heated air passes only through the tiny brass tubes, and before finding entrance to

TRIPLE ACTION CARBURETTER SECTIONED

the mixing chamber at the top of the carburetter is forced to pass in a uniform quantity between the felt plates. It is because of this that the triple action takes place for which the device is named. The air first is carburetted as it bubbles through the layer of fuel over the "hooked" ends of the air tubes; it is more thoroughy impregnated with fuel by reason of the spraying action caused by the air rushing through the tiny orifices; and, last but not least, it becomes veritably saturated with fuel in passing through the gasolene laden felt plates. Which, briefly, explains the "triple action."

It is pointed out by the inventor, Mathias Weiwoda, that it is impossible for the carburetter to deliver other than the dryest of dry gas, for the reason that all globules of liquid fuel are arrested by the felt walls through which they must pass before the mixture of air and gasolene enters the mixing chamber at the top. Regardless of how slowly the engine is running, the air must always be thordoughly carburetter because it is forced to pass through the fuel, added to which the laws of capillary attraction ensure that the felts always will be saturated as long as there is fuel in the float chamber.

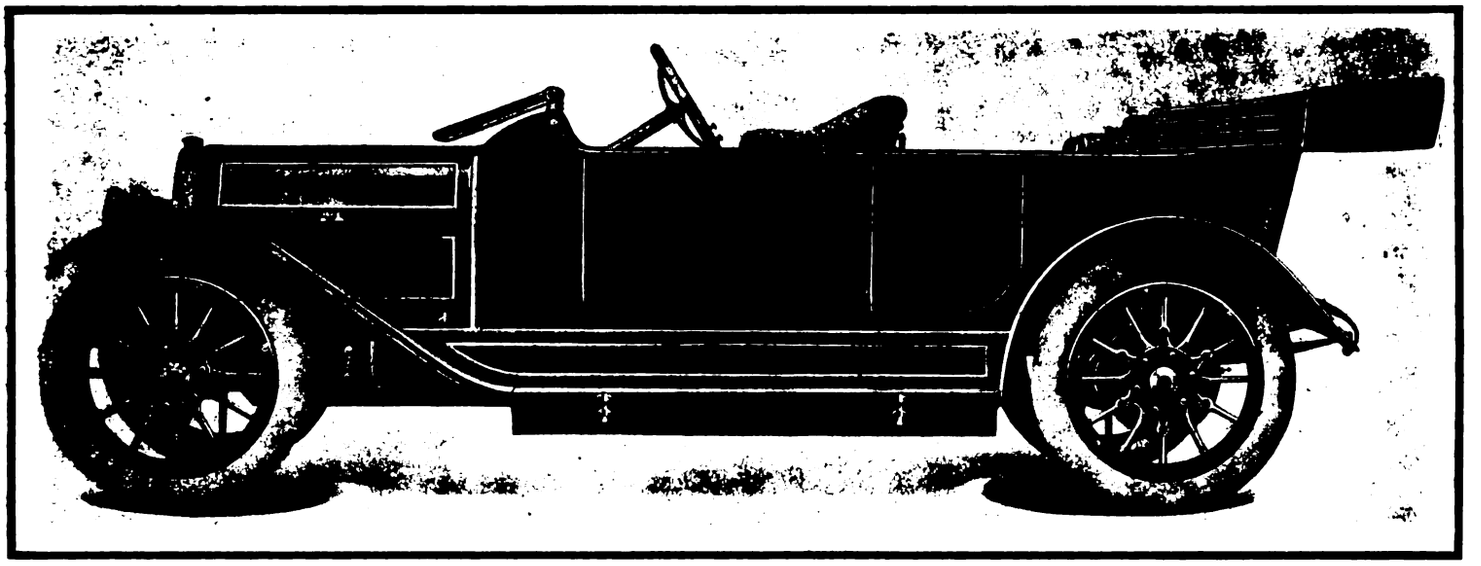
The mixture of hot air and fuel which collects in the mixing chamber naturally is too rich even to fire, and in order to thin it down to the proper proportion it is mixed with additional air by means of an adjustable throttle valve and a spring controlled auxiliary air valve. Both these valves are located at the top of the carburetter, where they are readily accessible. The former is so constructed that its opening always is in direct proportion to the opening of the throttle so that the mixture furnished the engine contains always the same fuel and air content. There is no needle valve in the device, its place being taken by an ordinary poppet valve controlled by the float. The whole device is enclosed in a cylindrical casing, which in the size suitable for an automobile engine of about 25 horsepower would measure approximately 5 x 5 inches over all dimensions. A tiny window is provided in the casing to permit a view of the float and the gasolene level, the former being easily removable without the necessity for disturbing anything other than the gasolene line connection.

Drain Hole That Should Be Clear.

Where spare tires are carried on the running board with the lower extremities inserted in a well, placed there for their retention, it is well to block up the tire slightly so that it will not prevent the escape of rain water through the drain hole in the bottom. It is also well to see that this drain hole is kept free from dirt, for moisture will in time rot the rubber.

Facilitating "Snipping" of Metals.

A piece of sheet metal that is thick enough to make cutting with snips a difficult matter can be carved up with comparative ease if one handle of the tool is held firmly in a vise and pressure applied to the other. Some snips are made with one handle shaped specially to facilitate being held in this way.



Oil that Aids Chipping of Metal.

When doing heavy chipping on wrought iron, steel, bronze or other tough, fibrous metals, the work will be considerably facilitated if a small wad of waste, soaked with heavy oil, is kept where the edge of the chisel can be frequently passed over it. The oil on the cutting edge makes the tool go in easier and cut faster.

MICHIGAN LINE IS THOROUGHLY RECONSTRUCTED

Four-Speed Gearset in Which High Speed is an "Overstep" for the "40" and Cone Clutches for Both Among the Important Changes—Longer Wheelbases, 14-Inch Cushions and Electric Lighting Systems.

CLEAN CUT APPEARANCE OF LATEST MICHIGAN "40" WHICH SELLS COMPLETELY EQUIPPED FOR $1,585

Not content with half-way measures, the Michigan Motor Car Co. of Kalamazoo, Mich., has very nearly completely reconstructed the two chassis that go to make up the Michigan line. And in the reconstruction the adoption of a four-speed gearset with an indirect high gear for the "40" is only one of the new features, though it is one of the most important of the many, that serve to distinguish the newer series cars from their predecessors. Also, Michigan cars—both are "fours" and are rated at 40 and 33 horsepower—hereafter will be sold completely equipped even to a dynamo electric lighting system; engine starters of either the electric or acetylene type will be added at a slight additional cost. The price of the "40" has advanced $85 to $1,585 and the "33" now lists at $1,400 in both roadster and touring form, the previous prices for these models being $1,150 and $1,250, respectively.

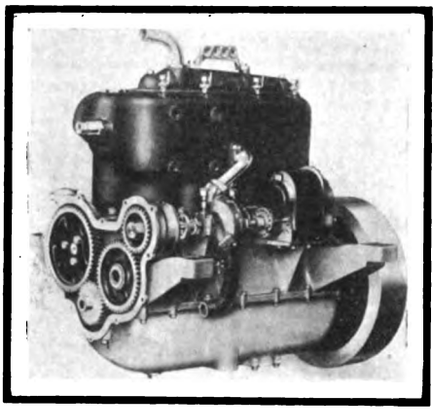
The bore and stroke of both the motors remain the same, the figures being 4¼ x 5¼ and 4 1/16 x 4½, respectively. Nor has any material change in construction been made, both remaining of the block cast L-head type. An important change has been made in the lubrication system, however, whereby greater lubrication efficiency is obtained and the possibility of smoking even under the most adverse conditions is eliminated. The pump-over splash system which has been used in the past, oil being circulated into troughs beneath the connecting rods, whence it is splashed over the cylinder walls and thence returned to repeat the performance, is retained intact except that an oil lead has been added to lubricate the timing gear train, thus eliminating the grease packing. The lower groove of each piston ring is beveled and drilled so as to draw down the excess oil and convey it to the crankcase instead of encouraging it to mount into the combustion space. Piston pin bosses are drilled.

The distinctive arrangement of the intake and exhaust manifolds both on the same side, though either may be removed without the necessity for disturbing the other, is retained without change. The carburetter is a single jet device selected for efficiency in furnishing properly proportioned mixtures at all engine speeds. As heretofore, ignition is effected by means of a Briggs magneto operating a true dual system in conjunction with a set of dry cells. Cooling water is circulated by means of a centrifugal pump of the orthodox pattern and heat radiation is assisted by a cellular type radiator and a ball bearing mounted fan.

Differing from the general practice, the lighting generator is mounted on a special bracket suspended from the two cross frame members that serve to support the gearset and is driven by means of a "silent" chain from the drive shaft flange. In the arrangement, provision is made for the adjustment of the chain for wear, and the whole mechanism can be taken out or disconnected temporarily quite easily. The system operates on a three-wire 16-volt circuit, the storage battery being split into two units to provide a lighting circuit of 8 volts with load balanced on the two sides of the accumulator unit. Unless otherwise specified, regular equipment includes the Vesta lighting system, specification of the electric starter in addition increasing the cost of the complete car $125.

In the transmission elements of the "40" two important alterations have been made. The first of them is the substitution of a large diameter leather faced cone clutch for the multiple disc clutch that has been used in the past—the "33" also has a cone clutch in place of a multiple disk clutch—and the other is the substitution of a four-speed selectively operated change gear mechanism for the three-speed gear previously used; in the "33," the three-speed gear is retained. In changing over from three speeds to four, cognizance has been taken of the fact that it often is desirable to run for lengthy periods on high gear and that under normal conditions such as obtain with the ordinary four-speed gearset not all the power of the engine is required, though excessive engine speed often is necessary in order to maintain a fairly high average touring speed. To obviate this

Digitized by Google

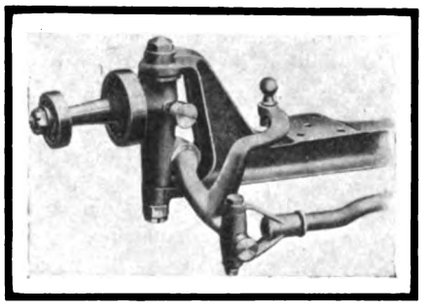


trouble the high gear in the Michigan gearset has been made an "overstep." That is to say, direct drive is obtained on the third speed and the fourth speed represents a higher gear ratio than is practicable with moderate power on direct drive. Incidentally, the four-speed gearset of this type generally is conceded to permit a better ratio of progression in speed changing than does the three-speed or ordinary four-speed gearset. Gears, of course, are carefully heat-treated and are proportioned to afford an ample factor of safety. The shafts run in imported annular ball bearings. By reason of the location of the selector fingers, central positioning of the gear shift lever is simplified. Both cars are controlled from the left side with the control levers in the center of the foot board.

The front axles of both the cars have been redesigned and are now a deep I-beam section with spindles of extra size. New practice is evident in the method employed to lubricate the spindle bolts and cross rod bolts. Ordinarily the spindles are drilled longitudinally, but under the new Michigan method they are drilled from the side, providing a method of forcing the grease upward and downward without the danger of weakening the spindles. Incidentally, the dirt which under ordinary conditions tends to work in, tends to work out under the new construction.

The rear axle of the "33" model is of the three-quarter floating type, change from the semi-floating type having been made by reason of the fact that tests tended to prove the greater efficiency of the former. In the "40," a change has been made from there-quarter to full-floating for the same reason. The casing of the axle in the larger car is formed of 3/16-inch hot-rolled sheet steel autogenously welded at the center. It is reinforced internally by tubes which carry the wheel bearings and extend through the main housing to a point as near the differential as is practicable. Here they are supported by elliptic plates embracing the wheel bearing tubes and extending to the main housing walls, to which they are welded.

Easy adjustment of the lateral location of the differential and main driving gear is obtained by two slotted nuts threaded on the differential cases and locked by claw dogs engaging the slots in the peripheries of the nuts and retained by cotter keys. Two sets of brakes are provided on both cars, service brakes being internal expanding and operating on 16 x 2½ inch drums in the case of the larger car and on 14 x 2 inch drums in the "33." In both cases substantial increases in dimensions have been made. Emergency brakes are external contracting.



The wheelbases of both the cars have been increased, the increase in the size of the "40" being two inches to 114 inches. With the increase in wheelbase length there has come also an increase in tire sizes, the "40" being equipped with 35 x 4½ inch tires instead of 34 x 4, and the "33" being equipped with 34 x 4 instead of 34 x 3½.

MICHIGAN "40" BLOCK MOTOR

In both cases, tires are mounted on Firestone demountable quick-detachable rims. Standard equipment includes one extra rim and the irons to carry it.

To the standard equipment of both cars, formerly consisting of horn, tools, demountable rims, foot and robe rails, there has been added an electric lighting system, mohair top with envelope and side curtains, electric horn, glass windshield, Jones speedometer, and tire irons. Either acetylene gas or electric engine starters will be fitted to either chassis at an increase in cost of $20 and $125, respectively.

MICHIGAN SPINDLE LUBRICATION

In the general mechanical reconstruction which has been made, the comfort of passengers has not been overlooked, as the adoption of upholstery no less than 14 inches in thickness would tend to make plain. The cushions are of the Turkish type which within a comparatively short time has sprung into such prominence Front springs are of the semi-elliptic type and rear members are three-quarter elliptic. Bodies have been refined in outline, of course, and present a modish straight line effect well set off by careful paint work and nickel plated trimmings. Running boards have been cleared by placing the tools in compartments beneath them, and the side lamps have been embedded in the dash, leaving no unsightly projections to mar appearance or to catch in the clothing of the passengers.

Receiver Named to Protect Two Trucks.

Despite the fact that the Motor Renting Co., which formerly was located at 502 West 45th street, New York City, is claimed to be no longer in business, a receiver was appointed for it in the New York City Court Monday of this week, 25th inst., upon the application of William M. Alberti, a judgment creditor. Alberti's judgment, secured October 4, is for $264.60, and he thought he was near to getting some satisfaction when he had Henry Schultz brought into court on supplementary proceedings as president of the company, but Schultz denied being more than an employe, so these proceedings were dropped.

Then an investigator looked into the Renting company's affairs and found that two motor trucks formerly in the possession of the judgment debtor were apparently abandoned in a garage on 108th street, near Columbus avenue, the wheels being missed from one and other parts in imminent danger of following, since the trucks were in an exposed place where a person of purloining disposition could pick up several parts with a few minutes' work. To protect the property and secure some form of adjustment the receiver was asked. The original claim was on promissory notes given in payment for two trucks, and the Motor Renting Co., now in the bankruptcy court, George Wishart and William H. Harrison.

Schultz's testimony in supplementary proceedings was brief and his most significant statement was that the concern for which he formerly worked is out of business.

To Prevent Round Drills Slipping.

A few longitudinal nicks with a cold-chisel will cure a round shanked drill of the habit of slipping in the chuck. The nicks need not be deep; they should, of course, grip the tool, care being taken that the drill is placed on a perfectly flat surface before it is nicked to obviate the possibility of breakage.

Hammering That Makes Brass Springy.

A strip of soft or annealed copper or brass can be rendered fairly springy by laying it upon a flat surface and hammering the entire surface of both sides with a light hammer. A spring made in this manner often will serve to replace a broken spring on a magneto circuit breaker for the time being.

REILLY RECOMMENDS RESPECT FOR "FORMER JOBS"

Tells Sales Manager How One Loquacious Youth Lost Coveted Position Because He Belittled the Last Line of Cars He Had Sold—How a Mind Acts When It Listens to Adverse Criticism.

"Hey! Where you going?"

This peremptory summons and demand for information, had it been hurled into the ear of a nervous man or one who had reason to believe his presence might be highly desired in a town he was endeavoring to avoid probably would have brought about a near approach to heart failure; falling on the ears of Reilly, however, he doggedly declined even to notice it, and without even a start pushed his money under the iron grating of the railroad ticket office and withdrew a ticket for his home town, 30 miles down the main line.

Questions Yield Scant Information.

When he did turn, the whole episode being a matter of mere seconds, he saw the Sales Manager, grip in hand, stalking across the waiting room from the street door. This individual repeated his request for information as to Reilly's destination.

"Home; where'd you suppose I was going?" he answered. "Where are you going yourself?"

"Away from home. Where do you suppose?" was the retort.

"Very elucidating!" commented the dealer, as his factory sales manager passed in the money for a ticket to a town in the opposite direction from Reilly's home place.

"What are you doing here, anyway? And what do you mean by coming to town and not coming up to the factory?" demanded the Sales Manager, as the two strolled toward the station platform.

The Two Tradesmen "Talk Shop."

"Oh, I had a little business with one of your high-brow lawyers. I didn't have time to pay a visit to-day," vouchsafed Reilly.

On the platform, conversation drifted to trade in general, for when together both invariably "talked shop." The connection between the rapidly succeeding topics would have kept a psychologist several moves in the rear, and suddenly the Sales Manager remarked, "Hear you're going to have a new salesman."

"You do? Who is he?"

"Why, didn't you hire that man I sent down?" queried the man with the grip.

"Oh! that man!" laughed Reilly. "Where did you get him?"

"He dropped in one day looking for a job," explained the Sales Manager. "I didn't have anything for him, but had heard you say you might put on another man if business kept up, so I told him to try you. Didn't you like him?"

"Yes and no." was the dealer's slow and thoughtful response. "I suppose he might make good, but I don't believe I'll take him on."

"What's the matter with him?"

"I don't know that anything in particular ails him." replied Reilly, "but I formed a

THE TWO STROLLED TOWARD THE STATION PLATFORM

prejudice against him. It's a shameful thing to admit, but I did. It was because of something he did when I slipped him a little test. I set a trap and he fell into it."

"What ever did he do?" demanded the Sales Manager, almost in alarm.

Trap That Revealed Character.

"Nothing, except that he knocked the line of cars he used to sell. Your chap strolled in and asked about the position he understood I had open and I was quite well impressed with him at first. I really began to believe he could sell cars. In fact, I believe it yet. But just to get the measure of all sides of his character, I asked him about the dealer he said he used to work for, just to see what he would say. And you ought to have heard the things he said. He became deficient in language when he tried to say all he wanted to.

"I asked him if he liked it over there, and he began his tale of woe. According to this fellow his last employer is about the meanest piece of humanity that ever grew. Also, his line of cars is rotten; they are hard to sell, full of defects, give no service, are too high-priced for their construction, break down all the time, the boss is a cheat and a crook, he is mean to his help, he doesn't care anything about his trade except to get the money for the cars, and—— Butt, whew! There's no use in me trying to tell you; it's too much. Moreover, I haven't wind enough to tell it all in one breath, and life's too short to make more than one story of such a tale.

Talked Himself Out of a Position.

"After I listened to him for a while he began to drop in my estimation, and the more he talked the further and faster he dropped, until he was so far down I could hardly hear him. That young man just about talked himself out of a job. Hire him? Never! I would just as soon breed a snake under the cushion of my Morris chair. He wouldn't stay with me forever, probably, and do you suppose I want to turn him loose in the world to show up the defects of the Reilly family. Not on your life! The family's bad enough now, especially the old man, and I don't want any such little trouble maker buzzing around my neighborhood.

"That's a big mistake too many fellows make, Jim; they talk disparagingly of the last line of goods they handled. They can't say anything bad enough about it. They will use it in their sales talk. If they happened to be working on a prospect and the prospect mentions the line of cars they used to sell they begin their little anvil chorus and think it makes an impression. Sometimes it does—but generally it's the wrong impression.

"Knocking" and the Psychology Thereof.

"Did you ever stop to think how your mind really works when someone starts to run down something you don't know much about. You become eager to learn more about it, just to see if what the other fellow said is really so; and then when you find he was talking from a point of prejudice you sort of sympathize with the man or

Digitized by Google

thing he knocked and are prejudiced against the knocker.

"I was taught that lesson when I was still a lad—and had hair. I was told not to emphasize the fault of goods I used to sell. Every line has what may be termed shortcomings. Often this line's salesmen, or so-called salesmen, become dissatisfied and quit. Then they consider that they have thrown off a yoke of thralldom, begin to picture the horrors of their previous condition of servitude and look for a 'perfect' line.

Reasons May Lie Back of Faults.

"If they only knew what lay back of the things they objected to they might be different. Maybe to remedy some fault would result in a greater one. Maybe the engineers have spent years on some one point. And if they only knew anything at all they wouldn't criticize so much, for the man who paid their salaries is trying to run his business as best he knows how. In any business there are things that seem foolish and without reason to an employe. He is absolutely sure he could do things better himself and remedy all the faults if he only had a chance. He tells his associates what he thinks, and is always on the point of quitting, and when he does get another job he just stands on his hind legs and fairly shrieks his denunciation of his last line of work and everything connected with it.

"A man who will do that isn't fair. He

REILLY AIMED A KICK AT THE SALES MANAGER'S BAG

will stab you behind your back. You can't trust him. If he is fair and above-board he will shut his mouth to the rest of the world and carry his kicks to the boss, perhaps through an indirect channel, or else say nothing at all. But whatever he does he shouldn't go out into the business world and spread tales of woe and disparagement about 'his last job.' Such talk never will help him get another position."

"You're not accusing me, are you?" demanded the Sales Manager. "I didn't know anything about him; I just sent him down to you because I didn't know what else to tell him."

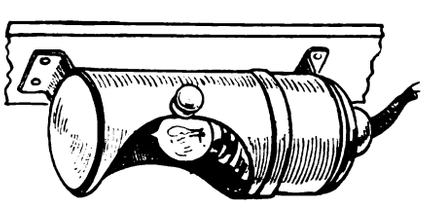
"Who said anything about you?" retorted Reilly. "I'm just telling you what I thought of your man."

Timetable Closes the Dissertation.

The train which was to bear Reilly away had arrived and now was pulling out. The pair had talked as the speed was accelerated and Reilly had turned toward the train, waiting to grab the rear of the last coach, his newsboy experience having taught him it was the safest spot to hop a train.

"The next one that comes I'll put him wise," shouted the Sales Manager, gleefully, as Reilly, having advanced toward the rear of the train, began the sidestep preparatory to the jump.

"O, you will, will you?" he shouted, and as he caught the handrail and bottom step, he aimed a vicious kick at the Sales Manager's traveling bag as he passed—but missed it.



Method of Drilling Holes True.

The common machine shop method of drilling a hole true to a given center—that is to say, a hole of from about ¼ inch upward—is to mark the exact center with a center-punch and with a pair of dividers make one or more circles around the center, the largest circle a trifle larger than the hole. If the lines do not show clearly they are accurately "pricked" with a prick-punch—a small, sharp-pointed center-punch. The drill is started in the "center-pop" and allowed to penetrate about half the depth of its point, when it is withdrawn and the cut examined.

If the edge of the cut is perfectly concentric with the circle or circles, the drilling is proceeded with; but if the drill has worked to one side, a shallow groove is cut with a round-nosed chisel down the side of the cut to "draw" the drill back to center. If the drill is small or the cut only of very slight depth a heavy, deep "center-pop" will bring the drill point back. The drill is allowed to cut a trifle more and if it centers properly it is sent down; otherwise the "drawing" process is repeated until the desired effect is obtained. Once the lip of the dirll has cut below the surface of the metal an error in centering cannot be corrected by drawing. Small holes are circled only once, as are larger holes that are not required to be absolutely accurate; but where the holes are large and must be exactly located, two or three concentric circles are made and prick-punched.

Dome Lights for Touring Car Tops.

When the top is up and the curtains are down on a touring car the interior conditions are much the same as in a closed car minus the conveniences that usually go with closed cars. One of the most important of the things that are missing is an electric light, and it is with a view to making provision for such cases that the Cleveland Electric Storage Battery Co., of 116 Market street, St. Louis, Mo., has brought out the special canopy top lamp shown in the accompanying illustration.

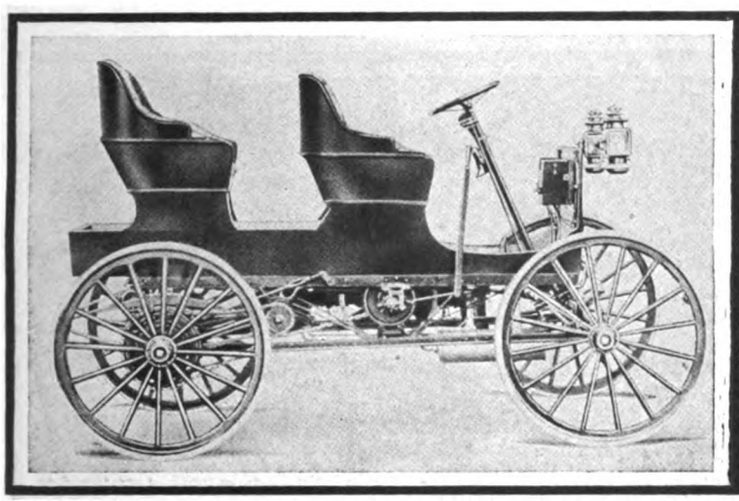
CLEVELAND DOME LIGHT

The device consists of a cylindrical metal casing containing a lamp in a suitable socket, means being provided for attaching the casing to the top. Its shape is such that it can be left in place when the top is folded, there being a shutter which covers the lamp and prevents breakage.

One Way of Closing Car Doors.

Different people have different ways of doing things, and the chauffeurs of taxicabs have little ways of their own that are interesting, instructive and sometimes expensive. For example, one of the guild had his attention called to the fact that one the doors of his "cruiser" was open, while making fair speed. His instant and effective response was to jam on his brake for an instant, reducing the speed of the car suddenly and causing the door to swing to with a crash. Without even looking around, the chauffeur released his brake, speeded up and went his way—oblivious of the fact that it had cost a neat little amount in tire rubber, brake bands and general wear and tear in many parts of the car just to shut that door.

Resistance Offered by the Air.



The resistance offered by the air to the passage of a car is considerable, when the machine is traveling at any speed. For instance, at 15 miles an hour there is a pressure of 1.1 pound for every square foot of head area; at 25 miles an hour there is a trifle over 3 pounds pressure per square foot; at 40 miles there is a pressure of 7.87 pounds; at 50 miles 12.3 pounds, at 75 miles 27.7 pounds, and at 100 miles an hour the pressure is 49.2 pounds per square foot.

OFFERS MOTOR WAGONS AT ONCE-IMPOSSIBLE PRICES

McIntyre Interests Engage in Production of Light Convertible Models —One of Them Lists at Less Than $400.

Although the trend of automobile prices has been steadily downward, the day when a brand new motor wagon of any sort would be purchasable, even by dealers, for the sum of $292.50 seemed far removed. Despite the fact, and probably unknown to a very large portion of the trade, such a wagon really is available. It is offered to dealers at the figure quoted by the Auburn Motor Chassis Co., of Auburn, Ind., which is an outgrowth of the W. H. McIntyre Co. of the same city and whose McIntyre cars and trucks are well known. W. H. McIntyre himself is president and treasurer of the Chassis company, H. C. McIntyre is secretary and Walter Schultz, engineer.

FOUR-PASSENGER "HANDY" WHICH SELLS FOR $487.50

"HANDY, JR.," LISTED AT AMAZINGLY LOW PRICE OF $390

The little wagon in question, styled the Handy, Jr., has a carrying capacity of 500 pounds and is readily convertible to the purposes of either passengers or merchandise. The Handy family consists of four members, their list prices being, respectively, Handy, Jr., $390; Handy, Medium $487.50; Handy, Water Cooled, $625; Handy, Sr., $750.

The car which touches the low water mark of price is the "Handy, jr.," and is the smallest member of the "Handy wagon" family, which includes two other members —the "Handy wagon" without suffixes and the "Handy, Sr."—having carrying capacities of 800 pounds and 1,500 pounds, respectively. The "junior" is built on the same lines as the larger machines throughout. As shown in the accompanying illustrations, the vehicle is of the express type, with wheels 34 inches in diameter, shod with 1¾-inch cushion tires, and is propelled by a two-cylinder motor of the opposed type, air-cooled, located under the body; the rear wheels, turning on a solid axle, are driven through a countershaft and side chains. The cylinders have a bore and stroke of 3¾ inches—in other words, it is a "square" engine—and is rated at 11 horsepower. It is placed with its shaft crosswise of the car, the planetary change-speed mechanism, giving the usual two forward speeds and reverse, being carried on an extension of the crankshaft and driving by chain to the countershaft. Gears are of cut steel and run in oil. The low speed and reverse are obtained through pedals and the high speed, in which no gears are doing duty, through a hand lever. The bevel gear differential is, of course, on the countershaft. Simple and efficient means are provided for taking up slack in all the driving chains.

The frame is of 1½ x 1½ x ¼ inch angle iron and is designed to accommodate a body 30 inches wide and 72 inches long. Cross members of the same material as the main frame support the motor and transmission, there being an outboard bearing for the end of the transmission shaft carrying the driving sprocket. Brakes of the contracting band type are operated on drums on the sprockets of the rear wheels. Wood reaches, stiffened by one-inch channel irons, connect the axles. The axles are 1⅛ inches in diameter, of what is known in the wagon industry as the long distance type, with Collinge collars. Full elliptic springs are employed both front and rear, all being 36 inches long and 1½ inches wide, with five leaves. Sarven wheels are fitted. The wheelbase is 65 inches. The full list price of the car is $390, which includes two oil sidelights, oil tail light, horn, and tools.

The medium weight "Handy wagon," designed for carrying 800 pounds, has a motor of the same type as the small machine, but with cylinders of 4⅛ inches bore and 3¾ inches stroke—a short-stroke motor—and is rated at 14 horsepower; it is air-cooled, like the smaller machine, and drives through the same type of transmission mechanism. Naturally, the dimensions of the car are larger throughout. The wheelbase is 77 inches and the wheels, though of the same diameter as those of the smaller car, have 1⅜-inch tires. The frame is of angle steel 2 x 2 x ¼ inch, hot riveted and trussed; axles are of forged steel, 1¼ inches square. The dealers' price of the medium weight car is $365.62 and the list price $487.50.

The "Handy wagon, sr.," which has a capacity of 1,500 pounds and lists at $750, has a motor with cylinders 4¾ inches "square" and carries a rating of 20 horsepower. The wheelbase is 86 inches. The body back of the driver's seat is 45 inches wide and 68 inches long. The wheels, of the same diameter as on the other models, have 2-inch rear and 1¾-inch front tires. On the two larger wagons pneumatic tires are fitted as an extra. The net price to dealers is $562.50.

A water-cooled model also has been brought out recently, having a 14-horsepower opposed cylinder motor and carrying 1,000 pounds load. The motor is placed under a conventionel type of hood at the front, and the cooling water is circulated by thermo-syphonic action. The motor and driving mehcanism are of the same general construction as on the air-cooled models apart from the cooling features.

May be National Tractor Test in Detroit.

If present plans do not go wrong, a national tractor test will next year be made a feature of the Michigan State fair, which annually is held in Detroit. If it is brought about, it will occur during the month of September.

SEASONABLE SETTING THAT HELPS SELL CARS

One Progressive Establishment That Obtained a Pleasing "Atmosphere" With the Aid of a Thanksgiving Motif—The Value of Cornstalks and Autumn Leaves in Making an Effective Salesroom Background.

The undeniably good effect of suitable background in the salesroom may not be appreciated by every automobile dealer, but it certainly is appreciated by those who control the destinies of the Premier branch in Indianapolis, Ind. Incidentally, these men, or more particularly J. Guy Monihan—who is responsible for the "stage setting" which is pictured herewith—made a clever play in a well thought out endeavor to put to good purpose the "spirit of the times."

It requires not more than half a glance to reveal that the salesroom has been decked out in autumnal trimmings, cornstalks and yellowing leaves and pumpkin faces and ferns and things in a way which is more than ordinarily suggestive of the particular day designated each year by the President as a time propitious for the offering up of thanks. The Premier decorators may have argued that inasmuch as everybody always affects Christmas trimmings at Christmas time, why not apply the same reasoning and affect Thanksgiving trimmings at Thanksgiving time; but be that as it may, it cannot be denied that he has obtained a desirable atmosphere—an atmosphere of quiet and cheerfulness that is particularly conducive to the signing of sales contracts. Or it may be that Monihan figured that every Premier owner had more than one reason to be thankful or that the car itself had reason to be thankful for having such distinguished parents or that the parents ought to be, and probably are, thankful to be the proud progenitors of such an enviable family.

Aside from all this, however, the salesroom is quite unusual in its decorative scheme and serves as an additional indication of the growing tendency toward more careful "stage setting" and the use of "properties" that are good, though previously they were viewed askance. It is an appreciation of the fact that there is something in "background" and "atmosphere" after all, and that as long as such is the case some one is going to benefit by it.

PREMIER SALESROOM TO WHICH THE "THANKSGIVING TOUCH" WAS CLEVERLY GIVEN

Color and Scenes for New York Show.

While the decorative theme still is carefully guarded, it has been made known that white and gold will be the color scheme which will prevail in that part of the New York show which will be held at Madison Square Garden. The other building which will be utilized, Grand Central Palace, does not so readily lend itself to decorative effort and, as on the previous occasion, landscapes and waterscapes fixed in the panels of the walls will constitute the chief ornamentation.

On the walls of the main floor will be several Long Island scenes, a view of Delaware Water Gap, views in the Berkshires, and a painting of scenes along the Hudson near West Point. On the mezzanine floor, Western views will be found, including the Grand Canyon of the Colorado, gorges and passes in the Rocky Mountains, California vistas, sections of the cattle country and prairies. The balcony will be devoted to the Sunny South, including paintings of the famous beach at Ormond, Fla., Savannah and other points.

City Designates Colors for Side Lamps.

In Grand Rapids, Mich., at least, it now is illegal for private automobile lamps to be provided with other than white side lights. It appears that a contrary practice was becoming too general and, as a result, the city fathers passed the necessary ordinance. The only motor vehicles privileged to display other than white side lights are fire engines, to which red and green have been assigned; police wagons, which must display red lights, and ambulances, the lamps of which must be equipped with purple side lights.

PROSPERITY IN UNITY IS ONE CITY'S PLAN

Dealers, Garagemen and Supply Houses in Mount Vernon Form an Association to Eradicate Trade Abuses—Arbitration of Disputed Accounts and a "Helping Hand" Committee Two of Several Unusual Features.

Whenever anything is suggested as remedial of a multitude of ills or difficulties of any description, the common practice is to label it as Utopian, which is but another way of saying that it is a fine thing but won't work; sometimes the criers of "Utopia" are wrong, however, and the decried plans succeed in spite of them.

Association Makes for Better Conditions.

The garagemen and dealers of Mount Vernon, N. Y., have undertaken plans of the sort. They are not endeavoring to bring things nearer to a millennial condition, but they have set themselves to effect changes that will make the garage and car selling trade in Mount Vernon a profitable business through the mediums of co-operation and good fellowship of the fifteen members who constitute the Mount Vernon Automobile Garage and Dealers' Association. There is but one man in the city who did not join the association, and it is almost needless to add that, with the rest of the tradesmen, he stands like the proverbial nephitine at a lawn party.

The association is little more than a month old and has hardly swung into its stride as yet, but the hopes of the members run high; which makes it pertinent to say that the organizers are not a group of idealists who conceived the scheme overnight and rushed into it without forethought; they are men who saw the trade in the whole city, which has a population of some 35,000, slipping down grade, prices being cut, money being lost through bad debts and an unhealthy form of competition growing rapidly.

Price Cutting That Affected Trade.

In the city are, as stated, fifteen places of business connected with the automobile trade; a few accessory dealers only, several combine a garage business with car agencies and the remainder are garagemen exclusively. Of the whole number the largest establishments are the Mount Vernon Auto Station, at Prospect street and North Fourth avenue, and Joseph A. Hennings's garage and agency, on North Third avenue. Trade was better several years ago than it was just prior to the formation of the association; in those earlier days, garages were not so numerous and each did more business. Then the smaller establishments began to spring up and price-cutting began.

"Bad Debts" Cut Well Into Profits.

Another destructive feature of the business was the bad debts. Owners—not all, of course, but some—would trade and store at a garage and leave without paying their bills. Some other garage, however, always welcomed them. Oftentimes the bills were left unpaid because of disputes, although the owner was abundantly able and willing to pay what he regarded as a just debt, if he were but convinced that it was just. Some of the chauffeurs insisted upon their 10 per cent. commissions and some of the garagemen lost trade when they refused to "come across." Owners felt free to buy gasolene and supplies where they wished, although the garagemen maintained that such trade should go to the garage where the owner stored. Many customers were slow in paying bills and taking everything together, the garageman individually felt justified in expressing the sentiment of so many other garage proprietors, "No money in it."

Scope of the Association's Work.

Then came the idea of the association; E. H. Bowman, one of the proprietors and the active member of the firm in the Mount Vernon Auto Station, was the father of it. First he allied the largest garagemen and dealers with himself and they went after the smaller men. It was slow work at first, but finally all agreed to come in—sixteen of them. But when it came to signing the agreement one backed out, for reasons of his own.

Many details of the trade are covered by the rules that the association members adopted. The principal points are:

1. Co-operative buying.
2. Account adjusting committee.
3. Committee to help failing business.
4. Storage schedule.
5. Uniform gasolene price.
6. Compelling supply buying at garage of storage.
7. Prompt payment of bills.
8. Uniform wages to employes.
9. No commissions to chauffeurs.

Co-operative buying, while it may not be the most important consideration so far as garage operation is concerned, is worthy of attention from the standpoint of financial returns. Heretofore each man had bought what he needed as he needed it. Now the plan is to "lump orders" and obtain better discounts. Bowman states that in the course of a year he uses about 2,500 dry cells; by co-operative buying he can save two cents on each cell, which means $50 a year. Similarly applied to other supplies, the discounts are of no inconsequential amount.

Account Adjusting Committee.

One part of the plan of the association which, if any, has a tendency toward the Utopian, but which is not impracticable if the members but stand together and do not allow dissension to creep in, is an Account Adjusting Committee. Preceding this in order of sequence, however, is a rule that no member of the association shall accept for storage any owner who owes a bill of any description at any garage represented in the association. Should a car owner leave a garage without paying his bill, it is the committee's duty to try to adjust the difficulty. The membership of the committee is not permanent; it is appointive and is to consist of two non-partisan members of the association and the garageman who has the grievance. These three are to call upon the offending owner, if such he may be termed, and endeavor to make peace. If it is a disputed account the committee is resolved into a board of arbitration and every effort will be made to bring the owner back into the fold. If they are unsuccessful the owner must abide by the consequences and shift for himself.

The "Helping Hand" Idea.

Another committee of a similar nature which also suggests Utopia and which is without a name, but is designed to assist in placing the whole Mount Vernon garage trade on a paying basis: Should there be a member of the association who is not making the money he feels he should make, this committee's services are at his disposal. His accounts and business methods are to be examined, an effort is to be made to ascertain why he is not successful, and once the solution is found the unfortunate mem-

Digitized by Google

ber is to be given a concerted boost toward the realm of profits. But if after the committee has done all it can do he cannot make good, he must of necessity fail, for the committee cannot step in and run the man's business for him; he must have some ability all his own with which to work out his salvation.

Hereafter there will be no advantage in an owner shifting garages, so far as storage prices are concerned The schedule adopted is: Smallest cars, $10; light delivery, $12; others, $15, $20 and $25, the latter, of course, being the large touring cars and limousines. Gasolene is to be sold at 20 cents a gallon, with a discount of 1 per cent. per gallon to owners owning 50-, 100- and 200-gallon coupon books. The coupon book discount of 1 per cent. a gallon will apply at all times, regardless of any future change in the fixed retail rate. The garagemen now are paying 16 cents.

Boosting Accessory Sales.

In connection with storage, the association has adopted a rule to the effect that every owner must purchase his gasolene and supplies at the garage in which he stores. This is to give the garageman the profit which he claims he does not always make on storage alone. There, however, is an alternative; the owner may buy where he pleases, but if he goes outside the garage for supplies and gasolene his storage rate automatically is raised $5 a month.

Bills must be paid promptly. The system operated by the Mount Vernon Auto Station has been adopted by the association. This requires the payment of bills within 15 days after rendering; should an owner fail to do so, there is a likelihood that the Account Adjusting Committee will be called into action.

Elimination of Chauffeur's Rake-Off.

Wages to employes heretofore have been variant. The members of the association believe a uniform schedule is best and have decided that a fair rate per hour is Foreman, 75 cents; mechanics, 60 cents; apprentices, 40 cents. This wage schedule, apparently, leaves little to be desired by the men in the way of remuneration, and the garagemen hope it will be the means of promoting a firm feeling of harmony between the members of the association and the workmen.

One of the great evils to be met by the new organization was that of paying commissions to chauffeurs. Some tradesmen had already discounted the practice when the association was formed and the comprehensive union of garages and supply stores, if enduring, should eliminate this species of "graft" in Mount Vernon territory.

"We know the car owners are opposed to it, and so are we," said Bowman. "There is no excuse for it. If commissions are given it is a case of rob yourself or rob the owner. I know one man who sells gasolene for 18 cents and gives chauffeurs a 10 per cent. commission. He buys at 16 cents, and therefore is making but two-tenths of a cent a gallon. He must sell five gallons in order to make a cent profit. Of course, I don't know anything about the gallons he gives, but if I were an owner I wouldn't buy much 'gas' of him."

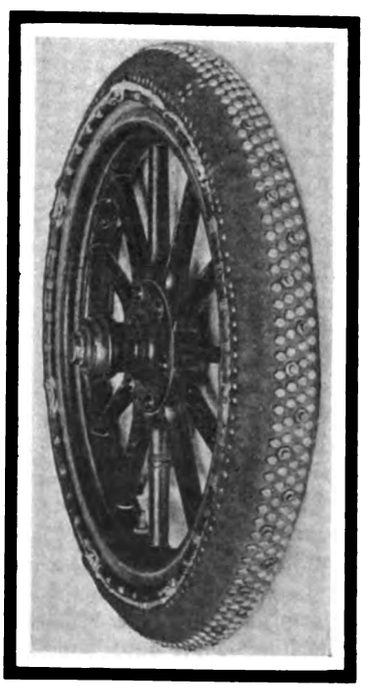
Bowman is a garageman and not a dealer; he had an agency last year, but this season relinquished it.

"Unless you are able to take care of both," he said, "you are sure to neglect one or the other."

Why He Gave Up Agency.

"Did you give up the agency because the garage paid better?" he was asked.

"No," was his reply, "I gave up the agency because I have so much money invested in the garage that I couldn't very well give up the garage."



Bowman's garage is 80 x 100 feet and is about the largest in the city. There is a capacity for 75 cars, but the average storage is in the neighborhood of 40. Nine men are employed, three being night men, whose duty it is to wash and polish the cars. His business partner is Nanning Stires, an attorney, who also is president of the association. The association's other officers are Vice-president, Albert Jincks, Jr.; treasurer, Joseph Henning; secretary, Albert Jincks, Sr.

Woodworth Tread with Double Grip.

At a time that is decidedly appropriate, when the weather is giving indications of the snow and ice that are to come and invest the streets with a slipperiness that makes the smooth-tired automobile a thing to be handled with the utmost delicacy, the Leather Tire Goods Co., of Niagara Falls, N. Y., has brought out a new Woodworth tread designed to hold the car on its course under the most trying road conditions.

The new band is styled the "double grip tread" and consists of a cover of the waterproofed leather that has acquired such a reputation for itself and its makers, with a studding of steel rivets designed to afford a hold on surfaces of ordinary unctiousness, while a series of special studs are provided to take care of extraordinary conditions, such as smooth ice or hard snow.

The special studs are about quarter of an inch longer than the regular studs, and are spaced about two inches apart; they are of special steel, tempered glass-hard, and can be screwed out when worn and new ones screwed in. The double grip tread is made in center-studded form for use on city streets or fairly good roads, and in full studded form for rutty country highways. In all cases the fastenings are of the

WOODWORTH "DOUBLE GRIP" TREAD

regular Woodworth type, with coil springs to keep the treads in proper position.

Wood Blocks for Factory Flooring.

Wooden blocks impregnated with creosote, such as commonly are used for pavement, gradually are coming into greater use for flooring factory buildings. Already several automobile factories are floored with them, their advantages being their practical indestructibility, their fireproofness, the lessened danger of damage resulting to dropped metal parts, and quietness. Incidentally, such floors are practically dustless and are not subject to the crumbling action which takes place when concrete or cement floors are chipped or abrazed.

Old Files for Removing Metal "Skin."

When it is necessary to file a cast iron surface that has been under friction and has acquired a glassy "skin," it is best and easiest to get through the skin by using the edges of old half-round, square or fishback files. The use of a good file means the spoiling of its cutting edges.

Bright steel screws and other small articles can be "blued" by the simple process of holding them on a piece of sheet iron over a fire until they assume the desired hue.

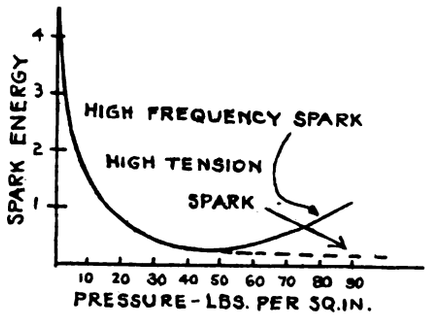
APPLYING HIGH FREQUENCY CURRENT TO IGNITION

Why "Stepping Up" High Tension Ignition Current Changes Its Characteristics and Causes Non-luminous Sparks That Are Better Than "Arcs"—Other Unusual Properties Made Plain by an Expert.

To those who incline toward delving into electrical phenomena it is doubtful if any are of greater interest than those which have to do with what has come to be known as high frequency current. Though it would require a large sized volume clearly to set forth all of the peculiarities of this peculiar kind of current, a great many of them that are interesting and instructive were made plain by Ray H. Manson, who is chief engineer of the Dean Electric Co. of Elyria, O., in a paper which he read at the last meeting of the Detroit Section of the Society of Automobile Engineers. Manson is an electrical engineer of ability, and his paper, which had to do with the adaption of high frequency current for ignition purposes, is more than ordinarily interesting and cannot fail to carry weight.



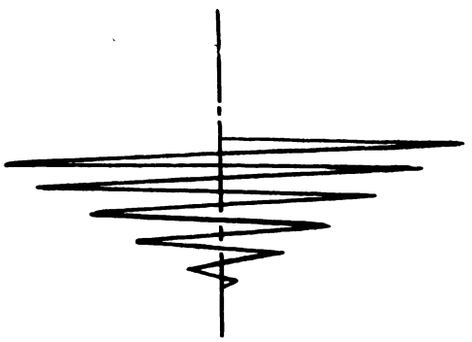


FIG. 2

Meaning of "High Frequency" Current.

Briefly, the term high frequency current means alternating current, in which the alternations or oscillations have been "stepped up" considerably higher than it is possible to generate them with the ordinary apparatus such as a magneto or an induction coil. The first commercial form of high frequency high tension ignition for internal combustion engines was developed by Seeley about seven years ago. Since then the apparatus has been produced in limited quantities by the Los Angeles factory of the High Frequency Coil Co., though no determined effort ever has been made to place it on the open market in quantity, the manufacturers being content to deal direct with car owners and users.

In leading up to his theme, Manson pointed out that the use of high frequency current for ignition purposes introduces several unusual and advantageous features.

"A high frequency discharge," he said, "is in the form of electrical oscillations, these oscillations rapidly succeeding one another, each succeeding one being of less intensity than the one preceding, gradually dying down to nil, as shown diagrammatically in Fig. 1. It will be observed that this electrical oscillatory action is similar to the mechanical vibration of a tuning fork or to the vibration of a strip of metal, which is firmly held in a vise and struck a blow. The first excursion of the strip of metal is the maximum, and the succeeding movements gradually diminish in magnitude until they die out.

FIG. 1

How Phenomena Are Produced.

"The high frequency discharge is obtained in practice in a very simple manner by means of a low capacity condenser. The source of electrical current can be the discharge from a low tension magneto armature or a battery and coil, any commercial type of interrupter being used, as in standard high tension systems. The condenser is connected across the interrupter gap and a small Tesla transformer or resonator included in series with the condenser. When the interruption of the current takes place, by the separation of the breaker contact points, the high inductive discharge of the armature or the coil is at once taken up by the condenser, which in turn sets up a series of oscillations across the gap made by the separation of these points, all of which takes place before the contacts have reached their maximum separation. These electrical oscillations passing through the primary of the resonator set up a high inductive field, which induces a current of high tension and of high frequency in the secondary of the resonator, this current being conducted to the spark plug.

"By properly selecting the capacity of the condenser and other constants in the circuit, an oscillatory discharge of any desired frequency can be obtained. In this particular system, one of over 500,000 oscillations per second is produced. This is so rapid as to exceed the sensibility of the nerves, the same as the X-Rays are invisible to the eye, and the very high mechanical vibrations are inaudible to the ear. Thus it is that the spark plugs of the high frequency system can be handled with impunity without danger of shocks.

Single Sparks Readily Divisible.

"What is apparently a single spark from the high frequency resonator can be separated by means of an air blast into a number of distinct sparks, each one probably representing a complete discharge of the condenser and consisting of a large number of oscillations. After discharging, the condenser is again charged by the induced current in the main inductance coil, this current being sufficient to charge the condenser a number of times.

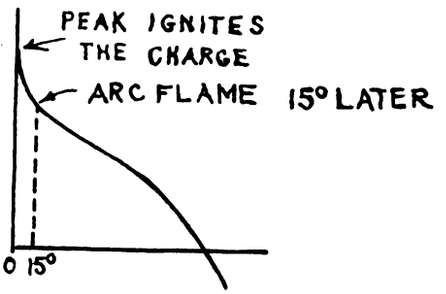

FIG. 3

When Heat Value Is Deceptive.

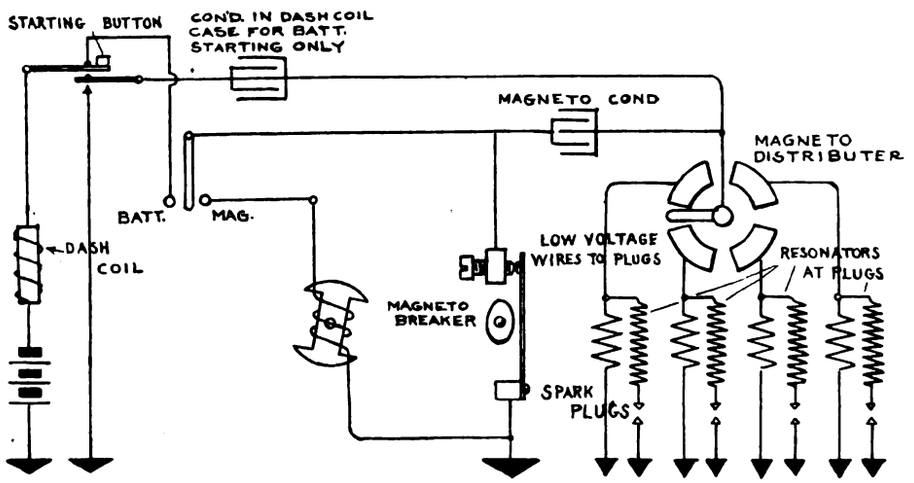
"In dealing with the spark from the low frequency induction coil and magneto, the heat value is considered of first importance. The high frequency discharge, apparently, has little heat, yet it will ignite a gas mixture with greater ease than will the dynamic spark. This can be shown conclusively by passing the two sparks through the same gas under the same conditions, and using a mixture of gas and air so rare that the dynamic spark will not ignite it, while the high frequency spark will ignite it.

"This is shown in another way by tak-

Digitized by Google

ing two sparks, one a 12-inch oscillatory discharge of about 1,000,000 oscillations per second and another spark of the same length from an ordinary induction coil. If hydrogen bubbles are produced in the path of these sparks, it will be found that the spark from the induction coil will have to penetrate the bubble before an explosion takes place, while if the oscillatory discharge passes within two or three inches of the bubble, the invisible feelers or branches will explode the gas.

Application of the "Ionic Theory."



"If we make use of the 'Ionic theory' of electricity (that the current or 'fluid' is carried by positive and negative ions and that when the current passes these ions are arranged in a similar manner to iron filings by magnetism) we can find reasons for some of the advantageous features of the high frequency discharge for gas engine ignition.

"The high frequency spark ionizes the gas for a radius of one-half an inch or so around the contact points, the action being similar to the coherer or detector of the wireless telegraph. This can be observed by putting a discharge under pressure and in total darkness. Professor Frederick Blake, one of the foremost authorities on high frequency currents, states that this ionizing increases the speed of propagating flame tremendously.

Rapidity of Flame Propagation.

"Comparing this action to that of the induction coil or dynamic spark, in the latter flame is propagated only from a few molecules in all directions at the point of the spark. Thus, the weak high frequency spark is more efficient than a very large hot spark of the high tension low frequency kind, the only advantage of the latter being the igniting of more molecules of gas at the spark points, with a slight gain in the time required to burn completely the whole volume of gas contained within the cylinder.

"Another important advantage of the high frequency spark for igniting gases under pressure was brought out by Reginald A. Fessenden, prior to August 12, 1902. In experimenting with wireless telegraphy, a new phenomenon was produced, that of increased radiation when the pressure exceeds 60 pounds above that of the atmosphere. At this point the radiation begins to increase, and at 80 pounds is about 3½ times what it was at 50 pounds. This is shown diagrammatically in Fig. 2 ,the spark energy gradually decreasing as the pressure increases until 50 pounds is reached. With the high frequency discharge it increases

SIMPLE WIRING OF COMPLETE HIGH FREQUENCY HIGH TENSION IGNITION SYSTEM

rapidly as described. In the case of a dynamic or low frequency discharge the downward characteristic of the curve is continued, as shown in the dotted line, the spark energy always decreasing with the increase in pressure.

"The term 'radiation,' as used in this connection, really means 'radiant energy' or the electro-magnetic energy dissipated in the spark gap. Therefore, it can be seen that instead of the spark energy of the high frequency discharge being less under operating cylinder pressures, it really is augmented under these conditions.

Properties of Non-Luminous Rays.

"There is still another phenomenon in the ignition of gases by means of the high frequency oscillatory discharge. It is a scientific fact that a high frequency oscillatory discharge is composed largely of non-luminous heat rays, which are sometimes known as Herschelian, from Sir W. Herschel, who first discovered their existence. These non-luminous rays come outside of the red rays of the visible spectrum, and are more effective than the visible rays of the spectrum. The high frequency discharge being very rich in these non-luminous rays will ignite a mixture even when it is shielded from the luminous spark discharge. Experiments demonstrate that gas can be ignited very rapidly by these non-luminous rays when there is no possibility of the luminous portion of the spark being in contact with the gas. A similar phenomenon is produced in the engine cylinder when non-luminous rays from the high frequency spark heat the gases therein contained to their flashing point.

High Compression Increases Efficiency.

"In the Hi-Fre-Co system, a plug spark gap of 3/32 inch can be used to advantage where the .01 of an inch spark gap is the limit for the low frequency magneto. Naturally, a proportionately greater amount of gas is included between the terminals, and an otherwise highly efficient oscillatory discharge becomes more effective in the rapidity with which it ignites the mixture.

"As the high frequency oscillatory discharge is of very much less duration than a dynamic discharge and does not depend entirely on visible heat to ignite the charge, but on a combination of the features previously explained, there is no fusing or burning away of the spark plug electrodes, as there is in a low frequency magneto system, employing the so-called 'arc flame.' An apparent advantage of this latter discharge is in the heat which is exhibited by the thick, heavy flame when discharged at atmospheric pressures.

"At a pressure of over 60 pounds in the cylinder, this thick, heavy discharge becomes a mere thread, although it still retains the same characteristic curve which is reproduced by the oscillograph, as shown in Fig. 3. The peak of this curve represents the high voltage discharge and the portion at the right, occurring about 15 degrees later, is the flaming portion of the discharge. The former is effective in igniting the gas mixture, while the latter is of no useful purpose and actually is of a serious disadvantage when the magneto is driven at high speed, due to the burning up of the spark plug contacts."

Proper Placing of Lock Nuts.

When two nuts, one thick and the other thin, are put on a single bolt, one nut acting as a lock, the thin nut should be at the bottom, in the same position as a lock washer, because the top nut will be under the greatest strain and should, therefore, be the thick one.

Graphite for Packing Stuffing-Boxes.

In packing stuffing-boxes on rotary pumps and similar devices, it is well to make liberal use of graphite in the packing material. New packing will compress rather easily, and the gland should be screwed down soon after re-packing to avoid leakage.

STARTING COLD MOTORS ON COLD MORNINGS

Why a Chilled Engine Is Difficult to Start—Various Methods of Applying Heat Sufficient to Vaporize the Fuel—Motor Starters Eliminate Cold Weather Starting Troubles—Danger in the Use of an Open Flame.

It makes no difference how good a motor is; it will give more or less trouble in starting if it becomes very cold. The excellence of the motor has nothing to do with it; neither has the carburetter efficiency. The trouble is that there is not enough heat in the frigid air to keep the gasolene in a vaporous state long enough to become ignited. The carburetter does the best it can; the liquid is thoroughly sprayed into the air and just a trifle of heat would do the rest; but the heat is lacking, the gasolene becomes chilled and instead of filling the cylinders with an inflammable vapor, it condenses and is deposited on the icy, iron surfaces, or collects in heavy, woolly vapor, close to the piston head. If the air is very damp there is likely to be further aggravation in the condensation of moisture on the spark plug, effectually short-circuiting it and preventing the generation of the indispensable spark.

Motor Starter a Winter Boon.

The owner of a car that is fitted with a good motor starter is a man who takes no interest in "wrinkles" for overcoming starting troubles, for the sum total of his labors, providing everything is in normal condition, is the pressing of a button or the swinging of a lever. A starter of the gas type will very quickly warm up cold cylinders until they pick up on gasolene, and an electric starter will keep the motor turning over at a rate that will bring about the desired results with little delay; at the worst only a little persuasion in the way of priming while the motor is running under the starter is all that will be required.

Things that May Induce Explosions.

There are various "wrinkles" for making motors easy to start when weather conditions are unpropitious, and most of them depend upon the application of heat in one way or another. If dampness and the consequent short-circuiting of the plugs by water is at the bottom of the difficulty, the remedy, of course, lies in removing the plugs, drying them and trying again. If the air is excessively damp it may be necessary to heat the plugs before replacing them, for it does not take long for a watery deposit to re-form on the points. The use of a little kerosene, put into the cylinders the night before, will prevent wet plugs, nine times out of ten, and will do the motor good in addition. The kerosene may be squirted in through the priming cocks and the engine turned over by hand a few times while still warm, or the oil may be injected by way of the intake pipe and one of the many combined priming and auxiliary air valves that are on the market.

Value of the Kerosene Heater.

There is another way in which kerosene can be used, and that is as a fuel to heat the garage and the motor. A small kerosene heater is a splendid thing, properly used, and will save an enormous amount of the trouble that goes with hard starting. Lighted half an hour or so before the car is to be used, and placed as close as possible to the motor—under it, if this is practicable—it will heat things sufficiently to make starting an easy matter, provided, of course, that the motor is in normal condition. An oil heater is also a very great comfort when it is necessary to work on a car in a garage not otherwise heated. And apart from the fact that working with cold, stiff fingers is an extremely disagreeable business, doing repair work or making adjustments when one's digits feel as if they were twice their normal size, is unsatisfactory because it is difficult to do things as they should be done.

When Hot Fuel May be Effective.

A wrinkle that often is effective in getting a chilled motor moving consists in heating the gasolene used for priming the cylinders, or else filling the carburetter with hot fuel, first draining off the cold liquid. Or hot gasolene may be poured on the wire screen at the mouth of the air inlet. The greatest care should be taken, however, in heating the fuel; the proper way is to place a half-pint squirt can of gasolene in a vessel of hot water until the desired temperature is attained. Of course, the effect of heating the fuel will not last long in the cold environs of the interior of the motor, and not a second should be lost in cranking the engine after the hot gasolene has been used.

The fact that gasolene in the form of a very heavy vapor will settle near the piston head of a cold motor naturally suggests that if a spark could be produced in this little fog-bank, it might be ignited. This is true, and it not infrequently happens that a motor that resists all other attempts to start it will promptly get down to work if the cylinders are fitted with plugs that reach down into the gas far enough to enter the low-lying vapor. Such plugs are not the best for regular running, ordinarily, and for this reason it is somewhat difficult to obtain them; when everything else fails, however, the long plug may be the saving of the situation. Two-cycle motors which start hard often are amenable to this method of persuasion.

Hot Cloths Better Than Gasolene Torches.

Once in a while a man is found who indulges in the practice of heating his carburetter and intake pipe with a gasolene torch or other open flame in order to save trouble in starting. The only thing that can be said of such a method of warming up, is that it is thoroughly dangerous and ought to be severely let alone.

One of the most efficacious methods of applying heat is to wrap cloths around the carburetter and intake piping and pour boiling water on them. The fabric will hold the water and the heat and warm up the metal much more effectually than if water were poured direct on the piping; a given amount of water goes much further if held and made to give up all its heat than if it is merely allowed to run off and give most of its heat to the unappreciative air. The trouble with this plan is that there is a possibility—in some cases a probability—of getting water into the ignition apparatus and the carburetter. If such is the case, the cloths can be dipped in hot water and most of the water squeezed out before the cloths are wrapped around the pipes.

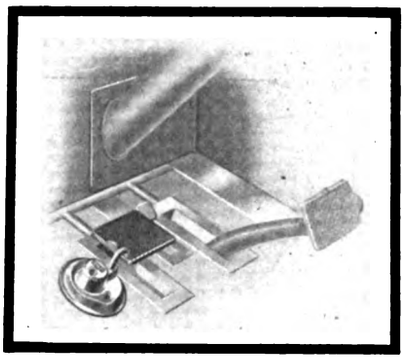
Take Chill Out of Cooling Water.

If plenty of hot water is available there is nothing more effective than filling the cooling system with it. There are circumstances, however, under which hot water must be used with considerable care. In the case of a car with a big motor and a correspondingly big cooling system — whether a powerful pleasure car or a commercial vehicle of large capacity—the amount of heat required to make any im-

Digitized by Google

pression on the great area of cold metal is very considerable, and a small quantity of hot water poured into the radiator would be so quickly chilled as to do no good. Furthermore, if the weather should be very cold and the motor should refuse to start, there would be considerable danger of the water freezing in the pump and the radiator because of the rapidity with which it would lose its heat in passing over the cold metal walls and also because water that has been heated freezes more quickly than water that has not been heated and therefore contains its normal air content.

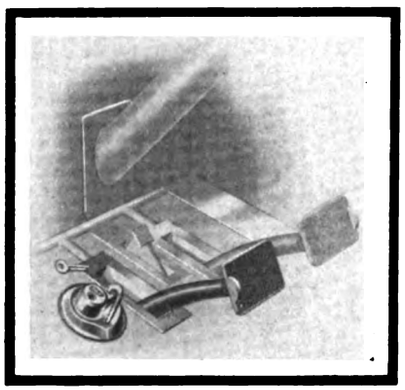
If, therefore, only a little water is available, it is better to use it on the carburetter and intake piping, and if hot water poured into the cooling system does not have the desired effect and there is no way of keeping up its temperature, it should be drained off before it has a chance to congeal. Of course, trouble from the freezing of previously heated water is not likely to occur except in very cold weather, but it is just as unwelcome then as at any other time, to say the least.



Gasolene of very light grade, or gasolene and ether mixed together half and half, or even ether alone, often are effective for priming because of the readiness with which they vaporize and form an inflammable vapor. A few feeble puffs of this light stuff often will warm the cylinders sufficiently to cause better vaporization of subsequent charges inserted via the priming cock, so that a near-explosion that is ineffective from a power point of view is not necessarily wholly wasted.

Whatever may be the method adopted for applying heat for starting purposes, the chances of getting the motor going are much better if the crank is turned rapidly than if it is pulled over slowly. A motor that will not start when cold if cranked deliberately, often will pick up if turned over rapidly. Sometimes a big motor, or one in which the compression is very high, can be started on two cylinders by taking out the spark plugs from two other cylinders to permit rapid cranking. Once two cylinders are well warmed the engine can be stopped and the plugs replaced; the rest is easy.

Under extreme conditions, as when a motor must be started outdoors in very cold weather, with not much chance for the application of heat, it is of course best to drain the cooling system, if it is not filled with an anti-freezing mixture, and try to get the motor started with an empty radiator. Then, no matter how cold it may be or how long it may take to get under way, they will be no danger of freezing. Ether, long plugs and brisk cranking are useful in such cases. When the motor is fairly well warmed up, water can be put in a little at a time, care being taken not to allow the engine to cool enough to make it hard to start again.



Locking Clutch to Prevent Thievery.

A. L. Loveley, former purchasing and stock manager for the E. R. Thomas Motor Car Co., of Buffalo, N. Y., and prior thereto assistant purchasing agent for the Packard Motor Car Co., has formed the A. L. Loveley Sales Co., of 517 Union Trust Building, Detroit, Mich., which is producing the Tabor clutch lock, designed to make harder the way of the thief and the joy-rider.

TABOR LOCK HOLDING CLUTCH

The Tabor lock, which is shown in the accompanying illustration, is designed to hold down the clutch pedal, in which position the clutch is disengaged and connection between the motor and the transmission mechanism broken; thus the propulsion of the car by the motor is impossible until the lock is released, though the wheels are free to rotate and the car can be moved by hand. The lock is screwed to the car

PEDAL FREE FROM LOCK

floor and the base, through which the screws holding the lock to the floor are passed, is covered by the upper part of the device, and this is held in position by virtue of the Yale lock, so that the screws cannot be tampered with when the lock is locked. The catch which engages the clutch pedal is in the form of a hook, which can be swung around clear of the pedal when the proper key is used; the shank of the hook passes through a hole in the floor of the car and is of case-hardened steel. In locking the clutch, the hook is pulled up, its tapered end inserted in a small hole in the pedal pad and pedal and hook are depressed together; when the pedal reaches the end of its downward movement the lock holds it there until released by means of the key.

Where Demonstrators Have Privileges.

If speed tests and hill climbing demonstrations really are necessary for the consummation of motor car sales, San Francisco dealers have the better of it, so to speak, for police regulations which went into effect on Monday last, 25th inst., provide the means whereby a demonstrator can ply his trade to his heart's content without fear of police interference because of his speeding. That is on at least two streets, one of which embraces a hill which is ideal for demonstrating purposes.

As a means of preventing abuse of the new order of things, which was brought about largely by the efforts of the Motor Car Dealers' Association, it is necessary for the demonstrator to obtain a permit which privileges him to speed at will along Nineteenth avenue within the limits which are marked by notification signs, or for the long four blocks which are embraced by the Dolores Hill. Permits are issued to none but demonstrators, and persons outside the trade caught speeding within the limited areas will be prosecuted in the usual manner.

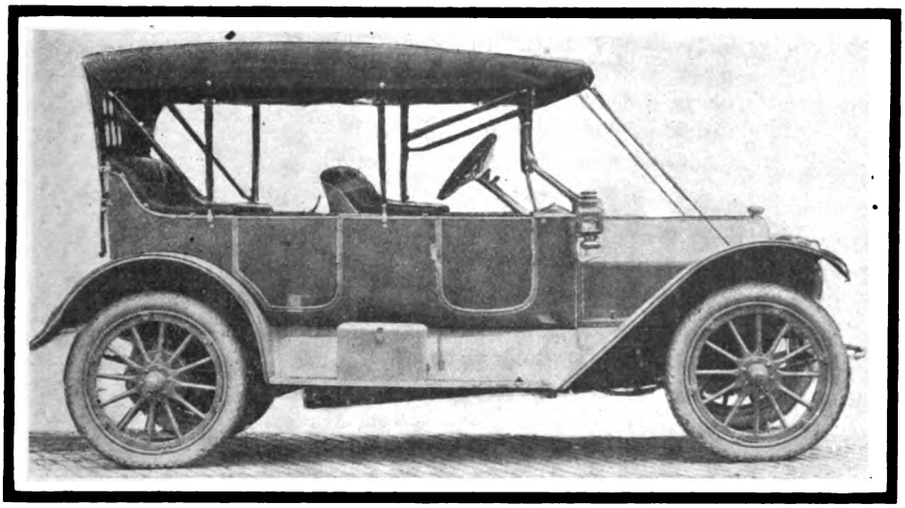
To Increase Efficiency of Flat Drills.

The common blacksmith-made form of flat drill for metal work can be made very fast-cutting by turning the edges, in the direction of rotation, to form lips, or else by grinding grooves above and parallel with the cutting edges on the forward faces, the drill being forged rather heavy for the purpose.

Home Made Tool for Brass Turning.

One of the most convenient of hand-tools for turning brass is made of a triangular file by grinding off the teeth, breaking off an inch or two at the point and grinding a single face at an angle of about 35 degrees. The temper should be drawn to a medium straw color at the point, the body being made soft.

Milling Applied with a Coarse File.



A very good substitute for a milled edge on a screw head or the like can be produced by rolling the object under a rather coarse flat file, exerting considerable pressure on the file. If the metal is not too hard it will be scored sufficiently to look well and afford a good grip.

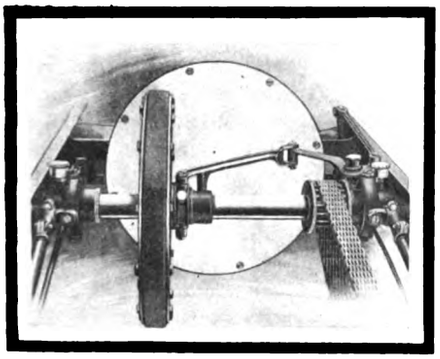
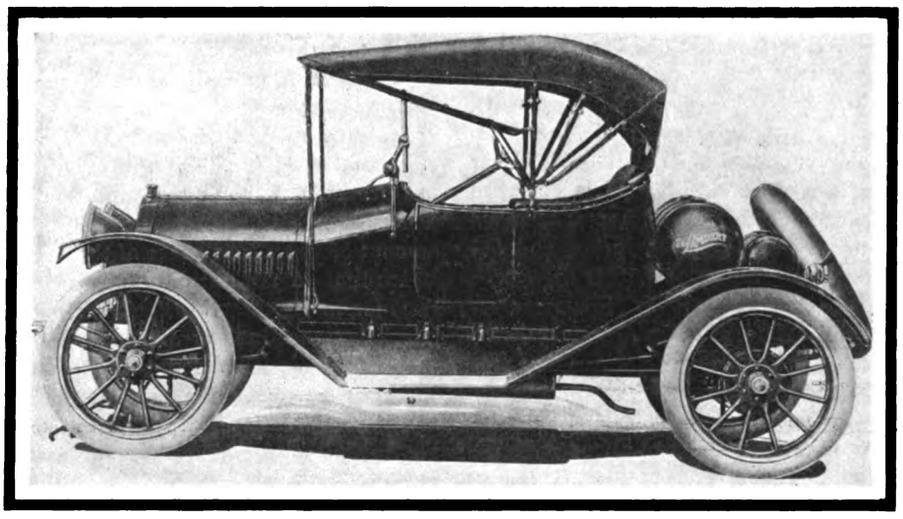
FRICTION DRIVE LAMBERT PRACTICALLY UNCHANGED

One Make of Motor Now Used in All Models—Room for Improvement Only in Comfort and Appearance.



Extensive changes hardly are to be looked for in the transmission system of a car that eliminates as much of the conventional transmission gear as does the Lambert friction-driven machine; and it might reasonably be assumed that a car that has been on the market for twelve years, always built with the friction drive as a central feature, would be so far developed that very little alteration of any kind would be required to keep it fully abreast of the general progress made by the automobile industry generally. And as a matter of fact such is the case.

LAMBERT IN TOURING FORM EQUIPPED FOR THE ROAD



LAMBERT PEDAL CONTROL

LAMBERT FRICTION DISKS

The Lambert car, which is the product of the factory of the Buckeye Mfg. Co., of Anderson, Ind., and is one of the leading exponents of the principle of transmission power and changing speed by means of friction disks instead of through the intermediary of a clutch and sliding gears, is so slightly altered that a close scrutiny by an eye accustomed to the details of that particular machine would be necessary to disclose the improvements that have been made where experience indicated that there was room for them.

The most momentous change, if change it may be called, is the adoption of the Rutenber motor for the power generating unit of all models. Heretofore, while a number of motors of this make have been used by the Buckeye company, other makes also were installed in various Lambert cars; but the results obtained from the Rutenber have been such as to lead to its installation in all machines now manufactured at the Anderson factory. The company's feeling in this matter is that it can obtain better results, on the whole, by installing a motor manufactured by specialists in that line and devoting all its attention to the production of the chassis and its friction drive, than by dividing its energies by engaging in the manufacture of engines.

LAMBERT FRICTION DRIVEN ENCLOSED ROADSTER MODEL

Apart from the matter of motors, the improvements made are practicaly all worked out with a view to enhancing the appearance of the car, the comfort of the passengers or the convenience of the driver. The construction of the mudguards and the hood and their fastenings have been revised to give greater strength and better appearance and to eliminate rattling and rumbling when the car passes over rough road surfaces. All the mouldings on the hood are attached by an electric welding process, which eliminates rivets and results in a smooth, sightly covering for the motor. The side aprons of the mud-guards have been strengthened by bracing.

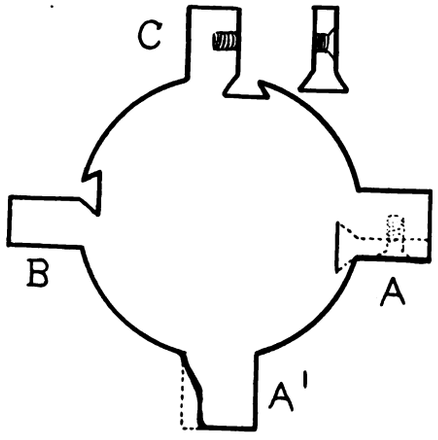
It is a well known fact that the hole which is drilled in the center of many springs for the center bolt is the source of no little trouble; breakages at this point are of common occurrence. In the new Lambert cars the front springs have no center holes. The convenience of the driver has been studied, with the result that the throt-

Digitized by Google

tle control lever has been placed above the steering wheel—an improvement over the former somewhat inconvenient place under the wheel. There is now no partition in the middle of the front seat; the entire width of the seat is unbroken and there is sufficient room for three passengers, with a little close sitting—provided the passengers are not built on bulky lines.

With the exception of the changes referred to and a straight-line effect which has been given to the hood, the Lambert car is exactly as it was Of the four models that constitute the line, all embody the same constructional features, the slight differences that exist being due to the fact that some models are equipped with less powerful motors than others, and so require less weight and strength. Model 99 is built with five-passenger touring body and with a two-passenger roadster body. In either case the only difference is that the roadster has a wheelbase of 112 inches while the touring car is five inches longer. The motor is of 40 horsepower, having individually cast cylinders with a bore and stroke of 4⅛ and 5¼ inches, respectively.

The Lambert friction drive mechanism remains exactly as heretofore; a large disk driven directly by a shaft coupled to the motor shaft by a universal joint drives a second disk, of the same diameter, mounted on a shaft extending across the frame of the car. The driven disk is slidable on the cross shaft which it turns, and the nearer it is moved to the periphery of the driving disk the faster it rotates and, of course, the faster the car will be driven, provided the engine speed remains unchanged. A "silent" chain runs from a small sprocket on the cross shaft to a large sprocket on the rear axle which attaches to the differential housing.



The smaller Lambert cars, both of which are five-passenger touring models, are designated as models 10 and 40. Model 40 has a wheelbase of 112 inches and is equipped with a motor rated at 30-35 horsepower, its bore and stroke being 3¼ inches and 5¼ inches, respectively. Model 10 is the smallest car of the line, having a 25 horsepower motor with cylinders 3¼ x 4¼ inches bore and stroke; it carries five passengers in its compact and attractively designed body.

The two larger cars, the model 99 touring car and the roadster, are priced at $1,250, model 40, 30-35 horsepower touring car, at $1,030 and the model 10, 25-horsepower machine costs $1,300. The regular equipment of all models includes two large acetylene headlights and two oil side lights and an oil tail lamp, all finished in black enamel and nickel, demountable rims, coat rail, aluminum-covered front floor-boards, wheel-puller, jack, horn, set of tools and license number.

PUTTING NEW DRIVE FACES ON WORN HUB CLUTCHES

Quick Expedients for Temporary Service—Permanent Repairs That Make Parts Almost as Good as New.

There are two principal methods of forming the driving ends of the live shafts of rear axles. In one the driving ends of the shafts are "upset" or spread out by hammering while hot, and the heads so formed are machined to make dogs which engage in notches in the hubs of the wheels. In the other method, which is far more commonly used and is considerably less expensive to manufacture, the ends of the shafts are squared and are connected with the

REPLACING WORN DOGS

wheel hubs by means of floating dogs, the teeth of which fit into corresponding notches in the hub members.

In course of time the faces of the dogs, whether they are of the separate type or are formed integral with the shafts, become worn out of square. The thrust, when this has occurred, is not direct, and, moreover, a back-lash develops in proportion to the amount of wear. The effect of the back-lash is harmful to the entire transmission system, for in starting there is a jar or shock which is transmitted through the live shafts to the differential, the propeller shaft and its universal joints, the gearset, the clutch and the engine itself. In time the keys on the various charts and the splines on the gearshafts are very likely to be affected by the constantly recurring shocks.

If the dogs are formed integral with the shafts and the shafts are both of the same length, they can be reversed—that is, the right shaft can be put into the left side of the axle, and vice versa. This will bring into play new driving faces on the dogs. If separate dogs are used, they can be changed around to opposite sides, with the same result. While it is a good thing to do this as a temporary expedient, the main trouble, which is the back-lash, is not eliminated. It can be taken up, however, by means of the method shown in the accompanying illustration.

At A1 is shown the effect of wear on one of the driving faces; the dotted lines indicate the original form of the face. To make the repair, the irregular fillet in the corner is cut away and the face neatly squared, and a dovetail undercut, as shown at B, with hacksaw and file. Filling pieces are made of tool steel or 3 per cent. nickel steel, as shown at C, and the filling pieces and dog faces are drilled for machine screws; the former are countersunk to take the screw heads and the latter tapped for the threads. The faces of the filling pieces are left a trifle high.

If the dog faces are worn it is only to be expected that the corresponding faces in the notches will be worn, and the job is but half done when the dogs are re-faced as described. A similar process can be employed for facing the worn places in the hubs, when the drive will be practically as good as new—perhaps a little better, for the steel wear-pieces may be of better stock than the original parts.

Californian Solves Repair Problem.

Eliminating the repair bill is an object in the life of nearly every motorist, but the only efficient solution found thus far is that credited to H. H. Hart, according to dispatches from Oakland, "across the bay" from San Francisco. Whether it really happened is not essential; it is a good story, anyway.

The car cost $4,500, and inside of a comparatively short time had run up a repair bill of $2,000, which accounts for Hart's determination to "solve" the problem at any cost; it may also be stated that the cost is the principal drawback in the solution. One day last week Hart called his chauffeur, James Litz, into the library of the Hart home and said

"Take that car out and lose it."

"I can't lose it," replied Litz. "It's too well known; somebody would find it and bring it back again."

"Then sink it in the middle of the bay," said Hart.

For the first time in weeks the car ran smoothly to the ferry station and was driven aboard the boat. Litz asked the mate to show him the deepest spot in the harbor.

When the boat reached the designated place Litz ran the car to the vessel apron, pulled wide the throttle and leaped to the deck. The automobile went into the bay, and the repair proposition for that particular car was settled forever.

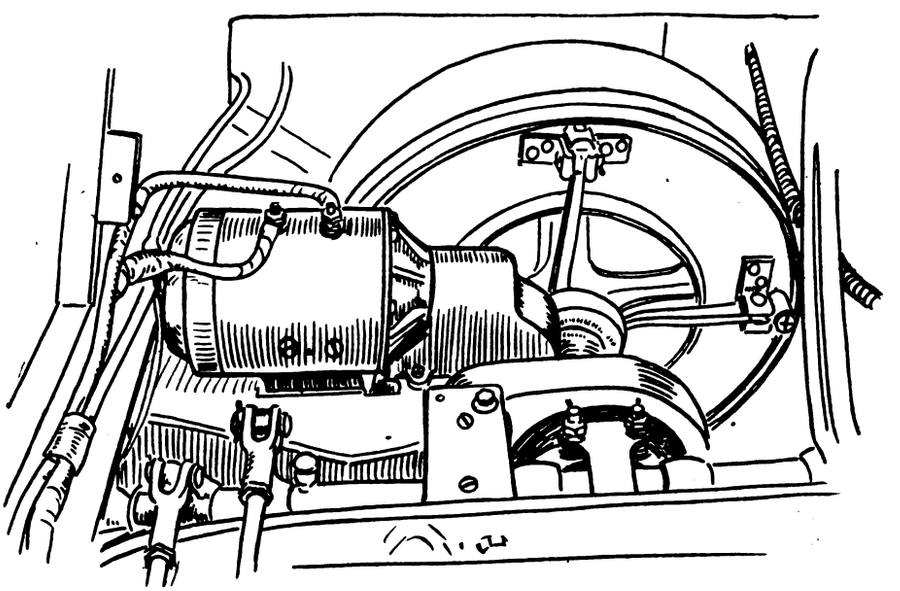
APPLYING THE ENERGY THAT STARTS AND LIGHTS

Pros and Cons of One and Two Unit Electric Lighting and Starting Systems Discussed and Their Advantages Pointed Out—The Modicum of Care Necessary to Keep Them "Right" and How to Doctor Troubles.

(This is the tenth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by the dealer and owner alike.)

Though there is no controversy regarding the desirability of electric lighting and engine starting systems, agreement being apparent that such systems are a logical and necessary development, opinion is more or less divided as to whether the generator and motor best may be combined in a single instrument or whether it is better to separate them and make of them distinct units which are independent of each other insofar as that is possible. There is much to be said for and against both methods of construction; manufacturers themselves are about evenly divided.



HARTFORD GENERATOR SHOWING COMPACTNESS AND COMPLETE ENCLOSURE

Single and Double Units Compared.

In addition to being dependable and serviceable and of minimum weight, it goes without saying that any such system, whether it be of the single unit or the two unit type, must be as simple as possible and above all, it must be accessible, for none can be expected to run forever without any attention or without reasonable care. Apparently the ease with which a system can be cared for and the facility of making repairs without disturbing any more of the system than is directly concerned with the trouble in hand, is the rock upon which designers split. Little, if anything, is said anent the efficiency of the two methods of construction, for the reason that there is little to be said; the efficiency of one can be made and is made just as high as the efficiency of the other. Similarly, little controversy wages over weight, for it is fairly well established that the weight of one need be no more than the weight of the other.

The single unit system has the advantage that the motor and generator are combined in a single compact instrument which may be located with slightly less special provision for its reception and with, perhaps, distribution of the wiring over a smaller space. This is offset in the two unit system, however, by the fact that each unit is smaller than the single combined unit, and lighter, and not infrequently it is easier to find proper locations for the smaller units than it is for the large one. Incidentally, though the advantage may be a small one, the splitting up of the system into two units might permit of a slightly better distribution of weight.

DISPOSITION OF HARTFORD STARTER WITH RELATION TO FLYWHEEL

Neither Type Need be Complex.

Whether or not the combination of motor and generator really adds complication to the system, comparing both types of systems in their completeness, is open to question. There are some motor-generator systems that are more complicated than separate unit systems, and vice versa. Be that as it may, however, mere compactness, such as is in evidence in the average motor-generator system, is not necessarily an indication of complexity, which fact already has been made plain in the ninth of the series of articles dealing with the subject which appeared last week in Motor World. Either type of system, regardless of its complexity, which in the majority of cases is merely apparent complexity bred of the smallness of the parts and their close incorporation, can be easily understood in a manner that will permit the average dealer or owner to take entire charge without the

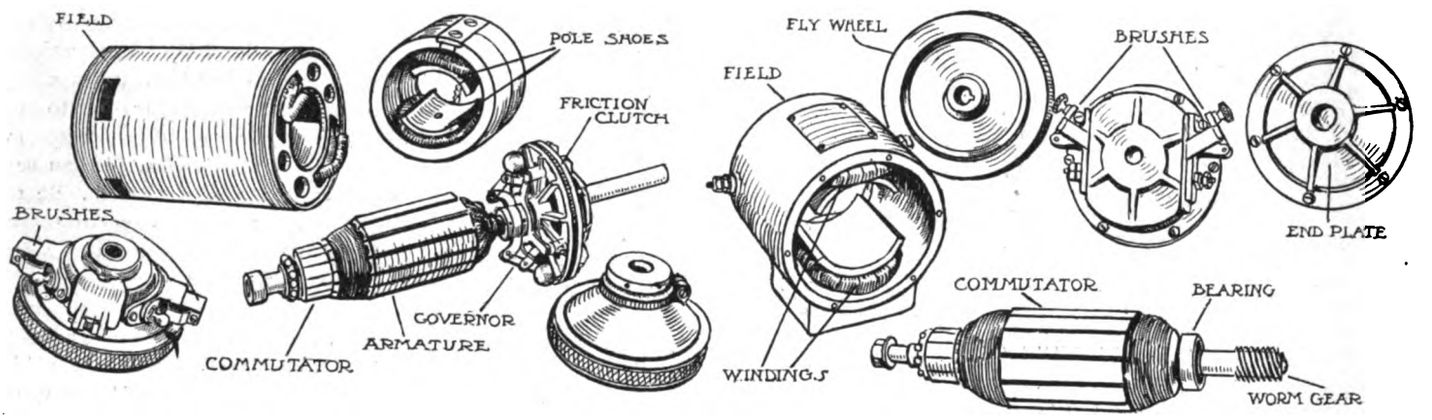
Digitized by Google

slightest fear of untoward complications resulting, provided sufficient interest is taken to obtain the necessary education.

The two unit system has an apparent advantage over the single unit system, in that the derangement of either of the units does not necessarily impair the action of the other. It will be appreciated, of course, that failure of the generator unit will permit the motor starter and the lights to be used only until the battery is exhausted. But with the engine starting unit out of commission temporarily, the generator will continue to generate current which may be used to light the lamps.

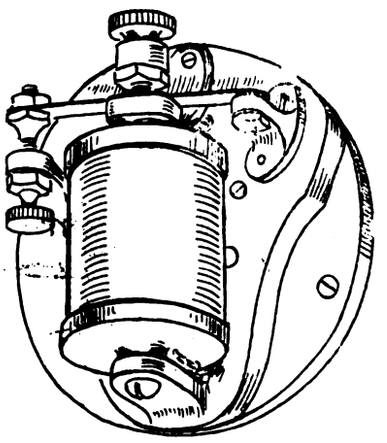
Motor-Generators Easy to Care for.

With the single unit system, on the other hand, there is the possibility that any derangement which may occur will temporarily put both branches out of commission. Fortunately, however, such machines are so ruggedly constructed and there is so very little that can get out of order—there is but the one moving part—that trouble is the exception rather than the rule. Generally, when trouble manifests itself it is not with the generator or the motor, but is confined to some other portion of the system, such as the circuit breaker, the fuses or the wiring. One of the advantages of the single unit system is that attention can be centered on the one machine; the care of one automatically means the care of the other.



Method of Obviating Reversed Polarity.

In the Hartford lighting and starting system, which is manufactured by the Hartford Suspension Co. of Jersey City, N. J., separate machines are used for the generation of current and for power to start the engine. Both the generator and the electric motor are exceptionally small and light units, and the system is otherwise distinctive in several respects.



The generator is of the type in which the fields are permanent magnets supplemented by electro-magnetic pole pieces, the particular advantage of the system being that the permanent magnet field insures rapid "building up" and at the same time obviates the possibility of the polarity of the field being reversed in the event of the battery inadvertently being wrongly connected up.

Friction Clutch that Governs Output.

By way of obtaining constant voltage and thereby protecting the battery from the high charging rates such as would obtain if the generator were direct connected and the car engine run at high speed, an automatic centrifugal clutching governor is employed. It is shown by the accompanying illustration and consists of two plates spring pressed together, one of them being faced with a friction material and the other being plain. In operation, when the speed of the armature reaches a predetermined limit, approximately equivalent to a car speed of 15 miles an hour, the weights fly out under the action of centrifugal force, thereby separating the clutch plates.

HARTFORD GENERATOR AND MOTOR DISASSEMBLED SHOWING FEATURES OF COMPONENT PARTS OF EACH

CUT-OUT IN DETAIL

The electric motor which forms the other unit in the system is of the series wound type, this method of winding having been chosen by reason of the fact that the torque increases in proportion to the load placed upon it. The whole machine measures but 7½ x 4½ inches overall dimensions, though despite this fact it is rated at 1/3 horsepower. The high rating is due to the speed at which it operates, 7,000 revolutions a minute being normal speed. In order to permit this high speed, the motor is connected to the gasolene engine through the intermediary of a double reduction gearing in which the first step is obtained through worm gearing on the armature shaft and the second step through orthodox spur gearing.

Wherein Flywheel Increases Efficiency.

To increase the efficiency of the motor and permit it to maintain its high rotative speeds during the moments when the pistons of the gasolene motor are passing compression centers, it is fitted with a small flywheel which weighs approximately 4½ pounds. The electric motor drives the gasolene motor through a roller clutch mechanism which is positive in action. To obviate the possibility of damage resulting in the event of back-fires, a friction clutch is interposed between the electric motor and the gasolene engine. The driving gears are always in mesh, and the rotative speed of the gasolene motor under the power of the engine starter is from 40 to 70 revolutions a minute, the reduction being 125 to one.

The Three-Wire System Made Plain.

The remainder of the Hartford system consists of a combination fuse and switch block which is mounted on the dash, and a combination volt-ammeter, which also is dash mounted. The automatic cut-out is enclosed in a tight housing and mounted between the meters on the meter board. The system operates on what has been styled the three-wire plan. That is to say, the storage battery is divided into two units of six volts each, with the lighting load split up between two in such a way that all the lights operate at six volts. For engine starting purposes, however, the two units are connected in series, giving a total

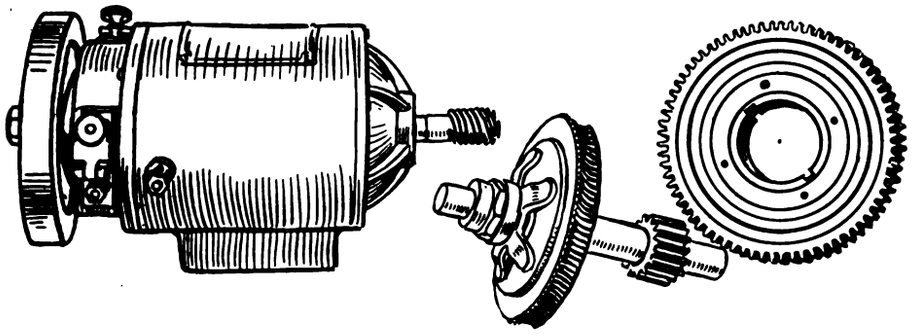
Digitized by Google

voltage of 12. The starting motor is placed in operation by depressing a starting button located on the dash or in any other convenient place.

How to Adjust Cut-Out Mechanism.

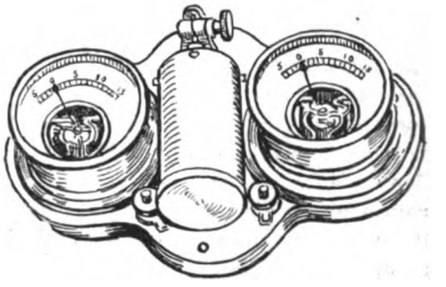
In caring for the Hartford system, it should never be necessary to touch the cut-out. Its contacts are set at the factory and the adjustments should not be disturbed unless the device gives unmistakable evidences of derangement. Owing to the fact that contact is made and broken only at long intervals, the points are subjected to little or no wear, and consequently need not be touched. If they show signs of burning or pitting or corrosion after long service they may be cleaned with a fine flat file or with a couple of pieces of fine emery cloth glued to opposite sides of a piece of thin Bristol board.

and carbon composition designed to run for indefinite periods without adjustment or wear. In fact, the adjustment is automatic, the tension being maintained constant, regardless of the length of the brushes. Another excellent feature of the design is that the brushes and brush holders may be removed together and intact without the necessity for disturbing any other part of the generator.



Caring for Commutator and Brushes.

Periodically, the brushes should be taken out of their holders and cleaned with a cloth dampened with gasolene and all accumulations of carbon dust or road dust removed. The commutator should never be touched as long as it exhibits a glazed, brownish appearance, for it then is in the very best condition. If it appears dry and scratched, however, the brushes first should



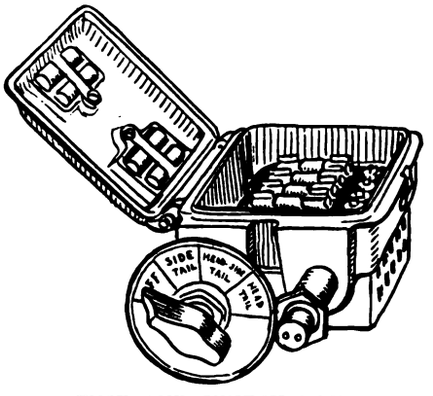
amined first to make sure that they are bearing properly on the commutator and that their connections have not become broken or loosened as the result of vibration. If such measures do not induce the machine to generate, and the rest of the wiring is intact and the fuses have not "blown," it is the better part of wisdom to ship the generator back to the manufacturers, for it is likely that the trouble is beyond the repair of anyone other than an expert.

Fuses that Act as "Tell-Tales."

As the system incorporates a fuse block, the fuses should be suspected first if the lights go out or if they cannot be lighted. New fuses are carried in the lid of the fuse block and can be inserted in less than a minute. Before they are put in place, however, examination of the system should be made and the trouble which caused the fuse

HARTFORD MOTOR STARTER SHOWING WORM AND SPUR GEARING

HARTFORD METERS AND CUT-OUT



When the device is operating properly—its operation may be examined by removing the cover—the contacts will come together when the car speed becomes approximately 15 miles an hour. If, by reason of wear, they do not come together the adjustment of the lower contact may be altered a very little bit, so as to bring the contacts a fraction of an inch nearer together when the cut-out is open. This will cause them to come together a little sooner.

Simplicity of Governing Device.

The clutching mechanism in the generator is rugged in construction and is so simple in action that there is nothing to get out of order. It is completely enclosed and, as it cannot be gotten at, that fact may be taken as an indication that it is not supposed to be gotten at. Similarly, as the armature shaft is carried in ball bearings its requirements in the way of lubrication will be exceedingly moderate. A few drops of fine machine oil about once in every 1,000 miles will suffice. More than that should not be used, for there is danger that it may be thrown out onto the commutator and brushes.

The commutator and the brushes are the only parts which need and should have periodic inspection. The brushes are a metal

be examined to make sure that there are no hard particles imbedded in their ends, and a piece of No. 00 sandpaper held against the commutator while the machine is run-

FUSE AND SWITCH BOX

ning. When the commutator exhibits a uniformly bright surface the sandpaper should be removed. Applying a minute quantity of best quality vaseline on a piece of felt held against the commutator while it is rotating is good practice, only care should be taken not to use too much lubricant. Oil never should be used, because it is bad for the insulation.

In the event of the generator failing to generate, the brushes always should be ex-

to "blow" discovered and remedied. If the lamps can be lighted but cannot be made to burn with their customary brightness, the cut-out had best be examined to make sure that it is performing the functions for which it is intended. If it becomes inoperative through any fault, the battery will gradually discharge itself either through the generator, if the contacts are stuck together, or through the lamps if the contacts do not come together as they should. It should be remembered that the voltmeter and the ammeter are placed in the circuit to serve as indicators of the operation of the system.

The electric motor of the Hartford system is about the same size as the generator, and like it, is armor clad and completely dirt- and water-proof. As there is but one moving part in the machine, that part being the armature, there is little or nothing that can get out of order or give trouble. The motor, like the generator, is fitted with a pair of brushes and a commutator, of course, and these parts are the only ones that should ever require attention. The care that has been outlined for the generator applies also in the case of the motor, and consists essentially in keeping the brushes clean and the commutator free from accumulations of dirt and oil.

COURT SAYS CITIES NEED NOT POST SPEED WARNINGS

Untermyer, Fined $10 in New York City, is Beaten in Court of Appeals — Provision of State Law Sustained.

Despite the popular understanding that the automobile law of New York State exempted cities of the first class from the posting of speed limit signs, which are required in other communities, Irwin Untermyer, son of Samuel Untermyer, one of the wealthiest and best known attorneys of New York State, felt called on to test the law and late last week he received the answer which nearly everyone expected he would receive. In other words, the law and the popular understanding were upheld by the Appellate Division of the Supreme Court, which confirmed the fine of $10 imposed by the lower court on Untermyer for speeding at the rate of 30 miles an hour on upper Broadway. In disposing of the suit the court remarked what is plain to all reasonable people—i. e, that it is practically impossible to "sign post" a city of such enormous proportions as New York. Justice Clark, who handed down the decision, says:

"The point raised here is that as it is not shown that signs were posted, the local ordinance does not apply; the magistrade had no jurisdiction, and the speed limit is therefore covered by section 207, which permits 30 miles an hour. The answer is that the State act expressly provided that nothing in this article shall impair the validity or affect any of the ordinances, adopted and prescribed pursuant to law in any city of the first class.

"The appellant claims that the grammatical construction of the section compels that the condition regarding the posting of signs, still required in other cities and incorporated villages, to be also applied to cities of the first class. I do not think so. That statute is awkwardly phrased, but I think it is clear that special provision has been made for cities of the first class, permitting them to pass such ordinances as they please, and that there is no condition in regard to posting signs. If this is not so there is no speed limit in the city of New York except that provided by the general law.

"I think the act was modified directly in view of the former decisions. It was recognized that in the enormous territory of the city of New York the posting of signs would be extremely difficult if not practically impossible, and, therefore, the provision eliminating cities of the first class from the limitations of the law in respect to traffic ordinances was made comprehensive and exclusive. It follows that the judgment appealed from should be affirmed."

Adopt Constitution and Choose Name.

Although no officers have as yet been elected, a name, at least, has been adopted for the organization of New York automobile and accessory dealers which is to boost and boom the automobile into more publicity through the medium of races and other contests. At the meeting which was called for and held on Monday afternoon, 25th inst., it was unanimously decided that it be styled the Motor Dealers' Contest Association of New York. The purpose of the meeting, primarily, was to adopt a constitution and bylaws drawn up by a committee of seven appointed at the first meeting on Wednesday last, 20th inst. After lengthy discussion the constitution and bylaws were adopted, and it was decided to elect a board of directors of 11 stockholders which should, in turn, appoint an executive committee of eight members. Among other routine business that was transacted, it was agreed to increase the capital from $10,000 to $30,000, each stockholder to be limited to three shares. All unsold stock is to be retained in the treasury, and if necessary retired to reduce the capital stock.

Lupton's Suit Brought to a Close.

Although the United States Supreme Court reversed the decision of the Circuit Court and on August 7 last directed that a verdict of $733.50 in favor of the Automobile Club of America be transformed into one of $709.52 for David Lupton's Sons Co., contractors, of Philadelphia, it was not until this week that the order complying with this mandate was asked of and granted by the lower branch of the judiciary. The present order directs the clerk of the court to enter judgment for the Lupton company. The suit was begun August 30, 1907, and grew out of a contract entered into August 17, 1905, whereby the Lupton company was to furnish metal window sashes in the club's house, which was about to be erected in New York City. The agreed price was $10,344. When the contract was nearly completed union trouble arose and the Luptons claimed they were barred from completing the work and asked damages. One defense was that the contract was not binding because they were a Pennsylvania corporation and had not taken a license to do business in New York State. The answer to this is that it was interstate commerce. The court evidently upheld this view and ruled that the Philadelphia contractors were within the law in their inter-city transaction

WISCONSIN'S REGULATIONS FOR SMALL TOWN GARAGES

Code Is Simple and Is Applicable to Garages Outside the Larger Cities —Fire Prevention is the Primary Object.

While New York, Chicago and various other large cities have adopted garage regulations that are almost infinite in detail, it follows that many of the requirements are wholly unapplicable in towns of lesser population. In Wisconsin, however, the State Fire Marshal has evolved and promulgated a set of rules for general application in that commonwealth and has ordered copies posted in all garages. The regulations, 13 in number, are:

None but fireproof buildings should be used as a garage; never any building, part of which is used for public meetings.

The floors should be of cement.

Heat with steam. Allow no flame, fire or fire heat, stove, boiler, furnace, forge or torch in the garage.

Use electric, incandescent lights, protected by wire basket guard; never use lamps, candles, lanterns or other open lights.

Store all gasolenes in an approved underground tank, equipped with standard pump. Never keep gasolene in open vessels, or allow gasolene to run or drip on the floor or into drainage system.

Use approved safety cans or approved portable tank in transferring gasolene to cars.

Make sure that gasolene tank in the car is free from leaks and that the caps are secure.

Provide standard metal waste cans on each floor, especially near the work bench, for oily waste. Destroy this waste each evening.

Allow no shavings, refuse or waste to accumulate.

For private fire protection, keep pails of sand with scoop and approved chemical fire extinguishers on each floor.

Beware of carburetter flooding.

Absolutely permit no smoking in the garage.

Always be careful and vigilant.

Large placards have been prepared at the cost of the State and given to all fire chiefs for distribution to garages. One copy of the placard has also been mailed to each garage, to prevent omissions.

Hale Heads Waco Motor Club.

Dr. J. W. Hale has been elected president of the Waco (Tex.) Motor Club. The other officers are: Vice-president, C. Ivey; secretary, R. Lane; treasurer, W. Seley.

MOROSS ISSUES DECLARATION OF WAR ON BERNA OLDFIELD

Burman's Manager Crosses Rockies and Hurls Legal and Printed "Bombs"—Waves Broken Contract at the "Speed King."

War, cruel war, has been declared between Barney Oldfield, contest promoter and "star" performer, and E. A. Moross, likewise race promoter, and manager of Robert Burman. Moross threw the first bomb into the enemy's camp when he instituted a petition for an injunction restraining Oldfield from holding a scheduled meet on the Tanforan track at San Francisco, Cal., on Sunday, 17th inst., but somehow the missile missed fire, for Judge Seawell refused to grant the petition and the contest was run as advertised.

The ill feeling between the two managers is the natural development of a situation where two persons in the same line of business try to do business in territory only sufficiently large for one. Moross alleges that when, in the spring of 1910, Oldfield sold Moross his stable of racing cars—for the large sum of $30,000, it was then alleged—the bill of sale carried with it the guarantee that Oldfield—who had been "outlawed" by the A. A. A.—had retired, and that he would stay retired. On the grounds that Oldfield had broken his contract, Moross applied for the injunction which, as before stated, was denied. Moross also asserts that Oldfield "froze out" Burman, and prevented his entering the meets which Oldfield promoted by limiting the piston displacements of the cars eligible to 450 inches, whereas Burman's smallest car has a piston displacement of 600 inches.

In his second strategic move, Moross "ambushed" the spectators who attended the Tanforan meet and presented them with dodgers announcing in very large and very bold letters that, although Oldfield was afraid to meet Burman, the latter would force the issue at Tanforan, but the move went the way of the previous onslaught, and Oldfield and his troupe were the sole entertainers. As a final thrust, Moross enlisted the aid of P. J. Walker, the A. A. A. representative, who decreed that in the future if Oldfield is to hold closed meets they must be advertised as such. Oldfield, for his part, has very little to say, save that he is willing to drive an exhibition mile at the same meet but not at the same time as Burman. This, however, is not entirely satisfactory to the other side, so a "challenge" has been drawn up and distributed in dodger form, wherein Oldfield is invited to participate in Moross's meet at Emeryville, just across from San Francisco, on November 24th, and to meet Burman in competitive events from 5 to 25 miles. Just to show that Burman could do it, Moross staged an impromptu meet at Tanforan on Thursday, 21st, and the "star" drove a mile in 48⅗ seconds, slightly better than Oldfield's time made on Sunday, 17th inst.

Oldfield "Whole Thing" at Sacramento.

Driving a Benz, Barney Oldfield was the "whole thing" at his own racemeet at Sacramento, Cal., on Saturday, 16th inst. He accounted for the three competitive events and also made the fastest times in the mile time trials, negotiating one mile in 50 seconds. The summary:

Three miles, for cars with displacements of under 450 inches—Won by Barney Oldfield (Benz); second, Fred Melaun (Cino). Time, 2:58⅕.

One mile, time trials—Barney Oldfield (Christie), time, 0:49; Fred Melaun (Cino), time, 0:59⅘.

Five miles, free-for-all handicap—Won by Barney Oldfield (Benz); second, A. J. Edwards (R. C. H.). Time, 4:52⅕.

One mile, against circular dirt track record of 47⅗ seconds—Barney Oldfield (Christie). Time, 0:50.

Six and one-quarter miles, Australian pursuit—Won by Barney Oldfield (Benz); second, A. J. Edwards (R. C. H.); third, Fred Melaun (Cino). No time taken.

Four Tradesmen Disciplined by A. A. A.

The Chicago Motor Club's Around Lake Michigan Tour, which was run October 21st to 25th, was indirectly responsible for the suspension by the contest board of the A. A. A. until June 1st, 1913, of three manufacturers and one dealer. The Coey-Mitchell Auto Co., of Chicago, which deals with Coey-Mitchell cars, and the Stutz Automobile Co., which handles Stutz cars in the Windy City, were disqualified for not starting the cars which they had entered, and the Moline Automobile Co., East Moline, Ill., and the Staver Carriage Co., Chicago, were given the same punishment for advertising the performances of their respective products as the performances of stock cars, whereas the contest was run under Grade 3 rules.

Electric Vehicle Club Enlarges its Scope.

The Electric Vehicle Club of Boston has changed its name to Electric Motor Car Club of Boston. The change is one of the outgrowths of the adoption of the new constitution, which, among other things, divides the membership into three classes: (1) those deriving their income from the sale of electric automobiles and accessories; (2) private owners and operators, and (3) representatives of trade and daily papers.

BARNEY OLDFIELD HUMBLED BY COOPER IN THREE RACES

"Speed King" Badly Beaten in California After Injunction Fails to Prevent Meet—Burman and Moross Look On.

"Injunctioning" having failed to net E. A. Moross the satisfaction of preventing the running of Barney Oldfield's racemeet on the Tanforan one mile track at San Francisco, Cal., on Sunday, November 17th, or of forcing Oldfield to give "Bob" Burman a "look in," so to speak, Moross and his star did the next best thing—they witnessed the racemeet and, presumably, paid the price of admission. And if Dame Rumor has it correctly, great was their satisfaction, for they had the pleasure of seeing Oldfield well trounced in each of the three competitive events in which he started; Earl Cooper, in a Stutz, performing the trouncing, and winning nearly all the laurels of the day.

Cooper's victories included a five-mile contest for cars with displacements of under 451 inches, a five-mile free-for-all, and the leading event of the day, the 25-mile free-for-all. A match race between A. J. Edwards (R. C. H.) and Maurice Gaston (Maxwell) resulted in a victory for Edwards, who completed the distance in 6:20. Two-mile time trials were driven by Fred Melaun (Renault) and Earl Cooper (Stutz) in 2:05⅗ and 1:53⅗, respectively; Oldfield failed to lower the record for the distance of 1:35⅗ on a circular dirt track; his time was 1:43⅖. A single mile time trial, which Oldfield completed in 0:0⅗ seconds, driving the Christie, marked the close of the meet. The summary:

One mile, time trial—Barney Oldfield (Christie). Time, 0:50⅗.

Five miles, for cars with displacements of under 451 inches—Won by Earl Cooper (Stutz); second, Barney Oldfield (Benz). Time, 4:48⅕.

Two miles, time trial — Fred Melaun (Renault). Time, 2:05⅗.

Two miles, time trial—Earl Cooper (Stutz). Time, 1:53⅗.

Five miles, free-for-all—Won by Earl Cooper (Stutz); second, Barney Oldfield (Benz). Time, 5:20⅕.

Two miles, against circular dirt track recodr of 1:35⅗—Barney Oldfield (Benz). Time, 1:43⅖. No record.

Five miles, match race—Won by A. J. Edwards (R. C. H.); second, Gaston Maurice (Maxwell). Time, 6:20.

25 miles, free-for-all—Won by Earl Cooper (Stutz); second, Barney Oldfield (Benz). Time, 25:42.

The Twitchell Gauge Company

is now owned and controlled by

A. Schrader's Son, Inc.

of New York City

THE TWITCHELL GAUGE CO. owns and controls the basic patents on all pencil type gauges and will vigorously prosecute all infringements on the rights granted by U. S. Letters Patent No. 927,298, issued July 6, 1909. The most important of these cases has just been started. These suits are being pushed not only to protect ourselves, but to protect all our jobbers and their dealers from illegal competition.

The fact that A. Schrader's Son, Inc., has bought the Twitchell Gauge Co., is sufficient evidence to the trade of the value of the Twitchell patents and the quality of the guage.

Its accuracy, its simplicity, its durability, the ease with which it can be applied and read—owing to the fact that the Twitchell can be used with the tire valve at any position and that the indicator-bar positively locks at pressure in the tire—make the New Twitchell the leader of tire gauges. This superiority, as attested by thousands of motorists in 1912, and the necessity for a tire gauge will be impressed on every car owner in the country by our advertising campaign. This advertising will bring car owners to you asking for the Twitchell. Be prepared to meet this demand.

1913 Pullman 1913

Intake Side of the 6-66 Motor

It's no task to work up enthusiasm in selling the Pullman product—because Pullman dealers know that every piece of material is the finest that money can buy and that every single operation is as thorough and complete as the most skilled workmanship can make it.

All cylinders in Pullman motors are cast in pairs. This method of casting makes them the easiest to handle and produces the most perfect castings. There is ample water space, especially around the valve seats. By properly jacketing the motor at this point a considerable amount of valve warping is prevented. All cylinders are ground on Heald grinders to the most accurate measurements employed by any factory in the automobile industry. The maximum variation allowed on the size of the bore is one-half of one-thousandth of one inch while the absolute maximum variation on the out-of-round is one-quarter of one-thousandth of an inch.

And the care employed in the production of the motor is only characteristic of that done upon every part of a Pullman car. The result is a car not only up to the minute in design and construction but a car famous among its dealers for the repeat orders that it bring .

PULLMAN MOTOR CAR COMPANY, York, Pa.

Digitized by Google

THE present demand for self-starting and lighting equipment has created a demand for an ignition system capable of producing a hot, dynamic spark independent of the engine speed.

This demand is being successfully met by

The Atwater Kent Ignition System

the starting button of which produces, not a few weak sparks, but a single heavy flame-like spark, thus insuring at all times the perfect ignition of any mixture that will burn.

Other salient features of the Atwater Kent System are the extreme simplicity of mechanism, only three moving parts, one contact, one adjustment and one non-vibrating coil.

While the Atwater Kent System is high in value and reputation, it is not high in price. In fact, it will cost less

than half as much as a good magneto and will give superior results at a much less cost of upkeep.

We can now furnish two types of the Atwater Kent System for use on cars as sole ignition in place of the magneto, in conjunction with lighting and starting equipment.

***Type "F"* without Automatic Spark Control.**

***Type "K"* with Automatic Spark Control and insulated primary circuit.**

No matter what the requirements, the Atwater Kent System of Ignition affords ideal ignition.

Write today for detailed information and illustrated booklet "D."

Are you watching the growth in motorcycling?

Many manufacturers of automobile accessories can find a profitable field for extending their business by adapting some of their specialties to the requirements of the motorcyclists

Over 80,000 motorcycles will be built in 1913

and all these motorcycles will require tires, magnetos, carburetors, spark plugs, bearings, lamps, batteries, horns, chains, motors, oils, speedometers, rims, gears and forged and manufactured parts of all kinds

You can reach this growing field

by advertising in

THE BICYCLING WORLD (FOUNDED 1879) and MOTORCYCLE REVIEW

The oldest cycling journal published and the recognized authority on motorcycling and all allied subjects

Prest-O-Starter

Starts your engine (old or new) quickly and easily in coldest weather

For Four Cylinders $20

For Six Cylinders $25

$1.50 extra for two-way valve necessary when the same tank is used for both starting and lighting.

Here's a starter that adds practically no weight to your car, is perfectly simple and is as durable as the engine itself. Easily applied to any engine, old or new, very economical in the use of gas, and requires no expert repairing.

How Prest-O-Starter Works

The principle of starting a motor with Prest-O-Starter is the same as "starting on compression." A measure of acetylene, at low pressure, is pumped from your Prest-O-Lite Tank into the cylinders.

Touch your spark—your engine starts.

Unlike "gasoline priming," it is not affected by heat or cold. It is certain.

In cool weather, by opening a valve on the dash, you can feed gas at low pressure into the intake manifold. This allows your engine to run on acetylene until it is warm enough to run on gasoline.

If the Prest-O-Starter did no more than prime your engine in this way during cold weather, this convenience would be well worth the price.

But Prest-O-Starter is more than a primer. When installed properly, it will start your engine, summer or winter, almost invariably without recourse to the crank.

Make Sure Your Starter Is Installed Correctly. Look It Over

The Prest-O-Starter is easy to install correctly. In fact, it's so very easy to install that some good factories and garages install it with utter carelessness, overlooking the one or two simple features vital to success in operation. Fortunately this is an easy matter for the car owner to correct, even if he isn't a mechanic.

Our literature tells you exactly how the Prest-O-Starter is installed, and how to adjust it. Anyone can give it the slight attention it may need or quickly tell a dealer where the trouble lies.

Every Prest-O-Starter is sold with the assurance of satisfactory service. The entire Prest-O-Lite Organization is back of every one. If you have any trouble, report it to us or to our nearest branch. We'll wipe it out quickly.

Insist Upon GETTING the Outfit COMPLETE

During warm weather the connection which feeds acetylene into the intake manifold is not needed. So some dealers are not installing it. But in cold weather this feature is vital. You're entitled to it. It's included in the price, so see that you get it.

Now More Than Ever You Need One

Your Prest-O-Starter, properly installed, will average better than 95 starts out of 100 attempts. The few failures are caused by your motor stopping on dead center, or cylinders filled with burnt gas. Both of these conditions can be easily avoided when stopping your motor. But should either or both happen, an eighth or quarter turn of the crank, with the switch at neutral, will remedy the trouble at once, with all of the danger and labor of cranking eliminated.

Rest assured that no other starter can give you as high efficiency with as great economy, durability and freedom from mechanical trouble. The price is within easy reach.

Get in touch with any of our branches—or your dealer—or write us for descriptive literature.

ONE LOOK locates the trouble

Lift the hood and look. A single glance, bright day or darkest night, tells the whole story of what's wrong with your ignition when your motor is equipped with *J-D* Visible Gap Spark Plugs. Hunting around with matches, short circuiting with a screw driver, unscrewing the plugs to examine the points—all that fuss and loss of time are needless.

J-D Visible Gap Spark Plugs

See how simple the secret of their efficiency is. In the porcelain—outside the motor—is an opening or port. In the portion of the central electrode and facing this port is an adjustable gap, regulated by knurled nut at the cap so that it can be widened or closed entirely. Through this port you see if the spark is jumping the gap in the electrode. If there is no spark at the gap you know the trouble lies behind in wiring, magneto, coil or batteries. If the spark jumps, but proper ignition fails to follow, then the points must be fouled or carburetion is faulty. By widening the gap you can increase intensity of spark and scour the points clean through the J-D patented electrical action found in no other plug.

There are other services this plug can render. It facilitates timing of engine, regulates spark for any cylinder and uses minimum current.

Yet the Price Is Only $1.00

If your dealer cannot supply you, we will mail as many as you want prepaid on receipt of price. Our guarantee, "Your money back or a new plug unless you are absolutely satisfied," goes with every plug.
A new edition of our classic "Ignition and Spark Plug Talk" is just off the press. Write for a free copy.

WHEN ORDERING BY MAIL, BE SURE TO GIVE THE SIZE WANTED OR MAKE OF MOTOR.

"The Horn that's Made for the Discriminating"

TUTO HORN

THE TWO TONE HORN

Tuto, The Standard of the Future.

THE dual service of the TUTO horn is making thousands of friends for it and the purchasing public are specifying this type of warning signal in preference to all others.

¶ The TUTO'S rapid increase in popularity has been made solely through its service-giving qualities, its positive, instant action, effectiveness of both signals, the low and the loud, and the entire absence of confusing or objectionable notes.

¶ The makers of the TUTO horn were first to produce a practical dual service signal with a low note for ordinary use and a loud note for emergency purposes. Furthermore, the TUTO horn was the first warning device to provide this double service through the manipulation of a single push button, so arranged that the natural increase in pressure, incident to approaching danger, would positively sound the loud note.

¶ All of these novel features of the TUTO horn are covered by issued patents and pending applications so that this efficient dual warning signal can be obtained only in the TUTO and TUTO-ETTE horns as made by the Dean Electric Company.

¶ Car makers have been quick to appreciate the advantages of the TUTO horn, and many thousand horns are used as standard or special equipment on the leading cars of this country.

¶ We are the largest makers of electrical warning signals in the world, our orders for two months alone, amounting to 55,000 horns for standard equipment on 1913 cars.

Electric Lighting
Electric Self-Starter
Standard Equipment

1, *Clock*; 2, *Speedometer*; 3, *Carburetor Adjustment*; 4, *Ammeter*; 5, *Ignition Switch*; 6, *Lighting Switch*; 7, *Dash Light*; 8, *Carburetor "Flooder"*; 9, *Self-Starter Button*; 10, *Clutch Pedal*; 11, *Brake Pedal*; 12, *Accelerator*; 13, *Muffler Cutout*; 14, *Control Lever*; 15, *Brake Lever*; 16, *Steering Column*; 17, *Dash Ventilator*; 18, *Horn*.

The One Thing That Will Attract Your Attention First, on Each of the 1913 Abbott-Detroit Models is the Beautiful Body, With Its Artistic Lines and Superfine Finish.

In Touring Cars and Runabouts alike, the body lines are long and flowing; the fenders broad and sweeping; the doors wide and well mounted, flush with the side of the body.

The seats, deep and spacious, are upholstered with 12-in. cushions made of an excellent grade of curled hair and leather, backed up by oil tempered spiral springs. There is ample room for the full complement of passengers to ride in comfort.

Another Thing

The great ease of riding which every one notices when, for the first time they ride in an Abbott-Detroit, is due to our three-quarter elliptic, underslung spring construction.

Unlike other cars, the Abbott-Detroit springs are hung under the axles instead of being mounted over them.

The result is that the whole car is lower, the center of gravity thus being brought nearer the ground—the car is rendered safer to drive at high speeds and the comfort of the occupants is very materially increased.

The New Self-Starter

The Abbott-Detroit cars are equipped with our own design of electric self-starter, not a combination of ignition, lighting and starting devices such as some manufacturers employ, but a real dependable self-starter built as a part of the engine, connected to the crankshaft with an independent train of gears through an over-running roller clutch.

When the gasoline motor starts, this clutch releases the gears and they remain idle while the gasoline motor is running.

Electric Lighting

The current for the electric lighting system is supplied by a dynamo operated by the engine, which, in addition to supplying sufficient current to light all the lamps brilliantly, keeps a storage battery, from which current is drawn while the motor is standing still, always charged to its full capacity.

Other Important Features Are

Carburetor dash adjustment, by means of which the gasoline mixture may be changed to suit conditions—a carburetor priming device—a clock speedometer set—black enameled and nickel trimmed electric head lights, side and tail lamps—demountable rims—extra large artillery wheels—over-sized tires—Continental motors with enclosed valves—Timken Roller and imported Schafer Annular Bearings—oil tempered springs—nickel steel transmission—double trussed nickel steel, full floating type of rear axle—heavy duty forgings, double heat treated—dry plate multiple disc clutch.

"The demand of the day is that an ***organization*** *shall be judged by its product, and not by* ***what*** *it claims for itself." Keep this in mind* ***when you*** *examine these* 1913 *models.*

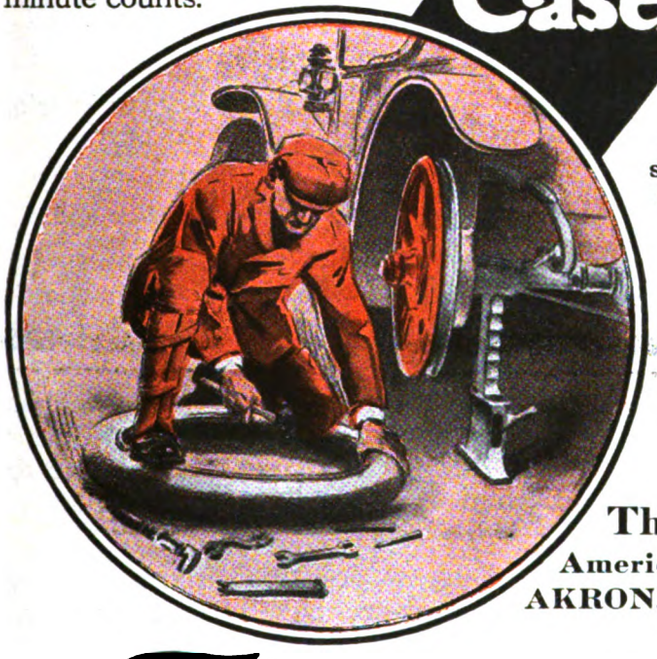
The Days of Tire Trouble Are Over for the Knowing Car Owner Who Will Have Nothing But

Firestone



Quick-Detachable Demountable Rims

You need never fear delay in an emergency if you are secured by these time-saving rims. Four or five minutes at the most is needed to change tires.

Figure the worth of this when catching a train, when every minute counts.

Which is your Case?

Their simple, practical design permits of the exchange of rims with no special tool beyond an ordinary wrench. In case of repeated punctures the tire may be exchanged whether rim is on or off the wheel.

Tires Cannot Be Thrown. When puncture or blow-out occurs, the Firestone rim holds tire securely in place. The valve-sleeve, by preventing valve from slipping out of place, holds metal plate inside tube in regular position. Will not let clincher side ring slip. It is a refinement which means much in safety to every user.

There's Economy as Well. Firestone Rims are made with non-split base. Moisture, dirt and other foreign matter cannot get at the tire to decay and ruin casing or inner tube.

Firestone Rims remove the last "fly in the ointment" of perfect motoring pleasure. Equip your old car with them, and demand them for your new one.

The M & P One Thousand Pound Electric Truck Comes to Your Customer, Mr. Dealer, With an Iron-Clad Guarantee Back of It.

This guarantee covers every possible angle, protecting you and the buyer in the matters of reliability and economy of operation.

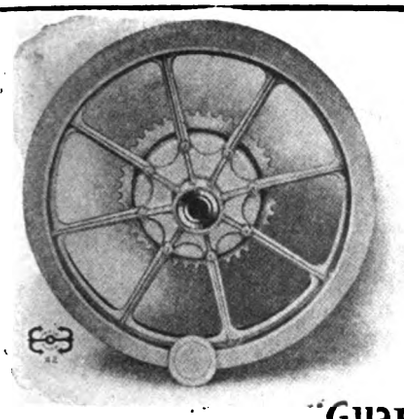
The M & P One Thousand Pound Electric Truck is the first electric truck of its quality to be sold at M & P Prices. And because of long experience, and low overhead we are producing a vehicle which will positively give more or better service at lower cost of operation than can any other electric truck selling for as high as $2,200.

Comparison with the gasoline truck is unnecessary. We are selling electric trucks whose advantages are obvious.

A Truck That Makes Good at a Price That Sells It

The M & P Truck is the acme of simplicity—strong, sturdy, reliable and economical. In a word, it is properly designed and properly built. It is "Made to make good and it does." Tests prove that the cost of operation is twenty-five to thirty-three per cent less than that of a similar powered gasoline car.

A point that will also appeal to your trade is the price. It puts the high grade electric delivery wagon within the reach of the average retail merchant, who is, at present, utilizing horse-drawn vehicles for transportation purposes. We have the facts and data to prove to you and to such a merchant that the "M & P" can save him a surprisingly large aomunt of money.



You, Mr. Dealer, have studied the electric commercial proposition—you know that the trade is hungry for it. You don't have to go to the big manufacturer to sell this truck. You have but to present it to the dry goods merchant, the hardware man, or any other merchant with a delivery problem, to prove there is a waiting market.

Get the facts and figures covering this proposition, including complete description of the M & P and our liberal commission to you. Find out how and why it will pay you to get busy now.

SHELDON STEEL WHEEL

"Guaranteed to Outlast a Score of Cars"

SHELDON Steel Wheels Lighter Than Wood

These wheels are one piece construction. The hub is bored to receive the bearings, of which you have several options. The rim is turned to size, saving the cost of S. A. E. Bands, which are unnecessary. There are no flange bolts to come loose—a defect in wood wheels often causing much trouble and annoyance.

The economic disposition of material makes SHELDON STEEL WHEELS counteract tremendous side pressures. Lighter than wood, SHELDON STEEL WHEELS permit quick acceleration, which means fuel economy. Light weight and the rapid heat radiating capacity of steel increases the life of tires 100 per cent. Does this saving increase the value of your car?

SHELDON STEEL WHEELS make a quality truck still better and build a reputation for such a truck that is bound to make more and more business for its manufacturer. Comparative cost considered, the difference will come back in tenfold measure.

This company is now prepared to make delivery of steel wheels for one ton trucks, other sizes to follow. This should appeal to truck manufacturers who have been subject to annoying delays incident to receipt of wood wheels. Were the steel product no more valuable from an engineering standpoint than the wooden wheels this one item of convenience should appeal. Get your axles and wheels from one source, save trouble and freight.

Manufacturers, engineers, and others can get additional information that is bound to turn them into customers.

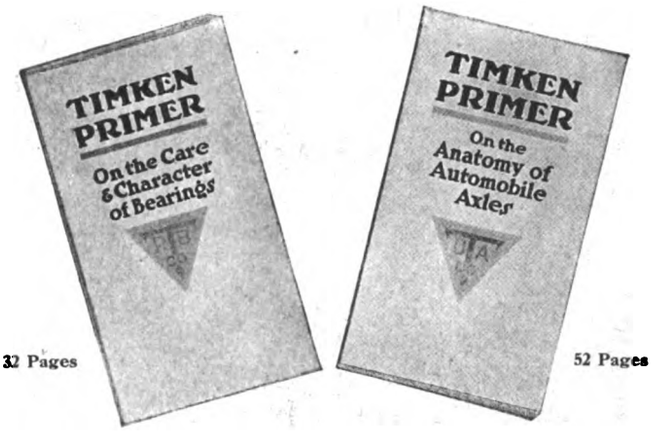
Hyatt Quiet Bearings

QUIET BEARINGS are essential to present day axles and transmissions. Noise must be eliminated.



Sound is produced by the vibratory motion of any solid substance. Sudden shocks or jars produce vibrations. Rigid bearings transmit and intensify them.

The flexibility of the Hyatt Roller cushions shocks—absorbs vibrations—hence reduces noise. An actual test will demonstrate these facts conclusively.

Sixty-five thousand transmissions are equipped with Hyatt Quiet Bearings this season.

Understand Your Motor Car!

¶ These two free booklets will give you a clear conception of the importance and the construction of axles and bearings—the foundations on which the whole car rests.

¶ They are yours for the asking—sent free, postpaid, on request to either Timken Company. Write for the

Free Timken Primers *Free*

ON BEARINGS ON AXLES

¶ Called Primers because written in plain non-technical language that anyone can understand. One car owner writes: "The Timken Primers are certainly a boon to the owner of an automobile; they are extremely interesting and contain a wealth of information."

Here are some of the Subjects covered in the Timken Primer on Bearings

¶ Importance of the bearings.

¶ The many different things that the bearings must do.

¶ Where to find the anti-friction bearings in a motor car.

¶ A B C of Timken Tapered Roller Bearings.

¶ How the Timken Bearing works. How it is made.

¶ A very important comparison of the principles of various types of ball and roller bearings.

¶ Care of bearings—lubrication and adjustment.

In a simple, human-interest way Timken Primer on Axles tells:

¶ How life and safety depend on the axles.

¶ How the rear axle performs four distinct functions and is composed of several hundred separate pieces requiring thousands of operations to make.

¶ It tells how to lubricate, adjust and care for the axles.

¶ In separate chapters it takes up the front axle, the rear axle and axles for commercial cars. It explains full-floating, torque, action of the differential, of the brakes and many other things.

¶ The Timken Primers don't try to sell you anything. Timken Axles and Bearings are sold only to motor car manufacturers to be incorporated as integral parts of their cars. The Primers will give you just the information you need to properly appreciate and understand the fundamentals of your motor-car. They are free. Send for them today.

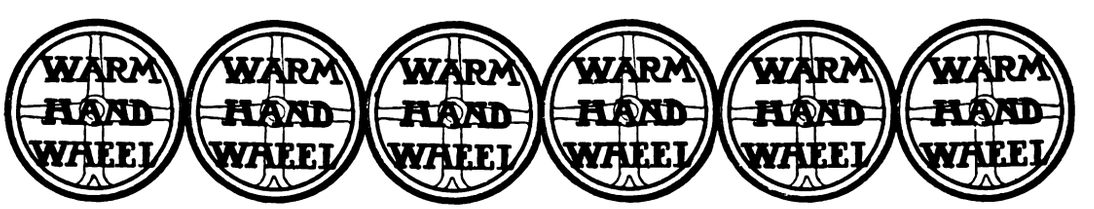
DEALERS—Now Is the Time to Get More Business Through the Sale of Warm Hand Wheels. Winter Is Upon Us.

You can't get away from the fact that the Warm Hand Wheel is not a luxury but a necessity in large demand among those who drive for pleasure and business in winter.

No progressive dealer can afford to overlook the importance of this accessory as a ready seller with a liberal commission back of every sale—at this time particularly, when six months' steady use is ahead—you ought to grasp the opportunity NOW.

The Warm Hand Wheel is operated through either storage battery or electric lighting system, using a negligible amount of current. It is particularly adapted to the Ford car, using the current from the "built in" magneto, without interfering with the ignition.



You, Mr. Dealer, should canvass your trade. Just find out how many car owners would appreciate a warm, delightfully comfortable steering wheel in all conditions of winter temperature—how many would do more driving in winter and so make more business for you. You will find the business waiting.

The Warm Hand Wheel is an economical consumer of current—can be installed in a few minutes—is always dependable and sells on sight.

The retail price is $15. Your commission is large and will warrant you in featuring the device. Now is the time to get your territory. Will you write for the proposition?

Warm Hand Steering Wheel Company

EISEMANN

LOOK at this type E. M. direct high tension magneto closely, note first how simple is the construction work itself—and how readily accessible is every single part of the mechanism.

All vulnerable parts of each system are separate from the other—for instance, a separate contact breaker is used for both battery and magneto. On the other hand, to avoid unnecessary duplication, parts not subject to accident and wear are used in common.

The cams are large, round steel pins instead of the old-fashioned sloping steel pieces. These cams assure absolute accuracy in breaking the circuit every 180 degrees, and as the break occurs very quickly, the efficiency of the spark is correspondingly greatly increased. It is by this means, largely, that Eisemann Magnetos have become noted for the hot, fat spark they develop.

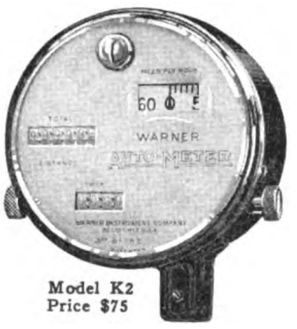
BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.



To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Wire or write us, no matter where you are.

Our PRICES compete with LEADING AMERICAN makes.

Warner Quality
Steering Gears

ANYBODY can claim quality—but a record of eight years use on the better class of cars is indisputable proof. That proof is back of Warner Steering Gears.

The prime features of Warner Gears are: accessibility; complete interchangeability; use of eccentric sleeves; adjustable angle of column; large bearing and contact surfaces specially hardened and ground, assuring ease of motion and durability.

The Warner line includes a wide range in both pleasure and commercial types.

We guarantee dependable deliveries.

Get acquainted with Warner Quality—make it another selling argument.

We modify our designs to meet your detail requirements, or build on approved designs on seasons quantity specifications.

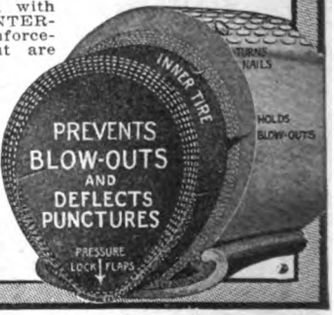
INTERLOCK INNER TIRES
Stop Tire Troubles

INVESTIGATE AND LEARN WHY SO MANY THOUSANDS OF MOTORISTS ARE DISCARDING INNER SHOES, RELINERS, FILLERS, AND OTHER MAKESHIFTS FOR INTERLOCK INNER TIRES—AND WHY INTERLOCKS ARE HANDLED AND RECOMMENDED BY THE BEST SUPPLY DEALERS AND TIRE HOUSES ALL OVER THE COUNTRY.

One weak point of the automobile to-day is that you can't depend on its tires. INTERLOCKS revolutionize this condition by making your tires so strong that blowouts become practically impossible. INTERLOCKS save half your tire expense—save repair bills—double your mileage—prevent punctures and completely free you from all fear of tire trouble.

What INTERLOCKS Are.—The INTERLOCK is a complete inner tire (not an inner shoe) which is placed between the outer casing and the inner tube to strengthen the outer casing and protect the tube. It is the only reinforcement which is locked by air pressure to the rim and which becomes an integral part of the tires, and, therefore, cannot heat or chafe. Even if the tire is broken the INTERLOCK will hold.



INTERLOCKS Insure Safety.—You know that the sudden blowing out of a tire may easily ditch any car when going at fair speed—the safety of INTERLOCKS should appeal to you.

Reduce Your Tire Expense.—You can have the tires on your new car equipped with INTERLOCKS if you specify them. INTERLOCKS are the only perfect tire reinforcement. They cost a little more but are cheapest in the long run.

For your present car—ask any dealer or supply house, or write to us for the name of your nearest supply source. INTERLOCKS will make any fairly sound tire more than carry you through the season. They are easily placed and are made in all sizes.

We Want Dealers Everywhere.—Write for Special 30 Day Offer. Booklets, Prices, Records of Road Tests and Testimonials of users.

Stewart Delivery Trucks

Money-Savers
Time-Savers
Trade-Bringers

Sell Stewart Trucks in Winter Months

No let-up in business for the dealer who handles Stewart Delivery Trucks. Cold weather only increases the need for motor delivery. Merchants are already worrying over their holiday deliveries. They know that their horse equipment will be inadequate during the cold, snowy days and the rush and long hours of the Xmas trade and special sales.

We can guarantee prompt deliveries of Stewart Delivery Trucks in time for the winter business. We can furnish dealers their demonstrators almost immediately. Now is the time to go out and get this desirable business. Merchants are looking for the right car; one that is scientifically designed for hard delivery service. You can get their orders for Stewart Trucks now. Write for our literature and liberal proposition to dealers.

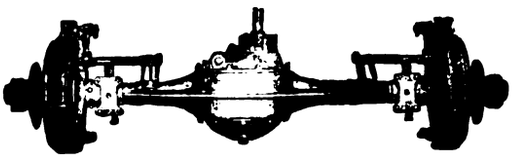
K · D

The Motor With the Sliding Crescent Valve

KNIGHT-DAVIDSON

1896 — 1912



The CRESCENT valve of the K-D Motor, fitting around the stationary piston wall affords a larger port area than any other poppet or slide valve on the market. It is simpler and, consequently, better than any other valve construction known and is here offered to discriminating manufacturers, not as an experiment, but as a tried, tested and proved mechanical advance. The K-D motor is simple, silent, cools rapidly, has the simplest oiling system known, will not carbonize. Last and most important, will give on a given quantity of fuel more power, speed and endurance, unit for unit, than any other engine on any type of an automobile. We want to present some facts to interested manufacturers.

Weed Chains

The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires

Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

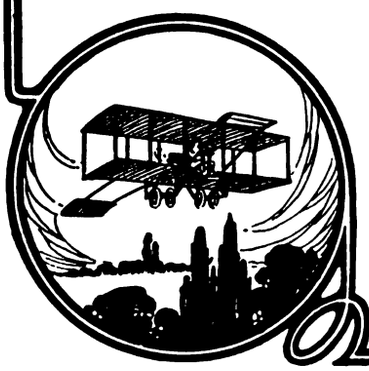
Cadillac fore-door touring car
Equipped with
Hess-Bright ball bearings in transmission



Hardness and Durability in Ball Bearings

The selection of the correct design is only the first step in the making of a genuinely durable ball bearing.

The softer the steels used, the lighter will be the loads they can safely carry. The points of contact in a ball bearing are slightly flattened by compression. So small are these load-carrying areas, however, that extreme density and hardness are essential.

Steels that could be hardened sufficiently for the requirements of serious commercial ball bearing service were unknown until somewhat recently. It is the development of modern alloy steels, as much as laboratory research in the matter of design, that has made possible the phenomenal endurance of the best modern annular ball bearings.

An incidental requirement is that the balls and races be hardened CLEAR THROUGH, not merely on the surface. This is done in order to secure uniform compressibility between different balls, also between different parts of the same race. A ball with a soft center, and with one side hardened to a greater depth than the other, would have two factors of variation in compressibility. All of these elements of uncertainty are eliminated by hardening clear through and by careful treatment to secure perfect homogeneity of grain.

DEALERS

Be Sure Your Cars Are

EQUIPPED

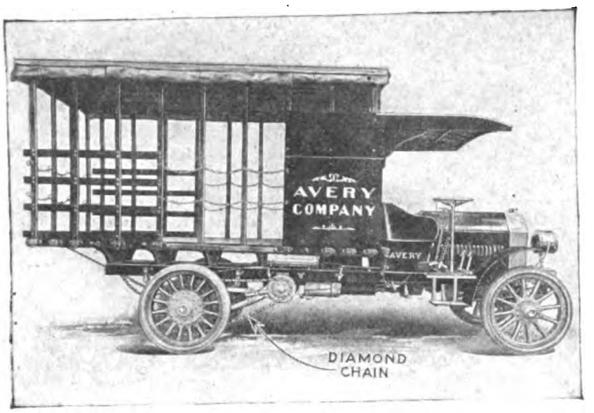
With

R·I·V Ball Bearings

IMPORTED Since 1904 — *Quality* — R.I.V. CO. 1771 B'way, N. Y.

DEALERS

Bearings of Recognized Worth are Ear Marks of Car Quality



DEALERS

Are the Cars You Represent R.I.V. Equipped?

Exceeding accuracy is guaranteed. This is not the stereotyped claim so common in the field, but an unqualified, proven statement. The steel balls used in *R. I. V. Bearings are uniformly within 1-10,000 of an inch true—all of them,* and the dimensions are correspondingly accurate in proportion.

Hardness out of ordinary, tensile strength of the balls, no excessive side play. Consider these points, Mr. Dealer, and add them to other features noted here. *Then recommend R. I. V. Bearings—insist on them.*

Diamond Chains Standard Equipment On Avery Trucks

Because of their strength and durability under the hardest service conditions Diamond Chains are used by The Avery Co. on all their farm and city trucks.

In the manufacture of Diamond Truck Chains we use Nickel Steel Rivets exclusively and the most advanced methods of heat treatment. All holes in side bars are reamed accurately to size and pitch—not punched as is the usual practice—and all parts are gauged to extreme accuracy.

Such material and construction makes Diamond Chain standard equipment on the majority of trucks.

Our treatise "Power Chains and Sprockets" gives interesting and valuable information on the subject of chain drive for Trucks.

Fedders Square Tube Radiators

Repaired With Ease By Any Tinsmith in Case of Accident

Fedders radiators are standard on a big line of pleasure and commercial cars. Automobile engineers specify them for the service they render.

Note that every individual square tube of the Fedders Radiator is completely surrounded by water and that passage obstruction is impossible owing to this form of construction.

In case of accident you do not have to lay up your customer's car while waiting for expensive and time consuming repairs incident to sending the whole radiator to the factory. It is only necessary to take out the tubes damaged and insert new ones —and this can be done quickly and at little expense.

Also note that these radiators are made of copper by far and away the best heat conductor known among the baser metals.

Write for our catalog today and have the above and other points of superiority amplified.

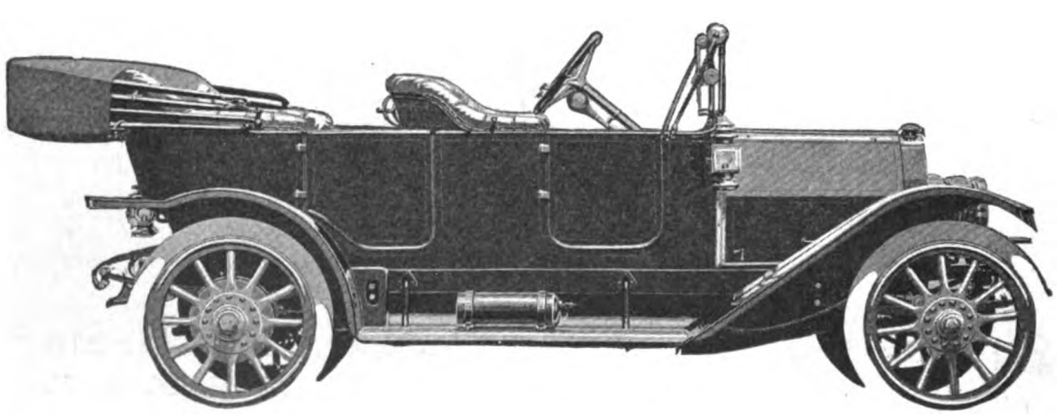
High-priced feature No. 6

The great number of aluminum castings in the Overland Model 69T are a guarantee of its high quality. We use 8 tons of the first grade aluminum every day. It is especially heat treated—just as carefully as the expensive steels which go into the car.



Aluminum costs many times what brittle iron does. It is tens of pounds stronger; its lightness reduces weight and saves tire bills

Overland 69T crank cases, gear cases, manifolds, hub caps, pedals, steering wheel spiders, etc., are all of A-No. 1 aluminum.

You will have to pay $1200 in any other line to duplicate this wonderful car.

A catalogue upon request. Please address Dept. 50.

Vol. XXXIII New York, U. S. A., Thursday, December 5, 1912 No. 11

USE OF LETTER R CAUSES TWO MAKERS TO LOCK HORNS

Similarity of Names Chosen for Brake Linings Brings Sharp Conflict—Lawyer Sued Over Failure to Secure Copyright.

"Motobestos" and "Motorbestos" may differ by one letter, but they are so near alike that the Asbestos & Rubber Works of America and the American Asbestos Co. are spending considerable money to see who is entitled to a trade name of this description for a brake lining. The Asbestos & Rubber Works of America, which is located in New York City, is the coiner of "Motobestos," and the American Asbestos Co., located in Norristown, Pa., is the father of "Motorbestos." Each is a brake lining, the one product looks like the other, and the names are very much alike. Lest some wag interpose with the suggestion, it may be stated that the New York concern charges its rivals with having put the "r" in "Motobestos."

Both concerns have been making these products for some time. The first the New York company knew of the rival product was more than a year ago, when one of its salesmen demanded commission on "Motobestos" sold in his territory without his knowledge. Investigation revealed that what he had seen in a customer's store was the similar product.

Just which name was conceived and used first is unsettled. However, in August, 1911, the Asbestos & Rubber Works engaged Victor J. Evans, a patent attorney in Washington, D. C., to secure a copyright of the word "Motobestos." Seventy-five dollars were paid as the first fee. Meantime Edward H. Garcin, the company's president, went abroad, and when he returned was wroth to find, he claims, nothing done about his trade name; his first move was to secure a new attorney and demand that Evans repay the $75, which, of course, was refused, whereupon Garcin brought suit.

The new attorneys filed an application for "Motobestos" in January of the present year, and a few days later application was made for "Motorbestos." It was ordered that testimony be taken to ascertain which word and product was first on the market and thus establish which company has the greatest right to its nomenclature. This testimony is being taken in various parts of the country and a hearing on the applications will be had this month.

Tone Company to Produce a $900 Car.

Fred I. Tone, one of the best known automobile engineers in the West, who has served as chief engineer of the Overland and American establishments, has formed the Tone Car Corporation, under the laws in Indiana, with au authorized capital of $200,000, which amount shortly will be increased. Tone is president of the new company, W. P. Kirk, of New York, treasurer, and Mark H. Miller, of Indianapolis, secretary. It is probable that the factory will be located in Indianapolis and that a number of Tone's former associates will join him in the new enterprise.

The Tone corporation will build a $900 car which cannot well fail to command instant attention. It will be a five passenger model having a wheelbase of 110 inches, and employing a block motor, 3½ x 5, left hand steer, center control, wire wheels and electric lights and starter. First deliveries will be made in June next.

Trenton Empires Are Consolidated.

The Empire Tire Co. and the Empire Rubber Mfg. Co., of Trenton, N. J., have consolidated under the style Empire Tire & Rubber Co., capitalized at $1,000,000, equally divided into common and preferred shares. Charles H. Baker was chosen president of the consolidated company, of which C. Edward Murray, who was treasurer of both of the companies involved, became treasurer, and A. Boyd Cornell secretary.

HYDRAULIC DRIVE PATENTEE SUES ONE OF HIS LICENSEES

Manly Secures Attachment for Royalties and Other Claims Against Remington Standard Company—Matter of Long Standing.

Charles M. Manly, inventor of the hydraulic drive bearing his name and the chief figure in the Manly Drive Co., a New Jersey corporation with offices in New York, this week sued out a writ of attachment for $3,641.90 in the Supreme Court in New York County against the Remington Standard Motor Co., a West Virginia corporation with its principal office in New York and which is one of the licensees under the Manly patent.

Manly and the principals of the Remington Standard company have been on particularly cordial terms, but the latter, which produced at least one truck utilizing the Manly hydraulic drive, apparently has not made substantial progress and the inventor has tired of waiting for his due.

His claim is made up of three items, the first for labor and material, supplied between January 1, 1911. and July 31, 1912, amounting to $645.19, of which but $53.29 was paid, leaving a balance of $571.90; the second item covers a transmission sold to the Remington company March 29, 1911, the price of which was $1,200. Of this amount only $650 was paid, the balance due being $550; the final claim is for royalties. According to Manly's complaint, it was on July 7, 1910, that his company licensed the Remington Standard company, in return for which the Manly company was to be paid $2,500 a year, payment to be made within 30 days after the end of each calendar year. As the $2,500 due January 30th last has not been paid, Manly, of course, includes that sum. All of the claims were held originally by the Manly Drive Co. but have been assigned to Manly himself.

N. A. A. M. TO CONSIDER PROBLEMS OF USED CARS

Creates Committee for Purpose; Also One to Deal With Annual Models —Prepares to Assume Duties of M. C. A.

Used car problems finally are to receive the serious attention of the National Association of Automobile Manufacturers. At the Detroit convention of the assiciation, last month, Hugh Chalmers suggested the appointment of a committee to deal with the subject, and the suggestion took practical form at the regular December meeting of the executive committee, which was held in New York yesterday, a committee on used cars being created, with Chalmers as chairman. The other members are as follows: O. C. Hutchinson, J. T. Farley, C. W. Churchill and F. A. Groves.

Also growing out of an address on the subject, delivered at the Detroit convention, H. O. Smith, of the Premier Motor Mfg. Co., was appointed the head of another committee on yearly models, which likewise was created yesterday. Smith is uncompromisingly opposed to the annual model policy. His fellow committeemen are W. H. Whiteside, Alfred Reeves, S. D. Waldon and Charles T. Jeffery.

The contest and demonstrations committee, which heretofore has consisted of three members, was enlarged to five, the new appointees being Howard Marmon and H. E. Coffin. Alfred Reeves also was named to succeed Benjamin Briscoe, resigned. The other members of the committee are H. O. Smith and Windsor T. White

Marmon is the present executive of the Manufacturers' Contest Association, in which office he succeeded Coffin. Their appointment on the N. A. A. M. committee marks the beginning of the end of the M. C. A., which, in fact, was an outgrowth of the N. A. A. M., being formed at the time that the latter body did not consider it the better part of wisdom directly to share in the direction or government of the sport.

The Manufacturers' Contest Association will go out of existence and most of its duties will be performed by the enlarged N. A. A. M. committee on contests and demonstrations. The duties are largely in the nature of consulting with and being consulted by the American Automobile Association. The N. A. A. M., however, has no intention whatsoever of taking an active part in either the promotion or government of the sport.

In response to an invitation of the Carriage Builders' National Association, Charles Clifton and H. H. Rice were appointed members of the advisory board of the C. B. N. A. technical school, to which the N. A. A. M. has been a contributor each year.

Because of a conflict between rival dealers' associations, the sanction granted by the N. A. A. M. to the Pittsburgh show was withdrawn and that city is now out of the official circuit.

One change in the membership representation was made, H. M. Jewett succeeding H. A. Lozier as the representative of the Lozier Motor Co.

To Continue American Commer Trucks.

One of the outgrowths of the receiver's sale of the Wyckoff, Church & Partridge property, to interests represented by Chester Griswold and Attorneys Howard C. Dickerson and George A. Ellis, is the formation of the American Commer Truck, Inc., which, on Friday last, was incorporated under the laws of New York with authorized capital of $10,000. As the corporators are merely lawyers' clerks, and as all those in position to speak still decline to give information, the whole meaning of the truck corporation is not plain, although evidently it is designed to continue the production of Commer trucks in this country, for which Wyckoff, Church & Partridge hold rights.

What American Commer Truck, Inc., will acquire is a matter for speculation. Among the Wyckoff assets of which it will not become possessed, however, is the real estate — salesroom and garage — at 56th street and Broadway, which has been sold to the Swetland Operating Co., which was organized for the purpose by H. M. Swetland, who was one of the largest creditors of Wyckoff, Church & Partridge.

U. S. Motor Receivers Oppose Bankruptcy.

The receivers for the United States Motor Co., against which a petition in bankruptcy was filed by three small creditors in Trenton, N. J., last month, have taken the first step in an effort to have the bankruptcy matter dismissed in order that the equity proceedings in the United States District Court in New York City may proceed and that the property may be sold January 8, according to the order of the court.

The step taken by the attorneys for the creditors consisted in the filing of a demurrer to the petition when the matter came up in the Federal court in Trenton, Monday last, 2d inst., the demurrer alleging that the petition is insufficient and not possessed of grounds for an adjudication in bankruptcy. The court set December 30 as the date for argument on the demurrer.

Overland Superintendent Goes to Europe.

H. L. Shepler, general superintendent of the Willys-Overland industries, has sailed to Europe, where he will spend two months.

U. S. TIRE MAKES START ON "BIGGEST PLANT IN WORLD"

To Double Morgan & Wright Factory in Detroit and Enlarge Other Works—Daily Output to Exceed 5,000 Tires.

What evidently is an impressive start toward that "largest and best tire plant in the world," which early this summer the United States Tire Co. announced its intention to build, has been made in Detroit. It will take the form of a doubling of the Morgan & Wright factory in that city.

Ground already has been broken for several new buildings and the work will be pushed as much as possible. When it is completed there will have been erected 16 new buildings, ranging in proportions from 2,000 square feet to 131,000 square feet. In addition to those assigned for manufacturing purposes, the structures will comprise a finely appointed laboratory and several enormous warehouses, also a huge boiler plant which will double the Morgan & Wright boiler capacity. All of the buildings will be of brick and reinforced concrete and those used for manufacturing will be equipped with the most modern machinery known to the rubber trade.

When the work is finished, the Detroit plant will have a floor space of more than 1,000,000 square feet, or twice its present size. It will also employ 6,000 workmen as against the 2,500 now employed, and its output, it is stated, will be in excess of 5,000 tires daily.

When announcement first was made that the United States Tire Co. was to build the "largest and best tire plant in the world," it was surmised that it implied ultimate concentration of its tire production in one plant, but that nothing of the sort is in view is indicated by the fact that, in addition to doubling the Detroit plant, the factories in Indianapolis, Hartford and Providence also are being or will be enlarged. In Hartford, a new power house and power plant has been built at a cost of more than $175,000; in Indianapolis, a six-story structure, 800 x 170 feet, is being erected; and in Providence a three-story building, 75 x 300 feet, is to be constructed.

Van Dusen and Warren for Themselves.

Walter H. Van Dusen, formerly assistant sales manager of the E. R. Thomas Motor Co., and Joseph Warren, until recently a member of the sales staff of the Abbott Motor Co., have joined hands and will set up in business in the Ford building in Detroit. They will act as manufacturers' representatives.

MORGAN PREFERS BRITISH WORKMEN; SENDS MESSAGE

Having Prospered in America, he Opens Door to his Countrymen —Suggests How to Dodge Contract-Labor Law.

With the love of mother country warm in his veins, B. Morgan, who signs himself "M. S. A. E.," which is taken to mean Member Society Automobile Engineers, and who manufactures a number of automobile specialties in Newport, R. I., is seeking English help. Morgan came from the "tight little isle" some ten years since and, it is said, secured the favor of the late Col. John Jacob Astor to such good purpose that he became the head of his extensive private automobile establishment. Between times, Morgan evolved several specialties and still later set up a garage in Newport, where he has continued to prosper.

He now requires more help and, remembering the days and scenes of his childhood, is reaching into England for the mechanics which he most desires. He has written one of the British trade papers that they must be "good all-round men, capable of taking hold of a car and going right through with the repairs, even making parts, if necessary."

Morgan is familiar with the American law which forbids the importation of laborers under contract, but he has been over here long enough to learn that there are ways out of even that difficulty. Accordingly, he suggests that if any good Englishman who visits America will file an application with him he will have no trouble in securing a job. He promises, or holds out promise of, wages running from 30 cents to 36 cents per hour for the ordinary repairman up to 50 cents an hour for an A1 mechanic.

In placing the temptation before the English workers, Morgan assures "plenty of over-time," but does not guarantee uninterrupted work, as he suggests that when the busy season is over a good man can go South and secure employment, or else return to England.

"League" Demurs; Question Ford's Patents

After several postponements, the International Automobile League, of Buffalo, finally has filed a demurrer to the suit brought against it in the United States Supreme Court in Buffalo by the Ford Motor Co., of Detroit, in which a temporary injunction was granted.

The Ford complaint, which charges the so-called league with having infringed Ford patents by advertising or otherwise offering for sale, Ford cars at less than list prices, is attacked largely on technical grounds, in that the Ford company failed to allege that it is the sole and original inventor or discoverer of the improvements claimed, or that it failed to submit proof that it made application for the patents, or derived title thereto, in accordance with the then existing laws of Congress. The defense that no copies of the patents are attached to the bill of complaint also is set up in the demurrer, in which, however, the chief or most unusual point raised is that "it appears from the allegation that said bill of the Ford Automobile Co. has no patent upon the Ford automobile as a complete product."

It is upon these grounds that a dismissal of the complaint is asked by the league, which admits that it is a New York corporation composed of Alfred C Bidwell, John H. Tranter, William Priess and John C. Hurley.

New Departure Negotiating for Whitlock.

Negotiations are in progress which probably will result in the absorption of the Whitlock Coil Pipe Co. of Hartford, Conn., by the New Departure Mfg. Co. of Bristol, in the same State. The parties to the transaction have not yet agreed upon the price which, apparently, is the only stumbling block, but that the obstacle will be removed is indicated by the fact that the annual meeting of the Whitlock company, which was due to occur this week, was twice postponed in order to promote reconciliation of the difference between the two companies. The meeting now will be held on Wednesday, 18th inst.

In the earlier stages of the industry, the Whitlock Coil Pipe Co. seemed in a fair way of controlling the automobile radiator business in this country, but it gradually relinquished its manufacture, and during recent years has devoted itself wholly to the production of metal pipes of all description, engine manifolds among them.

Willard Purchases a Fourth Building.

Although little more than a month ago the Willard Storage Battery Co., of Cleveland, O., purchased the property adjoining its factory No. 1, thereby making the plant consist of three separate units, the company just has bought still another brick and steel building adjoining their premises, which will constitute plant No. 4. Although close together, each of the buildings is separate and distinct and three of them are individually equipped for the manufacture of storage batteries, regardless of what may happen to the other units. The most recent purchase will be used for storage purposes, but will be utilized for manufacturing expansion whenever necessary.

NEW YORK DEALERS ADOPT USED CAR DISPOSAL PLAN

Trading Cars Is Eliminated But Dealer Acts as Agent in Selling the Used Vehicle—How the System Is Applied.

After wrestling with the subject for a long time, the Automobile Dealers' Association of New York City finally has placed the stamp of its approval upon a plan which is calculated to inject a measure of business sense and relief into the used car situation, although the plan itself is not a new one, and, with slight variations, has been followed for some time by at least several dealers in the metropolis and elsewhere.

With minor changes to meet the conditions in the individual salesrooms the plan is that which has solved the problem for the A. Elliott Ranney Co., the Hudson dealer in New York, and which entirely eliminates trading; the company disposes of the customer's old car, but it does not trade. In connection with the disposal system. Several documents are used to record steps in the transaction.

When a man goes to the Ranney company to purchase a new car and desires to turn in his old vehicle, he is asked what valuation he places upon the old car and he then delivers it to the Ranney company, signing a blank which reads as follows

SECOND HAND CAR AGREEMENT.

I, the undersigned, hereby agree to leave with the A. Elliott Ranney Company for sale, my ..... automobile, and I hereby authorize the A. Elliott Ranney Company to retain from the proceeds of such sale the sum of ..... dollars to apply on the annexed order. The asking price for my used car is ..... dollars, subject to change in my discretion.

The A. Elliott Ranney Company assume no responsibility for loss or damage to the car by fire or otherwise.

Name .....

Address .....

Date .....

As is evident, this document authorizes the Ranney company to sell the car and to retain a certain amount from the proceeds. Should the asked price be $2,000 and the price of the new Hudson $1,600, the company would be authorized to retain $1,600 out of the $2,000, but should the asked price be $1,000, the company would be authorized to retain $1,000. When the used car is sold the company keeps the money secured for it and the customer who wishes a new Hudson pays the difference between the new car's price and what the old one sold for, provided this latter figure is less than the price of the new Hudson.

Digitized by Google

Should the customer insist that he be given a new car immediately, he is asked to pay for it on delivery and whatever is secured for the old car is remitted to him as soon as it is sold, with no charge for the selling. In this case, a letter to the customer or some other written record cancels the clause authorizing the company to retain any of the money received for the used car. In case the customer does not want to pay outright for a new car and also does not desire to be without the use of his old car, even for one day, the company endeavors to arrange a sale while the customer retains possession of the car, the owner of the car and the prospective buyer being brought together at some time and place arranged. But under no circumstances will the company take the car in trade.

When the scheme first was inaugurated, a couple of years ago, the public was a bit slow in accepting this form of merchandising, but when the logic of the situation was explained the protest became insignificant. An added point of interest is that the Ranney company assumes no risk whatever; if the tires are bad when the car is received and there is likelihood that a blowout may result during a demonstration of the used vehicle, the owner's attention is called to this fact when the car is taken in and any blowouts are repaired at his expense. The non-assumption of risk applies in every particular.

If it is found after several days that the price asked by the owner of the used car is too great, bargaining is begun; he is informed of the best offer obtained, and if the owner concedes a point the prospective buyer is asked to come up a trifle, and generally satisfactory terms are reached. The Ranney company states that through this plan used cars seldom remain in their used car department longer than a week.

The buyer of the used car, if he does not pay cash, but makes a deposit, is given a receipt in the following form

Received from ..... the sum of ..... dollars as deposit on used ..... car, No. ....., to be delivered on the ..... day of ..... at agreed price of ..... dollars. Failure to accept delivery of this car on the date specified or failure to pay the balance of the purchase price, viz..... ..... shall be deemed a cancellation of this receipt, and the purchaser shall forfeit the deposit thereby paid, time being of the essence of this receipt. No guarantee or representation of any kind, nature or description is given or made by the A. Elliott Ranney Company not expressed herein.

When he makes final payment he is given this type of receipt:

Received from ..... the sum of ..... as final payment on the purchase price of ..... used car, No. .....

No guarantee or representation of any kind, nature or description is given or made by the A. Elliott Ranney Company not expressed herein.

After the sale is consummated the used car buyer gives the Ranney company this form of receipt for the car

Received from the A. Elliott Ranney Company ..... used car, No. ....., as represented to me at the time of the purchase.

No guarantee or representation of any kind, nature or description is given or made by the A. Elliott Ranney Company not expressed herein.

This paper states that he has bought it "as is" and that he takes it as it stands and for just what it is. The Ranney company makes no repairs and does no overhauling unless the owner of the car so orders; such orders, however, often are received in the expectation that, say, $50 spent on a car will increase its value $100 or $150.

At the meeting of the Automobile Dealers' Association last week, when the plan was endorsed, about half the members present expressed their approval by signing an agreement to follow the suggested system. The selling of the used cars, without any charge for this service, is not reckoned as a loss, but is classed as a legitimate expense of the business, like advertising, insurance and any other "overhead." The concensus of opinion among the dealers was that used cars always will have to be reckoned with and that the solution of the question is in the best way to handle them.

Much money has been lost through trading; cases have been known where prospective purchasers of cars have gone to used car establishments, bought an old car of the model they intended buying, paying, say, $500 for the old vehicle, and then have traded it in for $700, making $200 while the dealer lost that amount or more. "Shoppers," who properly are classed as better salesmen than automobile salesmen, frequently travel along "automobile row" and by telling "what so-and-so offered" for the old car, force the price up to an exorbitant figure. The dealer who acts merely as an agent in disposing of the used car is protected again such losses. A modification of the Ranney plan which is favored by some agents is the actual taking in trade of those cars which are of the same make as the dealer sells, all other makes to be sold for the account of the customer.

Charles A. Stewart, general manager of the Automobile Dealers' Association, in commenting upon conditions in New York City, said he was surprised when the reports of the members at the last meeting showed more cars to have been sold in 1912 than in 1911, despite statements that 1912 has been a poor year; he also expressed surprise when inquiry among the dealers developed that fewer used cars are on the salesroom floors this year than last. "This does not mean that used car conditions are good," he said, "for they are not. It means that last year some of the dealers found themselves pretty close to the wall because all their money was tied up in old cars, and consequently they are more careful this year; some of them, however, are still losing money through trading. The general situation, however, indicates that we are progressing toward the plane upon which we hope to place the business."

Changes Among Prominent Tradesmen.

N. H. Mineter has been appointed sales manager for the Findeisen & Kropf Mfg. Co. of Chicago, manufacturers of the Rayfield carburetter. Formerly, and for several years, he was identified with the Stromberg Motor Devices Co of the same city.

Emerson Brooks, one of the veterans of the industry, who for 20 years was vice-president of J. M. Quinby & Co., the Newark (N. J.) body builders, has acquired an interest in Burr & Co., body builders, at Amsterdam avenue and 75th street, New York City. He will devote himself to the sales and repair departments, but will retain his interest as a director in the Remington Truck Co. and the Manly Drive Co.

Henry M. Duncan has been appointed supervisor of the eastern district of the United States Motor Co. to succeed W. F. Smith, resigned. Previously, Duncan was general manager of the Westchester Appliance Co. of New York. His appointment places him in charge of the United Motor Companies in Syracuse, Pittsburgh, Washington and Atlanta. In addition, Duncan will act as the manager of the United Motor Philadelphia Co.

C. J. Pettit, manager of the Prest-O-Lite Co.'s New York branch, has been transferred to Minneapolis, from which point he will control three Prest-O-Lite depots—those in Minneapolis, St. Paul and Winnipeg, the latter of which constitutes an important part of the Prest-O-Lite system in Canada. The vacancy in New York caused by Pettit's transfer has been filled by the appointment of C. B. Clendenen, who formerly was connected with the company's headquarters in Indianapolis.

It transpires that C. F. Pratt, former president of the Ohio Motor Car Co., of Cincinnati, who was reported to have become vice-president and general manager of the Ames Motor Car Co., of Owensboro, Ky., really has been made vice-president and manager of the F. A. Ames Co., of that city, which, though affiliated with the Ames Motor Car Co., devotes itself wholly to carriage manufacture. George W. Yeoman is still the vice-president and general manager of the Motor Car company and says he has no immediate intention of relinquishing those offices.

The Week's Incorporations

Grand Rapids, Mich.—Auto Equipment & Supply Co., under Michigan laws, with $10,000 capital.

Alpena, Mich. — Auto Sales Co., under Michigan laws, with $50,000 capital; to deal in motor cars.

Saginaw, Mich.—Garber-Butch Co., under Michigan laws, with $10,000 capital; to operate a garage.

Los Angeles, Cal.—Eastern Motor Car Co., under California laws, with $25,000 capital; to deal in motor cars.

Pittsburgh, Pa. — Hollis Motor Vehicle Co., under Pennsylvania laws, with $5,000 capital; to deal in motor vehicles.

Taunton, Mass.—S. & M. Co., under Massachusetts laws, with $5,000 capital; to deal in motor cars and operate a garage.

Hudson, Mass. — Raymond Engineering Co., under Massachusetts laws, with $150,000 capital; to manufacture and deal in motors.

Waterloo, Ia.—Repass Automobile Co., under Iowa laws, with $25,000 capital; to deal in motor cars. Corporators—O. A. Repass, C. L. Herring.

Houston, Tex.—Cartercar Co., under Texas laws, with $20,000 capital; to deal in motor cars. Corporators—R. H. Rushway, E. Emmert, C. D. Ferguson.

Des Moines, Ia.—Union Motor Co., under Iowa laws, with $10,000 capital; to deal in motor cars. Corporators—E. G. Plummer, Preston Offhill, W. H. Wilkins

Rockford, Ill.—Schlig Auto Repair Co., under Illinois laws, with $5,000 capital; to repair motor cars. Corporators—John J. White, John Schlig, Doris White.

Trenton, N. J.—Roberts Rubber Mfg. Co., under Delaware laws, with $1,000,000 capital; to manufacture tires. Corporators—F. T. Roberts, W. L. Watson, E. Horowitz.

Alton, Ill.—Alton Automobile Co., under Illinois laws, with $10,000 capital; to deal in motor cars. Corporators—Hugo F. Horstman, William Winter, Leo F. Winter.

Los Angeles, Cal.—Alcorn Rubber Co., under California laws, with $20,000 capital; to deal in motor car tires. Corporators—James A. Alcorn, C. F. Wickland, Jay Baker.

Kansas City, Mo.—England Bros. Motor Co., under Missouri laws, with $2,000 capital; to deal in motor cars. Corporators—Edward England, E. W. England, and others.

Jacksonville, Fla.—Atkinson Tire & Supply Co., under Florida laws, with $25,000 capital; to deal in motor car tires and supplies. Corporators—R. L. Atkinson and others.

Chicago, Ill. — Illinois Tire Filler Co., under Illinois laws, with $10,000 capital; to manufacture tire fillers. Corporators — Albert Jacobs, Anton Percival, Charles B. Stafford.

Asbury Park, N. J.—Cress Automobile Co., under New Jersey laws, with $250,000 capital; to deal in motor cars. Corporators—Louis F. Grice, Harry A. White, F. Frank Appleby.

Detroit, Mich.—Cragg Motor Mfg. Co., under Michigan laws, with $4,000 capital; to manufacture motors. Corporators — Edmund F. Allerman, Ida A. Cragg, Mayory G. Cragg.

Pittsburg, Pa.—American Motor Fire Apparatus Co., under Pennsylvania laws, with $1,000,000 capital; to manufacture motor fire apparatus. Corporators—T. F. Burchell and others.

Newark, N. J.—Touraine Motors Co., under New Jersey laws, with $37,500 capital; to deal in motor cars. Corporators—C. Edmund Van Vlieck, Jr., E. M. Dailey, Fred W. Kolb.

Chagrin Falls, Ohio—Falls Garage Co., under Ohio laws, with $10,000 capital; to operate a garage. Corporators—C. S. Gore, T. C. Waite, H. D. Bishop, T. H. Nuggett. A. H. Nuggett.

Morgantown, W. Va. — Colonial Motor Car Co., under West Virginia laws, with $10,000 capital; to deal in motor cars. Corporators—Arthur A. Exley, William E. Graham, Alva D. Wolfe, J. Howard Wolfe, C. William Cramer.

Detroit, Mich.—Gearless Differential Co., under Michigan laws, with $20,000 capital; to manufacture motor car devices. Corporators—George D. Bailey, William F. Trudeau, Frank Howarth.

Chicago, Ill.—Chicago Garage Owners' Association, under Illinois laws, to conduct an association for mutual benefit. Corporators—Wm. L. Rudd, E. A. Wise, Harry Salvat, B. F. Campbell.

South Bend, Ind.—South Bend Motor Car Works, under Indiana laws, with $10,000 capital; to repair motor cars. Corporators—John D. J. Farnemann, Alfred C. Mecklenburg, Hilton Hammond.

Grand Rapids, Mich.—Pneumatic Tire & Rubber Co., under Michigan laws, with $1,000 capital; to deal in tires. Corporators—W. O. Hughart, George T. Kendal, W. B. Gilbert, Thomas B. Bradfield.

Milwaukee, Wis. — Milwaukee Motor Show Association, under Wisconsin laws; to conduct an automobile show. Corporators—Emil Estberg, F. J. Edwards, G. W. Brown, J. A. Smith, P. S. Bates.

Toledo, Ohio—Willys-Overland Co., under Ohio laws, with $25,000,000 capital; to manufacture motor vehicles. Corporators—Walter Stewart, Isaac Kinsey, Royal R. Scott, A. H. Smith, G. W. Bennett.

Shelbyville, Ky.—Fawkes, Pulliam & Graham, under Kentucky laws, with $3,300 capital; to deal in motor cars and operate a garage. Corporators—George Fawkes, Harry Pulliam, E. Burnett Graham.

Rotterdam, N. Y.—General Vehicle Co., under New York laws, with $10,000,000 capital; to manufacture motor vehicles. Corporators—A. H. Jackson, S. L. Whitestone, J. F. Zoller, all of Schenectady, N. Y.

New York, N. Y.—Gross Auto Rental Co., under New York laws, with $5,000 capital; to rent motor cars. Corporators—Jacob S. Gross, Simon Gross, 241 West 143d street; Herman Strizver, 2327 Crotona avenue.

Richwood, Ohio.—Scharf Gearless Motor Co., under Ohio laws, with $5,000 capital; to manufacture motor cars. Corporators—George W. Wordem, John E. Scharf, W. N. Siples, E. M. Payne, L. J. McCoy.

Buffalo, N. Y.—Buffalo and Interurban Motor Delivery Co., under New York laws, with $125,000 capital; to operate a motor delivery. Corporators—J. George Berner, Clinton T. Horner, Wilbur B. Grandison.

Dayton, Ohio — Dayton Equipment Co., under Ohio laws, with $10,000 capital; to deal in motor car equipment. Corporators—Henry Stoddard, George L. Baker, Gilbert J. Loomis, W. C. Smith, Charles D. Heald.

Barker, N. Y.—Progressive Motor Car Co., under New York laws, with $30,000 capital; to deal in motor cars. Corporators—Arthur H. Terleeson, John B. Smith, Harry S. Schuhr, all of 175 Crescent avenue.

Chicago, Ill. — Lakeside Motor Truck Transportation Co., under Illinois laws,

Digitized by Google

with $2,500 capital; to operate a garage and motor car livery. Corporators—A. C. Goldsmith, E. L. Shanci, Ambrose Risdon.

Memphis, Tenn. — Nolan Bros., under Tennessee laws, with $5,000 capital; to operate a garage and deal in motor cars. Corporators—J. W. Dickson, Dr. W. S. Anderson, E. Becker, E. Gerber, L. C. Nolan.

Cincinnati, Ohio—Northway Motor Co. of Cincinnati, under Ohio laws, with $600,000 capital; to deal in motor cars. Ralph E. Northway, William Pabodie, Wesley D. Fruste, Edward D. Decebach, F. B. Enslow.

New York, N. Y.—Kells Motor Radiator Corp., under New York laws, with $650,000 capital; to manufacture automobile radiators. Corporators—Corneilus A. Cole, Alexander F. Garbee, Henry A. Bingham, 32 Nassau street.

New York, N. Y.—Joseph H. Penders, Inc., under New York laws, with $25,000 capital; to manufacture and deal in motor cars. Corporators—J. H. Penders, Elizabeth Penders, Catherine Hahn, all of 218 East 49th street.

Huntington, Ind. — Huntington Auto Transit Co., under Indiana laws, with $25,000 capital; to operate a motor transit. Corporators—James M. Hicks, Samuel A. Stemen, John W. Caswell, Wesley W. Hawley, Oscar E. Bradley.

New York, N. Y.—Auto Record Publishing Co., under New York laws, with $10,000 capital; to publish a motor publication. Corporators—Charles A. Loring, 138 Pearl street, Boston, Mass.; John W. Buckmaster, 253 Broadway, N. Y.

Coldbrook, N. B.—Maritime Motor Co., Ltd., under New Brunswick laws, with $250,000 capital; to manufacture and deal in motor vehicles. Corporators—W. W. Skinner, W. G. Pugsley, George Gordon Hyde, George Williamson.

Minor Business Troubles.

Chester S. Norris, a repairman of Cambridge, Mass., has filed a voluntary petition in bankruptcy; his debts are $1,860 and his assets amount to $25.

Ralph Goldsworthy, trading as the Ohio Auto Carriage Co., at 1737 East 12th street, Cleveland, O., has filed a petition in bankruptcy; it shows liabilities of $12,348 and assets of $9,039.

Thomas F. McDonald, individually and trading as the Atlas Oil Co., of Atlantic City, N. J., has filed an involuntary petition in bankruptcy; he gives his assets as $1,027 and his liabilities as $3,346.

A voluntary petition in bankruptcy was filed last week in Trenton, N. J., by the C. B. Brokaw Automobile Co. of Plainfield, in the same State; liabilities are placed at $26,094.87 and asests at $29,749.74.

NATURE OF BANKRUPTCY MAY AFFECT PATENT RIGHTS

Involuntary Petition of Assignee a Possible Damage to Assignor—Federal Court Rules in Fault Finder Case.

Just how voluntary or involuntary bankruptcy may affect the assignor of a patent when the assignee is the individual or concern in bankruptcy is a point decided this week by Judge Hand in the Federal court in New York City in the case of the Automobile Fault Finder and Anti-Forgery Pen Co., a lengthy named concern against which a petition was filed several weeks ago.

Judge Hand's ruling was called forth when attorneys for the assignors of the patents asked that the petition, which is involuntary, be dismissed on the grounds that one of the petitioners was not properly a creditor because of the nature of the contract upon which he based the debt. There also was the statement that unless the assignees of the patents expressed or showed an unwillingness to utilize them they would not revert to the assignors. Therefore, if the petition had been dismissed it was the intention to submit a voluntary petition for the purpose of protecting the patent assignors.

To bear out this procedure the stockholders and directors of the corporation submitted to the court their willingness to file a voluntary petition and, acting with this in view, Judge Hand decided that this was sufficient evidence of the willingness of the company to cease using the patents and that this would protect the assignors. He stated in his memorandum that the company was apparently insolvent and that, while the creditor's claim was questionable as to rank in bankruptcy, the wisest procedure was for affairs to go on through the bankruptcy court without delay, whereupon the motion to dismiss the petition was denied.

Omaha Dealer Meets Frightful Death.

John J. Deright, president of the Deright Automobile Co. and J. J. Deright & Co. of Omaha, Neb., and one of the best known dealers in the West, committed suicide or met death accidentally at his own hands on Thursday forenoon last, 28th ult. He was found in a room on the second floor of his company's building with the entire right side of his head blown off by the explosion of two shells of a double-barrelled shotgun which lay at his feet. Although he had been subject to attacks of indigestion, his ailment was not serious and as he had been in a cheerful mood on the morning of his death there are those who believe that an accidental discharge of the gun occurred while he was cleaning it preparatory to a hunting trip. Deright located in Omaha 16 years ago. He came from Denver, where he had been in the bicycle trade, and when the automobile industry developed he promptly engaged in it and built up a fine business. He is survived by his widow.

Lawyer Heads St. Louis Tire Company.

The St. Louis Tire & Rubber Co., which recently was organized, under Missouri laws, with an authorized capital of $150,000, has elected officers as follows: President and general counsel, H. C. Barker, of Carter, Collins, Jones & Barker; vice-president and general manager, J. A. Swinehart, of Akron, O.; treasurer, William H. Glasgow. Directors—C. C. Collins, of the Missouri Lincoln Trust Co.; Roy F. Brittain, Cotton Belt R. R. Co.; Alfred E. Einstein, Union Electric Light & Power Co.; C. N. Skinner, Buxton & Skinner. The company will produce the Krotz solid tire and also a pneumatic tire, in which it is stated the fabric will be incorporated in somewhat unusual fashion.

Factory Promoter Freed by Court.

Four criminal charges which several months ago, at the instance of residents of New Castle, Ind., led to the arrest of William R. Hostetter, who figured as general manager of the Universal Motor Co., have been dismissed by the court. The complainants accused him of having obtained money under false pretenses in that they paid for Universal stock in the belief that the factory was to be erected in New Castle. When the factory failed to materialize, they "sicked" the police on Hostetter. Ground for the building of the factory still is unbroken.

Receiver for New York Lamp Company.

Following the filing of a petition in bankruptcy, Henry C. Quinby has been appointed receiver for the Knickerbocker Brass Goods Co., which manufactures automobile lamps at 405 East 124th street, New York City. The company's liabilities amount to $40,405 and its nominal assets to $47,820. The United States Motor Co. figures as the largest creditor to the extent of $12,000.

Marathon Dealer Sues Marathon Maker.

Because of differences growing out of an agency agreement, the Marathon Motor Works, of Nashville, Tenn., has been made defendant in a suit for $20,000 for alleged breach of contract brought by the Marathon Motor Car Co., of Greenville, S. C. The case will be heard at the March term of the Federal court in Nashville.

In the RETAIL WORLD

Sledge & Rid are about to build a garage in Madera, Cal.

Orcutt & Buchanan are building a garage in Clearfield, Pa.

G. F. Cowden, Jr., is building a garage in Midland, Tex.

Benson & McMaster are erecting a garage in Lanesboro, Minn.

Gicord & Negus have let the contract for a garage in New Bedford, Mass.

Furcht, Fowler & Stinson are about to erect a new garage in Hailey, Ida.

Charles Deane of Grand Rapids, Mich., is building a garage at 307 State street.

A garage is to be constructed for William Melick, on Ann street, Stroudsburg, Pa.

H. B. Thrasher has established what is styled the City Garage, in St. Augustine, Fla.

Alpheus Lane of Paola, Kan., has sold the City Garage to J. W. Torrey of Kansas City.

Putnam & Tozer of Troy, N. Y., have taken over the garage business of Hillard & Rover.

Hull's Garage in Hagerstown, Md., has gone into the retailing of cars. Fords will be handled.

Charles Jenkins and Dart Northrup have leased the Wasco (Cal) Garage from Harley Kearns.

A garage is to be erected in Philadelphia, Pa., on Vine street, for Michele Lauria; its cost will be $4,800.

H. W. Reichert of Tipton, Ia., has taken over the interests of his partner in the Northwestern Garage.

John Barrett is about to build a garage in Indianapolis, on 30th street, the estimated cost being $30,000

The E. J. Kelley Co., of Torrington, Conn., plans to build a new garage, 70 x 90 feet, on Railroad square.

Home Service Garage is the style of a new business in Philadelphia, Pa. William Morroa is the proprietor.

A new garage is to be constructed in Charles City, Ia., for the O'Harrow Auto Co. The building will cost $5,000.

Carl B. and Lyman Spitzer have had plans prepared for a garage to be erected in Toledo, O. It will cost $12,860.

Stilz & Graessle of Nashville, Tenn., are remodeling their carriage factory into a garage; they also will sell Haynes cars.

Gustave Jacobson of Spring Valley, Wis., is about to build a garage in Hudson, in the same State; he also will stock Ford cars.

Scott D. Nichols, of Troy, N. Y., has leased a building on River street and will convert it into a garage; he handles Ford cars.

A new building has been erected at 1512 Broadway, Seattle, Wash., for Frank Waterhouse & Co. The firm handles Garford cars.

T. L. Duque of Los Angeles, Cal., has let the contract for a brick garage, to be erected on Grand avenue; the estimated cost is $12,500.

Frank Schellenger of Yuba City, Cal., has leased the Sutter Garage to Roy Worden and Jay Gould; they will conduct the business.

H. J. Strickler, who last March sold his interest in the Sheldon (Ill.) Auto Garage to William McCloud, has repurchased the business.

Fred Barnum, who conducted a garage in Naugatuck, Conn., at 52 South Main street, has disposed of the business to Richardson Bros. The latter operate a garage at 52 South Main.

Smith-Warner Motor Car Co. is the style of a new selling company in Nashville, Tenn., located at 600 Broadway; Americans will be stocked.

Thomas Oscar and M. O. Flom have formed a partnership and entered the garage field in Stoughton, Wis. Oscar & Flom is the firm style.

The Seller-Mountford Auto Co., of Algona, Ia., has dissolved; Mountford will continue the business under the style Mountford Auto Co.

The Southern Auto & Equipment Co. has established a repair and supply business in Atlanta, Ga., at 94 South Forsythe street; J. J. McNeal is manager.

George H. Bord of Troy, N. Y., is about to open a garage in what was a livery stable, on Liberty street; the remodeling of the building will cost $7,000.

C. D. Adams has arranged to represent the F. E. Murphy Automobile Co., of Minneapolis, in South Dakota; he will establish a garage in Sioux Falls.

E. L. Walden of Peabody, Kan., and A. C. Gray of Hollywood, Cal., plan to erect a garage and salesrooms in the latter town; they also will handle Ford cars.

Hood Auto Filling Station is the style under which a gasolene and oil supply company has opened up in Nashville, Tenn. It is located at 119 Eighth avenue.

The McKeesport (Pa.) Vulcanizing Co. has established a business at 214 Fourth avenue, in that city; S. L. Stitler and Harry Lebowitz constitute the company.

The Hofmeister Motor Co., of Watertown and Milwaukee, Wis., has purchased the garage operated in Jefferson, in the same state, by Clarence Puerner.

Plans have been prepared for a garage which is to be erected at Avenue B and East 20th street, New York City, by John W. Brookman; it will cost $25,000.

Walter S. Kidder, of Dayton, O., has secured permission to build a two-story brick garage at Grand and Salem avenues; the application names $4,000 as the cost.

M. M. Mays of New Springfield, O., has added his name to the list of dealers in that State; he will handle R. C. H. cars in parts of Mahoning and Columbiana counties.

The garage and machine shop of A. J. Parker & Co. and the Howell Garage & Supply Co., in Howell, Mich., have been consolidated; the style of the new business is Parker-Spencer Co.

P. F. Leeland and Hampton Mays have opened up a garage and repair shop on East Connor street, Jacksonville, Fla. They have styled their establishment "The Dixie."

Pope Motor & Cycle Co. is the style of a new copartnership just established in Oklahoma City, Okla., at 218 North Harvey avenue; it comprises J. F. Ide and L. G. Suggs.

Daniel Sylvester, a wagon builder in Flushing, N. Y., is about to enter the garage trade; he has awarded the contract for a one-story brick garage, 40 x 175 feet, to cost $10,000.

The Electric Co., in Victoria, B. C., has had plans prepared for a two-story concrete garage, 30 x 60 feet, to be erected on

Digitized by Google

Discovery street adjoining the company's car barns; it will cost $10,000.

Samuel Houser and R. N. Hoews have formed a dealership firm in Omaha, Neb., and have located at 102 Farnam street. They have the Stevens-Duryea agency for Iowa and Nebraska.

The assets of the Tip Top Auto Co., of Hood River, Ore., have been sold to R. R. Carter and L. H. Goodenberger; hereafter the business will be known as the Columbia Auto & Machine Co.

The Riddell Auto Co. of Des Moines, Ia., is about to open a branch in Oskaloosa, in the same state; the agency will be used as an Overland distributing center for the southeastern part of the state.

The American Motor Car Co., located at 6016 Euclid avenue, Cleveland, O., has been reorganized under the style Northern Motor Co.; C. V. Lloyd is manager. American and Marion cars are stocked.

The Abbott Motor Car Co. has been formed in Cleveland, O., and will proceed to erect a building for its occupancy; temporary quarters have been secured at 2027 Euclid avenue. Abbott-Detroit cars will be sold; C. H. Davis is general manager.

R. F. Lindquist, a Tacoma (Wash.) business man, and for several years connected with the Standard Oil Co., has entered business for himself; he has established an agency for Miller tires at 755 South C street.

The Detroit Motor & Machine Co., which for several years has operated a machine shop on Hillger avenue, in Detroit, just has been incorporated with an authorized capital of $150,000, $75,000 of which has been paid in; the remainder is represented by property. The new capital will be utilized in the enlargement of the business.

Col. K. C. Pardee, one of the veterans of New York trade and who for many years was identified with the Maxwell-Briscoe interests, has returned to the business after a short retirement. He has secured the metropolitan agency for the Briggs-Detroiter car and established an attractive salesroom at Broadway and 61st street.

Recent Losses by Fire.

Chisholm, Minn.—Shannon's Auto Garage, damaged. Loss not given.

Atlanta, Ga.—Firestone Tire & Rubber Co., Auburn avenue, damaged. Loss not given.

New York, N. Y.—Forty-ninth Street Garage, 15 West 49th street, garage damaged and one car destroyed. Loss, $3,000.

Chicago, Ill.—Jackson Boulevard Garage, 1305-07 Jackson boulevard, garage damaged and four cars wrecked by explosion which caused fire. Loss, $10,000.

USED CAR DEALER SUED BY CAR OWNER IN MIXED DEAL

Automobile Is Replevined and Then Is Returned to Dealer—Latter Claims Owner Interfered and Blocked Sale of Car.

A Royal Tourist car of 1910 model, which was the property of Louis Talerka of New York City, would, if it had the ability, be very much confused as to whom its owner is and also as to where it is going next, all because of a lawsuit commenced in the New York City Court by Talerka against Green's Purchasing Agency, of Broadway and West 48th street, a used car establishment, which latterly has been figuring as the "auto department" of the not easily forgotten Manhattan Storage Co.

Talerka, it appears, turned over the car to the agency to be sold, placing a valuation of $1,000 on the vehicle. Just how much time the agency was to have in which to sell the car is disputed, but Talerka claims that when the specified time had elapsed he demanded his car and that it was refused. The agency alleges that it sold the car, but that before it could make delivery Talerka replevined it. The replevin order was granted in the City Court and delivered to a sheriff. The Green people then made claim that the undertaking on replevin was insufficient and the sheriff was ordered to give back the car to the agency. The next move was made by Talerka, who appealed to the Appellate Term of the Supreme Court for New York county, with the request that his undertaking he declared sufficient; if decision is favorable to him the sheriff will be called upon to give the car another of its checkerboard moves. Then may come a suit to ascertain whether the sheriff's last move was proper and, if it was not, the car may move back again.

Financial Straits Cause Stein to Quit.

The Stein Tire & Rubber Co., which has been a figure in New York's automobile affairs at 1741 Broadway, has withdrawn from the trade and the principal in the concern, Arthur S. Stein, has exchanged his position of merchant for that of salesman, being now connected in that capacity with the Howe Rubber Co., of New Brunswick, N. J. Unfortunate accounts are said to have had much to do with Stein's undoing.

When financial troubles began to loom threateningly the E. J. Willis Co., a Chambers street supply house, being the largest creditor, took a considerable portion of the Stein stock in payment, and only last week the remainder was taken over by the Auto Owners' Supply Depot, of 1773 Broadway. What accounts remain uncollected have been entrusted to the Sonora Motor Horn Co., which occupied a part of the same building that housed the Stein company. The Sonora concern has removed to 83 Chambers street and will busy itself for the next few months in efforts to collect the Stein accounts.

As a reminder of its business career, the Stein company appears in the New York City Court as defendant in an action brought by the Portage Rubber Co., of Barberton, O., in a suit based on a note for $4,376.33 for goods sold and delivered, and which went to protest in September. Another note, for $4,500, held by the Central Savings & Trust Co. of Akron, O., due October 21 last, also has been protested. Both notes are said to bear the endorsement of Arthur S. Stein, E. J. Willis and the E. J. Willis Co.

Oliver Truck Succeeds Oliver Car.

The jigs, dies, patterns, patents and similar assets of the Oliver Motor Car Co., which practically died borning, have been acquired from the receiver by a new corporation styled the Oliver Motor Truck Co., of which G. A. Meyer is president and general manager. Two other officers are F. J. Meyer, treasurer; R. F. Beach, sales manager; D. Brewster, superintendent. Temporarily, at least, the company will conduct operations at 460 Lawton avenue, Detroit, where it will produce the Oliver 1,500-pound light delivery wagon and the 3,000-pound truck which brought about the undoing of the old company.

Meyers Becomes Swinehart's Manager.

After casting about for the right man for a considerable time, the powers that be in the Swinehart Tire & Rubber Co., of Akron, have selected Clifford E. Meyers for the office of general manager. Previously Meyers was manager of the Diamond branch in Cleveland. Incidentally, A. E. Williams, formerly the Swinehart advertising manager, has gone to the Staver Carriage Co., of Chicago, in the same capacity.

Receiver Now Takes Whitesides Truck.

Following the closing of the plant by order of the directors, Mark Davis has been appointed receiver for the Whitesides Commercial Car Co., of Newcastle, Ind. From its beginning, a year ago, the company has lacked funds and never made much progress.

Parts Makers Take up Complete Chassis.

Heretofore confining itself to the manufacture of parts, the Nichoalds Co., of Detroit, has taken up the production of complete chassis for the trade. The company is located at 424 Grand River avenue.

ENGINE STARTERS AS SAFETY DEVICES.

Although on more than one occasion the engine starter has been eulogized as a "life saver" in both the slangy and pure English meanings of the phrase, the full extent of its far-reaching benefits are but gradually being comprehended.

As surely as wear is the greatest agent in the natural "dissolution" of an automobile engine, just so surely does any device which reduces wear act to prolong life, and it it here that the life saving role of the engine starter becomes apparent, for it encourages the practice of stopping the engine when the car is stopped temporarily. While the actual wear that takes place when an engine is "turning over" idly is very small, it no longer is necessary to endure even that small amount of wear in order to obviate the physical labor of setting the engine in operation again.

The manner in which it eliminates accidents due to cranking with gears in mesh often has been remarked, but there are occasions when the starter may serve equally important purposes, which hinge directly on the seeming proclivity of some motors to stall in crowded streets and thereby obstruct traffic, and to stop in even more dangerous places, of which a railroad crossing with a train approaching is a more or less familiar example that invariably places human life in jeopardy.

In such cases, where the car is fitted with an engine starter the engine can be quickly and easily re-started and the hazard is immeasurably reduced. Even when the engine refuses to start immediately under the persuasion of the starter, it is perfectly feasible with many such devices, particularly electrical devices, to propel the car itself with them out of danger and into safety. In short, the engine starter rightly may be considered as a factor of safety as well as a convenience.

THE EPIDEMIC OF "TIRE FILLERS."

It is quite evident that the idea widely obtains that there are millions to be made in the manufacture and sale of tire filling compounds. It is a dull week indeed when there are incorporated less than a half dozen companies with that end in view, and it is a poor company which cannot incorporate under the laws of Delaware with an authorized capital of at least $1,000,000.

Despite the unfavoring and unrelenting attitude of tire makers toward the use of such compounds, the number of tire filling enterprises already greatly exceeds the number of tire manufacturers, and if their increase continues there soon may be a tire filling company for every other separate tire that is produced, and the dictionary will be depleted by the efforts of word coiners to find apt or original designations for their respective compounds.

Several tire filling compositions have been on the market for a term of years, but at no time has their sale compelled world-wide attention. It is only within the last twelvemonth that the manufacture of such concoctions became epidemic, and the cause for it apparently rests in the remarkable success achieved not so much from the sale of a particular filler as from the sale of stock, "state rights" and other "rights" by several groups of shrewd men who seized the opportunity—or created it—and made the most of it.

Regardless of the merits of tire fillers, it is fairly plain that when the epidemic shall have run its course the number of sadder but wiser persons will have been greatly increased.

TRUCK LOADS AND LEGAL REQUIREMENTS.

Whether or not it becomes law, or whether it even gets so far as to come before the legislature, the proposal of the New York State Highway Commission to arbitrarily limit the maximum weight to be carried by a single motor truck axle, with the object of preventing the injury which heavy motor trucks are alleged to have caused to road surfaces, will at least have the effect of calling attention to the fact that there is a practical way in which the law may be obeyed while carrying loads that would overload two axles. That is to say, three axles can be used.

Trucks of the three-axle or so-called semi-trailer type, in which the front end of a load-carrying two-wheeled trailer is supported on a fifth-wheel on the frame of a short tractor, have been demonstrated to be entirely practicable, the principle having been adopted by a number of builders. Not only is the weight distributed over three axles instead of only two, but the load can be heavier in proportion than is usual in two-axle trucks and an approximately equal distribution of weight over the three axles is possible.

Should the proposed amendment to the highway law be enacted there is no doubt that manufacturers would be able to design three-axle trucks of paying capacity without exceeding the proposed limit of four tons per axle.

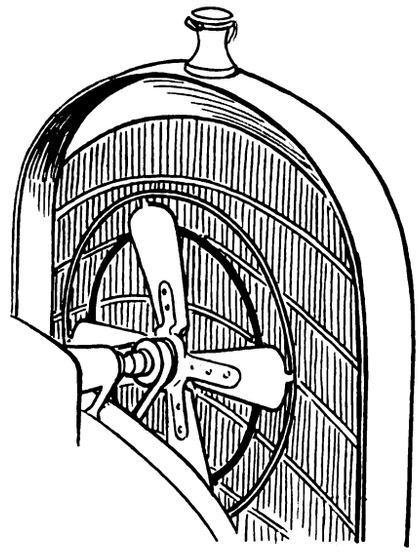
S. A. E. SCHEDULES ANNUAL THREE-DAY WINTER MEETING

Sessions Will Be Held in New York's Newest Hotel—Papers To Be Read and Subjects for Discussion

Changing slightly the program that was adhered to last January, the annual winter meeting of the Society of Automobile Engineers which is scheduled for the three days beginning January 16 next, will be held at the Hotel McAlpin, at the corner of 34th street and Broadway, New York City, instead of at Madison Square Garden. As was the case at the last winter meeting, the session is to be preceded by a meeting of the Standards Committee, which will be held at the headquarters of the society at 1786 Broadway on Wednesday, January 15th; it is called for 9:30 in the morning.

Business and professional sessions of the Winter meeting proper will be commenced at 9:30 on Thursday morning, January 16th, and will be continued in the afternoon at 2 o'clock and on Friday morning and afternoon. Friday evening, January 17th, has been reserved for the annual dinner, and business will be suspended with the termination of the last session on Saturday morning.

Among the papers and reports which will be discussed at the meeting, some of them having been held over from the Summer meeting cruise, are. Effect of Relation of Bore and Stroke in Automobile Engines, by John Wilkinson; Stability of Automobile Propeller Shafts, by J. M. Thomas; Method of Brake Capacity Determination, by S. I. Fekete; Leaf Springs, by L. J. Lane; Standardization of Drawings, by George W. Dunham.



In all probability at least some of the following subjects also will be treated of either in papers or by discussion: Motor sizes for trucks; comparative data on motor tests; relation of road testing to dynamometer testing; worm gears; magneto couplings; relation of design to construction of motor cars; will the six-cylinder motor eventually displace the four-cylinder motor for pleasure cars? Is the transmission preferably located on the rear axle as a separate unit or combined as a unit with the power plant? Why has the 42-inch wheel been discarded? With the electric starter, lighting plant and ignition possible in one unit, will the magneto be discarded? Wire wheels.

London Show Breaks Attendance Record.

If figures go to prove anything, the popularity of the automobile show is not wanting abroad. During the eight days and nights the London show was open to the public, 255,112 persons passed the turnstiles, as against 226,095 in 1911 and 218,908 in 1910. Each year, Wednesday proved the largest single day, the attendance figures for that day each year being 38,115, 38,746 and 48,749, respectively.

Little Known Features of Well Known Cars

It is the protection afforded the more delicate and easily deranged parts which have to do with the proper functioning of the car that has made the modern automobile reliable. While it is not always feasible so to strengthen a part that it can bear without ill effect all the blows that are directed toward it, in nearly all cases it is possible to arrange some sort of a contrivance to relieve the more delicate parts of the strain.

RAMBLER RADIATOR PROTECTION

Such practice is common with the car owner as well as with the manufacturer, as exemplified by the fitting of a bumper for the protection of the radiator. It is rare, however, that the practice is extended so that the radiator is protected from blows directed at it from within the hood. Such, however, is the case with the Rambler car, on the radiator of which is is fitted a guard to prevent injury in case a fast whirling fan blade should become loosened, or so bent as to be able to contact with the fins on the cooler tubes. As shown in the sketch, the device is nothing more nor less than a circle of quarter-inch wire, of slightly less diameter than the fan, and which is soldered on the radiator fins directly in front of the fan.

December 7-22, Paris, France — Paris Salon.

January 2-10, New York, N. Y.—Importers' salon in Hotel Astor.

January 4-11, Montreal, Can.—Annual automobile show in the Drill Hall and Armory, under the auspices of the Automobile Club of Canada.

January 6-11, Cleveland, Ohio—Cleveland Automobile Show Co.'s exhibit in the Central Armory.

January 11-18, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Pleasure cars only.

January 20-25, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the First and Third Regiment Armories.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

January 21-26, Toledo, Ohio—Annual show in the Exposition building under the auspices of the Toledo Automobile Shows Co.

January 25-February 1, Providence, R. I.—Annual show of the Rhode Island Automobile Dealers' Association in the Providence State Armory.

January 27-February 1, Ottawa, Can.—Annual show of the Ottawa Valley Motor Car Association in Howick Hall.

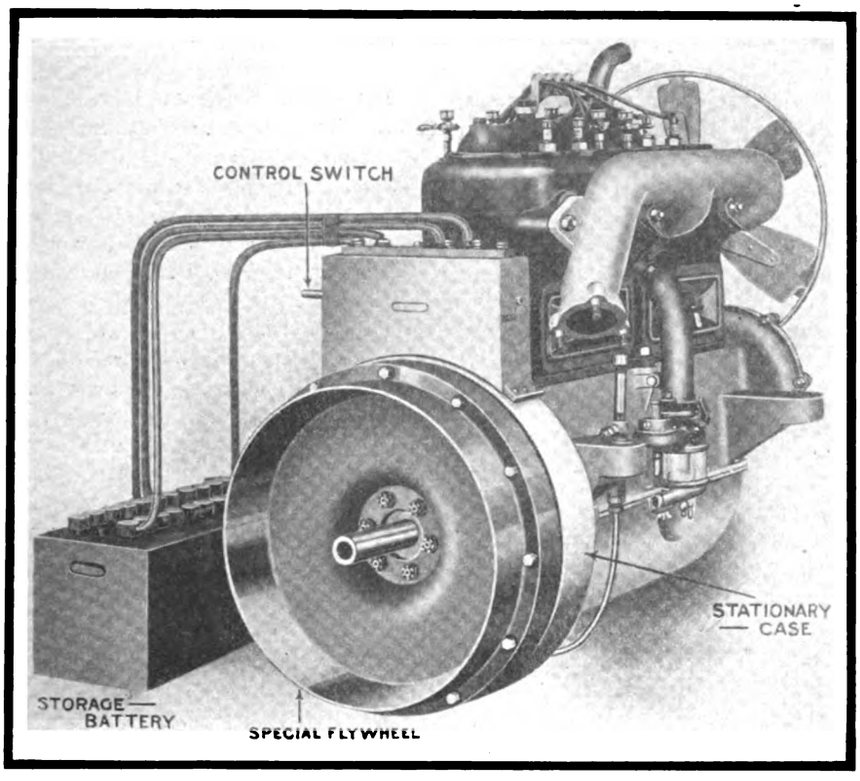
January 27-February 1, Scranton, Pa.—Third annual show of the Scranton Automobile Dealers' Association in the 13th Regiment Armory.

January 27-February 1, Detroit, Mich.—Detroit Automobile Dealers' Association's Show in the State Armory.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Pleasure cars only.

February 8-15, Hartford, Conn.—Sixth annual show of the Hartford Automobile Dealers' Association in the State Armory.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.



February 10-15, Minneapolis, Minn.—Minneapolis Automobile Show Co.'s show in the National Guard Armory.

APLCO ADDS FLYWHEEL TYPE OF LIGHTER AND STARTER

It Is of Combined Motor and Generator Pattern With Only One Moving Part—Simple Control Mechanism.

Supplementing other electrical apparatus, prominent among which is a lighting system and a combined lighting and engine starting system, the Apple Electric Co. of Dayton, O., has developed and brought out another new lighting and starting system which is radically different from anything that has borne the Aplco trademark in the past and which is calculated to overcome any and all of the objections, hypothetical or otherwise, that may have been raised against other systems.

APLCO FLYWHEEL TYPE LIGHTER AND STARTER, SHOWING ELEMENTS

The new Aplco system is of the pattern known as the flywheel type, in contradistinction to the previous Aplco combined system designed to be driven and to drive either through the timing gear train or through some other convenient rotating shaft. It differs in several respects from other such flywheel systems, however, and has the advantage that it may be applied to any existing engine without the necessity for altering either design or construction to any considerable degree.

Briefly, the new system consists of two units, one of which is attached to what is described as a pad on the frame of the motor and the other is bolted directly to the flywheel, the appearance of the apparatus as attached to a standard motor being shown by the accompanying illustration. The field, which is of the multipolar type, is contained within the armature, the latter being bolted to the flywheel and rotating about the field. The mechanism is completely enclosed in a stationary aluminum case upon the top of which is mounted the control unit.

The controller is a modification of the controller furnished with the older type A6 Aplco lighting and starting system and incorporates a number of improvements calculated to render its action more efficient and more automatic. One of its features is that it is equipped with the distinctive Aplco "stop charge" device which automatically reduces the amount of charging current to the battery in proportion as the battery approaches the fully charged state. Similarly, it also increases the charging rate as current is drawn from the battery for lighting or starting.

For starting and for lighting the voltages are 6 and 12, respectively, the battery being of the 12-volt size. Manipulation of the controller handle for starting automatically connects the battery for a pressure of 12 volts, causing the combined dynamo and motor to "spin" the engine at approximately 120 revolutions a minute until it picks up its own cycle of operations, when, if the starting handle is released, it is spring-returned to the "stop" position, effectually preventing the battery discharging itself through the motor when the current is not needed. Altering the position of the starting handle to the "running" position automatically rearranges the battery connections so that the battery receives its charge at the rate of 6 volts. The generator commences to charge the battery, provided, of course, that charging is necessary, at 250 revolutions a minute. Control of the output is entirely automatic and is held within the limits prescribed by experience as the most advantageous to the battery. The simplicity of the mechanism is indicated by the fact that but four wires are required to carry the current from the battery to the controller.

Michigan Fourth Speed Not an "Overstep."

Although the pen is said to be mightier than the sword and its influence is known to have altered the destinies of nations, it is powerless to alter the mechanical construction of a gearset, for instance—except on paper. Consequently the four-speed gearset with which the Mighty Michigan cars are equipped remains of the type in which high speed is direct drive and is not, as inadvertently was stated last week in Motor World, an "overstep" with direct drive on "third." In designing the Michigan four-speed gearset, the manufacturers have worked on the hypothesis that true arithmetical progression in gear changing is productive of the greatest efficiency and flexibility and for this reason the gear changes in Michigan cars have been arranged so that they virtually represent speed ratios varying by a common difference, as 1, 2, 3, and 4, with direct drive on fourth.

Will Make Inner Tubes in Sections.

The Roberts Mfg. Co., of Trenton, N. J., which recently was incorporated under Delaware laws with an authorized capital of $1,000,000, has in view the production of a sectional inner tube for automobile tires, the first of which are being produced in a plant in Trenton. The tube, which is the invention of Frederick T. Roberts, the moving spirit in the company, is made up of 10 separate sections, in each of which are 32 cells running the length of each section. Each cell is filled with compressed air, the ends of the tube being vulcanized to prevent its escape. In the event of a puncture, it is the idea that only a comparatively few cells will be affected and that the substitution of an unpunctured section immediately will repair the difficulty. In other words, instead of carrying "spare" inner tubes, the motorist will have need only to carry the "sections," each of which are about 10 inches long.

WHY BUSINESS DOESN'T COME

Dealer Should Find Answer to This Question If He Wishes to Overcome Obstacles—Inaggressiveness a Cause.

What is the reason I don't get the business that I don't get? is a question that every dealer can afford to ask himself again and again until he has arrived at a satisfactory answer. Indeed, unless he does ask it of himself and puzzle over it till definite conclusions are arrived at, his business is quite likely to stay just as it is and the number of customers to remain about the same.

One of the secrets of successful salesmanship is careful planning. And to plan carefully one must take into account all the negative influences as well as those in his favor. No successful salesman is ever satisfied. Just as he studies his successes to get out of them the pure gold, so he studies his failures until he wrings from them the elements of weakness.

Analysis of Failures.

Many dealers easily can answer the question by admitting to themselves that the reason they did not get the business they failed to get was that they did not go after it aggressively, persistently and intelligently. Others would have to confess that they simply took what came and did not seek to analyze why more did not come. Still others might deceive themselves by fancying it was entirely a matter of price, when it was not.

But price-cutting is not salesmanship. The majority of people are not throwing away money; on the other hand, where value is established decisively and thoroughly the average man does not look for or expect a cut.

There must be some real reason. What is it? Do not give up till you have nailed it down. There is a cause wherever there is an effect. If one study causes and effects he shall soon know just what is necessary to be done to get the orders that he failed to get.

Business develops just as it is made to develop; it increases just as it is planned to increase if the plans are made with intelligence from the standpoint of actual facts.

THE CUT PRICE EXPLAINED.

If the meaning of a cut price is explained to a prospect he will rarely pursue the subject further.

Every car on the dealer's floor depreciates in value the minute he cuts the price of any one of them. News of cut prices travels like fire. Not only do the friends of the man who gets the car know it, but the other dealers know it, and the result is that when, after a year or two of use, the purchaser of the discount car wants to trade in his car he finds that the dealer, in arriving at values, will make his starting point the discounted price instead of the list price—so he has gained nothing.

Every business man who has it explained to him that, where one has to divide the money with the customer he cannot give the service, is quick to appreciate that he to cannot expect to have his cookie and his penny, too.

DOUBLE VALUE FROM POSTAGE.

It is just as important to advertise to the customers you already have, and thus sell them more goods, as it is to advertise to people who have never done business with you. Indeed, it is far more important. You know the credit standing of those with whom you are doing business and they know you; logically, it ought to be much easier to sell them anything.

Every bill and every statement that goes out of your office should carry with it a reminder of something you sell. Sometimes your lines of cars and their advantages, sometimes your repair shop, your garage facilities. At other times, like fall and winter, it is good business to advertise the things that appeal particularly at those times. At the present time tire chains, non-skid tires, non-freezing oils, anti-freezing solutions, all can be made profitable subjects for brief, pointed advertisements on slips three and a half inches wide by six inches long.

As a matter of fact, several of these slips touching on different articles would prove profitable business producers. Postage, when used as suggested, costs nothing and the investment for printing is so slight as to be negligible.

One dealer sends every customer hints on care of cars during the winter season with various cautions, etc., that are greatly appreciated and help accent his desire to preparations, thus missing a good part of the selling season.

PROFITS POSSIBLE IN WINTER.

The minute cold weather starts the demand for alcohol and other non-freezing solutions is very active. There is money to be made supplying this demand, and the wise dealer will cash in on it. Too many garagemen wait until the freezing weather actually arrives before pushing the various preparations.

The sign should be up now and be big enough to force attention from every regular customer and every transient.

Incidentally, the cold winter months offer many other opportunities to the energetic garageman. For example, in every locality there are numbers of people who have private garages which are unheated. If these people were circularized and the advantages of keeping their machines in a warm garage during cold weather were pointed out, it would help to bring in many new boarders and at the same time create a new market for many other forms of garage service.

AWAKE-N DISING WORLD

OPPORTUNITY IN NEW MODELS

Creation of Fresh Interest Easy at Time When Latest Cars Arrive in the Salesroom—Methods Dealers Have Used.

When the new models come in, the automobile dealer has a wonderful opportunity to create fresh interest in the line he sells; for, regardless of what the motorist may be driving at the time, he is always interested in examining new cars and observing improvements.

How to get the people into the store, however, is a problem that has many angles, all of which are well worth studying. The announcement in the local paper is, of course, a natural and a logical method of attracting attention and can be made very effective. But this is not the only means of stimulating interest, and the dealer who is actively seeking business will not let his efforts rest there.

Effectiveness of Mailing List.

One dealer who has been successful makes a specialty of having an up-to-date mailing list. This list includes every one who has purchased a car from him during a period of four years, the names of every automobile owner in his territory and a very complete list of "A1" prospects (not owners) which has taken much time and effort to compile. To each of these he mails a neatly printed invitation the day before the newspaper announcement appears. Thus the big newspaper advertisement is in the nature of an effective follow-up to the personal invitation.

Taking Advantage of the Telephone.

On top of this, after the second day and for the ensuing three or four weeks, the salesman on store duty takes his list of prospects and extends telephone invitations to a score of them to drop in that day. While telephoning the salesman makes it a point to incidentally ask the prospect the names of any friends who might be interested, and thus many valuable additions to the list are secured.

As a result of this systematic work, many sales are developed and the most is made of a big opportunity.

OPERATING THE GARAGE'S DOORS.

Whoever drives into the North Woodward Garage of Edwin Brosch, in Detroit, appreciates the fact that he does not have to step out of his car to open the garage door, as in many places, nor does he have to sit in his car and toot his horn while waiting for a busy employe to find time to come and open the door.

Within convenient reaching distance is a rope, a slight pull on which opens the doors. The man in the rear of the garage pulls another rope and the doors close automatically.

Going out again, a rope from the inside is pulled and again the doors open without any fuss or trouble, and in the same way are they again closed by one of the garagemen.

It is done by means of ingeniously arranged sash pulleys and weights. The idea is simple and practical and makes a strong hit with car owners; also it renders unnecessary the horn tooting that often amounts to a neighborhood nuisance. It is worthy of wider adoption.

THE DEALER AND ADVERTISING.

Advertising is not a magical Aladdin's lamp to be utilized by the dealer only at such times as he desires instant increase in his business. Advertising is more like the good salesman who goes on his way making his daily round of calls, convincing some, but not able to close for reasons that cannot be overcome in a day; half convincing others that another call will enable him to close; making a sale here and there, but always building up the reputation and influence of his house and adding to its prestige, and in the end making a very profitable showing.

All of which means that advertising should be used systematically, regularly, not in occasional flashes.

Advertising should be regarded as an investment, not as an expense. And each advertisement should drive home some real point about the goods. After reading it, a new point, a solid fact should be lodged in the reader's mind. Continued effort along such lines is bound to prove profitable.

Most manufacturers have an advertising service department and stand ready to furnish not only good electrotypes but excellent copy that can be used to advantage by dealers handling their cars.

Many accessory and tire manufacturers pursue the same policy, so that to-day it is easy for the dealer who wants to advertise to get the right illustrations and the right text that will add reputation and business.

PROOF OF REAL SALESMANSHIP.

Real salesmanship is nothing more nor less than the establishing of a thorough appreciation of the value of the article you are selling in the mind of the other man. When you do this your work is well done and you need not worry about the results. You may not get the order then and there, but if you have succeeded in establishing in the mind of the prospect the dollar-for-dollar value of your product so that he believes it is the best for the money, the order will inevitably follow.

In selling automobiles this naturally presupposes two things—fiirst, that the salesman has convinced himself of the value of his car by the analysis of its construction, by careful comparison, by accurate knowledge; second, that he knows his car through and through. There are many other methods of salesmanship, but this sort of selling achieves large results and builds permanent business.

Solutions of The Used Car Problem

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Best Four Articles Dealing With the Subject.

By J. W. FRASER, Cleveland, O.

How to handle the used car problem is, in my estimation, almost as difficult as the tariff. But it seems sooner or later, it will receive very serious thought by the students of automobile disposal, and eventually will be to a certain extent brought to a more satisfactory basis than at present. In my opinion the methods used by dealers in automobiles to take used cars in trade are almost suicidal. One dealer offers a certain amount in trade on a new car, the next offers more, or less, depending on how anxious he is to dispose of his allotment, and in most cases sacrificing some or almost all of his profit, and what he has made, if any, is represented by a second-hand car which requires as much or even more salesmanship to dispose of than does a new one.

Now in order that every dealer may be on the same basis and not be placed in embarrassing positions, I am led to believe that the dealers should get together and form a company—an automobile trading company—and when a customer has a used car to trade for a new one that he be referred to this company, the head of which should be a thoroughly practical man, and well versed in all makes of cars, and also possessing the faculty of properly appraising the value of a second-hand car; if need be, he should run it and look into the condition of tires, style, paint, bearings and general condition throughout.

The appraiser of this concern should take into consideration the probable figure at which the car can be disposed of and from that sum deduct a certain amount and arrive at the proper amount to be allowed by the dealer in new cars, and also, if need be, give the customer a check payable to the order of a dealer for a new car, or at least a statement in writing that can be used as a basis of allowance in a trade. This credit slip would be given as part payment for a new car; then all the dealer will have to do will be to turn in the old car to the automobile dealers trading company to be reimbursed for it and deliver his new car, obtaining a price that is legitimate. At the end of the business year the profits of the second-hand company can be divided pro rata.

This method would tend not only to put all dealers on the same footing but would eliminate the cut-throat practices now employed, and simply mean that if a certain dealer is compelled to dispose of a certain percentage of his allotment at a reduced figure, he must be frank and honest about it and not try to sear his conscience by imagining he is keeping up his price by making an exorbitant allowance for the old car, whereas he really is foisting on himself a very poor bargain.

The public at present has a very good idea as to what a second-hand car can be bought for, and naturally the dealer who makes the most extravagant allowance is the one who usually gets the business. As most of the standard cars now built are a good buy at the figure set upon them, this suggested solution of the problem would also tend to check the practice of the car owner making himself the hawker of a "lemon" in the shape of a used automobile; in the end it also would increase his self respect and keep him out of the Annanias club, as most men are prone to boast of their ability as traders and in so doing have a tendency to boost the price obtained by them for their old cars or minimize the price obtained from the dealer, thereby again putting the dealer in an embarrassing position with the next prospective customer, who probably knows exactly what cash consideration on his old car Mr. B gave and obtained for his latest acquisition.

By W. F. O'BRIEN, Chicago, Ill.

In seeking to solve the used car problem, why not follow the custom employed in disposing of the automobile's forefather—the horse.

A big price is paid for a good horse, but after its usefulness has been worked out of it, it is sent to the "killers" and killed, and parts that are still useful to this generation are put back on the market in different ways, as, for instance, the hide for leather, bones for fertilizer, etc.

The old automobile should be headed toward the "killer." The main reason they are not headed that way is because the dealers are too anxious to make a big sales showing, and therefore allow too much for the old cars. As he can not afford to let the "killer" have the cars at a price, the market consequently is flooded.

The "killer" referred to is the man who buys the old car and dismantles it. The engine goes, perhaps, to the man building a boat, the farmer for a wood cutting machine, feed cutter, etc., and not a few to the would-be mechanic and aviator, to rebuild their old cars, their planes, air-wagons, ice bobs or other freaks, that find their way sooner or later to the smelter in the whole, not even dismantled. The tires, steering gears, radiators, axles, transmission, etc., not of a too antique design, generally find a ready sale to the unfortunate individual who has collided with a tree or other obstacle with his new, or nearly new, car, and wants it repaired cheaper than it could be done by a machine shop furnishing new parts. By the time this is done the brass, copper, aluminum, odds and ends have gone to the smelter and the old car or cars are completely off the market.

Let the dealers strive to sell to parties who junk the old car and not to the ones who patch it up and "sting" some one, which only makes one more hard customer who takes long talking to convince that a good car is like a good horse, and a poor one like a balky nag.

This Competition Closes Monday, December 16th. No "Solution" Received After That Date Will Be Published or Considered.

EDUCATING PUBLIC THROUGH THE SHOW WINDOW

Silent Lecturer and Moving Pictures Instruct Those Who Pass Establishments of Automobile Dealer and Tire Manufacturer in New York—Hundreds Daily Familiarized With Shop Operations.

NEW YORK CHALMERS SALESROOM SHOWING HOW THE FACTORY WAS BROUGHT TO BROADWAY

Showing visitors through the factory is a pleasure for the up-to-date manufacturer who is anxious to put his product on an advanced footing with the public; the visit to the factory not only affords the manufacturer an opportunity of winning the caller's esteem through courteous treatment but it presents an occasion for impressing the sightseer with the solidity, thoroughness and reliability of the company, and hence the desirability and safety in owning its product. Many factories extend a perpetual invitation to interested and uninterested persons to inspect the plant.

The Chalmers Motor Car Co. of Detroit, Mich., however, has gone this personal visit one better, as is evidenced by this company's metropolitan distributer, Carl H. Page & Co., of Broadway and West 50th street, New York City. As Page cannot take New York to the factory, he has brought the factory to New York—that is, he has brought a fairly good substitute and is daily educating Broadway in the workings of the big Chalmers plant.

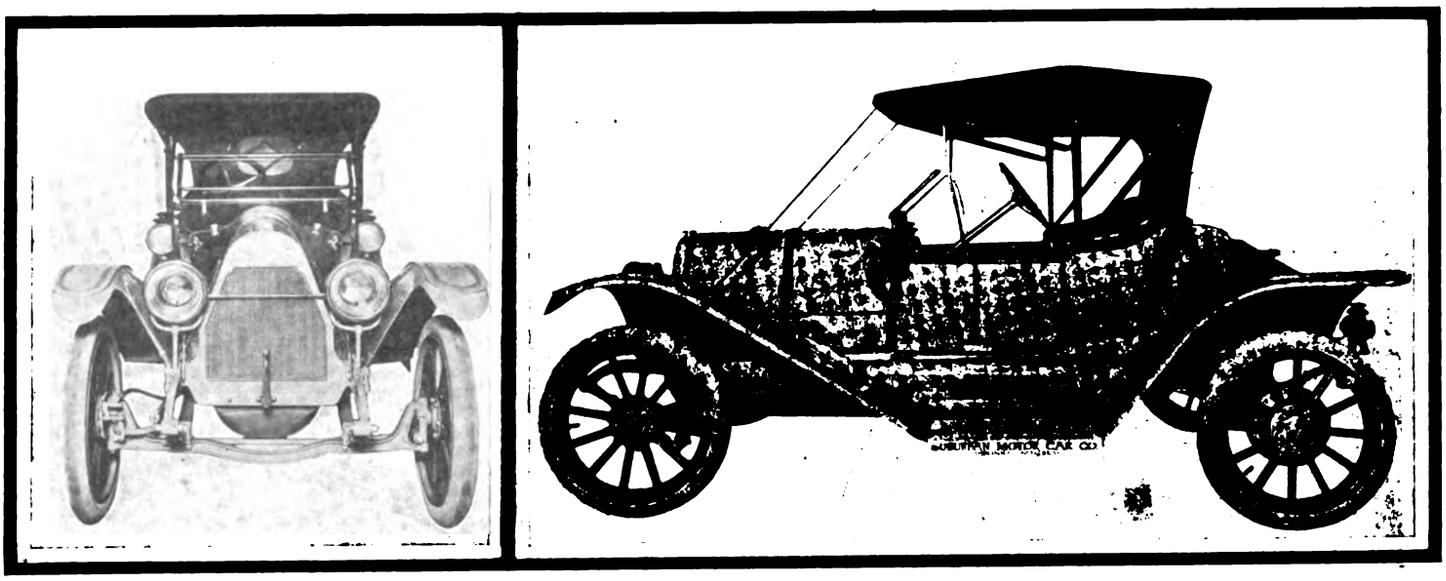
The plant, although it occupies several acres in the "Automobile Capital," is, in New York, contained in one of Page's show windows, and he is getting value received for the money he has invested in window space. The factory in the window is nothing more nor less than a large paper mache picture in relief, showing the entire factory, detached structures and all, just as it is seen by a bird flying over the establishment. The windows are translucent and the throwing of an electric switch in the background gives an excellent imitation of the factory as it appears when the night force is at work. From the street the picture is seen in attractive perspective and of itself is sufficient to win attention.

But the scheme does not end here—in fact, the picture may be said to be a minor part of the plan. Between the picture and the window is an upright standard carrying a book of photographs taken in the factory, the separate pictures being mounted on linen and capable of being let fall over the top and at the back of the standard, just as maps are handled in schoolrooms. On the floor near the window are a quantity of automobile parts. The remaining figures in the scene are a pointer and a man.

The man is the teacher in the "public school." Turning the leaves of the book to a photograph of the paint shop, for instance, he points to the explanation, printed on the photograph in letters large enough to be read from the sidewalk, indicates the operations described and then, with the pointer, touches the relief picture of the paint shop at the rear of the factory prem-

Digitized by Google

ises. The next photograph may be that of a man drilling a connecting rod big end. The explanation is indicated, the teacher pushes his pointer through the hole in a real connecting rod he has picked up from the floor and holds the part up to the photograph as nearly as possible in the same position as the rod is held by the mechanic in the picture. Next may be a man turning a camshaft or a crankshaft, and similar procedure is followed. The demonstration serves to dispel much of the mystery that shrouds the making of an automobile with a large part of the public; many operations are unfamiliar even to the owners of cars.



The big relief reproduction of the factory is sufficient to attract attention; but when the man is on the scene, mutely operating his pointer, spectators are never lacking. The show window is close to the 50th street downtown station of the subway, and hundreds of people pass the corner every day.

Another window display of an educational nature consists of a miniature moving picture exhibition of spectacular tests of Diamond safety treads, and is "staged" in one of the windows of the palatial store of the B. F. Goodrich Co. of New York at 1780 Broadway. At the small end of a long, black, tapering box is a screen on which the pictures are projected; the other end, which is open, faces the window. The pictures, which are clear and sharp, show the marked difference in the behavior of two cars on a wet, slippery asphalt pavement, one machine fitted with smooth tires and the other with the safety treads. Sharp turns are shown, in which the smooth-tired car skids around and faces the way it came, while the safety treads hold true to their course; and braking tests, in which the same difference in adhesion to the slippery road surface is exhibited. The "movies" rarely fail to attract a crowd.

INITIAL PALMER PRODUCT A WELL-STANDARDIZED CAR

It Is a Roadster Model With Foreign Lines But Distinctly American Parts—Production To Be Pushed.

The initial product of the Palmer Motor Car Co. of Ecorse, Mich., which, as was told last week in Motor World, was evolved from the Suburban Motor Car Co., proves to be an unusual appearing roadster model which suggests not a little foreign practice in its lines. Despite the appearance of the car, however, apparent principally in the shape of the radiator and hood, its specifications reveal nothing that is radical in its make-up. In fact, all of the various components are of standard construction and the list reveals the names of only parts makers of recognized merit in the trade. Already a factory site has been obtained and preparations are being made actively to push production.

FRONT AND SIDE VIEWS OF PALMER ROADSTER, SHOWING DISTINCTIVE SHAPE OF HOOD AND RADIATOR

In the choice of a motor, conservatism is apparent in the dimensions of the cylinders adopted, a middle ground rather than an extreme in the matter of stroke or bore ratio being one of its features. It bears the well-known Hazard name-plate and the bore and stroke are 4 inches and 4½ inches, respectively, permitting a nominal rating of 30 horsepower. Motor auxiliaries, no less than the motor itself, have been the subject of much deliberation and careful choice, as is revealed by the fact that "mixture" is supplied by a Stromberg carburetter and sparked by a Bosch high tension magneto.

From the engine, power is transmitted to the road wheels through the intermediary of a multiple disc clutch operating in an oil bath, which type was chosen by reason of its universally "sweet" action and the usual absence of slipping and grabbing. The gearset is the product of the Brown-Lipe company and provides three forward speeds and reverse, obtained in the orthodox manner by means of a selectively operated hand lever. Both the front axle, which is of substantial construction and I-beam in section, and the rear axle, which is of the floating type, are produced by the McCue Co. of Buffalo, N. Y., in its usually thorough and workmanlike manner. The wheelbase of the standard chassis is 114 inches, with semi-elliptic springs both front and rear; tires are 34 x 3½ inches.

The roadster model which now is being produced is of the generally accepted pattern in which the steering column is located at the right side. The upholstering is deep and the seat is proportioned to permit both occupants plenty of elbow and leg room. Lending a rakish appearance suggestive of speed, the engine bonnet is rather longer than is usual, the effect being heightened by the low flush sides of the body and the location of a gasolene tank of generous capacity at the back of the seats. Behind the gasolene tank, which is rectangular in section, a small trunk, tapered to conform to the lines, permits the storage of tools and spare parts and at the same time adds a finishing touch that fills out the otherwise empty space and gives an unmistakable appearance of completeness.

The Right Way to Wash Radiators.

Running a car for a considerable distance over very muddy roads is apt to result in the clogging up of some of the radiator spaces with mud. This, of course, may easily be washed out with a hose, but the water should be applied from the rear so that the magneto will not be wetted.

REILLY EXPRESSES HIS VIEWS ON OVERCHARGING

He and the Sales Manager Argue the Pros and Cons of the Parts Price and Repairing Questions—They Haven't Yet Discovered Why Renewals, When Put Into a Car, Become So Highly Valuable.

The Reilly family had consented to run into the city and help the Sales Manager's family dispose of an abnormally large Thanksgiving turkey, only on condition that the Sales Manager's household forthwith migrate to Reilly's town for a weekend, while Reilly remained at the factory for a salesmen's meeting, and on the following

BEFORE THE SALES MANAGER COULD CLIMB OVER REILLY WAS AT WORK

Sunday help wreck the pompous post-Thanksgiving bird that Grandfather Reilly had sent from the country; which accounts for the appearance of the Sales Manager and his soon-to-be-host speeding over a country road in Reilly's car on Saturday afternoon, the cares of business and the factory left as far behind as was possible with this pair.

Reilly's Boyishness Asserts Itself.

For the first few miles out of town neither said much. The silence might have been unbroken for the thirty-or-so miles had not Reilly, in whom boyish traits had not entirely eliminated themselves, spied a walnut tree in a fence corner, which is sufficient to stop the progress of any youth. The Sales Manager looked in astonishment as Reilly closed the throttle and, with a "Come on, Jim!" jumped out of the car and began to climb the fence.

"What for? Where are you going?" the Sales Manager finally managed to ask.

"Walnuts," was the only comment.

Sitting in the car proved to be a solitary occupation, so the Sales Manager finally decided to emulate his companion and climbed the board fence, but by this time Reilly was busily at work, seated on a boulder, a cobblestone in hand as a hammer and a growing pile of nut shells giving testimony to his industry. It didn't take the city-bred man long to follow suit, once he discovered that the shaggy-barked tree bore the nuts for which he paid good prices at street corners.

Parts Catalogue That Needed Revision.

Silence again reigned, except for the clacking cobblestones, until the lightning-like brain of the dealer made a faraway jump to a very foreign subject and he asked: "When are you going to revise that parts catalogue?"

"Coming through the print shop now; why?" the Sales Manager managed to explain between bites.

"Nothing; only I think you need it. I suppose we'll get better prices on some of the parts, won't we?"

"Yes," admitted the Sales Manager. "Some of them have been cut down. But why? Are you starting to kick, too?"

"Well," was Reilly's admission, "some of my customers have been kicking, and if I think they're right why shouldn't I complain a little? If you keep on with that catalogue you'll be as bad as the factory that makes Henry's cars; he's only a few doors from me, you know, and he's lost a lot of trade because his customers thought they were being 'stung' on repairs—and Henry did sting some of them, too."

"How?"

High Prices Charged for Repair Parts.

"The usual way," answered the dealer. "Wants to get rich too quick. He's just like a lot more. They think because they're repairing automobiles that the stuff they put into them is worth from two to ten times as much as it would be if it were put into a wagon. Henry, to start with, had a parts catalogue that was a disgrace; but the factory people insisted that they knew what they were doing and put prices on parts that were away out of decent proportions. They charged about twenty times the first cost of a piece of steel even when all that was done to the piece in the factory was to make an eye in one end and a thread on the other. I can't see the justice of it, myself.

"Of course, Henry was charged for the part at the regular price, and he had to make his profit on it, even if his trade did kick. It was that way on all the parts. One of his customers walked in one day with a parts catalogue in his hand; he had added up the prices of all the parts that go into a car and found that they cost nearly three times the price of the completed car itself. Henry couldn't explain it; and I don't believe anyone else can."

The Sales Manager's Explanation.

"There are a lot of things you don't take into consideration, Reilly," interrupted the Sales Manager. "We have to charge more for parts than we would if we had a big factory turning out nothing but a few different pieces; it costs us more. We have to keep a stock on hand, and considering all the changes made in the cars, it is some stock. Also, for the earliest models, of which but a few were made, the parts call is not heavy, and sometimes to supply an

Digitized by Google

order we have to put one mechanic on the job and let him make it; that costs money."

"You may be right," admitted the dealer, as he almost missed his thumb with the cobblestone, "but it surely does make a customer sore to pay the prices some of them have to pay. On Henry's line of cars he charged a dollar for one of those buttons that goes on the thumb latch in the end of the brake lever. According to the car owner's viewpoint, those things ought not to be worth more than a dollar a quart.

Bleeding Trade Bred Discontent.

"But to get away from this parts proposition, a lot of his trade was justified in feeling they had been bled when they were called upon to pay bills. Some of the items were cotter pins, the size that costs 10 or 15 cents a pound; Henry charged them all up a cent apiece, which was a profit of such a big per cent. that no one would believe it if you told them, so I never took the time to figure it out. I got into a discussion with him about it one day and he said a cotter pin installed in a car was worth more because of the labor that had been put on it. I asked him if he didn't also put in a labor charge on the car and if the customer was not therefore called upon to pay twice for the labor. He shrugged his shoulders at that, but kept right on charging up cotter pins at one cent per.

"Another thing for which he offered the same excuse and which made bad feeling was the prices he asked for common nuts and bolts that were used in repair work. Mind you, they were not special nuts and bolts that he got from the factory, but the common, ordinary kind that you buy in any hardware store in a cardboard box. These were worth ten cents by the time the Henry workmen got them into a car. The transformation in the value of little things like that was wonderful when they passed through the Henry repair shop; it was a regular gold-plating establishment. Things went in worth less than a cent and were worth ten when they came out. If he only could create a demand for something and put it through his shop he would get rich in a month. The trouble is that there is a demand for his goods, but the people who own cars he has sold are wise to values and don't enjoy being squeezed: quite a few have quit him and gone to a shop that does nothing but repairing and does it on an impartial and businesslike basis.

Consistency Which Reilly Emulates.

"Down where those car owners now get their work done the boss has some sense of consistency and charges what things are worth. He has some system in his shop, too, and I may add that I try to run mine the same way; in fact, I have stolen one or two ideas from him. This overcharging business is about played out.

Explanations That Are Not Impressive.

"I know, Reilly," protested the Sales Manager, "but you must take into consideration the overhead and extra expense that is charged to these parts. If a factory did nothing but turn out thumb latch knobs it probably could make them for a few cents each; big production makes little costs and"——

"Sure! I know all about that," was Reilly's response. "You chaps in the factories are full of figures and explanations, but you don't often come in contact with the car owners who are charged for even nuts and bolts about ten times what they're worth. If you met more of them and heard them holler, you might change your views and, maybe, your prices. Hardware stores have to carry stocks of bolts and nuts and other things, and yet they don't squeeze the public, and I can't see yet why so many of these automobile prices should possess mushroom tendencies.

"In the early days the repairman considered that any owner he got hold of was legitimate prey, and owners haven't yet gotten over the idea that a repair shop is a thing to be avoided, because a lot of them are just that sort.

Lax Methods as a Cause of Overcharge.

"Some overcharging is done through the ignorance of the boss. He doesn't intend to squeeze anybody, but is squeezed by his help. He hasn't any means of knowing whether the men loaf on the job. He sends a car into the repair shop to have certain work done on it and bye and bye it comes down; the workmen say they have put in so much time on it and the owner is charged up with that much labor. He kicks, but the proprietor says the men really worked hard on that car all the time—and there you are!

"What's the solution?" asked the assistant walnut cracker.

"A little card system would work wonders," replied Reilly, "provided the boss knew anything at all about the time it takes to do various jobs. He should have some sort of a car record showing just what was done on the car, who did it, how long it took to do each separate job, and if the time was overlong, why. He also ought to have a time card on which the workman should put down what he has been doing all day. This is a big help toward weeding out poor and dishonest workmen. I have gotten rid of the undesirables in my shop; a good card system—and an honest foreman—did it. Also, the foreman himself inspects every job before it leaves the shop, and if anything has not been done right we make it right, and we don't charge the car owner for the extra labor, either. The man who did the poor work is given to understand that he'll be charged for it, if ever he does it again and, believe me, that policy always has worked wonders.

Playing "Safe" That Does Not Pay.

"One day an owner went over to Henry's shop to get a new rear axle housing. When Henry sent the bill he charged $140 for the metal! Just imagine that—$140 for a rear axle housing! He could have had one made to order for a lot less than that. The owner put up a howl, and Henry right there confessed his shortcomings. He said he couldn't find the price in the catalogue, had tried to get a price from the factory but couldn't, and so had made a charge that would be on the safe side. He tried to soften the owner's wrath with the explanation that when he got the right price, and if it proved to be lower than the price charged, he was going to remit the difference to the owner."

"Did he get away with it?" interrupted the Sales Manager in astonishment.

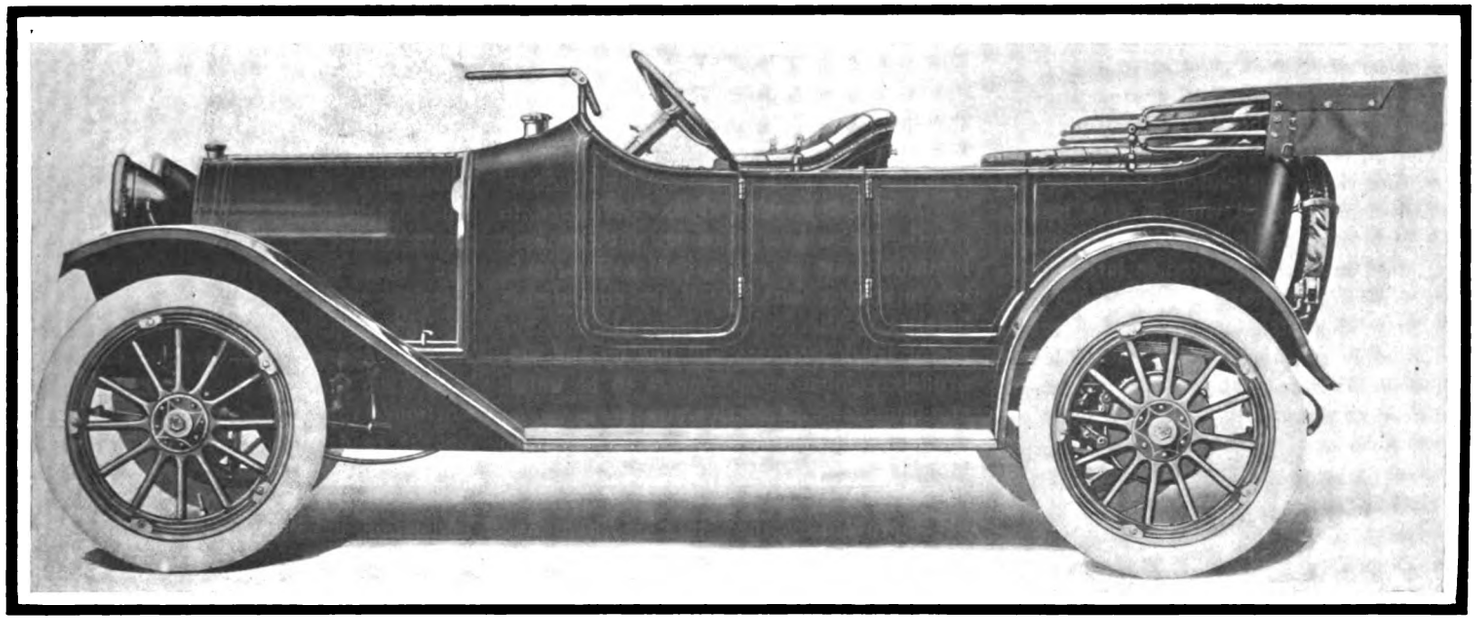
"Just imagine that kind of a repairman giving up money, once he got it! You needn't worry; he didn't get it. The car owner himself wrote to the factory and got the price, and Henry came near losing his agency. It took a lot of explaining and promising of good behavior on his part to keep his line. At that, I don't blame him so much, as he was doing what the factory had taught him in an indirect way. I honestly believe that some factories, his included, make up their parts catalogue by guesswork and make charges that they know are 'safe.'

A Race With an Irate Farmer.

"Speaking of a satisfied public," said the Sales Manager, as he dropped his cobblestone and began to climb the fence, "what do you make of the dissatisfied look on that individual coming across the hayfield?"

Reilly looked, and the one look was enough. The farmer who owned the walnut tree appeared sufficiently formidable, but his bulldog was more than formidable and Reilly beat the Sales Manager to the car. As the dealer threw in the clutch the canine bounded over the fence and from across the field came angry protests in which the two motorists distinguished "Robber" and "Thieves," and an angry fist made gestures in the air.

"Talking of robber repairmen," said the Sales Manager, "who's a robber now?"



"I didn't think he'd care; most farmers don't. Anyway, you ate as many as I did," retorted Reilly.

"Yes," rejoined his companion, "but you tempted me."

NEW PAIGE "FOUR" A CAR OF UNUSUAL VALUE

Unit Power Plant With "Silent" Chain Camshaft Drive, Dash Fuel Tank and Complete Dynamo Electric Lighting and Starting System Among More Prominent Characteristics—Lists at Less Than $1300.

LATEST ADDITION TO THE PAIGE LINE—A FIVE-PASSENGER, FOUR-CYLINDER TOURING CAR AT $1,275

In adding to its line a brand new model which lists at the low price of $1,275, despite the fact that it is fully equipped even to an electric lighting and engine starting system and numbers among its more prominent features left drive with center control, 4 x 5 unit power plant with "silent" chain camshaft drive, dash gasolene tank, 116-inch wheelbase and 10-inch upholstery, the Paige-Detroit Motor Car Co. of Detroit, Mich., has sprung a surprise that is real and must be reckoned with. Nothing has been skimped in the car and every little detail calculated to increase efficiency and comfort has been worked out in the way that helped make popular the smaller Paige car, which is continued practically unaltered. Throughout the design of the car there is apparent a studied attempt to obtain better construction and to eliminate the inefficiencies and inaccuracies which experience has pointed out.

The cylinders, for instance, are of the L-head type, though the intake and exhaust manifolds are cast separately and afterward bolted in place in order to permit greater cooling surface for the valves. Also, they are so arranged that they do not interfere with the valve mechanism which is enclosed by means of light removable covers. The intake manifold, in particular, is very short, the reason for the construction being to reduce the possibility of gas condensation and consequent "loading up." Both intake and exhaust ports are extra large to facilitate the ingress and exit of gas and no little of the actual power developed in excess of the rated power is laid to the fact that the valves are large—two inches in diameter.

By way of reducing wear and vibration, the pistons are made extra long and light and are carefully balanced. Another excellent feature is that the cylinders are offset, which, in combination with 10½-inch connecting rods, makes for straighter thrust on the crankshaft and thus reduces side wear on the cylinders The crankshaft is drop-forged of .35-.40 open hearth carbon steel and is of the three-bearing type with the flywheel flange formed integral; the three bearings are, respectively, 3, 2½ and 4 inches in length. The camshaft also is a drop-forging with all the cams, as well as an eccentric to operate the oil pump, formed integral. It is supported in three die-cast bearings. In the manufacture of the camshaft great pride is taken in the fact that all the cams are accurately ground within very fine limits, thus effectually providing against the possibility of valves opening slightly "out of cycle" and thereby causing irregular running and multifarious other troubles. The camshaft on the left side of the motor and the water pump opposite both are driven by means of link belt "silent" chains.

The lubrication system is what is known as the constant level pump-over type, the oil being pumped into pockets over the main bearings through suitably placed ducts, whence it drops into the bearings and eventually into the crankcase reservoir. Beneath each connecting rod big end bearing there are small troughs into which scoops dip, thus lubricating the connecting rod bearings and at the same time splashing the oil over the cylinder walls and auxiliary bearings. The oil level in the crankcase is sufficiently deep to ensure that the "silent" chains will run through it at all times, regardless of the angle at which the car may be tilted in hilly country.

In the cooling system, the water pump, which is of the centrifugal type, has been so arranged that in the event of accident the water will circulate by thermo-siphonic action. Radiation is assisted by means of an adjustable belt-driven and ball bearing mounted fan. Ignition is effected by means of a high tension Bosch magneto located to be driven from the water pump shaft, where it is instantly accessible for inspection or

Digitized by Google

to make such slight adjustments as may become necessary.

The Gray & Davis electric lighting and engine starting system, which forms part of the regular equipment, is mounted in the orthodox manner. Which is to say, the generator is mounted on an engine bracket and is driven from the pump shaft. The electric motor starter is mounted on a chassis bracket and is connected to the engine through the intermediary of gearing cut in the flywheel. Current for starting and lighting is drawn from a liberal-sized storage battery.

From the engine, power is transmitted to the road wheels through a multiple disk clutch and a three-speed selectively operated gearset. The clutch is composed of 14 disks and is fitted with 36 cork inserts in each of the driving disks. The change gear mechanism is mounted in large, high-duty Hyatt roller bearings. Shafts are tempered and heat treated, as are the gears; the case is of aluminum. Control levers are placed in the center of the footboard, the gearshift lever rising out of a small extension directly on the cover of the gear case, and the steering wheel is located at the left side.

The rear axle is of the three-quarter floating type with the orthodox bevel gear and enclosed propeller shaft, the housing serving also as a torsion member; radial action and driving strain are taken by a pair of radius rods substantially supported on the chassis. Two sets of brakes are provided, the service set being internal expanding, connected to the usual pedal, and the emergency set being external contracting, connected to a hand lever. The wheelbase is 116 inches and the wheels are shod with 34 x 4-inch tires mounted on demountable rims.

Equipment of the new Paige, which is styled model 36, includes, in addition to the usual complement of horn, tools, jack, tire repair kit, pump and demountable rims, a complete Gray & Davis electric lighting and engine starting system, silk mohair top with side curtains and envelope, ventilating windshield, Stewart rotating dial speedometer, adjustable foot rest, tire irons, license brackets and a complete assortment of electric lights.

Dealers' Association Grows Ambitious.

Having existed chiefly for the purpose of conducting an annual show, the Kansas City Motor Car Dealers' Association has awakened to a sense of greater and continuous usefulness. To carry out its plans in that direction, it has engaged E. E. Peake, a former insurance man, who has been appointed permanent secretary and who has established headquarters at 219 Commerce building, in Kansas City.

NEW YORK STATE MAY LIMIT WEIGHT OF TRUCK AND LOAD

Highway Commissioner Takes the Initiative and Outlines Law That May Be Introduced—Would Bar Some Vehicles.

While it may or may not be without good and sufficient reason—only the sequence of future events can make this clear—it is certain that motor truck manufacturers and dealers are considerably wrought up over the fact that the New York State Highway Commission is engaged in framing legislation having for its object the limitation of the weights of motor trucks permitted to use the highways. Moreover, the proposed limitations are so radical and so far-reaching in their effects that if the commission persists in the course it has laid out, the motor truck interests will line up and vigorously combat what appears to be unfair and oppressive restrictive measures.

Briefly, the idea of the commission is to bar from "any State or State and county highway which has been or may hereafter be improved by the State or State and county, any vehicle the weight of which shall exceed, in combined weight of load and vehicle, as related to the width of tire, the weight per width as given in the following table"—the table specifying that the maximum weight on a single axle shall be, for 1½-inch tires, 1,200 pounds; for 2-inch tires, 1,600 pounds; for 2½-inch tires, 2,000 pounds; for 3-inch tires, 2,400 pounds; for 4-inch tires, 4,800 pounds; for 5-inch tires, 5,600 pounds; for 8-inch tires, 6,400 pounds; for 9-inch tires, 7,200 pounds, and for 10-inch tires, 8,000 pounds. In other words, four tons is the maximum weight permissible, under the proposed measure, on any one axle, except on State or county roads "built of brick laid upon concrete base" or "highways having a roadbed of concrete six inches or more in thickness." These exceptions, of course, are of extremely limited value, because of the comparative scarcity of roads of the excepted kinds.

A second suggested method of limiting the weights of motor vehicles consists of specifying the total combined weight of vehicle and load to be allowed to use the highways. This works out to exactly the same maximum limit, as the greatest weight specified is 16,000 pounds on 10-inch tires. The complete list is as follows: On 1-inch tires, 1,600 pounds; on 2-inch tires, 3,200 pounds; on 3-inch tires, 4,800 pounds; on 4-inch tires, 6,400 pounds; on 5-inch tires, 8,000 pounds; on 6-inch tires, 9,600 pounds; on 7-inch tires, 11,200 pounds; on 8-inch tires, 12,800 pounds; on 9-inch tires, 14,400 pounds, and on 10-inch tires 16,000 pounds.

As a rule, large motor trucks are of about the same weight when empty, as their maximum rated loads; in some cases the truck weighs considerably more than its load. Moreover, in many trucks the weight on the rear axle is very much in excess of the front axle weight load. Under the provision limiting the load on a single axle to 8,000 pounds a four-ton truck would be an impossibility unless the weights were exactly equally distributed on the axles and the truck weighed no more than its load—conditions that would put all the four-ton trucks now built off the roads.

The "road experts" who are credited with instigating the proposed measures are said to have been prompted by the idea that heavy trucks are destructive to the roads and that by arbitrarily limiting their weights with loads the highways will be better preserved. Actual experience in the operation of trucks has shown that when the tires used are properly proportioned to the loads they carry the effect on the road surfaces is good, rather than otherwise, while horse-drawn vehicles, which are entirely ignored in the suggested legislation, undoubtedly cut up the surfaces with their steel tires, to say nothing of the chopping effect of the steel shoes of the horses. It is true that motor trucks when run at excessive speeds are injurious to roads; but this phase has been given no consideration, apparently.

The Highway Commission of New York State is not alone in this matter; similar movements are afoot in New Jersey, Massachusetts and Pennsylvania, and in all the States concerned the dealers and manufacturers of motor trucks are preparing to oppose the passage of any such measures, should they come before the respective legislatures. The action of the New York State commission still is uncertain—that is to say, it has not yet been decided to endeavor to have the next highway law amended at the next legislative session; but it is evident from the detailed weight limit lists that have been compiled that, in the vernacular, there is "something doing," and the motor truck people are preparing to do their utmost to block the passage of unfair restrictions.

San Francisco Votes Against a Show.

San Francisco will have no automobile exhibition during the coming show season, the movement to hold one having been voted down by the members of the San Francisco Automobile Dealers' Association. Those who so voted argued that, as practically all dealers have had their new models on display for some time, little or no benefit would accrue from a show.

PROFIT IN DOVETAILING SEVERAL BUSINESSES

Long Island Dealer-Garagemen Solves a Problem of Real Concern to Many Others Located in Small Towns—Finds Plumbing Work and Sale of Sporting Goods Fit Well With Garaging—Maintains Well Equipped Shop.

Doubtless the operation of a garage business in a comparatively small town, unless one should just happen to "strike it right," as the saying goes, hardly can be construed as a means of getting rich quick. In nine out of ten cases, depending upon circumstances and conditions, the effort to make both ends meet and leave a balance on the credit side of the ledger, requires head work on the part of the proprietor or manager.

Combining Non-Conflicting Businesses.

But while the possibilities of making the garage pay big dividends, even when each branch of the business that can be made to help swell the profits is worked to the fullest advantage, may be slight, just a little more head work in the direction of determining a non-conflicting business which can be dovetailed and conducted with the sale, repair or storage of motor cars, and which can be worked to the best of advantage at times when the garage and selling ends of the motor car business are slack, generally will be found profitable. Such, at least, is the experience of Thomas Blyth, who is the leading spirit in the Long Island Machine Shop and Heating Co., which operates the Amity Garage at Amityville, L. I., in conjunction with a plumbing and heating contracting business of no mean volume.

Although the contracting end of the business is pursued aggressively, no part of the automobile department—and there is no branch which is not followed, from the selling of cars to the building and rebuilding of bodies—is neglected. As for the sales end of the business, that is so small as to be hardly a factor. According to Blyth, he is located too near to the metropolis—Amityville, which has a population of 3,500, is but 32 miles from New York City—to cut a very wide swath in the selling line.

Small Profit in Car Sales Alone.

"Where a native has anything up to $1,000 to spend, as a rule I make the sale," he told the Motor World man, "but for cars of higher value they invariably go into the city. With me it works out this way: I buy a demonstrator and go hot-foot after all of the prospects whom I hear of, and by the end of the season I have disposed of five or six cars at the list price, and then sell the demonstrator as a second-hand car. When you take into account the fact that to make two or three of these sales I must needs take in exchange some dilapidated machine which has to be practically rebuilt before I can dispose of it, and that I have expended gasolene and oil as well as time and energy in order to consummate the sales, you will realize that, when all is said and done, I just about break even. But I might add that I have made five or six good customers, who also are boosters, and for this reason I continue the selling end."

Repairs and Supplies Greatest Revenue.

It is from the operation of the machine shop and the sales of accessories and supplies that Blyth draws the greater part of his revenue. The machine shop yields an estimated income of $12,000 yearly. The shop is housed in the cellar of the three-story brick building and is well lighted from two rows of windows on the sides. In the way of equipment, it is complete in every detail; three lathes of different sizes, a milling machine, grindstone and emery wheel and a small and a large drill press make up the power driven equipment of the metal working department. Power is supplied by oil engines, two of which are mounted at one end of the cellar. The smaller is used to drive the machinery at times when the repair business is not sufficiently heavy to call the larger machines into use, and to drive the electric lighting plant by means of which storage batteries are charged. The larger motor is used when the shop is rushed, and it also is called into play at such times as it is necessary to operate the compressor which stores air under pressure in a large tank for use in inflating tires. Woodworking tools in the shape of a bandsaw and a circular saw are provided to facilitate the building of bodies for commercial vehicles, while vulcanizers of various sizes provide the means of effecting tire repairs. Besides Blyth, who is a machinist of long experience and a former marine engineer, three men are constantly employed in the shop.

As previously stated, the plumbing and heating end of the business in no wise interferes with the other lines. "Jobbing," as plumbing repair work is called, is not followed for the reason that there is not enough of it to keep a union plumber on the job, so to speak, and the employment of a non-union man who would be willing to jump in and turn his hand at other work would involve trouble with the union when men were needed on the contract work, which embraces the furnishing of complete systems for plumbing, heating and ventilating in new buildings. The men for the work are hired as needed and let go when the contract is completed.

Garage's Location is Advantageous.

For reaping the benefits which accrue from transient trade, the Amity Garage is ideally situated. The Merrick road, which is the principal automobile thoroughfare on Long Island, and on which the garage is located, offers mile after mile of perfectly surfaced roadway, which serves to attract thousands of motorists past the door during the summer months, so that the sales of gasolene, oil and accessories and fittings are large. Main street, which to Amityville is all that the name implies, forms with the Merrick road the corner on which the garage is situated and leads directly into the heart of the town. The advantage of carrying a complete stock of and of amply displaying small "handy" devices where they will catch the eye of those who stop to refill their tanks, has not been lost sight of, and for this purpose a neat glass showcase is stationed at the left-hand side of the door, and is "chock full" of small accessories, while a series of shelves disposed along the wall serve for the display of larger articles, such as tire pumps, jacks, etc. The reserve stock itself is housed in a stock room of no mean proportions, and is valued by Blyth at $6 000.

Motor Boats Bring Summer Trade.

But the proximity of the garage to the two main lines of travel is not the only point in favor of its location. For about a block from the building is Great South Bay, which in the warmer months is a mecca for all sorts of motor boats, and this trade, too, is catered to. Besides the usual line of accessories which are similar to those carried for the motor car trade, special goods in the form of bilge pumps, propellors, etc., as well as a more or less complete stock of

Digitized by Google

bronze shafting and marine hardware are on hand. Naturally, the operation of the plumbing business would necessitate the stocking of pipe fittings, and these are stored in all sizes both in black iron for gas work and in galvanized iron for water. Overhauling and repairing marine motors goes hand in hand with the motor car work which enters the shop.

Storage practically is a dead issue. Although there is sufficient room for the accommodation of 20 cars, the avearge never is more than three, for which a flat rate of $20 a month is charged. The fewness of the cars on storage is attributed to the fact that the natives—that is, the people who live in the town the year round—when they do own cars the latter are generally of the variety which can be stored anywhere, so to speak, and a barn is pressed into service for the purpose. The people who come to the town for the summer generally own estates in the environs and naturally have their private garages. These "summerers," however, are first-class customers for accessories, and they also do much in the way of swelling the receipts from the repair and vulcanizing departments.

One of the most interesting features of the Amity Garage developed when Blyth led the Motor World man to the second floor of the building. There neatly stocked on shelves which encircled the room was a complete assortment of sporting paraphernalia. Baseball bats, gloves, masks, tennis goods, boxing gloves, fishing tackle, and a world of things of like import were revealed, one after the other, as the proprietor led the way around the room.

"Does it pay to keep them?" he was asked.

"Yes, it pays and pays well, provided a little care and judgment are exercised when the goods are bought," was the reply. "You see, this is the only place in town where these goods can be bought, and consequently I have laid in a full supply."

As he spoke, he led the way past compartments full of horsewhips and harness fittings to a set of shelves loaded with cartons all bearing green labels.

"Ammunition," he remarked. "At this season a great number of city folk come down to enjoy a few days at duck shooting, and shot naturally is indispensable. We carry a full line and find it worth while."

Connected to the garage building, which is owned by the company, is a blacksmith shop, which, however, is operated as an independent business. The "smithy" pays a yearly rental for his stand, and naturally attends to all of the work in his line which comes to the garage.

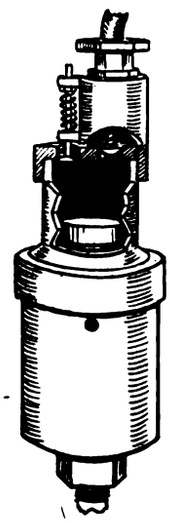
Spark Plug to Increase Power.

Appreciation of the important bearing that the character of the spark has on the efficiency and economy of operation of the gasolene motor has been the motive behind many spark plug designs having for their object the production of intensely hot and vigorous sparks capable of promptly and thoroughly igniting the gas in the cylinders. While most plugs are more or less alike, in a general sort of way, even when designed especially for hot sparking, the McCormick "power plug," shown in the accompanying illustration, manufactured by the McCormick Mfg. Co., of Dayton, O., differs in several respects from what may be termed conventional design.

Briefly, the idea back of the design of the McCormick plug is to make use of the principle of the condenser, which acts as a sort of reservoir of high-tension current, receiving a charge just before the spark occurs and discharging a larger volume of current than would be possible without the condenser.

As the above illustration shows, the upper part of the central electrode and its insulation are surrounded by a steel casing within which is the condenser. Instead of a pair of points, the discharge takes place from a central cone to the edges of an annular grounded electrode formed integrally with the plug shell. It is claimed that the volume of the discharge is such that a number of simultaneous and intensely hot sparks occur, igniting the gas in the cavity of the shell above the point of discharge and causing a spurt of burning gas that greatly intensifies the effect. The intensity of the discharge is such as to burn away or dislodge accumulations of oil or carbon, which otherwise would be likely to cause short circuiting of the plug and consequent misfiring. The price of the plug is $2.

Odd Outgrowth of Negligence Suit.



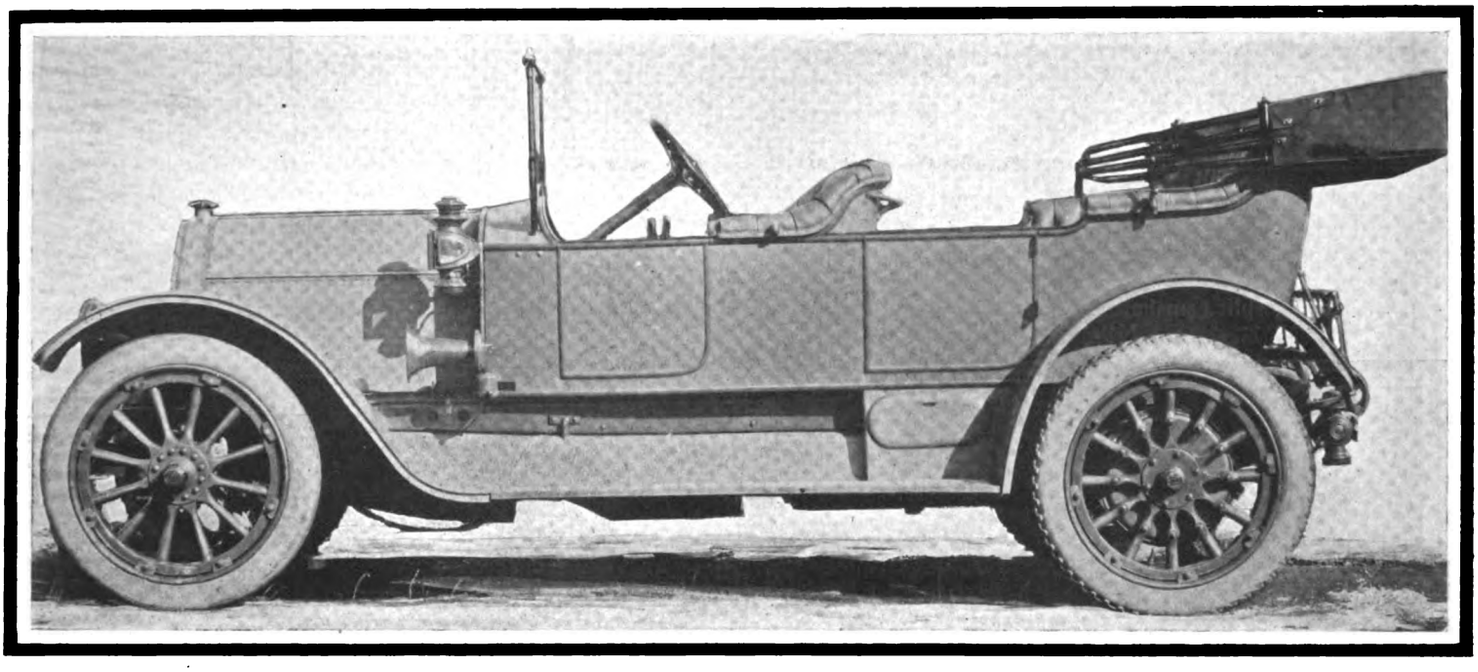
A negligence suit, which when tried in the Municipal Court in New York City a year ago resulted in a verdict of $715 against Henry Krauss, president of the Washington Bridge Auto Co., has become responsible for a legal action within that company. The original suit was brought by a man who was struck by a car and, in selecting someone to sue, he picked out Krauss instead of the corporation of which Krauss is president. Krauss, however, maintained that the corporation should have been sued, and after judgment was taken against him he sued the automobile company in the City Court to recover a total of $250, representing the judgment and what the fight had cost him. The City Court judge permitted the dispute to go to the Appellate Term of the Supreme Court for New York county, where Krauss hopes to get his money back.

Highest Court Rules on Dealers' Prices.

According to the decision of the Supreme Court of the United States, rendered on Monday last, it is unlawful discrimination to sell a commodity in general use to a dealer in one place at a lower price than to a dealer in a different place in the same State with a view of destroying or affecting competition. The decision was given in a case against the Central Lumber Co., in which the drastic law of South Dakota forbidding such practices is declared constitutional.

Pure Air Tire Pump from Cleveland.

To make the motor of a car do the work of pumping up tires, without, however, taking power through mechanical connection with any of the moving parts of the engine, is the idea back of the class of air-pumps known as "spark-plug" pumps—because they are designed to screw into the spark-plug hole. Of this type is the National pump, shown in the accompanying illustration, made by the National Motor Supply Co., of Cleveland, O.; it pumps only pure air into the tire, there being no outlet from the motor cylinder to the discharge end of the pump.



The pump is actuated by the cylinder compression, which forces a piston upward; the upper end of the piston compresses the air above it into a separate discharge chamber, where it is trapped by a check valve and passes on to the line pipe; this arrangement is clearly shown in the illustration, which also makes plain the arrangement of the air inlet valve beside the discharge chamber.

The piston is accurately finished and has metallic rings that are fitted with extreme care to avoid air leakage. The pump works noiselessly, as there are no loose parts to rattle and the piston is cushioned by air at each end of its stroke. With the pump is furnished a 12-foot length of fabric covered hose and a pressure gauge to show when the proper degree of inflation has been reached. The weight of the outfit is five pounds, so that it readily can be carried in the tool box of any automobile, and the price complete is $15.

FIAT LAUNCHES POWERFUL FOUR-CYLINDER MODEL

Distinctive Long-Stroke Block Motor Retained Though Its Dimensions Are Unusual—Complete Electric Lighting System and Full Equipment on All Cars for First Time—Other Models Unchanged.

LATEST FIAT MODEL WHICH MOUNTS A FOUR-CYLINDER MOTOR RATED AT 55 HORSEPOWER

Having virtually set the style in long-stroke block cast motors, the Fiat company of Poughkeepsie, N. Y., which is practically the American factory branch of the parent Fabrica Italiana Automobili Torino, with headquarters in Turin, Italy, has further perpetuated it by adding another four-cylinder model to its line. Also, the new car, which is rated at 55 horsepower and therefore is one of the most powerful stock "fours" on the American market, is listed with full equipment, as is the older "four" and the "six" for the first time, thus marking a significant change from previous Fiat policy.

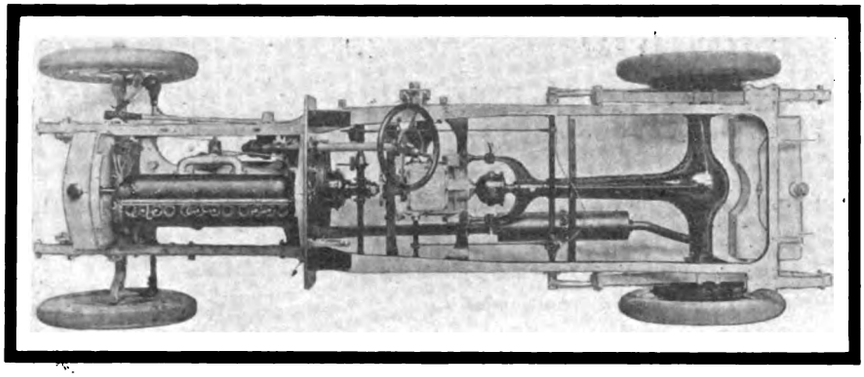
Indicating that the first Fiat models to come from the American plant were very nearly all that could be desired from the purchaser's point of view and from the point of view of the experienced Fiat engineers, the present productions virtually are counterparts of their predecessors; there have been no radical changes in design or construction, and the few minor changes that have been made scarcely are worthy of mention. The new "four" is exactly like the older models with but one exception—it is fitted with a compression releasing device. Engine starters are used on none of the cars, though a Gray & Davis electric lighting system is regular equipment on all.

In dimensioning the cylinders of the new car, which is styled model 55, the others being model 54 for the 35-horsepower "four" and model 56 for the 50-horsepower "six," the manufacturers have adopted figures which leave little doubt regarding the applicability of the designation long-stroke; the bore and stroke are 130 and 170 m.m., respectively, or 5⅛ x 6¾ inches. The dimensions of the other two models are the same and remain unchanged—namely, 110 x 150 m.m., which is equal to 4⅜ x 6 inches. As the three motors are identical except for a difference in the size of parts commensurate with power, a description of one will suffice for all.

All three are distinctive by reason of their clean-cut appearance and the harmonious disposition of such necessary auxiliaries as magneto and carburetter and water pump. The magneto and water pump are driven from opposite ends of a transverse shaft at the front of the crankcase, the shaft being driven by spiral gearing from the timing gear train. The location of the valves all on the same side permits their easy enclosure by means of a single plate and also facilitates the disposition of intake and exhaust manifolds. Both are cast integral and are completely water jacketed. The aluminum crankcase is cast in halves, the upper half supporting all bearings and having the motor supporting arms cast integral with it, and the lower serving the single purpose of an oil reservoir.

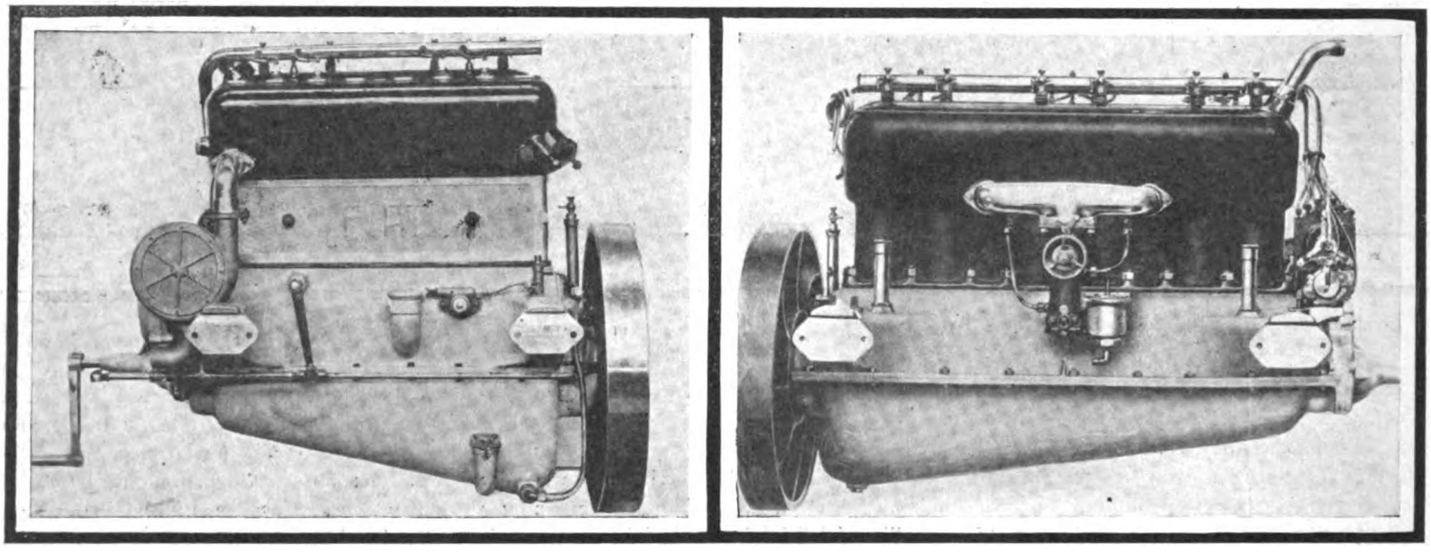
By way of ensuring positive and perfect lubrication, all splash is eliminated, and instead of relying upon the oil thrown over the bearings, each is fed under pressure from a centralized oil pump. The crankshaft is hollow, with suitable holes leading to the main bearings, and from here the oil is pumped up to the wrist pins through tubes, whence it finds its way to the cylinder walls through ducts in the pins. Baffle plates effectually prevent oil contained in the crankcase reservoir being splashed up to the cylinders. One of the individualities of the motor construction which throws light upon the thoroughness of design is that the valves are composed of no less than three alloys; the stems are carbon steel, to resist wear; the heads are nickel steel, to resist warping; and the surfaces are cast iron to ensure perfect contact and reduce the tendency toward pitting. The limit of tolerance in valve mechanism parts is small.

Another excellent feature of design which



Digitized by Google

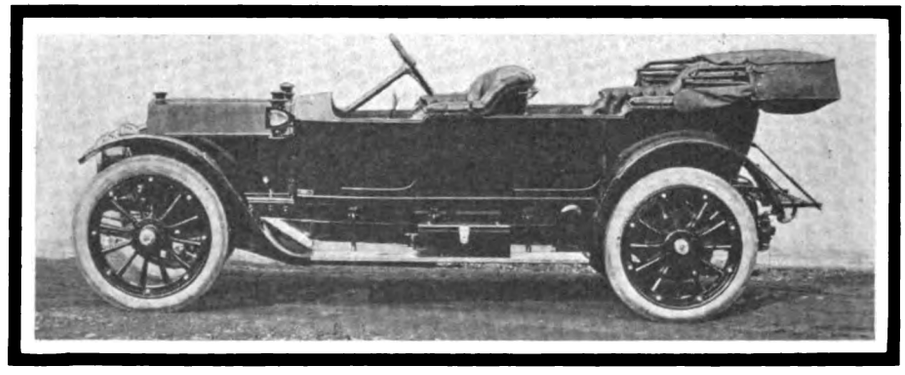
is common to all is that the single camshaft is equipped with separately cast and mounted cams, each pair, intake and exhause, being drop-forged integral, machined and afterward mounted. In this way, the necessity for using split camshaft bearings, considered undesirable by many, is avoided. In the new model 55, which is fitted with a compression release, the exhaust cams are made double length and are so arranged that when the whole camshaft is moved longitudinally, auxiliary cams raise the exhaust valves partly off their seats. In order to obtain this feature and at the same time retain positive drive to the camshaft, the forward end carries a two-arm yoke with an eyehole in each arm fitting over a short stud in the gear wheel, so that, as the shaft is moved endwise, the wheel remains stationary.



Differing from the usual construction, the rod which actuates the advance and retard lever of the magneto, which is a Bosch instrument operating a dual system, is passed through the crankcase. A short link enters the crankcase from the breaker box and hinges with a rod which emerges at the rear end of the case for connection with suitable linkage leading to the steering column.

In the transmission elements, no reason for change and little room for improvement has been found. The clutch is of the same multiple disc type running in oil that was perfected as long ago as 1904 and has been giving continuously good service ever since. It is contained in a housing bolted fast to the flywheel. Sixty-five discs are employed. The four-speed gearset has as one of its cardinal features its unusual compactness. Despite the fact that four forward speeds and reverse are provided, control being selective, the case measures only 10 inches in length. Shafts and gear wheels are alloy steel and no less than seven sets of ball bearings are used to mount them.

The combined rear axle housing and torque tube is one of the distinctive features of the car. The housing is formed in two pieces securely bolted together and is hung at the front end by means of a swiveling yoke the construction of which is peculiar to Fiat cars. The drive axles are of the semi-floating type and are mounted in R. I. V. ball bearings. In all models the brakes are mounted on the rear wheels, the drums being arranged to accommodate internal expanding emergency brakes and external contracting service brakes. The drums are 16½ inches in diameter and 2¾ inches in width.



SIX-CYLINDER FIAT CHASSIS, SHOWING REAR AXLE CONSTRUCTION

FIAT "4-55" MOTOR, SHOWING COMPRESSION RELEASE LEVER, AND A SIDE VIEW OF THE "SIX"

In designing the forward components of the running gear a laudable and satisfactory attempt has been made to reduce tire wear and at the same time to increase the ease with which the car may be guided. To these ends, the front axle is slightly cambered

FIAT SIX-CYLINDER 50-HORSEPOWER TOURING MODEL

Digitized by Google

and the steering pivots are arranged to give true pivotal steering. Which is to say, a line drawn through the centers of the steering pivots would meet at the road surface a line drawn through the wheel centers.

The wheelbases of the three models are 135 inches for the "six," which is mounted on 36 x 4½ front and 37 x 5 rear tires; 128 inches for the new model 55, which is mounted on the same size tires, and 123 inches for the four-cylinder 35-horsepower model which is mounted on 36 x 4½-inch tires both front and rear. All have demountable rims as a matter of course, the equipment including two spare rims. Springs in each case are semi-elliptic in front and three-quarter elliptic in the rear.

In emulation of so many other manufacturers who list their products with full equipment, Fiat cars are for the first time sent out from the factory ready for the road. In addition to the usual complement of top with side curtains and envelope, bulb horn, demountable rims, trunk rack, robe and foot rail, tire irons, tools, pump, jack and wheel puller, there is a specially designed rain-vision windshield, Gray & Davis electric lighting system, 100-mile Stewart & Clark speedometer-gradometer combined with a Seth Thomas external winding clock, a full set of electric lights and a large Klaxon horn.

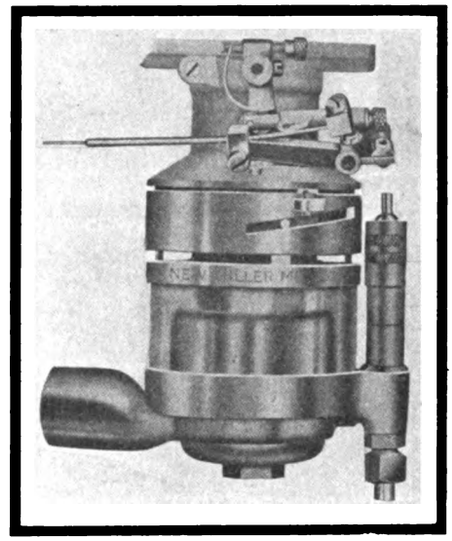
On the six-cylinder chassis, the touring car with either curved panel or straight flush-side seven-passenger body, or the five-passenger phaeton or the convertible roadster lists at $5,000; limousine and landaulet sell for $6,000 and $6,100, respectively. The new model in either of the touring or the convertible roadster forms sells for $4,500, the limousine and landaulet prices being $5,500 and $5,600. The smallest four-cylinder model lists at $4,000 for either of the open styles and $5,000 and $5,100 for the limousine and landaulet, respectively.

Formula for Reckoning Miles per Hour.

If it is known that a car has traveled a given number of miles in a given number of seconds and it is desired to know the rate of speed in miles per hour, it can be obtained by the formula

$$M \times \frac{3600}{S} = \text{miles per hour.}$$

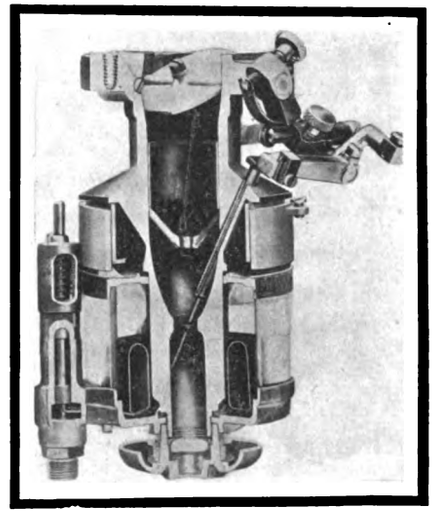
in which M is the distance and S the time in seconds.



To Remove Screw with Broken Head.

One very good way to remove a cap screw from which the head has been broken is to thread the top portion and then screw on it a nut which has been half split with a hack saw. If a pipe wrench then is applied to the nut, the closing of the jaws will clamp the nut on the screw thread and the screw can be removed quite easily.

NEW-MILLER INCORPORATES AND WILL ENLARGE SCOPE



Growth of Business Necessitates Additional Working Capital—Carburetter Altered in Detail But Basically Unchanged.

Though it was engaged in the manufacture of carburetters for several years in California, and has carried on the same

NEW-MILLER CARBURETTER

business, since last spring, at its present location, 514 North Capitol avenue, Indianapolis, Ind., the New-Miller Mfg. Co. just

SHOWING INTERNAL CONSTRUCTION

has been incorporated with a capitalization of $200,000, the growth of the business since the establishment of the Indianapolis factory having been of such proportions that the manufacturing facilities have proven inadequate and the added capital was found necessary to permit extensions and enlargements to be made.

Nor has the improving hand itself been idle, for since it was described in detail in the Motor World of June 20 last the New-Miller carburetter has undergone several minor improvements with a view to increasing its efficiency and economy, but the basic principle and the major features are unchanged. Briefly, the instrument is based on the theory that positively controlled mechanical action, of proper design and construction, is better than automatic action. Therefore, there is nothing automatically operated in the New-Miller carburetter, the throttle, the gasolene needle valve and the auxiliary air valve being interconnected and the opening of each always bearing a definite relation to the opening of the others. These openings are capable of the most delicate and accurate relative adjustment, and it is the claim of the makers that, once correctly adjusted to a given motor, the carburetter will give satisfaction indefinitely without further regulation, except such increase or decrease in the opening of the needle valve as may be required to compensate for atmospheric changes. This adjustment is made from time to time as may be required, and is effected from the driver's seat.

Of the float feed type, the carburetter has an annular hollow metal float surrounding the central mixing chamber in which the spray jet is located. Above the jet the passage widens out into a cylindrical chamber in which slides a sleeve connected by a link with the throttle valve, of the butterfly type, at the top of the passage. The sliding sleeve regulates the area of opening of the auxiliary air ports, which are cut in the walls of the chamber. The trunnion on which the butterfly throttle swings carries on one of its extended ends a spring cam which acts on the needle-valve. Thus when the throttle is opened or closed the air and gasolene adjustments are positively opened or closed in constantly fixed relation.

The detail improvements referred to, while not radical in themselves, are claimed to have considerably enhanced the efficiency of the instrument. The proportions of the air ports have been altered and their area fixed, so that the maximum opening cannot be changed. A longer taper has been given the needle of the gasolene valve to permit of extremely fine adjustment. Means for heating the carburetter with hot water have been discarded and hot air intakes are furnished in all cases, there being a cut-out, however, which renders the use of hot or cold air optional. The needle-valve adjustment to compensate for changes in atmosphere conditions is so arranged as to be made only from the driver's seat, through a Bowden wire control. Lastly, brass bowls are fitted on three of the sizes instead of glass.

STANDARD FEATURES ONLY IN THIS MISSOURI TRUCK

Unit Power Plant, Three-Speed Gearset and Chain Drive Employed—Conspicuous Absence of Novelties.

After having given the original model a strenuous test, the Palmer-Meyer Motor Car Co., of 5027 McKissock avenue, St. Louis, Mo., has completed arrangements for the construction of its 1,500-pound capacity commercial cars at the rate of about 300 a year, and now is actively in the market.

The machine, which is shown by the accompanying illustration, is of standard type throughout, offering nothing whatever in the way of novelty or startling features. The motor is placed forward under a hood and the load is carried well over the rear wheels in order to secure maximum traction. Solid tires are fitted.

PALMER 1,500-POUND TRUCK WITH STANDARD STAKE BODY

The motor has four cylinders, cast in pairs, and is rated at 26 horsepower; it is of the long-stroke type, the bore and stroke being 3⅝ inches and 4¾ inches, respectively. Water cooling is employed, the water being circulated by a centrifugal pump through a square tube radiator. All the motor bearings are of nickel babbit, split and shimmed for adjustment. The connecting rods are drop forgings of high carbon steel. The cams and camshafts are cut from single steel forging; timing gears are of steel, bronze and cast iron, advantage being taken of the various characteristics of these metals. The valves, all of which are on the right hand side and actuated by a single camshaft, are 1⅛ inches in diameter and the stems are completely enclosed, after the modern fashion.

The motor is lubricated by a constant level splash system, the oil being circulated by a positively driven plunger pump very accessibly placed on the side of the aluminum crankcase. The oil, after being splashed, drains back to a reservoir through a strainer, to be re-circulated. Ignition current is furnished by a magneto.

The casing of the three-speed gearset is bolted to the crankcase of the motor, forming a unit power. The clutch is of the disk type, running dry, and is provided with a spring adjustment. The shafts upon which the gears are mounted rotate in double annular ball bearings. Final drive is through side chains, the pull of the chains being taken on double rods of stout design.

The unit power plant is supported in the frame on a three-point suspension, plenty stiff enough to do its work without distress. All springs are semi-elliptics, 2 inches wide, 36 inches long in front and 46 inches rear; lubricators are fitted to the spring eyes to minimize friction and consequent wear at these points. The I-beam front axle is 2⅝ inches deep and 1¾ inches wide; the rear axle, which, of course, is of the fixed type, is a steel forging 1¾ inches square. All wheels run on ball bearings. The service brake drum is carried on the countershaft and is 10 inches in diameter and 1¾ inches wide, while the emergency brakes are, as usual, on the rear wheels, and are 13½ inches in diameter and of the same width as the service brake.

All the wheels, which are of the usual wood artillery type, are 34 inches in diameter; the front wheels have 12 spokes, 1½ inches square. The spokes of the rear wheels are of the same shape and size, but there are 14 of them. The tires, all of which are solid, are 2½ inches in front and 3½ rear, of the removable flange truck type. The wheelbase is 110 inches, the tread 56 inches and the car has road clearance of 13 inches.

The standard type of body, which is shown in the accompanying illustration, is of the low stake type, with a carrying capacity of 1,500 pounds. The chassis alone is priced at $1,450, and the prices complete with body varying according to the style. In the stake body the loading space is 84 inches long back of the seat. The standard equipment includes three oil lamps, horn and a complete set of tools carried in a special box. The car has a maximum speed of 25 miles an hour.

Twenty-five Exhibits at Grand Rapids.

Grand Rapids, Mich., is one of the towns which does not wait for New York to inaugurate the automobile show season. The local automobile dealers' association is an "early bird" and accordingly staged its fourth venture in the show line in the Klingman exhibition building from Tuesday, November 26th, to Saturday last, November 30th. In the matter of decorations, a green and white color scheme was indulged in in the choice of draperies, which effectively disguised the bare walls, and the streamers, which did like service for the ceiling; myriad incandescent lights, artistically arranged in streamers and clusters supplied the lighting effects. Motor cars, for both pleasure and commercial service, were exhibited by some 25 dealers; in all 36 different makes of automobiles were on the floor. Among the exhibitors were:

Abbott Motor Car Co., Abbott-Detroit; Adams & Hart, Imperial; Austin Automobile Co., Austin; Becker Auto Co., Ford; Buick Motor Co., Buick; Central Auto Co., Cadillac; Cowdin & Woodland, Cole; G. P. Dowling, Oakland and Hupmobile; W. S. Farrant, Chalmers and Regal; Hill Garage, Detroiter; Imperial Automobile Co., Imperial; International Harvester Co., I. H. C.; Grand Rapids Auto Co., Studebaker; B. F. Kenyon, Rambler; Mitchell Motor Co., Mitchell; Moran Auto Sales Co., Flanders "gas" and Flanders electric; B. W. Olin, Jackson; Oswald Motor Car Co., Kissel, Michigan and Baker electric; Overland Co., Overland, Marmon and Standard electric; Palmer Sales Co., Peerless; Peck Auto Co., Hudson; Rieske Auto Co., Cutting; Stratton-Woodcock Auto Co., White and Franklin; W. D. Vandercar, Reo; Robert Willey Auto Co., R. C. H., Winton, Crow, Hupp-Yeats electric.

Engine Starters Scarce at London Show.

According to statistics collected at the London show, engine starting devices are not viewed with a great deal of favor abroad. Among all the cars that were exhibited, representing the products of very nearly all foreign manufacturers, only 13 makes were equipped with engine starters. Of these 13, five were equipped with electric lighting and starting systems, three being American products; four were fitted with pneumatic devices, three had American spring starters, and one was fitted with an ignition starter which was operated in conjunction with a high tension magneto.

MAKING AND USING TOOLS FOR REPAIR SERVICE

Conditions That Justify the Expense of Apparatus for Special Work—Constructional Details of Appliances That Can Be Made in Any Good Repair Shop—Using Factory Information and Mechanics' Ideas.

Every one concerned with the repairing of automobiles has at some time or other found it necessary to devise special tools for certain work, the object being to save time in some instances and facilitate awkward operations in others. The making of these tools sometimes entails considerable labor, and although of undisputed value at the time, and the cost having been charged upon the job for which they intended, nevertheless it is sometimes problematical whether such expense is justifiable. This point must be borne in mind when special tools are planned, because if the making of

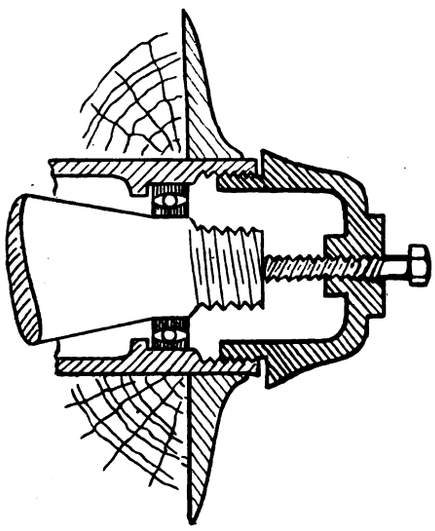

FIG. 1—WHEEL REMOVER

them is to be much more costly than the extra labor entailed in doing the work without them wherever this is possible, it is manifestly unfair to expect the customer to pay such additional expense. Cases arise, however, where ordinary tools will not answer the purpose, and in these cases charging for the manufacture of special tools is justifiable.

Factory Information Valuable.

Where a dealer or repairman handles many automobiles of the same make and model in the course of the year, he does not need to restrict himself to the number of special tools that he may make, as in the case of repetition work they undoubtedly will be of great value in the service end of his business and play an important part in curtailing the expenses of this department. In which connection it is a wise plan for dealers to get in touch with the engineering department of the factory they represent and find out what they can recommend in the way of tools; in this way may be found many solutions for problems that arise and cause trouble.

Producing Special Appliances.

Some of the factory tools are jealously guarded secrets, but when it is for the

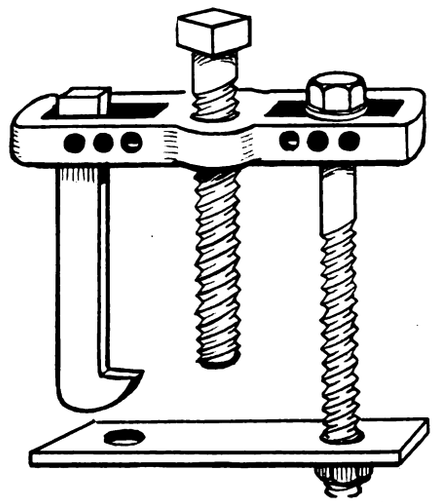

FIG. 2—UNIVERSAL PULLER

greater good of the greater number and when the possession of them tends to lessen the cost of upkeep by cutting down the labor bills, it is very short sighted policy to withhold the information. The case of the general repair shop that caters to all comers is in a measure different. The tools of a special nature then required are those that can be used in multifarious ways, and constitute time saving units that can be applied to almost any car and that will assist the man to do quicker and more accurate work.

The initiative of this tool making should not be left to the individual workman, nor, on the other hand, should their suggestions and efforts be ignored and discouraged. Ideas of practical men are valuable, and even if not feasible in the form in which they are presented, nevertheless silght alterations in detail may render them of considerable merit.

Clever labor saving devices may be turned to direct profit to the repairman, as is instanced by the wheel remover shown in Fig. 1. There is nothing particularly new in the idea, but it is a very rare occurrence to find the owner of an automobile in possession of such a handy and compact tool. It is not possible to keep in stock blanks for every type of hub cap, but existing hub caps can in nearly all cases be used as patterns from which the wheel withdrawal body can be cast. On the other hand, it is only a matter of a few minutes' work on the lathe to rough out a wooden pattern, and in some cases this will be even cheaper than wrapping the hub cap. The method of obtaining the casting is immaterial, as it will not have a large bearing on the fin-

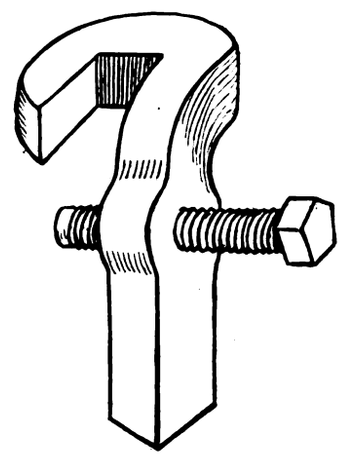

FIG. 3—ROD BENDER

ished article. The most convenient method will be the best one to use.

An Easily Made Wheel Puller.

A thread is cut on the new cap to correspond with that of the hub and a square boss is left on the outer portion to permit of tightening with an ordinary wrench. The cap is drilled and tapped to receive a bolt in the manner shown, the thickness of the material at the point where the bolt passes through being sufficient to allow the threads of the bolt to obtain a good hold. A 5/8 inch or 3/4 inch United States standard bolt and a boss of about 1 inch to 1½ inches in length will permit from 11 to 18 threads to engage, and this should be ample even if the wheel is a tight fit on the axle.

It is a curious coincidence that parts that are assembled with a driving or push fit

Digitized by Google

often become so solidly joined together that the usual means of disengaging them fails. Pullers of various sorts have been devised to perform this work, and undoubtedly answer the purpose for which they are intended if the right size puller is on hand for the particular job. But the differences in sizes of parts makes in necessary to carry so many pullers in stock that the expense for many shops is prohibitive. The idea contained in the puller shown in Fig. 2 lends itself to varied applications, and the cost of making several of them of different sizes is not serious.

Universal Wheel Remover.

A piece of square bar is slightly drawn down at both extremities, leaving the middle approximately as indicated in the sketch, allowing plenty of stock available around the center bolt. The holes in the sides must be drilled equidistant from the center, to ensure an even pull, and as there are several of these holes the drop hook shown in the left of the illustration can be adjusted to suit different widths of work, it being understood that two hooks are employed, one on either side.

It is not always feasible to use hooks, bolts, or plates and bolts being preferable in some instances, especially if the material is soft. In order to accommodate these bolts, the top of the main bar is slotted, this being preferable to a series of holes, as the tool then becomes universal. The easiest way to slot this is to drill a series of holes close to one another, slightly larger than the diameter of the bolt, the intervening metal being removed with a chisel or file, or it can be cut away with a hacksaw. It goes without saying that a good quality steel must be used for the cross-bar and of suitable dimensions to prevent any bending when pressure is exerted, otherwise its utility will not be very great. The parts that it is proposed to separate may be so tight that they cannot be parted by simply screwing down on the center bolt. It is well to remember that there is a limit to all things, even to the strength of metal. In such a case a well directed blow of a hammer on the head of the center bolt, while the side arms are in tension, often helps to dislodge the obstinate member.

Bending Device for Connecting Rods.

Parallelism of connecting rods in relation to pistons and cylinders is absolutely necessary in order to obtain good results and prevent rapid wear. Any disalignment will produce wear, upon the cylinders in the first place, causing them to ovalize; next, upon the pistons, with the same results; then upon the big end bearings, from the unequal pressures, and this is sufficient to affect the journals of the crankshaft. By placing a square edge upon the base chamber and resting the upright side against the piston, after the connecting rod has been tightly bolted to the crankshaft, any disalignment will be immediately indicated. The causes of disalignment are many, the most common being due to uneven scraping

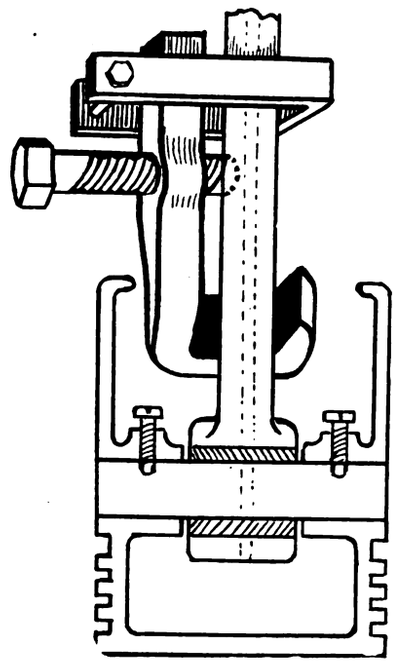

FIG. 4—BENDING A ROD

in of the bearings and uneven tightening of the big end bearing bolts.

With the crankshaft journal as a base and the connecting rod forming the perpendicular, it only requires a small amount

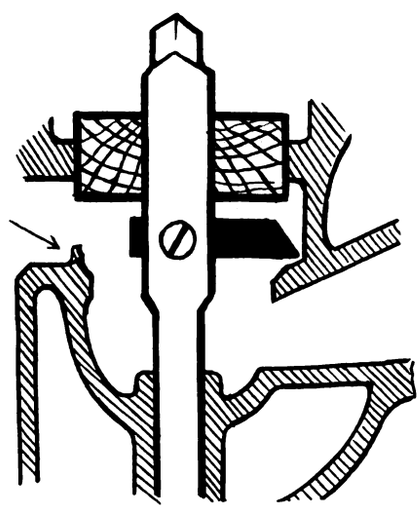

FIG. 5—VALVE RIDGE CUTTER

of metal to be inadvertently removed from one side of the bearing to throw the piston out of plumb. The purpose of the tool shown in Fig. 3 is to correct any such irregularity without removing the connecting rod after this has been bolted in position, and the method of application can be seen by referring to Fig. 4. The tool can be made with a hook at both ends, although it will answer just as well in the form here depicted by using a clip to steady the base. The hooked end is placed around the rod inside the piston, and presuming that the crank is brought to the top of its throw, and the clip secured, it only needs a slight pressure exerted by tightening the screw to bend the rod in whichever direction it is desired and as much as desired. This is an instance where one tool can be made for general use.

Valve Seat Ridge Cutter.

The tool shown in Fig. 5 belongs to the same class, the only difference being that, as the diameter of valve stems vary, several different size holders will be found necessary. It is not a vital necessity to have the stem of the cutter an exact fit in the guide, because the head of the valve seat does not have to be exact. This does not refer to the valve seat proper, but the portion of the casting around the top of the seat which is directly swept by the passing gases. After a valve has been ground several times it often occurs that there is a perceptible ridge remaining over the valve seat, as shown in the illustration with an arrow pointing to the "ridge." This will impede the free flow of the gases that pass the valves, and in the case of the exhaust these protrusions have been known to become incandescent, causing preignition. The tool for removing these obstructions consists of a piece of rod slightly smaller at the lower end and slotted to take a tool steel cutter which is held in position by means of a set screw. In place of the wooden bearing here shown screwed into the valve pocket, a bored-out valve cap plug is preferable, if such is easily obtainable. In the event that it is not available, a hardwood plug will answer, as it does not have to be an exact fit and if ordinary precaution is used the threads in the cylinder will not be harmed. The end of the tool protruding through the plug is filed square, to fit a standard tap holder.

Fiber Washers that Should be Wetted.

When fiber washers used in making up water joints appear to be slightly too small they should be soaked a few minutes in warm water. When thoroughly wetted they expand slightly, in which condition they should be applied.

Making File Edges "Safe."

For filing in corners where it is desired that only one surface shall be cut, files are made with "safe edges"—that is, blank edges, without teeth. Safe edges can very easily be made on ordinary files by simply grinding off the teeth.

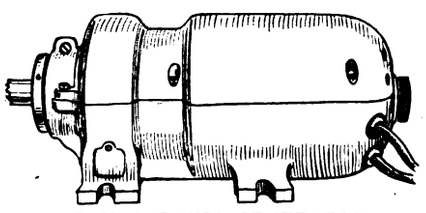
ELECTRICALLY LIGHTING AND STARTING THE CAR

The Distinctive Features of a Simple Lighting and Starting System Using Three Principle Elements Set Forth in a Manner to Make Plain Their Care—Voltage Regulation by Speed Governing Explained.

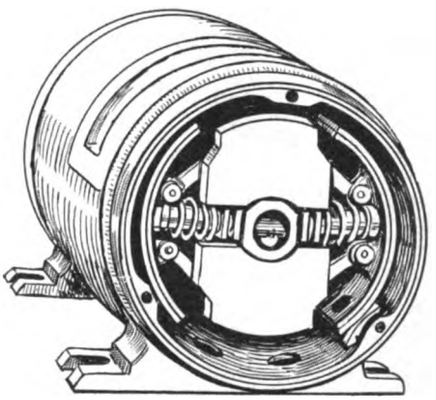
(This is the eleventh of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by the dealer and owner alike.)

One of the peculiarities of human nature that speedily develops into a bad habit is the general disinclination to "fuss with" things mechanical as long as "the other fellow" is willing to do the fixing. The person who relies upon some one else to adjust his carburetter or to find and remedy ignition faults soon gets to believe in his own mind that the work is beyond his ken and



APPLICATION OF GRAY & DAVIS ELECTRIC ENGINE STARTER

he is likely to be thrown into a sort of panic if even the veriest sort of minor trouble develops when his willing friend is absent. Really, there is no necessity for the panic, particularly now, when automobile mechanism has been reduced to a point of simplicity where the applicability of the time-worn saying "even a child can run it" is apparent, and the friend in need would be a friend indeed if he would keep away and let mister man-afraid-of-himself doctor his own troubles. It is the only way for him to gain the confidence that is invariably necessary.



Confidence Gained May Be Surprising.

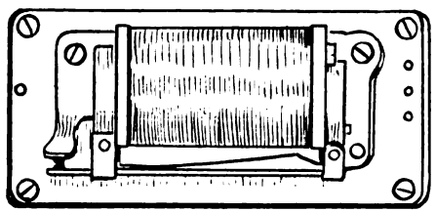
It is the same with electric lighting and engine starting systems. That all of them really are simple in construction and operation already has been pointed out in the past 10 issues of Motor World. It is doubtful, however, if those who are inclined to let "the other fellow" do the fixing ever will discover the truth; each must take hold of his own system and care for it himself; the confidence that will come of the experiment, if experiment it be, will be surprising. Not only will the owner or the dealer find that he is able to care for his electrical aquipment in the way it ought to be cared for, but he will discover also that the rest of the car of which he may or may not have been just a little bit afraid is not such a terribly fearsome conglomeration of mechanism after all.

GRAY & DAVIS GENERATOR

Obviously, indiscriminate tinkering is not to be encouraged; it may be, and generally is, bad for the mechanism. It is wise to let well enough alone — only be sure it is well enough before you let it alone. If the lights will not burn quite as brightly as they ought to, it is likely that some slight adjustment will bring them up to candlepower. If they cannot be lighted at all, it sometimes is the better part of wisdom to ship the apparatus back to the manufacturer for repair; in just as many cases, however, the trouble can be remedied by the owner or the dealer by the exercise of a little judgment and the application of his knowledge of the system, for modern automobile electrical apparatus is so constructed that troubles which require the ministrations of an expert seldom develop. The prime requisite is a working knowledge of the system; the owner ought to have it and the time rapidly is approaching where the dealer must have it if he is to be a successful dealer.

EXPANDING CLUTCH GENERATOR

Simple Components of Average Systems.



In all such systems, there must be a storage battery to furnish light—and possibly power; there must be a dynamo to charge the storage battery; and if the system is used to start the engine there must be a starting motor. The dynamo and the motor may or may not be combined according to the dictates of the manufacturer, though their combination does not of necessity increase the complexity of the system; in the opinion of not a few, it really simplifies the apparatus. Be that as it may, combined or separate, the care that is required to keep the system up to the top notch of efficiency is approximately the same in either case and the acquisition of the knowledge neces-

Digitized by Google

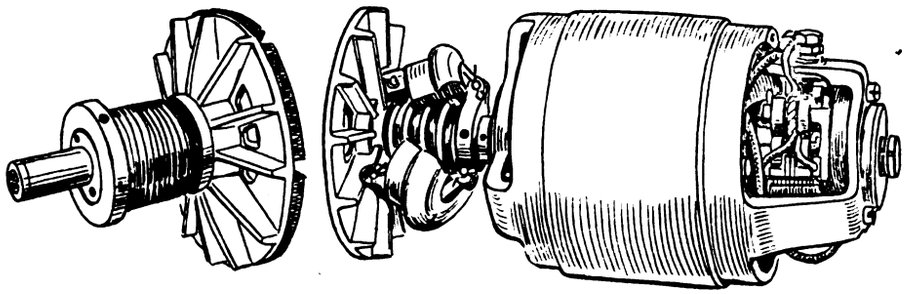
sary to make sure that it is "well enough" is not a task that need cause any one any gray hairs.

Three Elements that Accomplish Much.

In the well-known Gray & Davis electric lighting and engine starting system, which is manufactured by Gray & Davis, Inc., of Boston, Mass., for instance, only the three

GRAY & DAVIS CUT-OUT

elements outlined in the previous paragraph are used, broadly speaking. Of course, there is an automatic cut-out, for all such systems must have something of the kind, and there is a combined volt and ampere meter, and a switch and what is termed a junction box, the latter being merely a centralized distribution panel for the wires that lead to the lamps and the electric starter.



In common with several other manufacturers, Gray & Davis has preferred to separate the dynamo from the motor which starts the engine. The former is of the compound wound constant-speed type and is mounted to be driven from any convenient rotating shaft on the engine, and the latter drives the engine through the intermediary of gearing cut in the periphery of the flywheel. The automatic cut-out is of the simple magnetic variety, in which two windings are used in such a way as to ensure positive connection during the time the dynamo voltage is greater than the battery voltage and to break the circuit without fail instantly the battery voltage becomes the higher, as, for instance, when the engine is stopped and the dynamo is idle. It is mounted on the dash and is illustrated herewith with the cover removed.

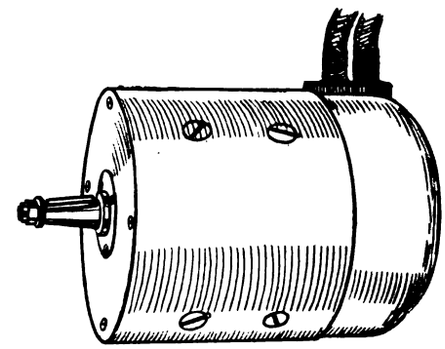
Theory of Constant Armature Speed.

By way of obtaining dynamo output regulation, the manufacturers have adopted what is probably the simplest method of all. The speed of the armature is maintained constant by means of a governing friction clutch; and as the machine is of the compound wound type, the current output is proportioned to the load. That is to say, the voltage remains constant regardless of engine speed fluctuations, but the amperage increases as the lights are turned on, due to the automatic increase in the strength of the field

Output Governed by Simple Clutches.

In order to obtain constant armature speed, two methods are used in the two different types of dynamos which are produced. In one, the clutching device is composed of two plates, one of which is aluminum and is faced with asbestos fiber and the other is cast iron, the plates being pressed together by means of a vanadium steel spring, the action of which is governed by centrifugal force obtained through the medium of two weights suitably connected. In the other, the clutching device is of the internal expanding variety. The characteristics of both are the same and both are illustrated herewith the better to make plain their construction.

GRAY & DAVIS DYNAMO SHOWING PLATE CLUTCH GOVERNOR



In operation, the dynamo is connected to the engine through the intermediary of a "silent" chain or a V-section leather belt, the gearing being such as will permit a normal speed of 1,200 revolutions a minute without slippage of the clutch. Of course, when the engine is speeded up, the weights will cause the spring pressure to be released slightly and the clutch will slip. Under normal conditions, with the car engine alternately accelerated and retarded, the dynamo clutch will slip almost continuously and in order to dissipate the heat which inevitably must be generated, a forced draft through the dynamo is provided by fan shaped wings cast on the plates of the clutch. By reason of the fact that the clutch spring pressure amounts to not more than one pound per square inch and the clutch surface is large—approximately 16 square inches—wear is minimized. Adjustment is provided, however, and may be made by turning a small nut located at the end of the shaft without the necessity for disturbing any of the parts. The weights are so proportioned that the dynamo can be overloaded at least 50 per cent. without detrimental effect, though an increase of speed of not more than 5 per cent. over 1,200 revolutions a minute causes instant response in that the clutch then commences to slip, holding the armature speed positively to 1,200 turns.

Like the dynamo, the Gray & Davis starting motor is exceptionally small and compact and is thoroughly protected from dirt and water; in fact, there are no openings whatsoever to permit of the ingress of foreign matter. Access to the brushes and commutator is had by means of a removable cap at one end.

By way of reducing complexity, to say nothing of reducing weight, the starting motor operates on the purely nominal pressure of six volts. As the lightning circuit also is a six-volt circuit, it may be appreciated that the wiring plan is materially simplified by the single voltage. Incidentally, the low pressure and amperage obviates the necessity for excessively heavy switches and wiring. The voltage is the same, by the way, as generally is used for ignition circuits.

What to Do in Case of Trouble.

In caring for the Gray & Davis system, it should never be necessary to touch the automatic cut-out other than to remove the cover and make sure that it is operating properly. The contacts should come together when the car speed is approximately 12 miles an hour, and they should separatea immediately the car speed is reduced to eight miles an hour. Inasmuch as the circuit is made and broken through the cut-out only at long intervals, wear at the contacts practically is nil. The only trouble which might occur would be due to foreign

GRAY & DAVIS STARTING MOTOR

matter collecting between the contacts; oil on the contacts will prevent proper connection being made and is likely to cause verdigris. In either case, the contacts can be brightened by gently polishing them with very fine emery cloth, two small pieces being glued to opposite sides of a piece of thin Bristol board.

The action of the cut-out, otherwise

Digitized by Google

known as a circuit breaker, can be determined with the aid of the combination volt-ammeter. When the engine is turning over slowly and no lights are turned on, the needle of the meter will stand at zero. When the engine is speeded up, the needle should swing over to the charge side. When the lights are turned on or the starter is used, the needle should swing over to the discharge side.

In the dynamo and the motor, there is nothing to get out of order, and the only parts that ever will require attention are the brushes and the commutator. By reason of the fact that the dynamo is run at constant speed and the starter is used only at infrequent intervals, perfect commutation should obtain for upward of 20,000 miles, which is equivalent to approximately two years' service.

Occasional Inspection Is Desirable.

However, it can do more good than harm occasionally to remove the cover over the commutator and brushes and inspect the mechanism, clearing away any accumulations of dust and dirt and carefully removing excess oil that may have collected. Just as long as the commutators exhibit a clear brownish glaze they should be let severely alone, for they then are in the best possible condition. If, however, they appear inordinately dry and the bright metal can be seen, they should be carefully sandpapered by holding No. 00 sandpaper against them while the armature is rotating, first removing the brushes. For a finishing touch a very minute quantity of fine vaseline can be applied with the aid of a piece of felt held against the commutator with the brushes in place while the machine is running. Care must be taken not to use too much vaseline, however, or it will gum up the brushes and the result will be poor commutation. The brushes should be cleaned all over occasionally with a cloth dampened with gasolene to remove carbon dust and traces of oil. It must be seen to that they slide quite easily in their holders. The shaft bearings of the dynamo and the motor should receive no more lubrication than is accorded the magneto. A few drops of fine machine oil about once a month will suffice.

The starting motor is placed in operation by depressing a small pedal supplementary to the clutch and brake pedals, the action serving first to enmesh the driving gears on the periphery of the flywheel and then to connect the motor to the battery. As the starting switch is ruggedly constructed it will never give trouble and need not be touched. It is wise, however, occasionally to go over the rods actuating the gear enmeshing mechanism and the switch and to place a couple of drops of oil on the bearings—but not on the switch.

ROTATION IN OFFICE MAKES NEW YORKER HEAD OF A. A. A.

Ohio Fight Enlivens Annual Meeting But Chief Disturber Is Dropped—Association's Attitude on Federal Aid Defined.

Laurens Enos, one of the best known motorists of Buffalo, N. Y., moved up into the presidency of the American Automobile Association at its annual meeting in Chicago on Monday last, 2nd inst. He was chosen to succeed Robert P. Hooper, of Philadelphia, who relinquished the office after having served two useful terms, to which considerable excitement had been contributed by the "war" in Ohio, which still is in progress. The new president took it over as the most unpleasant heritage of his office, and one which probably will prevent his duties from growing monotonous.

The other officers chosen are as follows: First vice-president, John A. Wilson, of Pennsylvania; second vice-president, Dr. H. M. Rowe, of Maryland; third vice-president, Ralph W. Smith, of Colorado; fourth vice-president, F. L. Baker, of California; fifth vice-president, Asa Paine, of Minnesota; secretary, John W. Brooks, of Connecticut; treasurer, H. A. Bonnell, of New Jersey; chairman of executive committee, A. G. Batchelder, of New Jersey.

Ralph W. Smith, of Colorado, and F. L. Baker, of California, were the only vice-presidents re-elected. During the year First Vice-President Frank M. Joyce, of Minnesota, died, and the elevation of Laurens Enos from the second vice presidency to the presidency naturally left those two offices vacant. The vice-president who was dropped was Dr. C. L. Bonifield, of Ohio, the cause of most of the turmoil in that State and in the A. A. A. itself. The secretary, the treasurer and the chairman of the executive committee were re-elected. Chairmen of boards were re-appointed as follows: Good Roads, George C. Diehl, Buffalo; Legislative, Charles Thaddeus Terry, New York; Touring, Howard Longstreth, Philadelphia; Contests, William Schimpf, New York.

As was the case last year, when the annual meeting was held in New York, two warring Ohio factions appeared orally armed for the fray. They were led, respectively, by Dr. Bonifield, of Cincinnati, and H. L. Vail, of Cleveland, the former the president of the Ohio Automobile State Association, and the latter the chief spokesman for the Ohio State Motor Federation, which was organized by the bolters from the Ohio State meeting of 1911, which they declared had been "packed" with mush-room clubs by Dr. Bonifield and his adherents.

During the year the Federation had appealed to the executive committee of the A. A. A. for recognition as the national organization's official representative in Ohio, which recognition, however, was denied. In Chicago, on Monday last, the fight was reopened when the Federation filed a formal application for recognition. Although the Bonifield element had bombarded him personally, and despite his sympathies, President Hooper upheld it and ruled that as the Federation's application was not in proper form and had not been filed at the proper time it could not properly be considered. His action precipitated a long and turbulent discussion, but he remained firm and, as a result—and very properly—the Ohio State Automobile Association retains official recognition, despite the fact that Bonifield and most of his followers have made themselves obnoxious.

The fight between the Ohio factions is so warm that the same reports of secession which followed last year's session are again current, and no man can say what the end will be.

Matters pertaining to good roads, to which the A. A. A. is so firmly committed, served as a peaceful offset to the turbulence created by the Ohioans. George C. Diehl, chairman of the A. A. A. Good Roads Committee, offered a resolution, which was passed, and which clearly defines the A. A. A. position in respect to "Federal aid" in the building of highways.

The report of the treasurer showed all bills paid and a balance on hand of $3,293.07. This favorable condition is largely due to the fact that Chairman Schimpf, of the contest board, as an amateur, does not draw a salary. This enabled him to turn over to the Association $5,000, although at the beginning of his term there was a deficit of $1,600. According to the working agreement existing between the A. A. A. and the Manufacturers' Contest Association, the latter body was to make good any deficit of the sort, but the health of the M. C. A. has not been of the best during the past year, and it remained for the non-salaried chairman of the A. A. A. contest board to keep the treasury full.

Richmond, Va., was selected as the city in which the next annual meeting of the association will be held.

In the preamble of the resolution the association asserts belief in the principle of State Aid and State Highway systems, and pledges itself to assist in obtaining State built and State maintained roads, with State Aid and supervision of county, market and township tributaries. Furthermore, attention was called to the general acceptance by automobilists of an unconstitutional

Digitized by Google

tax, called a "registration fee," simply because the money so raised is used for highway maintenance purposes.

The preamble also remarks the undesirability of distributing Federal funds for the piecemeal improvement of local roads, and places the A. A. A. on record as being definitely opposed to any sort of Federal aid which does not comprehend this general inter-State system of national roads constructed and maintained under the supervision of the Federal government. The resolution itself, as adopted by the A. A. A., is as follows:

Resolved, That this association hereby declares itself in favor of National roads as the specific object upon which Federal appropriations for good roads should be spent.

Resolved, That this association as the National body of automobilists shall do all in its power to discourage "pork barrel" methods in National roads appropriations, and shall use its influence with its constituent State bodies and local clubs to induce them as organizations, and their members as individuals, to assist in averting the great harm which the good roads movement would suffer if Federal appropriations for highways are permitted to become prizes for distribution among Congressional districts as a reward for political service.

Another resolution was introduced by Howard Longstreth, of Pennsylvania, which urges Congress to provide for a bureau of road travel, to be under the direction of the Secretary of the Interior, which, among other things, will have to do with the systematic marking of the National and State roads.

The report of William Schimpf, chairman of the contest board, showed that during the past year 132 sanctions had been granted, as against 116 last year and 175 the previous year. While the number of sanctions has increased, the number of registered drivers, however, had fallen off, from 819 to 575. Of this number 26 were amateur drivers.

Didn't See Races; Wants Money Back.

Because William Wallace, who hails from Quaker Town and who journeyed all of the way out to Milwaukee, Wis., to witness the Vanderbilt, Grand Prize and other speed clashes, was unable to tarry when the races were postponed for a week and therefore had his trip for naught, he has instituted suit against the Milwaukee Automobile Dealers' Association, which promoted the races, to recover the $120. That is the amount, he alleges in his complaint, that he paid for grandstand tickets to witness the racing and which he was unable to dispose of before his return to his Philadelphia home.

MEN, HORSES AND CARS IN FORT WORTH'S MIXED MEET

Mosley Is Honor Man in Automobile Events, Winning Five of Nine Races in Three Days—Clark Takes Three.

Weather conditions which, to put it mildly, were far from ideal seriously affected the attendance on the first and third days of the mixed—foot, horse, motorcycle and automobile—race meet which was held under the auspices of the Fort Worth (Tex.) Driving Club on Wednesday, Thursday and Friday, November 27th, 28th and 29th; all told, however, the conditions on Thanksgiving Day left little to be desired.

Of the honors in the automobile program, the better part went to C. Mosley, who, driving a Studebaker car, accounted for two of the three five-mile events which were on the program for each of the three days. George Clark, who, as usual, drove a Mercedes, cleaned up the free-for-all numbers which were run on Wednesday and Thursday, and in all probability would have done as much for a similar event which was run on the final day had not trouble prevented his starting. The summary:

Wednesday, November 27th.

Five miles, for cars with displacements of 231-300 inches—Won by C. Mosley (Studebaker); second, Chas. Craig (Studebaker); third, Wilbur Beaty (Studebaker). Time, 7:20.

Five miles, for cars with displacements of 300-450 inches—Won by C. Mosley (Studebaker); second, Chas. Craig (Studebaker); third, Fred Spreen (Pathfinder). Time, 6:45.

Five miles, free-for-all—Won by George Clark (Mercedes); second, Chas. Craig (Studebaker); third, W. Hearne (Cutting). Time, 6:43.

Thursday, November 28th.

Five miles, free-for-all—Won by George Clark (Mercedes); second, C. Mosley (Studebaker); third, Chas. Craig (Studebaker). Time, 6:17.

Five miles, for cars with displacements of 231-300 inches—Won by C. Mosley (Studebaker); second, W. Beaty (Studebaker); third, H. Schmidt (Buick). Time, 6:40.

Five miles, for cars with displacements of 300-450 inches—Won by C. Mosley (Studebaker); second, W. Beaty (Studebaker); third, H. Schmidt (Buick). Time, 6:39.

Friday, November 29th.

Australian pursuit, about 10 miles—Won by C. Mosley (Studebaker); second, H. Schmidt (Buick); third, Chas. Craig (Studebaker). No time taken.

Five miles, for cars with displacements of 231-300 inches—Won by C. Mosley (Studebaker); second, H. Schmidt (Buick); third, W. Beaty (Studebaker). Time, 6:41¼.

Five miles, free-for-all — Won by H. Schmidt (Buick); second, C. Mosley (Studebaker); third, C. Craig (Studebaker). Time, 6:41.

Six Thousand See "Exhibition" Meet.

Barney Oldfield staged his first "exhibition" meet on the one-mile track at the County Fair grounds, Fresno, Cal., on Sunday, November 24th. Though advertised as an exhibition meet which was closed to outsiders, in compliance with the rulings of the contest board of the A. A. A. as interpreted by the Western representative, P. J. Walker, fully 6,000 spectators were on hand, and great was the disappointment when no competitive numbers were run. Oldfield made the best showing of the day, when he drove the Christie for a single mile in 48 and 47⅕ seconds, respectively, times which are better than the record established by Burman at Brighton Beach on September 7th, but which will not be officially recognized because they were not electrically timed. Fred Melaun, driving a Benz, covered two miles in 1.51⅘, and driving a Cino, a single mile in 58 seconds.

Weathers Wins Thanksgiving Road Race.

Bert Weathers, who drove a Mercer car, won the 100-mile road race which was run on a ten-mile course at Visalia, Cal., on Thanksgiving Day, under the auspices of the Automobile Club. Second honors went to Johnson, who drove a Hupmobile; third place is disputed by Hammett (Nyberg) and Newkirk (Ford). One accident, which probably will result fatally to the driver, occurred when the car driven by George Williams skidded and upset in a ditch, pinning Williams beneath it. He was removed to the hospital, where it was stated that his chances for recovery are practically nil.

Overgaard Heads Nebraska Association.

A. R. Overgaard, of Fremont, has been elected president of the Nebraska State Automobile Association. The other officers are: First vice-president, Lee Huff, Omaha; second vice-president, C. E. Parsice, Minden; third vice-president, H. E. Gladfelter, Central City; secretary, O. C. Turner, Omaha; treasurer, E. R. Wilson, Omaha. The board of directors comprises: B. A. George, Lincoln; Carl Johnson, Havelock; Lee Huff, E. R. Wilson, Omaha; A. P. Overgaard, Fremont; J. E. Doty, David City; D. C. Dally, Beatrice; Ray Rarrison, Grand Island; E. A. Mason, Bloomfield.

VIRGINIANS ENTERTAINED BY DISBROW'S FAST FLYERS

Disbrow Himself Takes Lion's Share of Honors at Two-Day Racemeet —Morton Twice Goes Through Fence—and Lives.

Despite chilling blasts and weather which otherwise was more or less inclement, spectators were not lacking nor were the numbers meager at the two-day speed carnival which was staged on the mile track at the State Fair grounds, Richmond, Va., Friday and Saturday last, November 29th and 30th, by the Richmond Automobile Club. The better part of the honors which accrue from the contest went to Louis Disbrow, who, as usual, drove a Simplex in the competitive numbers in which he was entered and a reconstructed Fiat in the time trials.

On the first day, besides making a mile in 1:09½ in the time trial, Disbrow won both of the feature events of the day—a ten-mile free-for-all handicap which he completed in 11:03, starting from scratch, and all three heats of a special race, the first heat of which went for a single mile, and the second and third for two miles and in which his times for the respective heats were 1:13, 2:15 and 2:17½. The remaining events in the first day's program comprised a five-mile contest for touring cars, which went to John Minker (Kline) in 6:49½; a ten-mile contest for touring cars and roadsters with a price limitation of $1,600 and which K. C. Taylor (Buick) accounted for in 14:20½, and a five-mile match race between Joe Nikrent (Case) and Barber (Warren), which was completed with Nikrent in the lead in 6:33½.

On Saturday Disbrow made even a better showing and took three of the competitive numbers and lowered the local track record for a single mile to one minute flat, from the 1:06 which Oldfield made three years ago. His victories on the second day comprised a five-mile event for cars with displacements of under 600 inches, which he accounted for in 5:16½; a five-mile free-for-all, which was won in 5:21¾, and what proved to be the most interesting number on the program, a 25-mile free-for-all. Disbrow's time for the latter event was 26:49. Of the remaining events, Spencer Wishart took the ten-mile contest for cars with displacements of 231-300 inches in 10:43½; Taylor won a special five-mile event for old touring cars, covering the course in 7:13¾, and Joe Nikrent went to the fore in the ten-mile contest for cars with displacements of under 451 inches. His time was 10:59¾.

William Morton, who was placed in several of the contests, created no little excitement when he went through the fence when his tire burst during the running of the 10-mile event for light cars. Happily neither driver nor mechanician were hurt, nor was the car damaged to an extent sufficiently great to necessitate its withdrawal. Morton was in luck, as he escaped injury when he again went through the fence while on his eighth lap in the 25-mile free-for-all and with similar results. The summary:

Friday, November 29th.

Five miles, for touring cars—Won by John Minker (Kline); second, William Morton (Kline); third, Louis Menenghetti (Stevens-Duryea). Time, 6:49½.

One mile, time trial—Louis Disbrow (Fiat). Time, 1:09½.

Ten miles, for touring cars and roadsters costing under $1,600—Won by C. K. Taylor (Buick); second, R. F. Kaehler (Ford); third, George Booth (Maxwell). Time, 14:20½.

Heat race. First heat one mile, second and third heats two miles. First heat—Won by Louis Disbrow (Simplex). Time, 1:13. Second heat, first division—Won by Louis Disbrow (Simplex); second, Dave Lewis (Stutz); third, William Morton (Kline). Time, 2:24½. Second heat, second division—Won by John Minker (Kline); second, Spencer Wishart (Mercer); third, Joe Nikrent (Case). Time, 2:15. Third heat—Won by Louis Disbrow (Simplex); second, John Minker (Kline). Time, 2:17½.

Five miles, match race—Won by Joe Nikrent (Case); second, Barber (Warren). Time, 6:33½.

Ten miles, free-for-all handicap—Won by Louis Disbrow (Simplex), scratch; second, William Morton (Kline), 20 seconds; third, John Minker (Kline), 20 seconds; fourth, Joe Nikrent (Case), 20 seconds; fifth, Dave Lewis (Stutz), 12 seconds. Time, 11:03.

Saturday, November 30th.

Five miles, for touring cars—Won by John Minker (Kline); second, Morton (Kline); third, Louis Menenghetti (Stevens-Duryea). Time, 6:17½.

Ten miles, for cars with displacements of 231-300 inches—Won by Spencer Wishart (Mercer); second, Joe Nikrent (Case); third, William Morton (Kline). Time, 10:43½.

One mile, against the local track record of 1:01—Louis Disbrow (Fiat). Time, 1:00. New record.

Five miles, for old cars—Won by Taylor (Buick); second, Gordon (Metz); third, Kaehler (Ford). Time, 7:13¾.

Ten miles, for cars with displacements of under 450 inches—Won by Joe Nikrent (Case); second, William Morton (Kline); third, Dave Lewis (Stutz). Time, 10:50¾.

Five miles, for cars with displacements of under 600 inches—Won by Louis Disbrow (Simplex); second, Dave Lewis (Stutz); third, Joe Nikrent (Case). Time, 5:16½.

Five miles, free-for-all—Won by Louis Disbrow (Simplex); second, Dave Lewis (Stutz); third, William Morton (Kline). Time, 5:21¾.

Twenty-five miles, free-for-all—Won by Louis Disbrow (Simplex); second, Joe Nikrent (Case); third, William Morton (Kline). Time, 26:49.

Burman Makes Moross Meet.

True to his word, Barney Oldfield did not appear as a competitor at Ernie Moross's first California meet, on the Emeryville track, Oakland, on Sunday, November 24th, so that Moross's "star," Robert Burman, had things practically his own way from start to finish. Of the six events which made up the program, Burman took four and finished second in the fifth, a five-mile free-for-all handicap, which went to Joe Horan in 4:39. The remaining event was for light cars and went to Kirk Dunham (Detroiter), who completed the circuit in 5:52⅕. In addition to his victories, Burman drove an exhibition mile in 50 seconds, thus lowering the local track record by six seconds. The summary:

One mile, time trial—Robert Burman (Benz), time, 0:50.

Five miles, for cars with displacements of 161-230 inches—Won by Kirk Dunham (Detroiter); second, A. J. Edwards (R. C. H.). Time, 5:52⅕.

Five miles, for cars with displacements of under 600 inches—Won by Robert Burman (Cutting); second, Joe Horan (Darracq). Time, 5:01.

Three miles, free-for-all, for the Remy Brassard and trophy. First heat—Won by Robert Burman (Darracq); second, Joe Horan (Mercedes); third, Janette (Benz). Time, 2:56⅘. Second heat—Won by Robert Burman (Darracq); second, Joe Horan (Mercedes); third, Harkins (Benz). Time, 2:52⅕.

Ten miles, for cars with displacements of under 600 inches—Won by Robert Burman (Cutting); second, Joe Horan (Darracq). Time, 10:08.

Five miles, free-for-all handicap—Won by Joe Horan (Benz); second, Robert Burman (Darracq); third, A. J. Edwards (R.C.H.). Time, 4:39.

Making a Drill Bore Oversize.

A flat drill that is a trifle too small may be made to cut a hole larger than its own width by grinding it unequally, leaving one cutting edge longer than the other, so that the drill will rotate eccentrically.

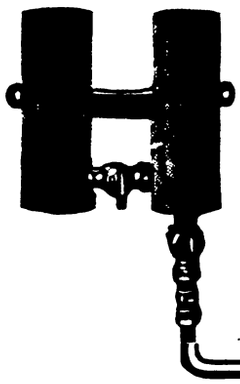
At The Point of PERFECTION

and the last work of inventive genius exemplified in this common sense economizer and engine saver.

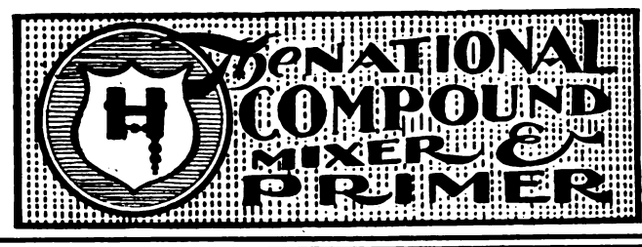
It is an acknowledged fact that no carburetor, however perfect, can get full power and service out of a given quantity of gasoline.

Your customers know this—you know it—and here we show the only real way to get maximum power from fuel, regardless of the efficiency of the carburetor in this particular.

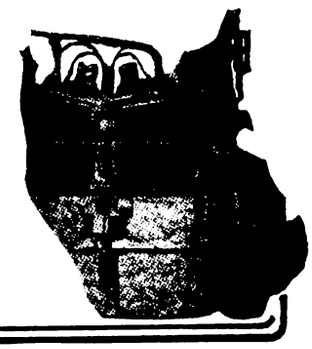
The National Compound Mixer and Primer, a small, compact, little instrument, located on the dash, admits air to the manifold, breaking up every drop of gasoline before it enters the engine.



With it perfect mixture and perfect combustion is assured—



Saving From 10 Per Cent. to 40 Per Cent. Gasoline



Increasing Power From 10 Per Cent. to 40 Per Cent.

Doing Away With Carbon

The Primer will instantly prime all cylinders with a rich mixture—NOT with pure gasoline—and can always be used to clean the engine in a very easy way.

EVERY DEALER

will find a ready sale for the National Compound Mixer and Primer—it is a money saving, power conserving convenience and the price will put it within reach of every car owner in every locality.

It's only a question of your getting this agency FIRST, while the field is virgin and sales and liberal commissions big.

You, Mr. Dealer, can get in on the ground floor if you will respond to the advertisement.

NOW—will you do it?

Lancia

AMERICA'S FAVORITE FOREIGN CAR SOLD AT AMERICAN PRICES

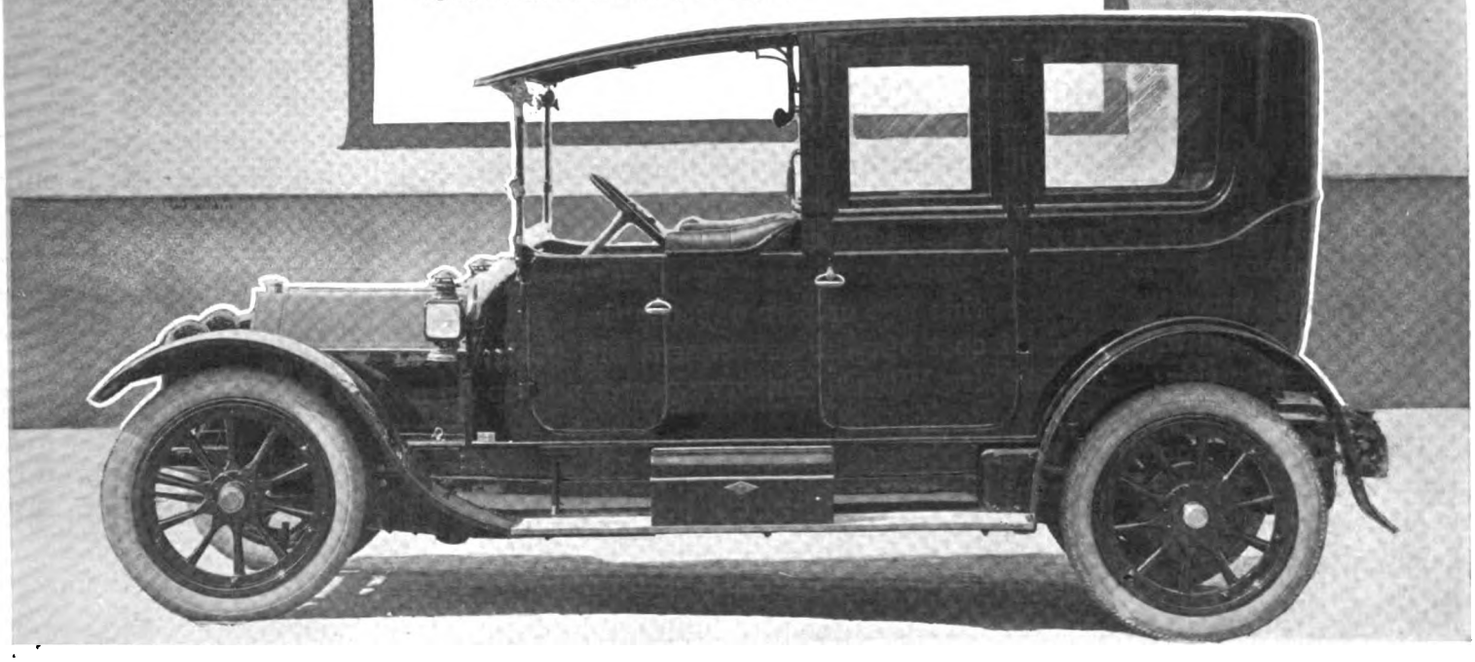
Lancia cars, made in Europe, offer the American buyer every European point of superiority in material, engineering features, workmanship, design and finish—and it is conceded that car building methods which obtain on "the other side" are years in advance of American methods.

And American Dealers can sell Lancia cars at American prices.

You, Mr. Dealer, know that limited quantity production insures the ***personal attention*** of every man engaged in the building. Lancia production is typically European because it ***is*** limited. Here are no American cut and dried operations that produce quantity at the heavy expense of quality.

Lancia dealers use these arguments as the basis for selling arguments.

Car wise buyers who want European automobiles are quick to grasp and act upon them.



There is some choice territory awaiting dealers who are looking for that ***different and better car.*** Are you such a dealer?

McCUE

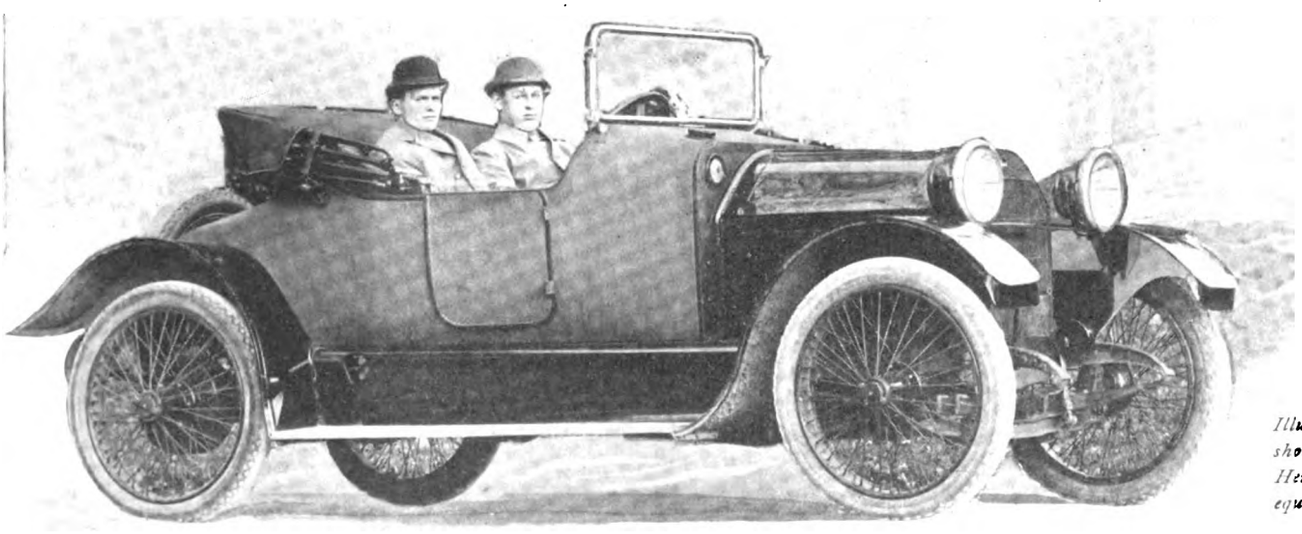

Illustration herewith shows one of the new Henderson Roadsters equipped with McCue Wire Wheels.

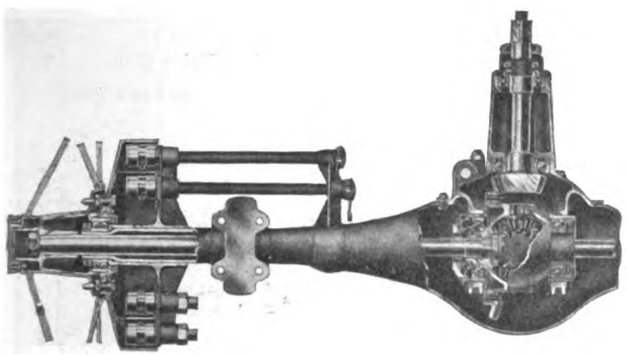
In the matter of car equipment, dealers can exercise a dominating force, for it is largely the demands that you make in concert that influences the manufacturer to give your trade what it wants.

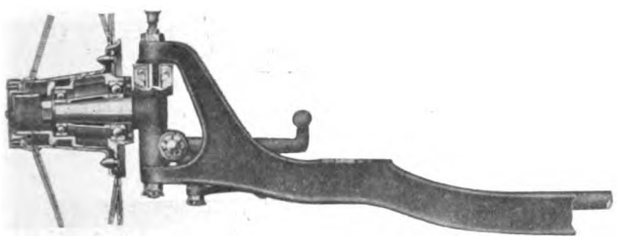
As a seller of cars you want the best equipment — you are responsible to your patrons and your success depends upon your ability to furnish cars of service—that is, if you are building for future growth and prosperity.

The lines you represent will sooner or later be equipped with McCue Wire Wheels. It is only a question of time. Economy, safety and common sense demand these wheels. Your good business judgment should make you grasp the significance of the statement.

Wire wheels sell more cars for you, for they reduce that "little old man of the sea"—tire upkeep—to a negligible quantity and it is this tire upkeep expense that prevents thousands of sales—to those who are not afraid of the initial cost but the subsequent big pocket book drain.



Also consider this: McCue Wire Wheels conserve power and speed and so make a big cut in fuel consumption.



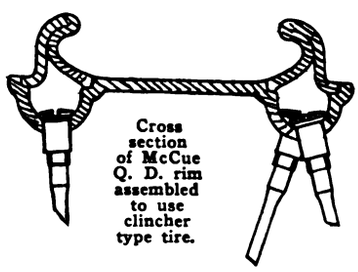
For your own good and in the interests of your trade get in touch with your manufacturer on this important subject. Don't delay and let competition pass you—don't be forced by competition, but keep ahead of it.

Investigate now—get the facts from us, digest them, and go to your manufacturer with them.

Digitized by Google

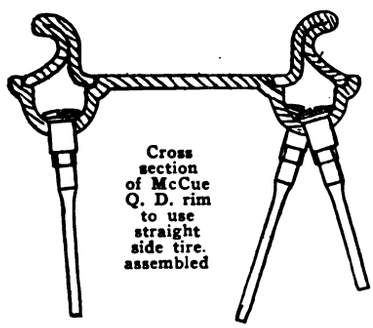
WIRE WHEELS AXLES

McCue Axles are not sold on price—but on merit.



It is conceded that the McCue front axle is the leader —from every standpoint—in the motor car field.

McCue rear axles exemplify the finest engineering skill backed by out-of-ordinary materials and methods of construction. They admit no superior.



An ideal combination is McCue front and rear axles plus McCue wire wheels. It is a combination that will make one of the strongest selling points any dealer can possibly put forth. However, McCue Wire Wheels are adapted to any axle and not confined to the McCue models.

McCue Wire Wheels May Be Had Equipped With Q. D. Rims

As may be seen by the illustration herewith, the McCue Company is now supplying Q. D. rims on their wire wheels. The general all around advantage of the McCue Q. D. Rim is that that portion of the wheel which is presented to the tire is perfectly smooth and flat. The spoke nipples are inserted in grooves which are rolled into the rim. Just incidentally these grooves add a considerable degree of stiffness to the rim as well as providing a means of preventing the nipple head from coming in contact with the wire. These Q. D. rims, of course, are furnished on the detachable wheel. Another point very much in favor of McCue Q. D. Rims is that by simply reversing the position of the rings the same set of rims may be used either for straight side tires or for the clincher type.

Cross section of McCue Q. D. rim assembled to use clincher type tire.

Cross section of McCue Q. D. rim to use straight side tire. assembled

The Conover *adds Class to the appearance of any Car.*

A BROAD, FLAT CHANNEL-BAR—rather than a tube—and of far greater resistance-strength; supported at four points by semi-elliptic steel springs; guaranteed unrestrictedly for two years against any contingency that may arise.

Best quality Steel, heavily enameled in Black, Royal Blue, French Gray or Maroon. One size only: bar 2 inches wide - - **$15.00**
(Any other color of enamel $5.00 extra)

Best quality Steel, Brass or Nickel plated. One size only: bar 2 inches wide - - **17.50**

Solid Bronze finished in either Brass or Nickel. Two sizes: bar 2 or 2⅜ inches wide **25.00**

BUT its big value lies in its *protective-power.*

Its ability to prevent annoying and expensive mishaps to the exposed front parts of your car.

Your insurance covers damage of more than $25.00. The Conover prevents this. Furthermore, it prevents damage of a lesser extent—*not* covered by your insurance. And in neither case must you wait for the car to come from the repair shop.

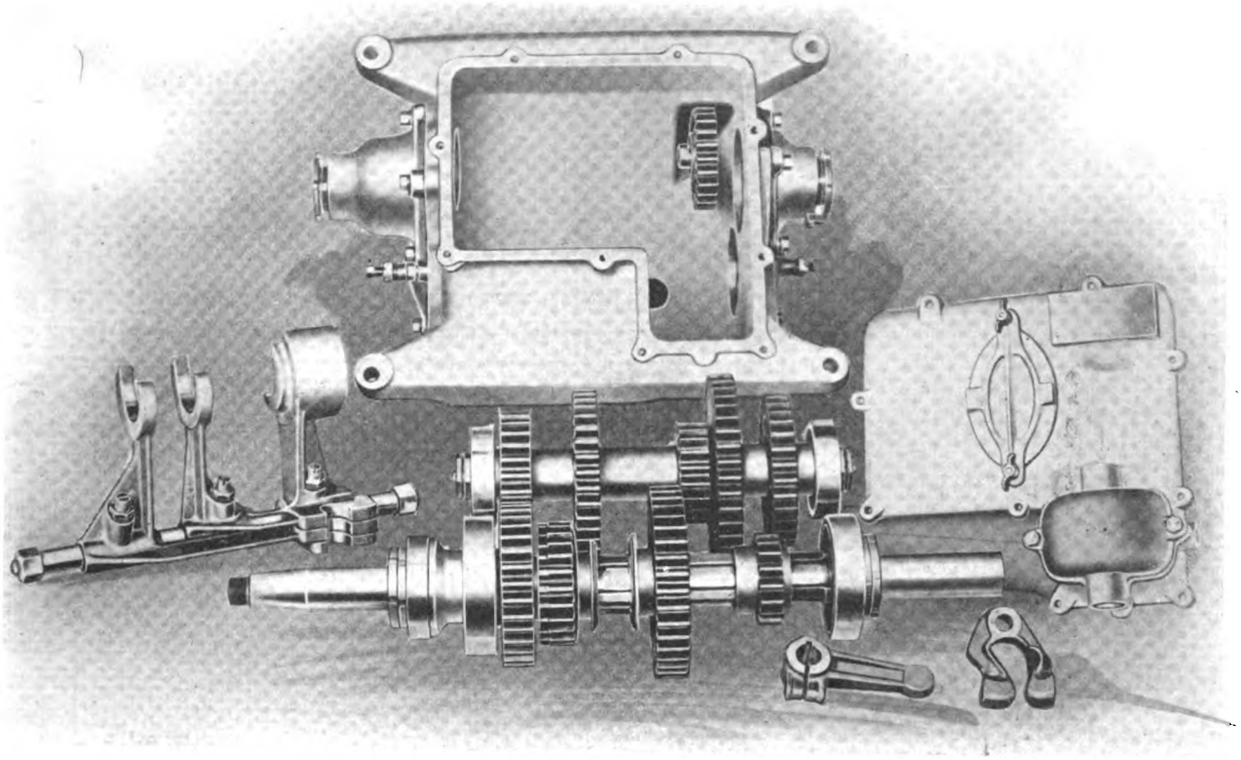
Discriminating Men of Means Want These European Models of Prestige and Performance

A Car for Americans



A few years since the ownership of a foreign car seemed a remote possibility to the "classes." Foreign design and workmanship were not understood—or appreciated—prices seemed out of reason.

Today, the demand for European cars is on the increase—Metallurgique, the aristocrat of Europe, is leading the foreign group—and this is just the logical result of our dealers' confidence in this—a car of rare worth, of service, power and speed, coupled with unique lines that spell to the eye "From Europe."

You, Mr. Dealer, have prospective buyers for this car. There are always men who appreciate foreign products for their true worth and exclusiveness. Now, just think this over. Locate the prospects and write to us. We will help you sell the Metallurgique.

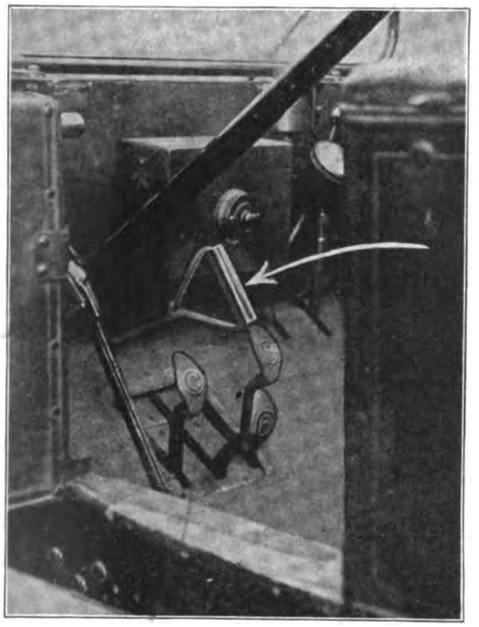
Pullman

Four-Speed Transmission

The design and care in the manufacturing and testing of the four-speed Pullman transmission, shown herewith, is another one of the strong sales points for Pullman cars.

The transmission case is cast in one piece. This gives rigidity, uniformity and extreme accuracy. The gears are very large in size, which fact minimizes the teeth pressure and insures better lubrication under full load conditions. All shifting forks work on one shaft which fact makes the construction extremely simple. All transmission bearings and gears are lubricated by light grease contained in the gear case.

After being assembled, prior to which each piece has been carefully tested, the transmissions are run on a testing bench for at least 20 hours. This enables the grinding in of the gears to a nice polish. The transmissions are then taken completely apart, inspected and carefully cleaned in gasoline—after which they are re-assembled.



In subsequent advertising we will go into the question of the heat treatment of these transmission gears which is one of the important features of Pullman transmission construction.

If you are looking for a continuous money-making agency, get in touch with us.

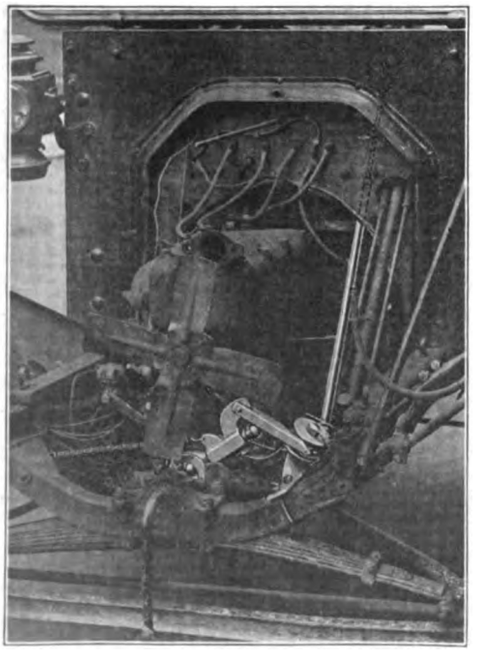
The Triplex Ford Engine Starter

How Are Your Ford Cars Started?

DO YOUR OWNERS STILL STRADDLE THE BUMPER AND CHURN THE CRANK?



You Will Give Them This Message if You Appreciate the Unequaled Advantages of Starting the Ford Car With the TRIPLEX ENGINE STARTER.

The TRIPLEX FORD ENGINE STARTER is a mechanical starter, which, of all types—compressed air, acetylene gas, electric and spring—is the only one on the market which at all times proves absolutely RELIABLE. In no respect is it a "Hit-or-Miss" proposition—working one minute and short circuiting or blowing out a cylinder head the next. It gives 100 per cent. uninterrupted service from the time it is attached. It comprises so few parts and is so simple and direct in application that it cannot get out of order, and it is as safe and durable as it is simple and effective.

You do not have to leave your seat to start the Ford Motor, WHEN EQUIPPED WITH THE TRIPLEX STARTER.

All that is necessary is to pull the lever. Will absolutely start the Ford 1,000 times out of 1,000.

Can be easily attached in one hour's time. Absolutely no holes to drill or mechanical work necessary to install same. Absolutely guaranteed to outlast the motor.

DEALERS: It doesn't require SALESMANSHIP to sell an ARTICLE for which every FORD OWNER is clamoring. Bring the TRIPLEX FORD ENGINE STARTER AND THE FORD OWNER together and a sale results.

GILMER TIRE REPAIR PLIERS

We are just about keeping pace with the tremendous demand for this "worth its weight in gold" little instrument, and so we can still fill your orders with reasonable promptness—if you don't delay.

You have read about this device. You must know how simple it operates—how positive are the cures it effects and how valuable it must be to the man who owns it. It is largely up to you, then, to help your trade in this tire upkeep matter—and you can do it by recommending Gilmer Tire Repair Pliers.

The operation of sealing up cuts and abrasions is simple. Just insert the prongs of the pliers into the injury, spread the pliers, throwing the ratchet lever to center when it locks. Then clean the wound, insert pure rubber gum and reverse the operation of opening. Then the tire will close **over** and **around** the gum, producing a permanent repair.

Remember, Gilmer Tire Repair Pliers sell for $1.00, and to see them is to want them. It is only necessary for you to demonstrate their worth in order to make sales, and in the doing you not only reap a good profit but also make a firm friend of the man you are helping to save dollars.

Send your order today.

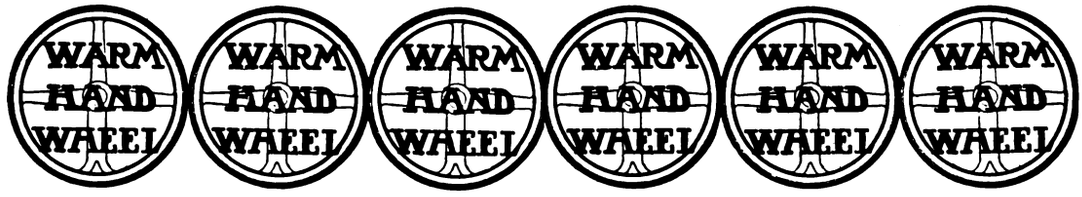
It takes little talk and little argument to convince the most skeptical that the Warm Hand Wheel is the most logical, common sense improvement in the automobile lield today.

It is only a question of you, Mr. Dealer, placing yourself in the position of those of your customers who drive in winter. Figure out how desirable this comfort-giving wheel would be to you.

Just look at it from their side of the fence. Don't you think they will be glad and eager to equip with a device that will make winter driving a positive pleasure by keeping the hands as warm as toast under all conditions of cold.

You must realize that if you do not grasp this selling opportunity now, your territory is bound to be invaded sooner or later by some more enterprising dealer who can see the sales possibilities that lie in the Warm Hand Wheel.



The Warm Hand Wheel can be installed by you quickly and without interfering with any of the working parts of the car. Once installed it remains, year in and year out, a source of comfort and satisfaction to the man who owns it.

That is the whole story.

Write today and get our proposition to you. Remember that the Warm Hand Wheel sells for $15 and offers you an opportunity to earn a liberal commission—more important, it will keep many cars on the road through the winter that would otherwise be housed—a matter of more sales through the dull winter months to you, as your own good business judgment will tell you.

The Warm Hand Steering Wheel Company

527 Fifth Avenue **NEW YORK CITY**

Digitized by Google

THE present demand for self-starting and lighting equipment has created a demand for an ignition system capable of producing a hot, dynamic spark independent of the engine speed.

This demand is being successfully met by

The Atwater Kent Ignition System

the starting button of which produces, not a few weak sparks, but a single heavy flame-like spark, thus insuring at all times the perfect ignition of any mixture that will burn.

Other salient features of the Atwater Kent System are the extreme simplicity of mechanism, only three moving parts, one contact, one adjustment and one non-vibrating coil.

While the Atwater Kent System is high in value and reputation, it is not high in price. In fact, it will cost less than half as much as a good magneto and will give superior results at a much less cost of upkeep.

We can now furnish two types of the Atwater Kent System for use on cars as sole ignition in place of the magneto, in conjunction with lighting and starting equipment.

***Type "F"* without Automatic Spark Control.**

***Type "K"* with Automatic Spark Control and insulated primary circuit.**

No matter what the requirements, the Atwater Kent System of Ignition affords ideal ignition.

Write today for detailed information and illustrated booklet "D."

WARD LEONARD WARD LEONARD

WARD LEONARD WARD LEONARD

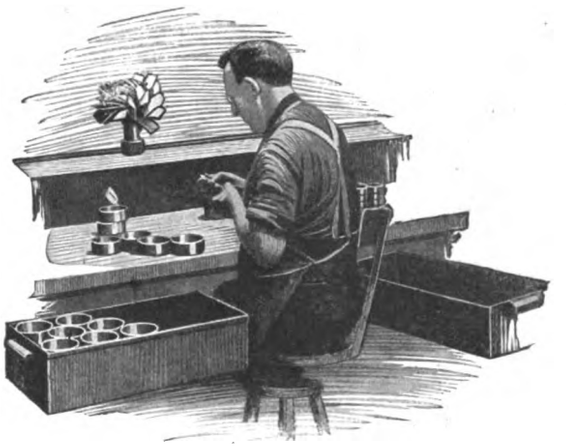
The Ward Leonard System *for* LIGHTING and STARTING

A Guaranteed Success

As far back as 1889, Ward Leonard Lighting Systems were used as pioneer installations in the line of dynamo lighting systems for moving vehicles. The batteries in these systems were "floated on the line" and "automatically controlled" just as is necessary in the case of motor cars.

Ward Leonard Electric Self Starters for automobile gas engines have been in use longer than the motor cars of nine-tenths of the manufacturers now prominent in the automobile industry.

The present Ward Leonard Dynamo Lighting System represents the evolution of numerous successive inventions, covering a period of 17 years. In 1905, a patent application covering the modern type of Ward Leonard Dynamo Lighting System was filed in the United States patent office. This patent was granted to H. Ward Leonard on November 5, 1912.



These are but a few facts to prove that we were in the game early. The designs of our systems are based upon fundamental truths, and for many years we have aimed at simplicity of structure and perfection of automatic control. Time will tell whether systems not based on scientific principles can live.

Sign of the bright red tag

¶ On the bench of each inspector is a rack full of crimson tags.

¶ Danger signals to be tied on every piece not made *exactly* to specifications; warning tags to insure that no imperfect parts shall enter the finished bearing.

Timken Tapered  Roller Bearing

¶ Here's a red-tagged 'cup' marked 'small O. D.'—date—name (Griffin) of the man who ground it. An inspector (Will Keyser) has found it to be half the thousandth part of an inch too small in outside diameter.

¶ So he tagged it red and sent it along, with other tagged parts, to the 'morgue.'

¶ 'Morgue' is the name Timken shop men give to the place where rejected parts go. It's the morgue man's task to break up those parts so they never can come, by possible chance, into use in the Timken Bearing.

¶ Twelve operations make the part called the 'cone.' Twelve inspections are given to *know* each dimension, each angle, is right. Let the slightest error occur at any step of the way—an inspector will spot it and—tie on the red tag quick!

¶ Long before such care was used, the Timken principle of tapered rollers revolving between a tapered cup and a tapered, two-ribbed cone gave a unique type of bearing that won marked success over all other kinds.

¶ In the years that have followed, Timken care *in every detail* of the making has added a hidden value that's only revealed in a life-time of good service.

The Timken Roller Bearing Company

Canton, Ohio, U. S. A.

The only axle manufacturer licensed to make automobile axles equipped with Timken Roller Bearings is the Timken-Detroit Axle Company

BUFFALO ELECTRIC FOOT CONTROL

THE driver of a *Buffalo Electric* has no burden placed upon the active or voluntary part of his brain in operating the car. The foot control requires no conscious effort—starting or stopping the car is as involuntary an effort as walking.

Any element in motor car construction which compels the car to obey an unconscious wish, as does the *Buffalo Electric's* foot control, stamps the car possessing that advantage as years ahead of the ordinary electric vehicle practice. *Buffalo Electric* foot control leaves both hands free to guide the car, and the mind is free to absorb and deal with conditions as they arise.

Exclusive patent rights restrict the use of foot control to *Buffalo Electrics*. It is simple and absolutely efficient. The best use of the hand-lever is to govern the maximum flow of power for your requirements—forward or reverse. When depressed, the foot pedal cuts off the flow of power and automatically applies the service brakes, independent of hand control. When raised, the service brakes are released and power applied gradually until its full flow is felt. Just the same as in walking, you lift one foot to make your first step, putting down both feet to stop.

Practical benefits of *Buffalo Electric* foot control have a dominating appeal to those who drive their own car. Its usefulness is most apparent in town or city driving.

DEALERS

Buffalo Electric foot control is but one of several features any one of which is of sufficient practical value to insure public endorsement of the car. Single reduction, direct shaft drive, caster steering effect, and other features all in the same car make *Buffalo Electrics* the most valuable asset to your field of endeavor. Write for full particulars.

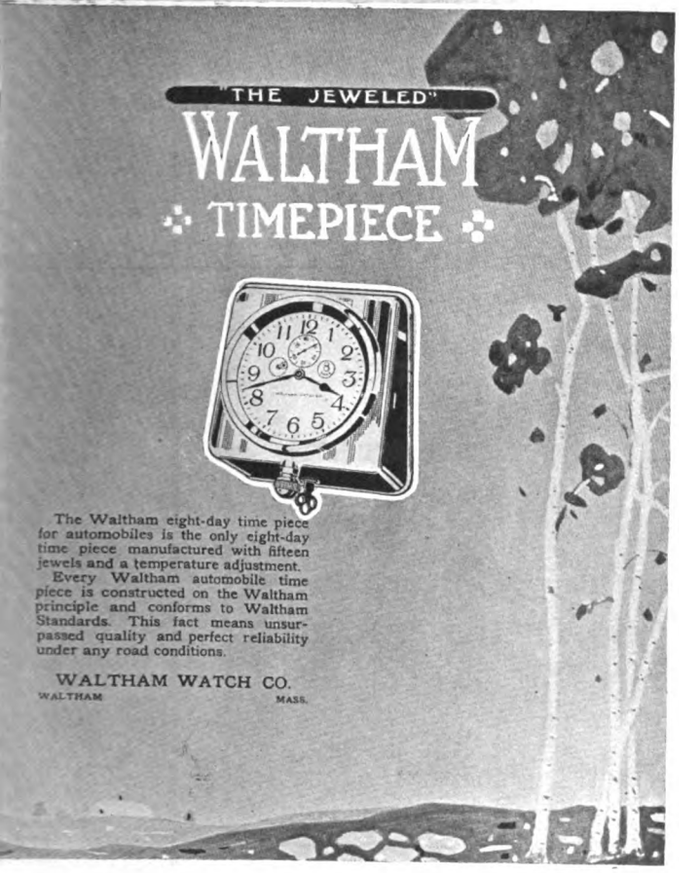
HOFFECKER'S SPEEDOMETERS

THE QUALITY THAT CAR DEALERS-MANUFACTURERS

The name "Hoffecker" on a speedometer and "Waltham" on a timepiece stand sponsor for quality that is standard and of world-wide reputation. Car owners who read and reason before they buy, ***know*** this quality and ***demand*** it.

No enlargement on the prestige of the Hoffecker and Waltham products is necessary here. This has been established through years of consistent service. It is rather the present intent to ***show how*** it is commercially possible to produce these instruments of precision and durability at prices within reason.



Hoffecker speedometers and Waltham timepieces have never been extravagently exploited. They have never had quality sacrificed to meet tremendous advertising overhead expense. They embody sterling worth in material, fine workmanship and finish, ***made possible only by the money that goes right into the instrument—not into indiscriminate waste publicity.***

Of course, they ***are*** advertised, but

Digitized by Google

COMBINATION OWNERS DEMAND WALTHAM TIME PIECES

READ THE MESSAGE

always on the "bull's eye" basis, and with no "scattering fire" effort. This publicity has value plus—for the car manufacturer, the dealer and ourselves. Read why. The double-page reduced advertisement shown here, is typical of Hoffecker-Waltham advertising, current in ***Motor, The Automobile*** and ***Motor Age***—three papers that practically cover the cream of car owners who, as readers of these publications, are qualified to recommend and buy intelligently. In brief, this group constitutes a buying and selling force in the field. Through reading and observation, they recommend the best to others and demand the best for themselves.

"Hoffecker-Waltham" is a combination that ***your*** trade wants. It is a combination that will make a good car better, lessen resistance and increase your prestige in your community as a dealer who is known as a believer in standard, dependable merchandise. In all probability the cars you sell ***are*** so equipped—if not, then get all the facts from us—you may be able to help your customers to more and better service.

Transmit More Power Because They Have Least Friction

The electric car axle problem is wholly one of friction.

That axle is best which takes the least current to overcome the inertia of its own parts.

Choice of materials—perfection of design—refinement—exactness—all enter into the fight to get the precious power to the wheels.

American Axles have proved their superiority so completely that they have been supplied to 80 per cent. of all the electrics in America.

The option of Bevel Drive or Lanchester-Daimler Worm Gear can be had with American Axles only.

Mayo Radiators

¶ A Mayo Radiator on any car is an ear mark of quality that presupposes quality of the whole machine. Leading car manufacturers know this and equip accordingly.

¶ In all probability the cars you sell are so equipped. If they are, then use the argument—it is a good one, because the car buying public has been largely educated in the quality of Mayo products.

¶ An inefficient radiator will spoil a good engine—a Mayo Radiator, designed and built along modern scientific lines, will make a good engine still better. The proof lies in past performance.

Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

Saves You Money

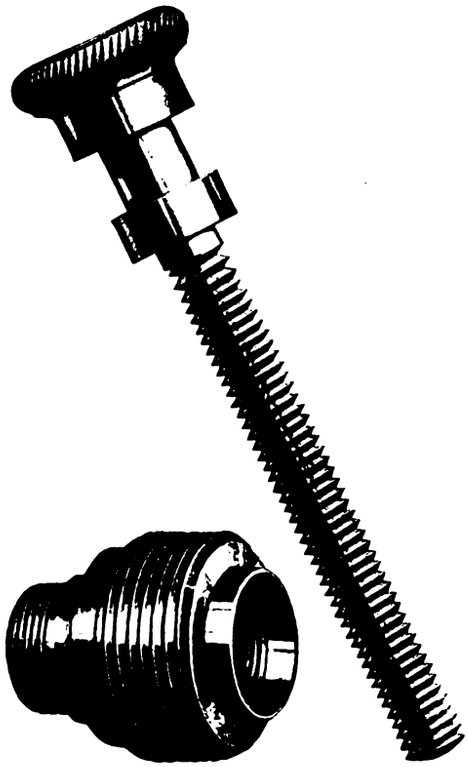
How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.



Price $1.00 Each
Ready for Delivery Now

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers and the dealers, or

Let Your Assemblers Judge

Your assemblers are the best judges of the quality of screw machine work. Their efficiency depends upon good fitting product, and good assemblers appreciate that kind only.

Acme milled parts have proved their quality to assemblers. The threads are clean cut and up to size, making the handling easy and the fit snug.

Our product is accurately shown by the illustrations in our "Special Milled Products" book. When you send in your samples for quotations ask for this booklet.

Put a poor tire on a good automobile and you get—a poor automobile.

The serviceability of a motor car is measured more than anything else by the serviceability of its tire equipment—just as a soldier's efficiency depends more on his feet than on his marksmanship.

Kelly-Springfield Automobile Tires have behind them seventeen years of rubber tire making experience. What these seventeen years stand for is shown pretty clearly in the fact that the average mileage given by Kelly-Springfield Tires exceeds by a thousand or two the average mileage given by tires of other makes.

And tire mileage means car mileage.

EISEMANN

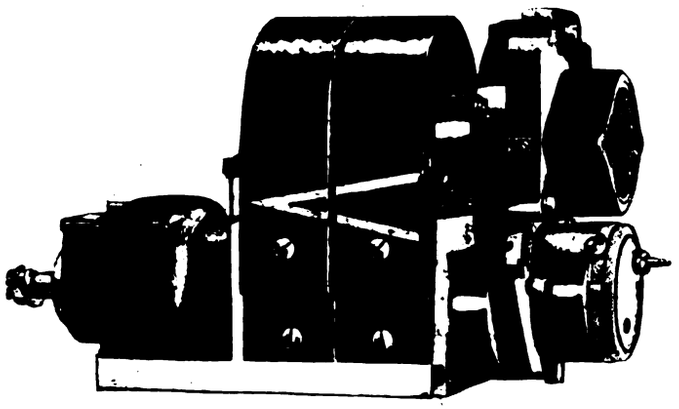
No other ignition system has solved the problem of commercial car ignition as well as the Eisemann systems with Automatic Spark Control Magnetos.

The Automatic Spark Control takes the question of properly timing the magneto away from the element of human guess-work and automatically places it, as it should be placed, dependent entirely upon the operation of the engine.

In other words, with the Automatic Spark Control on a magneto the advancing and retarding is done as it should be done, mechanically-and-automatically-right, instead of by guess-work, or not at all, as is the case when the magneto control is in the hands of the truck driver.

The Eisemann Magneto with Automatic Spark Control makes hills like level roads—it is in the performance of hill climbing that this wonderful Eisemann product shows to greatest advantage, by reducing the necessity of gear shifting to the absolute minimum.

It's a mighty interesting story we have to tell about the Eisemann Magneto with Automatic Spark Control.



Send to us for information.

Kline Kar Model 6-60, Touring, $3500

DEALERS

YOUR experience with other cars should tell you that it does not pay to handle a line that constantly worries the life out of you with complaints from the user, who has trouble with the machine. This user knows now that he is better off when he buys a car of quality in the first place, even though he must pay a little more for it, and he will soon begin to demand such a car of his dealer.

It is up to you to have the car in your line when he calls. The Kline Kar will answer all the requirements this prospect may impose and more.

Prices $1850 to $3500

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Wire or write us, no matter where you are.

Our PRICES compete with LEADING AMERICAN makes.

In the year 1913
More Remy Magnetos
will be used on American Cars THAN ALL OTHERS COMBINED. We are the world's largest manufacturers of Magnetos, Electric Lighting and Starting Equipment for Motor Vehicles.
Standardize Your Car — Specify Remy
REMY ELECTRIC COMPANY
Factory — Anderson, Indiana — General Offices
Branches and Service Stations in Automobile Centers.

THINK · THIS OVER · very carefully and read it twice, if necessary.

Is there any part of an automobile engine, or any other gas engine, that is more important to its efficiency than a Valve?

Your engine leaves the factory running smoothly and sweetly—tuned up to its highest power. Perhaps the valves pit—warp · go out of shape—fail to hold compression. Then the power diminishes, and what can be more aggravating to the driver, who has known the fullness of the pulling power of his motor, than to have it grow less and less?

You cannot slight this part by putting in an inferior product—valves that will give trouble, or even break from inexperience in their manufacture—valves of unsuitable material, not suitably heat treated.

Too much is at stake, and a slight extra cost at the outset, which is the exception, may save you many times over a probable later expense.

This Company, with the experience of many years as a guarantee, will furnish you with properly made valves, of the materials best adapted to your requirements.

Not only QUALITY, but efficient SERVICE is a factor—surely there is a satisfaction in getting the kind of work you want—when you want it.

"In exchange for your empty gas tank, accept only a genuine Prest-O-Lite"

This is the message that is going to Prest-O-Lite users everywhere.

In it there is a hint for the wise dealer, as well.

You know that no imitator of Prest-O-Lite has ever successfully imitated Prest-O-Lite Service.

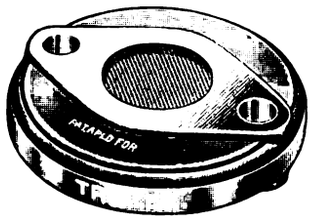
You also know that no imitator ever made good the large claim "more gas and better gas than Prest-O-Lite."

So does your customer.

Imitations are getting harder and harder to sell. There are now mighty few dealers trying it.

Most of those who yielded to the old but ever tempting claim "More Profits" have come back home.

To the dealer who is still trying to force imitations on people who won't have them, perhaps because he has money tied up in them, we can only say:



"The sooner you resume earning your good old Prest-O-Lite profit, the sooner you will make your income what it used to be."

The Prest-O-Lite Co. 287 E. South St. Indianapolis, Ind.

TRIPLEX

A FUEL SAVER *and* A MONEY SAVER

Increases Power Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets **all the power all the time**—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon.

ECONOMIZES FUEL
INCREASES MILEAGE
PROMOTES FLEXIBILITY

MAKES PERFECT MIXTURE
PREVENTS BACK FIRING
ADAPTED TO ANY CAR

The Triplex is sold with the understanding that if it does not do as we claim, we will gladly refund your money at the end of 60 days.

For further information, write us.

INTERLOCK INNER TIRES Stop Tire Troubles

The one weak point of the automobile is that you cannot depend on the tires. Thousands of motorists have solved their tire problem by discarding inner shoes, relinersa, fillers and other makeshifts and equipping their tires with **Interlock Inner Tires.**

Interlocks are complete inner tires (not inner shoes) placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They double the mileage of new tires and add 1,000 to 5,000 miles to old ones—save half your tire expense—and make tires trouble proof.

Dealers and Motorists—Investigate Interlocks

Don't delay—write now for booklets, data, prices, testimonials of users, road tests, etc. Mention size and kind of tires you use.

If You Need Motor Lamps
You Need This Catalog

We want you to write for the Solar Catalog before you decide on your motor lamps, for this is the most complete line of lamps on the market. Solar Lamps have been preferred by most motorists for the past fourteen years because of their brilliancy, their style, their strength and their several exclusive advantages —their special short focus lead glass lens mirror reflectors—the patented double ray light projection (in the Solarclipse), giving two distinct fields of light, for city and country use—the new black finish, the only such finish that's proof against heat and moisture—and other features that other lamps lack.

To fail to see Solars before you buy is to fail to include in your consideration the very finest lamps in existence. Solars are made for oil, electricity, gas and in combination, for pleasure cars, motor trucks, carriages, motor boats and airships. Write for catalog now—while you think of it. (136)

SPECIAL METAL STAMPINGS

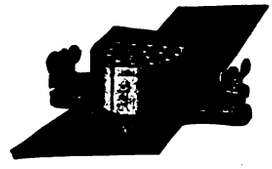
Standard Universal Rims

fit any style or make of tires. The side rings are reversible, they curve outward on one side to fit a straight side tire, inward on the other to accommodate a clincher. Two turns of a nut unlocks the rim for demounting, two more turns locks the rim in place. Write for catalog 607, which explains fully.

THE UNITED RIM COMPANY, Akron, Ohio

Repairing Casing

TIRE CUTS ruin casings. They admit moisture to the carcass, cause the fabric to rot and weaken, grow larger—end in blowouts.



You can repair **CASINGS** and **INNER TUBES** anywhere in 15 minutes, better than a Repair Shop can do—and for *one cent*.

Universal Auto-Vulcanizer

Patented

A practical vulcanizing outfit complete, with enough repair gum to make 40 patches. It weighs 3 pounds and can be carried in the tool box. **Simplest and most satisfactory device for eliminating tire troubles that has ever been devised.**

Absolutely automatic. Place the patch—attach the Vulcanizer—put in the gasoline—light it. No further attention required. In 15 minutes the job is done.

It *can't burn, scorch* or *injure* tube or casing. It *can't* get out of order. It *can't* fail to do its work. So simple, anyone can operate it. The Universal Auto-Vulcanizer saves its cost a *hundred times* over in trouble and expense.

Price Complete, **$4.00** Ready for Instant Use
Guaranteed Satisfactory or Money Refunded

Weed Chains

The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires
Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

Recommended and sold by all reputable dealers

K·D

The Motor With the Sliding Crescent Valve

KNIGHT-DAVIDSON

1896 — 1912

The CRESCENT valve of the K-D Motor, fitting around the stationary piston wall affords a larger port area than any other poppet or slide valve on the market. It is simpler and, consequently, better than any other valve construction known and is here offered to discriminating manufacturers, not as an experiment, but as a tried, tested and proved mechanical advance. The K-D motor is simple, silent, cools rapidly, has the simplest oiling system known, will not carbonize. Last and most important, will give on a given quantity of fuel more power, speed and endurance, unit for unit, than any other engine on any type of an automobile. We want to present some facts to interested manufacturers.

WE MAKE THE BEST

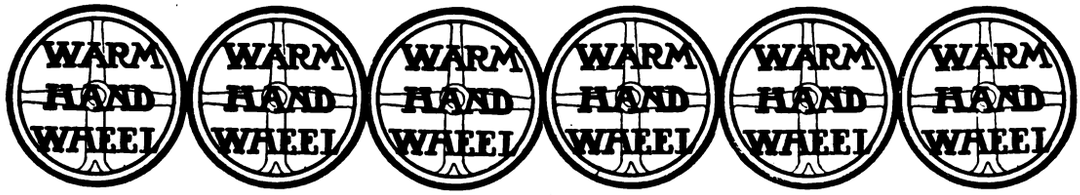
BANTAM ANTI-FRICTION CO., Bantam, Conn.

Digitized by Google

Have you investigated the proposition we have to make you yet?

This is the season of the year that a heated steering wheel is most appreciated—therefor the best season of the year for you to demonstrate to your own satisfaction just what are the real merits of this necessary device.

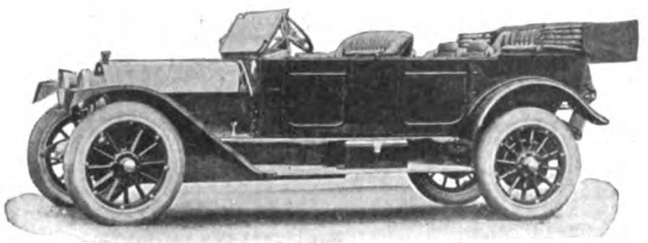
Call upon us to make good for you. Let us show you the most practical accessory put upon the market in months. We want good representation in your territory. If you can give it to us get in touch with us at once.



The Warm Hand Wheel can be installed upon any car in a very few moments. It is operated by the lighting outfit or storage batteries, except in the case of the Ford car. On Ford cars the Warm Hand Wheel operates from the magneto which is built into the fly wheel of Ford cars.

The cost of operating the Warm Hand Wheel is negligible as its current consumption is very low. Nevertheless it serves to keep the steering wheel just as warm as the driver desires it even for the coldest winter day. But the Warm Hand Wheel is a necessity at least six months in the year, for even in the fall and spring when the days are warm, the nights are cool enough to demand this device.

In consequence, the demand is already made. That makes the Warm Hand Wheel a certain seller, as the retail price, $15, is low enough to place it within reach of every car owner and at the same time allow you a good profit.



The Warm Hand Steering Wheel Company

"Service and Silence"

Kline Kar Model 6-60, Touring, $2500

DEALERS

YOUR experience with other cars should tell you that it does not pay to handle a line that constantly worries the life out of you with complaints from the user, who has trouble with the machine. This user knows now that he is better off when he buys a car of quality in the first place, even though he must pay a little more for it, and he will soon begin to demand such a car of his dealer.

It is up to you to have the car in your line when he calls. The Kline Kar will answer all the requirements this prospect may impose and more.

Prices $1850 to $3500
(Fully Equipped)

GILMER TIRE REPAIR PLIERS

We are just about keeping pace with the tremendous demand for this "worth its weight in gold" little instrument, and so we can still fill your orders with reasonable promptness—if you don't delay.

You have read about this device. You must know how simple it operates—how positive are the cures it effects and how valuable it must be to the man who owns it. It is largely up to you, then, to help your trade in this tire upkeep matter—and you can do it by recommending Gilmer Tire Repair Pliers.

The operation of sealing up cuts and abrasions is simple. Just insert the prongs of the pliers into the injury, spread the pliers, and move the ratchet lever over far enough to make the cut perfectly accessible. Then clean the wound, insert pure rubber gum and reverse the operation of opening. Then the tire will close **over** and **around** the gum, producing a permanent repair.

Remember, Gilmer Tire Repair Pliers sell for $1.00, and to see them is to want them. It is only necessary for you to demonstrate their worth in order to make sales. And in the doing you not only reap a good profit but also make a firm friend of the man you are helping to save dollars.

Send your order today.

G. WALKER GILMER, Jr.
52 North Seventh Street Philadelphia, Pa.

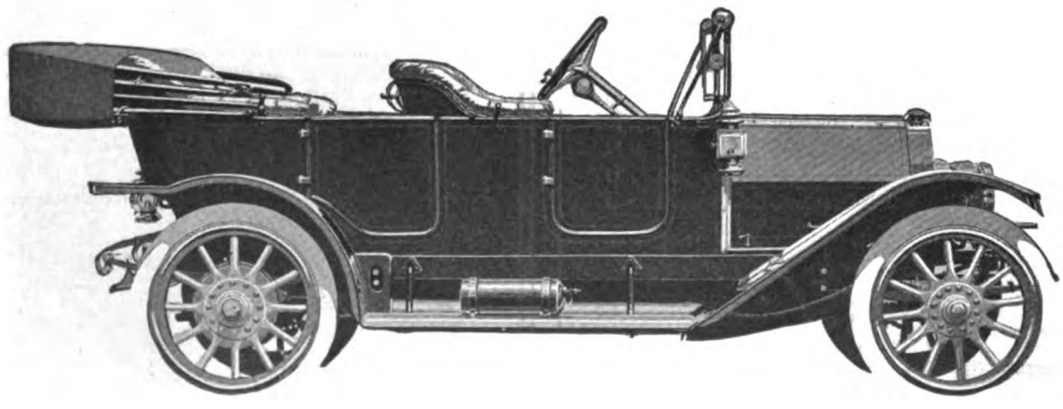
$985 *Completely Equipped*

Overland

$985 *Completely Equipped*

High-Priced Feature No. 7

Drop forgings are best known to the $5,000 and $6,000 cars. They demand special machine equipment; they make necessary expensive dies. The manufacturer of the $5,000 car type has got to go into the market and bid for them. He dare not consider installing the high priced machine equipment.



The Willys-Overland plant possesses over $3,000,000 worth of machine equipment. When we think a drop forging is needed at a certain point, we can go ahead and make it ourselves at comparatively trifling cost. In the Overland Model 69T there are no cheap castings substituted for drop forgings.

For instance, the Overland front axle is forged in one heat—without welding. Other manufacturers forge it in halves and then weld them.

We extend Overland drop forging to steering connections, control levers, crankshafts, camshafts, gear blanks and hundreds of other parts.

The Overland Model 69T is high priced in everything but price. In no other line can you buy as many high grade features for $985. You must pay $1200 for them anywhere else. Let us send you Overland literature to bear out these strong statements. Please address Dept. 50.

NEW YORK PURSUING GARAGES WHICH "SHORT MEASURE" GASOLENE

Inspectors With Specially Equipped Car Test Tank Pumps and Offenders Are Made to Pay Penalties—Of 35 Gasolene Dispensaries Visited 17 Are Discovered Giving Short Measure.

Although some of the garagemen of New York City are sorrowfully aware of the fact, not all of them know that the Bureau of Weights and Measures has inaugurated a campaign against short measure gasolene pumps and "will catch them, if they don't watch out." Inspectors of the Bureau already have secretly descended on 35 gasolene dispensers and, surprising to relate, found 17 guilty of giving short measure. All of the offenders were cited to appear at headquarters in the City Hall, where they parted with sums varying from $5 up. One pump that was short two gills in one gallon is said to have brought a penalty of $25 a gill—a total of $50. The Bureau, however, will not disclose the names of the offenders, nor the amounts of the fines imposed.

The inspectors, who are equipped with a specially designed car which affords ready opportunity for measuring the quantity of gasolene purchased from garagemen. The properly disguised car is driven up to a garage and, say, five gallons of fuel is purchased. As soon as it is poured into the car it is at once withdrawn and measured in a standard receptacle. If it measures reasonably close, all well and good; but if not, the garageman is due for trouble. The inspectors test the pump, and if the plunger or cylinder is the cause of the shortage a condemnation tag is placed on the pump and it cannot be used until it has been repaired by the owner and passed upon by the inspectors. In case the fingers on the standard, which are set for certain quantities, are improperly set they are fixed so that the proper amount is delivered and the fingers are then sealed in place. In the several makes of pump tanks the sealing is done differently, but it all is intended to prevent tampering with the apparatus.

Whenever a pump is found short the garageman is summoned to court, and if it is his first offense the case is referred to Commissioner of Weights and Measures John L. Walsh, who recommends to the Corporation Counsel what he judges to be the proper penalty. The amount of shortage and other circumstances are taken into consideration in fixing the penalty. It generally ranges between $5 and $25. The penalty prescribed by law is $100, and if the garageman is apprehended a second time he is not turned over to the mercy of the commissioner, who almost always recommends "mercy" for first offenders, but the garageman stands trial and takes the consequences. So far in the campaign there have been no second offenses.

"Morgan Syndicate" Gets International.

What is described as "a Morgan syndicate of bankers" has made a loan of $1,500,000 to the International Motors Co., of New York, which produces the Mack, Saurer and Hewitt trucks, the loan carrying with it Control of the company. In exchange for the money, the bankers have taken common stock and will reorganize the company. Ambrose Monell, president of the International Nickel Co., will, it is said, assume control of the company when it is reorganized. C. P. Coleman is at present its head.

FLANDERS, OF PONTIAC, FAILS; TWO MILLIONS GONE TO WASTE

Many-Sided Chase for More Millions Causes the Crash, But Creditors Probably Will Receive 100 Per Cent. —Mergers That Failed to Merge—Lien on Flanders's Own Farm.

After having dissipated practically all of its subscribed capital, $2,500,000, and having amassed debts approximating $1,250,000, the Flanders Mfg. Co. of Pontiac, Mich., on Friday last, 6th inst., paid the penalty when the Federal court in Bay City, Mich., placed it in the hands of the Detroit Trust Co. as receiver.

The action was the result not of a bankruptcy petition but of a petition in equity filed by the Wagner Electric Co., of St. Louis, the petition alleging that, while not insolvent, the Flanders company did not have sufficient money to continue operations; also that there had been mistakes in its productions, that there had been internal dissention and that threatened proceedings on the part of unfriendly creditors created a situation which could be relieved only by the appointment of a receiver. The petition was supported by the affidavit of Don C. McCord, general manager of the company, who swore that the statement contained in the petition was true, the directors having authorized such action.

There also has been filed against Walter E. Flanders, president of the company, a lien of $20,000 in favor of H. R. Haberkorn, a Detroit contractor, who erected buildings on the Flanders "estate." The lien is made up of $16,500 for work done and $3,500 interest on money paid, all of which is long past due.: The "estate," a large farm near Pontiac, which embraces a small lake, was acquired by Flanders when, less than three years ago, he became rich over night. He sold a part of it to his personal "shadow,"

Digitized by Google

adviser and press agent, E. Leroy Pelletier, and spent, it is estimated, something like $250,000 in buildings and improvements.

The assets of the Flanders company are, approximately, $2,000,000, a substantial portion of which is represented by a huge plant in Chelsea, Mich., which has been in the nature of a "white elephant" on the hands of all who ever owned it. It is believed, however, that the sale of the assets will net enough to pay all claims in full, and possibly leave something for distribution among the preferred stockholders. The common stockholders will be wiped out.

By order of the court, the receiver will continue the business until further notice, but there is every likelihood that it will be wound up as quickly as possible. As one of the creditors expressed it, "it is neither hoped nor expected that the business will be continued."

Of the indebtedness, all, save about $60,000, is due to 39 creditors, a Detroit bank being one of the heaviest. It holds notes to the extent of $150,000, which, however, are secured by the personal endorsements of Flanders himself and Dr. J. B. Book and W. S. J. Kopmeier and Geo. Uhlein, who are directors of the company. There also is due these directors approximately $150,000 for money loaned to meet various mergers.

Dr. Book was associated with Flanders in his several undertakings, and for a considerable time was his chief "angel" when money was most required. Kopmeier and the Uhleins became interested about 18 months ago, since which time they also have fairly shoveled cash into the Flanders furnace.

The failure of the Flanders company was not unexpected. Those familiar with its inside workings long had been aware that its condition was unhappy, and less than three months ago the failure was foreshadowed when Flanders plainly stated, in a communication to the stockholders, that in order to permit the business to go on money would have to be raised by mortgage bonds or otherwise. The appeal to the stockholders, however, did not strike responsive chords, and six weeks ago the company's creditors actively interested themselves in its affairs. An advisory committee of seven was appointed, which, in turn, appointed an investigating sub-committee of three, which probed deeply. It found that the sum of at least $300,000 would be necessary to carry on the business, but the refusal of the creditors to stand an assessment, or to subscribe for mortgage bonds, and the threatening attitude of several creditors made clear that the appointment of a receiver was the only way to conserve the assets for equal distri-

(Continued on page 20.)

WARD LEONARD'S PATENT LOOMS UP THREATENINGLY

Granted After Seven Years, Is Claimed to Affect Practically All Lighting-Starting Systems—Litigation Likely in February.

With the phenomenal growth in popularity of electric lighting and starting systems, that sooner or later patent litigation of a far-reaching nature must come to pass has been quite the order of things, and with the issuance to H. Ward Leonard, of Bronxville, N. Y., on November 5th last of patent No. 1,043,777 the actual beginning of such litigation has drawn much nearer. For Leonard, who is the head of the Ward-Leonard Electric Co., is sanguine that his patent, which has been pending since 1905, broadly covers several essential features of practically all of the electric lighting systems now in use.

Among them are (1) the self-closing switch which automatically opens when the car slows down so much that the dynamo voltage falls below the counter voltage of the battery, thus preventing the battery from discharging backward; and (2) the magnetic winding in the circuit between the dynamo and the battery which, when the electric energy tends to become excessive, automatically will control the field strength of the dynamo and thus automatically regulate the charging current regardless of any change in the speed of the motor car.

The Leonard patent, which is entitled Means for Control of Electric Energy, is made up of 79 claims, of which claim 70 serves to illustrate the application of the invention to dynamo lighting systems. It is as follows:

"The combination of a dynamo, a device "adapted to produce an electromotive force "counter to that of the armature of said "dynamo, a self-closing switch adapted "when closed to connect the dynamo arma-"ture and said device in a local circuit, an "electro-responsive winding connected to "said circuit and responsive to a maximum "condition of energy in said circuit, a mov-"able circuit controlling element automat-"ically controlled by said winding, and "means controlled by the automatic move-"ment of said element for controlling the "field strength of said dynamo."

It is understood that several licenses to operate under this Leonard patent have been secured and that others are being negotiated for, but that litigation will be instituted, Leonard freely admits. He states, however, that no suits will be filed until after February 1st next, when the new rules relative to patent litigation will become effective. These rules, which recently were promulgated by the Supreme Court of the United States, enable a patentee to prosecute suits for infringement in a much shorter time and at much less expense than at present is the case.

Los Angeles Tire House Changes Owners.

Franz O. Nelson, former branch manager of the Diamond Rubber Co., and Frank T. Price, a Diamond tire adjuster, have purchased the Mosher Rubber Co., of Los Angeles, Cal., and have taken over the business at 221 West 11th street They will operate under the firm style Nelson & Price, and in addition to dealing in tires, both new and second-hand, and performing vulcanizing work, they will carry a general line of automobile supplies and accessories. Price will be in active charge as Nelson has other interests to which he will devote most of his time.

Engineer Departs to Join Briscoe.

James Guthrie, for three years a division engineer for the United States Motor Co., and who is among the large number who have resigned from that establishment, has sailed to Paris, where he will meet Benjamin Briscoe, former president of the company. He will remain abroad six or eight months, during which period he will lend himself to the design and development of the under-$1,000-car which it is Briscoe's intention to place on the American market when he returns.

Reiman Sues 49 Objecting Stockholders.

Because 49 fellow stockholders in the Service Motor Car Co. of Wabash, Ind., sued out a restraining order preventing him from disposing of $20,000 of stock which he held, Charles S. Reiman, of Chicago, has instituted suit against them for $50,000 damages. The restraining order was dissolved last month, but the expense and experience to which he had been subjected Reiman believes is worth $50,000.

Schrader Erecting Seven-Story Plant.

A. Schrader's Sons, Inc., of New York, maker of the well-known Schrader valves and tire gauges, has awarded contracts for the erection of a factory building at Clermont and Atlantic avenues, in Brooklyn. It will be a seven-story, reinforced concrete structure, 100 x 225 feet.

Wagon Works to Make Motor Trucks.

The Tiffin Wagon Works, of Tiffin, O., is preparing to embark in the manufacture of motor trucks. Although its plans are well in hand, it will be several months before its product actually is ready to be placed on the market.

DEAN BRANCHES OUT INTO SPEEDOMETER AND IGNITION

Acquires Rights to Make Forse Speed Recorder and High Frequency Ignition Apparatus—Simplicity of Hi-Fre-Co System.

In addition to electric apparatus, in the manufacture of which it has engaged for many years, the Dean Electric Co., of Elyria, O., has taken up the production of speedometers. It has acquired the rights to the Forse speedometer, which until recently was made by the company of that name in Pendleton, Ind., and has very considerably improved the device, which hereafter will be styled the Elyria-Dean speedometer. It is of the centrifugal type.

The Dean scope in the electric field itself, which gradually has widened, has been made still wider. Apart from the Tuto and Rexo horns, the Dynalux lighting system, and the Otho lighting and starting system, the rights to which it recently acquired, the company has obtained a license to operate under the High Frequency Ignition Co.'s patent and is bringing out a Hi-Fre-Co magneto and coil.

The High Frequency system was developed by a company of that name in Los Angeles, Cal., but it has had small vogue in the East. It is quite radical but its recognition by such a reputable and well established manufacturer as the Dean Electric Co. cannot but serve to give it immediate standing.

The Hi-Fre-Co magneto system consists of a low tension magneto with breaker box and low tension distributer, the whole arrangement being very similar in construction to a high tension magneto except that the armature is wound with a comparatively few turns of fairly coarse wire and that the condenser is stationary and is located on the front of the distributer; as the current generated is low tension the careful insulation necessary with high tension instruments is not required. The individual primary wires lead directly from the distributer to resonators on the spark plugs, the resonators being, in effect, merely miniature Tesla coils which operate to "step up" the current; the stepping up process gives the high frequency current properties which are peculiar to itself and which are advantageous when applied to ignition service. Other than the wiring outlined and leading from the distributer to the resonators, there is only one wire; it leads to the magneto short circuiting switch on the dash and its function is the same as the function of the ordinary magneto cut-out switch. The dual system employs exactly the same elements as does the plain magneto system, except that a combined dash coil, condenser and switch is used. The magneto current is used for regular ignition and current from a 6-volt battery is employed for the reserve system.

Goodrich Again Denies Old Rumor.

Despite the fact that the B. F. Goodrich Co. hoped that its purchase of the Diamond Rubber Co. forever would set at rest the repeated rumors of the probable or possible amalgamation of the Goodrich Co. with the United States Rubber Co., the report has been resurrected and again is going the rounds. It, of course, has been denied, and it is no secret that, rightly or wrongly, the Goodrich interests believe that the long succession of rumors is circulated for well designed purposes.

Police Seek Officer of Top Company.

On a complaint charging him with absconding with $3,300.50, a warrant has been issued for the arrest of H. J. Reynolds, vice-president of the American Top Co., of Jackson, Mich. The money, it is stated, is part of a fund of $7,000 entrusted to Reynolds by the directors for the purchase of outstanding stock of the corporation. Reynolds had an office in Detroit but has not been seen there for about one month and his present whereabouts are unknown.

East Palestine Building Tire Factory.

The East Palestine Rubber Co., which recently was incorporated in the Ohio city of that name with an authorized capital of $50,000, has commenced the erection of its factory, which will be a two-story structure, 50 x 110 feet. It is expected that it will be completed before the end of the year. Wilmer Dunbar, a well-known rubber chemist, is president, A. S. Mauk, vice-president and Abram Hartley, secretary and treasurer.

Will Wholesale Unguaranteed Tires.

The Wholesale Auto Tire Co. is the style of a new concern which has been organized in New York City for the purpose of dealing in unguaranteed tires and which will locate about January 1st at 83 Chambers street. W. P. Cole, formerly with the now passing Sonora Motor Horn Co., will be manager. He will be assisted by Wilfred E. Willis, son of E. J. Willis, a cut-rate supply dealer located at 85 Chambers street.

Palmer Turns from Cars to Chassis.

The Palmer Motor Car Co., which recently succeeded the Suburban Motor Car Co. in Ecorse, Mich., and of which R. A. Palmer has become the general manager, has abandoned the original intention to manufacture cars. Instead it will produce complete chassis for the trade.

EXODUS FROM U. S. MOTOR AS NEW REGIME APPROACHES

Maxwell, Reeves and Many Others Follow Briscoe — Two Factories Closed and Columbia Car To Be Discontinued.

Making way for the new regime, and for removal of the headquarters from New York to Detroit, the exodus from the United States Motor Co. is now in progress. In fact, it is so well advanced that the interior of the big building on West 61st street almost suggests that it had been swept by a cyclone; vacant offices and vacant desks on every side.

Best known and most prominent of those who have taken or will take themselves elsewhere is Alfred Reeves, one of the vice-presidents and general sales manager of the company. He was practically a protege and one of the closest friends of Benjamin Briscoe, former president of the United States Motor Co., and although it was diplomatically stated that he would remain in the service, the statement was accepted with more than a grain of salt. It was fairly well known that he would follow the outgoing footsteps of his former chief, but until Monday last it was not known in what direction he would go. The direction of his going is one of the surprises of the situation.

He has acquired a substantial interest in the Hartford Suspension Co., of Jersey City, of which he has been elected vice-president and general manager. He will assume his new duties early next month, and with the greatly enlarged scope of the Hartford company—which now includes shock absorbers and electric starting and lighting systems—for the exclusive production of which an eight-story steel and cement factory has been built—bumpers, jacks and spark plugs—there will be no lack of room for the display of Reeves's talents and the exercise of that geniality for which he is famed.

Reeves's duties as general sales manager of the United States Motor Co. will be assumed by E. H. Brandt, one of the district managers.

Others who have taken their departure are J. D. Maxwell, one of the vice-presidents and the designer of the car which bears his name; A. R. Gormully, general purchasing agent; C. E. Reddig, chief engineer; George T. Hanchett, consulting engineer; Berry Rockwell, advertising manager, and M. H. Newton, head of the publicity department. Temporarily, Gormully has engaged with the Steinbock Engineering Co., and Reddig has become chief en-

Digitized by Google

gineer of the Timken-Detroit Axle Co., but the others have not yet placed themselves.

As a matter of fact, the sales, advertising, designing and engineering departments at the United States Motor headquarters have been practically wiped out; but as Walter E. Flanders, who is acting as manager for the receivers and who will assume the presidency and general management next month when the receivership is terminated, already has a large and extensive staff in his own establishment in Detroit, the vacancies will be quickly filled. J. W. Wellington, one of the United States Motors' vice-presidents, is among the few who will go to Detroit. He is to become assistant to Assistant General Manager McGuire.

The remains of the United States Motor sales staff was addressed one day this week by E. Leroy Pelletier, Flanders's publicity manager and right-hand man, who, among other things, blandly said to the assembled salesmen: "We want you to forget the past, because the old company was a failure and the name Flanders never has been associated with failure."

The formality of offering for sale certain stocks and all of the properties of the subsidiaries of the United States Motor Co. were performed this week when bids were advertised for. They will be opened on January 8th, at 11 o'clock A. M., in the United States Court in New York City. It is highly improbable, however, that there will be more than one bid to open—the one tendered by the reorganizers of the company.

Meanwhile, the manager for the receivers already has closed the Providence Engineering Works in Providence, R. I., and the Maxwell-Briscoe branch factory in Auburn, R. I. Most of the machinery of both plants will be shipped to the United States Motor factory in New Castle, Ind.

Among other things that are practically settled is the discontinuance of the Columbia car and the utilization of the Columbia factory in Hartford for the manufacture of parts for such of the cars as will be continued.

In the meantime, however, the minority stockholders of the Columbia company have not lost all hope of preventing the sale of that property, at least. Although Judge Hough, in the Federal court, declined to permit them to intervene, or interfere with the reorganization proceedings, they have appealed from his decision and the appeal will be heard on Monday next. They maintain that the Columbia company is solvent.

The United States Motor reorganizers, however, appear no more worried by this suit than by the bankruptcy action filed in New Jersey, and are going ahead with their plans as if all was serene.

TEABOLDT-METZGER AGENCY TROUBLE STILL IN COURT

Dispute of Long Standing Now Nears Trial—Exchange of Advertising for Cars Is Basis of One Point At Issue.

An echo of the days when C. R. Teaboldt & Co. was the representative of the Metzger Motor Car Co. of Detroit and sold Everitt cars in the Metropolitan district, was awakened by a case which was this week placed on the calendar of the Supreme Court for New York County and wherein the Teaboldt firm lays claim to $14,520 because of alleged faults on the part of the Detroit company. The case was filed October 21, 1911, and a delayed notice of trial was filed this week, which brings the action near to trial.

Both Teaboldt & Co. and the Metzger company—the former is out of business and the latter recently became the Flanders Motor Co.—agree that a dealership contract was entered into February 16, 1911, whereby the former was to represent the latter, the Metzger company claiming the contract was to expire July 1, 1911. Teaboldt & Co. assert, however, that the Metzger company refused to deliver cars for which 111 orders had been booked, and terminated business relations August 29, 1911, thereby damaging Teaboldt & Co. in the amount of $14,520.

The Metzger story is that the Teaboldt company was more or less short of money, that the contract expired July 1, when the agency was transferred to a company of sounder financial condition; the allegation is made that Teaboldt & Co. was disgruntled because it was not allowed to continue the contract for another year and expressed its feelings through the suit. Counterclaims are entered by the defense for cars and parts valued at $4,179.44, unpaid for, and for a balance of $3,902.83 due the company on advertising deals.

In regard to the latter claim, the defendant states that Teaboldt & Co. was authorized to sell cars to publications, part of the price to be in cash and the remainder in advertising space to "advertise generally the automobiles manufactured by the defendant." The dealer is said to have sold cars in this manner to the Review, the Globe, the Tribune and the Medical Journal, of New York, and to have used space to the value of $1,726.71, but the Metzger company alleges that there is yet unused space to the value of $3,902.83, but that the contracts are so worded that the space is the property of Teaboldt & Co. and that they have refused to transfer the space to the Metzger company. Teaboldt himself is now connected with the Packard branch in Chicago.

Northway Acquires Ohio Car Factory.

No other bids having been tendered, the receiver for the Ohio Motor Car Co., of Cincinnati, whose plant is at Carthage, O., has sold the property to Ralph E. Northway of Wyoming, O., William Pabodie of Hartwell, O., W. D. Furste and E. F. Deckebach, of Cincinnati and F. W. Enslow, a Huntington (W. Va.) barber, who constitute the Northway Motor Car Co., which recently was incorporated under the laws of West Virginia with an authorized capital of $600,000.

Northway, who previously was identified with the gas engine trade in Michigan, is president of the new company, and Furste is vice-president. They will continue the production of Ohio cars, but will devote the larger part of their energies to the manufacture of motors for the trade at large. The Northway purchase includes about 10 acres of land, of which about three acres are under roof. The purchase price was $65,000, $25,000 of which was represented by a mortgage.

Bankruptcy Finish of Singed Lion.

On Saturday last, 7th inst., Charles L. Robertson, of Adrian, was appointed receiver for the Lion Motor Car Co. of that city. The receivership grew out of the petion in bankruptcy filed by the Hess Spring & Axle Co. of Canton, O., the Frost Gear & Machine Co. of Jackson, Mich., and Moreland Bros. & Crane of Adrian. The liabilities of the company are $108,894 and its assets $105,546.

As it was fairly well known that the Lion company intended to discontinue business, as was stated in Motor World of November 26th, its formal failure is in no sense a surprise. Its plant practically was destroyed by a disastrous fire which occurred on June 2nd last, and although preparations were made to continue manufacturing operations, the company, despite its best laid plans, failed utterly to recover from the effects of the conflagration.

Changes in Cartercar Organization.

Succeeding J. J. Hartley, who has been transferred to Philadelphia, A. C. Leverton, formerly with the Brush Runabout Co. of Detroit, has been appointed general manager for the Cartercar Co. of Pontiac. A. Lehr and W. D. Block also have joined the Cartercar staff, the former as the purchasing agent and the latter as comptroller. Previously, Lehr was associated with the Studebaker Corporation and Block with the General Motors Co., of which, in fact, the Cartercar property is a part.

Digitized by Google

The Week's Incorporations

Detroit, Mich.—Detroit Motor & Machine Co., under Michigan laws; authorized capital, $150,000; to manufacture motors. Corporators—Hal M. Smith, Jay Hayes, Frank M. Blair.

Chicago, Ill.—Petro-Haul Mfg. Co., under Illinois laws; authorized capital, $150,000; to manufacture gas engines and tractors. Corporators—H. Bierman, H. Ploeg, E. E. Schmuck.

Puyallup, Wash.—Pierce County Auto Co., under Washington laws; authorized capital, $3,000; to deal in motor cars. Corporators—Alva J. Williams, J. Edward Shrewsbury.

South Bend, Ind.—Hoke Tractor Co., under Indiana laws; authorized capital, $50,000; to manufacture tractors. Corporators—John I. Hoke, Oscar C. Chambers, Lynn I. Hoke.

Chicago, Ill.—Lakeside Motor Truck Transportation Co., under Illinois laws; authorized capital, $25,000; to operate a motor delivery. Corporators—B. P. Dunlap, E. W. Macavoy.

Jersey City, N. J.—Millar Supply Co., under New Jersey laws; authorized capital, $100,000; to deal in motor car supplies. Corporators—J. A. Duffy, W. C. Marley, M. E. Thornton.

Chicago, Ill.—Storm Shield Mfg. Co., under Illinois laws; authorized capital, $100,000; to manufacture motor car accessories. Corporators—R. E. Wighton, L. E. Street, N. P. Street.

Wilmington, Del.—Light Commercial Car Co., under Delaware laws; authorized capital, $100,000; to manufacture motor cars. Corporators—H. E. Latter, W. J. Maloney, N. P. Coffin.

Philadelphia, Pa.—Auto Safety Signal Lamp Co., under Delaware laws; authorized capital, $100,000; to manufacture motor car accessories. Corporators—L. Abeles, J. J. Drew, J. G. Gray.

Dover, Del.—American National Motorbus Co., under Delaware laws; authorized capital, $1,000,000; to manufacture motor vehicles. Corporators—C. A. Clark, S. L. Conklin, J. A. Satterfield.

Cleveland, Ohio—Marvel Automobile Supply Co., under Ohio laws; authorized capital, $5,000; to deal in motor car supplies. Corporators—J. B. Rosenstein, Samuel I. Rose, M. L. Fonts.

Buffalo, N. Y.—Empire Radiator Co., Inc., under New York laws; authorized capital, $1,000,000; to manufacture motor car radiators. Corporators—Edward B. Green, Wm. S. Wicks, Charles J. Ellis.

Akron, Ohio—Motor Starting Co., under Ohio laws; authorized capital, $25,000; to manufacture engine starters. Corporators—H. A. Woods, H. Paul, A. M. Tschantz, E. W. Paul, C. L. Dinsmore.

Niagara Falls, N. Y.—Niagara Motor Car Corp., under New York laws; authorized capital, $10,000; to deal in motor cars. Corporators—Charles E. Cromley, Donald M. Hepburn, Louise S. Hepburn.

Waco, Tex.—Waco Auto Supply Co., under Texas laws; authorized capital, $5,000; to deal in motor car supplies. Corporators—W. H. Montz, Waco; H. B. Lyne and James Harrison, Fort Worth.

Amsterdam, N. Y.—John E. Larrabee Co., Inc., under New York laws; authorized capital, $100,000; to deal in motor cars. Corporators—Louise L. Larrabee, W. Warner Leavenworth, Katherine L. Larrabee.

Bedford, Ohio—Bedford Supply Co., under Ohio laws; authorized capital, $10,000; to deal in motor car supplies. Corporators—F. B. Senter, F. H. Calvert, Geo. W. Shaw, N. C. Boyd, A. B. Condon.

Chicago, Ill.—Electric Vehicle Maintenance Co., under Illinois laws; authorized capital, $2,500; to repair electric motor vehicles. Corporators—Wm. Knobloch, Wm. C. Russell, H. A. Tarantores.

San Francisco, Cal.—Acme Rubber Co., under California laws; authorized capital, $100,000; to manufacture rubber goods. Corporators—L. Seidenberg, G. M. Davis, W. S. Baker, J. C. Montgomery, F. Kenrick.

Cincinnati, Ohio—Citizens Auto Service Co., under Ohio laws; authorized capital, $7,000; to operate a taxicab service. Corporators—Wm. M. Davis, Frank W. Kelley, Louis J. Hoppe, A. Putnam, J. Louis Koehl.

Indianapolis, Ind.—New-Miller Carburetter Co., under Indiana laws; authorized capital, $200,000; to manufacture carburetters. Corporators—F. O. Fairbanks, R. M. Fairbanks, L. H. Calvin, Oscar L. Snyder, N. M. Doyle.

Aberdeen, So. Dak.—Aberdeen Automobile & Supply Co., under South Dakota laws; authorized capital, $25,000; to deal in motor cars and supplies. Corporators—G. M. Worthington, C. D. Worthington, M. J. Kidd.

Indianapolis, Ind.—Auto Lamp & Number Co., under Indiana laws; authorized capital, $3,000; to manufacture accessories. Corporators—Ransom Griffin, A. P. Conklin, R. H. Bruce, William F. Johnson, George L. Maas.

Columbus, Ohio—Bracken-Stauton Co., under Ohio laws; authorized capital, $5,000; to deal in motor cars, etc. Corporators—Wm. Franklin Bracken, Mary E. Stauton, Leo A. Stauton, May Bracken, Thomas M. Curtain.

Cleveland, Ohio—Dayton Airless Tire Sales Co., under Ohio laws; authorized capital, $10,000; to deal in motor car tires. Corporators—William A. Carey, H. Krejoi, F. M. Chandler, Ralph W. Edwards, M. Otter.

New York, N. Y.—Flex-O-Fill Core Co., under New York laws; authorized capital, $50,000; to manufacture tire filler. Corporators—Guy Osborn, 1493 Broadway; L. McCready, 50 Church street; F. H. Crooks, Newark, N. J.

Elmhurst, N. Y.—Elmhurst Garage, Inc., under New York laws; authorized capital, $5,000; to operate a garage. Corporators—T. G. Smith, 26 Clermont avenue; P. J. Testen, Millie Testan, 2123 Troy avenue, Brooklyn, N. Y.

New York, N. Y.—Gilbert-Fulton Corporation, under New York laws; authorized capital, $1,000; to deal in motor cars. Corporators—George J. Gilbert, Otto Gilbert, both of 556 West 181st street; Donald J. Fulton, 111 West 64th street.

New York, N. Y.—Bradhurst Garage Co., under New York laws; authorized capital, $5,000; to operate a garage. Corporators—George Glynn, 106 West 116th street; Jerome C. Jackson, 20 West 71st street; Paul R. Gordon, 149 Broadway.

New York, N. Y.—Rector Engine Corp., under New York laws; authorized capital, $150,000; to manufacture motors. Corporators—Edward Gore, 262 West 136th street; William Magowan, 250 West 154th street; Samuel C. Yeaton, 324 16th street, Brooklyn, N. Y.

New York, N. Y.—Motor Hauling Corporation, under New York laws; authorized capital, $5,000; to operate a motor delivery. Corporators—William G. McGrath, 68

Digitized by Google

William street; Mathiew B. Sentner, 52 Wall street; Samuel B. Kerr, 261 West 112th street.

New York, N. Y.—Auto Exchange & Equipment Co., under New York laws, with $1,000 capital; to deal in motor cars and equipment. Corporators—Harry Lauterbach, Idella Lauterbach, 1564 East 14th street, Brooklyn; Charles A. Spencer, 430 West 116th street.

New York, N. Y.—Kells Motor Radiator Corporation, under New York laws; authorized capital, $650,000; to manufacture motor car radiators. Corporators—Henry A. Bingham, 32 Nassau street; Alexander F. Garbe, 400 East 141st street; Cornelius A. Cole, Hackensack, N. J.

New York, N. Y.—American Commer Truck, Inc., under New York laws; authorized capital, $10,000; to manufacture and deal in motor trucks. Corporators—Raymond C. Thompson, 255 West 72nd street; Julius Kahn, 38 Union Square; Edward C. O. Thomas, 453 West 155th street.

New York, N. Y.—Universal Auto Appliance & Construction Co., under New York laws; authorized capital, $5,000; to manufacture motors, etc. Corporators—Frederick W. Darnstaedt, 535 West 162nd street; Moise J. Leclerc, 612 West 184th street; Henry B. Tucker, Mount Vernon, N. Y.

Changes of Capitalization.

St. Paul, Minn.—Electric Mfg. Co. from $10,000 to $60,000.

Toledo, Ohio.—McNaull Auto Tire Co. from $50,000 to $75,000.

Springfield, Ohio—Victor Rubber Co. from $69,000 to $150,000.

Detroit, Mich.—Van Blerck Motor Co. from $10,000 to $100,000.

New Britain, Conn.—Fafnir Bearing Co., from $100,000 to $200,000.

Monticello, Ind.—Clifford Automobile Co. from $15,000 to $30,000.

Recent Losses by Fire.

West Oakmont, Pa.—John T. Anderson garage damaged. Loss, $8,000.

Baltimore, Md.—Enterprise Fuel Co., Oak street, garage and several cars damaged. Loss, $20,000.

Philadelphia, Pa.—Kensington Motor Car Co., 1739 North Front street, garage damaged and eleven cars destroyed. Loss, $20,000.

Change of Corporate Names.

Akron, Ohio—Ideal Commercial Car Co. to Akron Motor Car & Truck Co.

Dayton, Ohio—Heathman-Holliday Motor Co. to Frank B. Heathman Motor Co.

SECOND PREFERRED OF U. S. RUBBER IS TO BE RETIRED

Four Shares To Be Exchanged for Three of First Preferred—Preliminary to Taking Over of Rubber Goods Company.

Carrying out the orders of the stockholders given at a meeting held last May, the directors of the United States Rubber Co. on Thursday, 5th inst., authorized the retirement of its second preferred stock. The retirement will be effected by the exchange of three shares of first preferred for four shares of second preferred.

It also was decided to offer to outside holders of Rubber Goods Co. preferred stock amounting to $2,413,900, with the privilege of exchanging their stock for the preferred shares of the United States Rubber Co.

According to one who is versed in the affairs of the financial district, it seems likely that at the outside close to 85 or 90 per cent. of second preferred shareholders will accept the offer of exchange.

"There is no reason why they should not do so," says this Wall street authority. "Their income will remain unchanged, as the first preferred pays 8 per cent. and the second but 6 per cent. The principal argument for the change is that they get a prior security, one of a much larger total, and therefore with a much wider and more stable market.

"In making an offer of par for par of United States Rubber preferred for Rubber Goods preferred, the Rubber company has in mind the ultimate carrying through of plans making it possible, if ever the feasible moment arrives, of a consolidation into itself of the Rubber Goods Co. By accepting the offer, Rubber Goods minority preferred shareholders will get 8 per cent. in dividends in place of the present 7 per cent.

"The feature of the new financing plans which is perhaps least understood is the proposed doubling of the capital stock of the General Rubber Co. by an increase from $5,000,000 to $10,000,000.

"This increase in capitalization is taken to provide funds for development of the big Sumatra and Ceylon rubber plantation. General Rubber Co. is the crude rubber end, and it owns and is directly concerned in this Far Eastern development. As all stock of General Rubber Co. is owned by United States Rubber and Rubber Goods Co., any issuance of the $5,000,000 new stock by General Rubber will involve no public financing."

As is quite generally known, the Rubber Goods and United States Tire companies are subsidiaries of the United States Rubber corporation.

Willys-Overland Stocks Open Strong.

Placed on the market for the first time on Monday last, Willys-Overland common stock opened on the New York curb at 69-71. The preferred is held at 100, which is the price set by the banking syndicate which engineered the refinancing of the Willys-Overland Co. The quotations are unusual, in that only one other 7 per cent. preferred stock of an automobile concern sells at par or better. The exception is the Packard Motor Car Co. preferred, selling for about 105. Overland common at 71 compares with General Motors at 38½, Studebaker at 43, United States Motor at ⅛, and Packard at 205.

Bruns and Victor Companies Settle Dispute

Differences which arose between the Bruns Auto Co., of Brooklyn, and the Victor Motor Truck Co., of Buffalo, N. Y., regarding a dealership were settled last week when an action instituted about a year ago in the Supreme Court for Kings county was discontinued. The Bruns claim was that it paid deposits of about $1,100 on contracts for trucks and that, following a disagreement of Victor affairs in New York City, the trucks ordered were not forthcoming and the deposits were not returned.

Ford Assets Now Exceed $20,000,000.

According to a statement of its condition made public early this week, the total assets of the Ford Motor Co., of Detroit, amount to $20,430,000, an increase of $7,833,000 during the year. The real estate and buildings are valued at $4,266,000, an increase of $2,655,000. The increase in the floating indebtedness amounted to $426,000, but, on the other hand, accounts payable were decreased $500,000. The increase in the surplus for the year amounted to $6,910,000.

Republic Rubber Advances Two Workers.

To fill the vacancy caused by the death of L. J. Lomasney, L. T. Petersen has been elected first vice-president of the Republic Rubber Co. of Youngstown, O. John H. Kelly, sales manager, was chosen second vice-president, which office previously was occupied by Petersen. At the same meeting of the Republic directors, A. H. Harris was added to the board.

Grossman Sails to "Do" Europe.

Emil Grossman, president of the Emil Grossman Co., New York, is among those who sailed to attend the Paris show. Before his return he will visit also the leading automobile and accessory manufacturers on the Continent.

In the RETAIL WORLD

C. G. Lemley and C. F. Wright have secured permission to build a garage in Portland, Ore., on 23d street; it will cost $15,000.

W. R. Derrick, a horse livery operator in Vallejo, Cal., is to enter the automobile trade; he is about to build a garage adjoining his stables on Capitol street.

Merritt J. Osborn, a dealer in St. Paul, Minn., has purchased a site on 6th street and will erect a new building; the estimated cost is $55,000. He handles the White line.

Merritt Osborne, Detroit electric and White distributer in St. Paul, has opened a garage in Minneapolis on what is known as the "Hill." It is his third garage in that city.

The Forest Street Garage has opened up in Gloversville, N. Y., under the management of Joseph Maurie; Regal, Metz and Inter-State cars and Gramm trucks are carried.

B. W. Rowe of Orlando, Fla., has purchased an interest in the Sanford (Fla.) Machine & Garage Co. He will remove to the latter town and engage actively in the business.

Clarence Smith has bought a half interest in the automobile and repair business of W. P. Ruth, in Downs, Kan. It is proposed to enlarge the plant and improve the equipment.

C. J. Benham and W. H. Pierce have entered the trade in St. Paul, Minn., with quarters at 352 Minnesota street; they will carry Nassau tires and will handle the Cartercar.

C. E. and Leon Williamson, B. F. Gilman and Homer Marsh are about to build a garage, 45 x 100 feet, in Tecumseh, Mich. They will operate under the style Tecumseh Garage.

The Fashion Automobile Station, at 4610 Cottage Grove avenue, Chicago, is about to erect a garage on 51st street; it will have a capacity for 450 cars. Harry Salvat is manager.

The G. W. Hawkins Automobile Co., of Houston, Tex., is having new quarters erected at Dallas avenue and Main street; it will be ready for occupancy before the end of the year.

The Kansas City (Mo.) Automobile & Supply Co., of 1504 Grand avenue, has purchased land near 18th street and will erect a building for its occupancy; the cost is estimated at $40,000.

B. D. Spinney, J. Stuart Bertram and Geo. Routh have entered the trade in Jacksonville, Fla., at 905-907 Main street; Spinney and Bertram have been connected with the business for more than 10 years.

With capital of $25,000, a garage company has been formed in Barnesville, Minn. The incorporators are E. Leonhardt, G. J. Dahm, G. W. Seefeldt, J. H. Fisch, J. A. Cramer and J. H. Boltz, all of Barnesville.

Curtis, Gray & Reilly have entered the trade in New Hampton, Ia. The members of the firm are J. L. Curtis, Charles Gray and Frank and Charles Reilly; a salesroom and garage, 35 x 100 feet, are being erected.

Carl Ayers has sold his interests in the firm of Ayers & Phiffer, in Horton, Kan., to his former partner, Willard Phiffer, who has admitted Theodore Schecher to partnership. The new firm has secured the Studebaker agency.

Under the style Private Garage Service Co. a somewhat novel business has been established in Chicago, at 556 East 40th street; the company will cater only to those car owners who keep their automobiles in private garages.

Two stories are being added to the building at 915-917 East Pike street, Seattle, Wash., occupied by the M. S. Brigham Motor Car Co. The company handles Cadillac cars. When completed the building will contain 18,000 square feet of floors.

The Capitol Auto Co., of Springfield, Ill., whose building was recently destroyed by fire, plans to secure temporary headquarters on Washington street, near First, and later to rebuild on the site of the burned structure; J. Stuart Allen is manager.

Auto Equipment & Supply Co. is the style of a new enterprise in Grand Rapids, Mich. A downtown location is being sought; the officers are: President and manager, E. R. Corbin; vice-president, Leon V. Underwood; secretary and treasurer, C. W. Darrah.

B. H. Coleman of Warren Center, Pa., has purchased the interest of J. T. Corbin in the Athena Motor Co., of Athens, in the same State; Leo Segar, the other member of the firm, will continue the business with Coleman. The old style will be retained.

The S. & L. Machine Repair Co. in Cleveland, O., has been succeeded by the Southside Garage; S. M. Slansky and J. M. Siller, who also are proprietors of a supply store at 25th street and Clark avenue, will continue the garage business at 3114 West 32d street.

Frank C. Smith, for a number of years connected with the John Widdicomb Co., of Grand Rapids, Mich., a furniture concern, has entered the automobile trade; he has secured the agency in his city for Detroit electrics and has his salesrooms with the Becker Auto Co.

E. J. Bartlett, formerly sales manager for the Stutz Motor Car Co., of Hartford, Conn., has been made Stutz dealer in the counties of New Haven, New London and Middlesex; the style will be Stutz Motor Car Co. of New Haven, the business being located in the latter city.

Merritt J. Osborn of St. Paul, Minn., has purchased a site, 91 feet on 3d street and 150 feet on College avenue, and will erect thereon a two-story garage; when completed it is said it will be the largest garage in the Northwest. Merritt handles White gas cars and Detroit electrics.

T. C. Peterman of Perry, Ia., and L. E. Mason of Lohrville, in the same State, are building a garage in Slater, also an Iowa town; they will occupy it in the spring and, besides conducting a garage, will deal in several lines of cars. Peterman now is a dispatcher on the C., M. & St. P. R. R.

Bishop & Loper, who just have taken the Abbott-Detroit agency, are erecting a new unit tile garage, 60 x 100 feet, in Port Jefferson, Long Island, N. Y., which will be ready for occupancy about January 1. The firm also owns the Ardencraig Garage in Port Jefferson, which will be continued.

The Ardery-Holliday Motor Car Co., of St. Joseph, Mo., has completed a garage and salesrooms, 75 feet on 8th street and 85 feet on Sylvanie street; the first floor is devoted to sales and live storage and the second floor to dead storage, the machine shop and supplies. Hudson and Marathon cas are stocked.

Patchogue Garage Co. is the style chosen by Harry Lawrence, Jr., and J. A. Udall, Jr., for a new agency and garage business in that Long Island town; they will handle

Digitized by Google

the Abbott-Detroit and Jackson lines. Their building, which is new, is 50 x 100 feet, with a wing containing a machine shop, and is of unit tile construction.

Hansen-Thuesen Automobile Co. of Fresno is the style of a new California company which will operate in Fresno and San Francisco; it has the agency for the Norwalk car. Hansen will have charge in Fresno and Thuesen will conduct the company's affairs in San Francisco; at present the latter is located in the Jackson headquarters in Golden Gate avenue.

Changes Among Prominent Tradesmen.

P. F. Steinhauer has been appointed sales manager of the Colby Motor Car Co. of Mason City, Ia. Previously he was an Abbott-Detroit traveling representative.

Gerald Fitzgerald, assistant manager of the Remy Electric Co.'s branch in Chicago, has been promoted to the management of the branch which the company is opening in Minneapolis. He will assume his new duties on January 1st.

Ralph Murphy has been appointed manager of the H. H. Franklin Mfg. Co.'s service department in Syracuse, N. Y., succeeding J. F. Troutman, resigned. Before taking up his new duties Murphy was chief of the Franklin inspection department.

Everitt S. Benson, who has been assistant eastern district manager of the United States Tire Co. since its organization, has resigned that office. His plans for the future have not yet matured. Benson is a veteran tire man, having at one time been secretary of the Hartford Rubber Works Co. and later treasurer of the G & J Tire Co.

Claude M. Nankivel, 17 State street, New York City, has been appointed foreign distributor for Stewart trucks, made by the Stewart Motor Corporation of Buffalo, N. Y. He will handle the sale of those vehicles in Europe, Australia, New Zealand, South Africa and South America. Nankivel is no stranger to export work, having had ripe experience not only in the automobile business, but with others.

A. J. Fisk, at one time general manager of the Witherbee Storage Battery Co. and at present serving as western sales manager of A. R. Mosler & Co., has resigned the latter connection to become identified with the Ward Leonard Electric Co. of Bronxville, N. Y. Fay Morton Henkel, for four years eastern manager of the Remy Electric Co., also has become attached to the Ward Leonard Company. Both Fisk and Henkel will serve in the sales department.

Minor Business Troubles.

The Central Tire Supply Co., of 2540 Broadway, New York City, has filed schedules in bankruptcy i nthe Federal court; the liabilities are $3,208 and the assets $1,206, consisting of stock, $200; accounts, $818; office furniture, $100, and cash, $88.

Herbert C. Crane, general manager of the Seek Auto Co., which operates a garage at 5140 Lake avenue, Chicago, has petitioned for the appointment of a receiver; the petition is directed against J. Harry Seek, E. D. Green and E. W. Mick, the other stockholders.

The Tire Core Co. of America, New York the Eastern distributer of Dahl tire filler, located at 246 West 59th street, New York City, filed its schedules in bankruptcy this week. The assets amount to $3,364 and consist of one car, $650; machinery, $323; office furniture, $262; accounts, $2,016; cash, $113. It also has a claim of $20,000 against the Dahl Punctureless Tire Co., of Minneapolis, Minn., the value of which is problematical. The liabilities are $8,240.

Klaxon-"League" Appeal is Argued.

Argument was heard this week in the United States Circuit Court of Appeals for the Second Circuit, in New York City, in the appeal of the Lovell-McConnell Mfg. Co., of Newark, N. J., against the International Automobile League, of Buffalo, N. Y., growing out of the efforts of the former to prevent the Buffalo house selling, advertising or in any other way handling the Klaxon horns. The suit charges infringement of the Klaxon patents Nos. 923,048, 923,049 and 923,122.

In the United States District Court in Buffalo the Lovell-McConnell company was granted an injunction restraining the League from cutting the Klaxon prices, and the plaintiff asked that the injunction be made more extensive so as to restrain the League from handling the horns; this the court denied and an appeal was taken.

In the argument in the higher court this week the recent Dick mimeograph decision of the United States Supreme Court, which held that a patentee might specify what materials should be used with his invention, was cited as upholding the conditional license plan under which the Lovell-McConnell products are sold and which permits the company to declare "objectionable" anyone who does not adhere to its terms.

Purchaser Fails to Recover Deposit.

If a man makes a deposit on a motor truck for future delivery and before the delivery date decides that he does not need the vehicle, he may do well to study the case of Alexander Bing vs. Garland Automobile Co., which was decided in favor of the defendant this week in the New York City court. The Garland company, which represents the Velie truck, claims the whole action was caused because Bing, who is an art manufacturer, changed his mind about the purchase and adopted a peculiar means for getting his money back. According to the termination of the court action, he will not get it back.

The order for the truck was placed with March 10, 1912, as the delivery date; $300 was the deposit. March 26, the Garland company claims, Bing asked to have the delivery date postponed, and April 26 a letter was written to Bing asking him when he would take his truck. The next afternoon at 5 o'clock, it is stated, he appeared at the Garland company's place of business with an attorney and demanded his truck. He was told it could not be gotten out of the garage for him that night, but that he might have it the next day. Bing therefore set up a claim that he had been refused his truck and asked for his money back.

Hollister Trucks with Hydraulic Clutch.

Composed largely of former members of the Remington Standard Motor Co., which, as was told last week in Motor World, got itself into difficulties with its licensor, the Manly Drive Co., and which is going out of business, the Hollister Standard Motor Co. has been incorporated under New York laws with $675,000 capital. Adolph Bausch is president and treasurer of the new company and Learned White is secretary. Although both of these men were intimately connected with the Remington company, as were W. H. Langford, H. H. Sivier, B. F. Yoakum, Emerson Brooks, P. E. Remington, George A. Grounds and David H. Lyons, all of whom are directors in the new company, no attempt will be made to employ the Manly drive transmission about which the Remington truck was built. Instead, the new company is preparing to bring out two entirely different commercial vehicles, rated at three and five tons' capacity. The use of hydraulic mechanism still is adhered to in the new truck, however, though it is not in the driving mechanism, strictly speaking. It will employ a hydraulic clutch, which is the invention of C. P. Hollister, for whom the company is partly named, but otherwise will be orthodox as regards its power plant and transmission elements. Already a factory, 300 x 75 feet, has been acquired in Farmingdale, L. I., N. Y., and active preparations are being made to introduce the initial product in the very near future.

Armstrong Doubling Output of Springs.

The J. B. Armstrong Co. of Flint, Mich., which manufactures automobile springs, has commenced the erection of two additions to its plant—one 85 x 140 feet, the other 35 x 100 feet. The new buildings will double the Armstrong capacity.

Contributions concerning any subject of automobile interest are invited and, if adequate, will be paid for; or, if unavailable, will be returned provided they are accompanied by return postage.

Cable Address, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, DECEMBER 12, 1912

OUTPUT "FORECASTS" AND DEPOSIT SYSTEMS.

It is not often that trade organizations of such size or importance take notice of such statements appearing in print, but it has become known that the executive committee of the National Association of Automobile Manufacturers has deemed it wise to take cognizance of the exaggerated estimate of the 1913 output compiled by an alleged automobile trade journal, which was so proud of its work that it mailed the figures to the daily press of the United States, which largely reproduced them. In courteous terms, the executive committee has suggested to the trade press that publication of such inaccurate figures serves no good purpose. Certainly, their wide circulation gave rise to a great diversity of printed opinion, not all of which was favorable to the automobile interests.

In its issue of November 21st, Motor World remarked the ridiculously exaggerated statistics in question, which would have it believed that the probable production during 1913 will be 627,000 cars, and stated that the figure was so grossly inaccurate that it was astounding that any one who even claimed to be in touch with the trade should stand sponsor for it.

The action of the N. A. A. M. in diplomatically "deploring" the dissemination of the "forecast," should have a good effect on the ready reckoners and cause them to temper their endeavors with at least a semblance of common sense. There is no doubt but that the 1913 output will be larger than the production of 1912; even without being made ridiculous, it will be quite large enough for all practical purposes, if, indeed, it does not prove too large.

In this respect, and exerting an influence which is not always recognized, the deposit system which, while apparently an artificial development of the automobile industry, and one that often has required defense, has proven in the nature of a blessing in disguise. While it has not and cannot wholly prevent over-production, it has greatly reduced the volume thereof and assisted to keep it within reasonable bounds. As one of the best known manufacturers, in a public address, recently remarked, "the number of cars a dealer can sell while in a manufacturer's office is often quite different from the number he actually can sell in his territory." The deposit system is a curb on such unbridled enthusiasm, for not every dealer is ready or willing to back his enthusiastic estimates with deposit money. Over-production is the bane of all industries, and anything which tends to reduce or restrict the evil is a safety valve, the value of which is not to be minimized or despised.

OPTIMISM AND RAINBOW CHASING.

Properly tempered, optimism is a glorious quality; it is the sunshine of life. It promotes good cheer, dissipates the blues, permits to be seen the silver lining behind the cloud and generally inspires men to greater things. But nothing has caused more grief than the loose and oft-expressed sentiment of public speakers and public writers that whoever is not an optimist is a pessimist, or a "knocker," to employ inelegant vernacular. It is belief of the sort that induces fools to rush in where angels fear to tread.

There are degrees of optimism just as there are degrees of pessimism. It is an admixture of both that achieves the best results. When this state of mind obtains it permits both sides of the picture to be seen; it permits a balance to be struck and serves to steady both men and things. It is unrestrained, or at least poorly tempered optimism that is largely responsible for the succession of crashes that have occurred in the automobile industry during the past three months.

The discomfited individuals were long on optimism and short on judgment. Their eyes were trained only for sunshine. The fact that occasionally even the heavens grow dark and that rain falls did not occur to them until too late, or when rain fell they had thoughts and eyes only for the glorious rainbows which follow, and at the foot of every rainbow they discerned even more clearly the pot of gold which is associated with childhood. They saw only millions in the automobile industry, and, seeing nothing else, they pursued rainbows and blew bubbles with the simple abandon and unrestrained enthusiasm of childhood.

The child is a most glorious example of optimism. But when children attain to man's estate it is fitting and in the nature of things that they temper their optimism and cease to see castles in bubbles and pots of gold in rainbows. In other words, the day of "rainbow chasing" in the automobile industry is nearly past. "Rainbow chasers" may remain but in the end they and their followers cannot but come to grief. Men will continue to fool themselves but it is not possible to fool all of the people all of the time.

NEITHER AGE NOR CLOTHES AN INDICATOR OF A BUYER

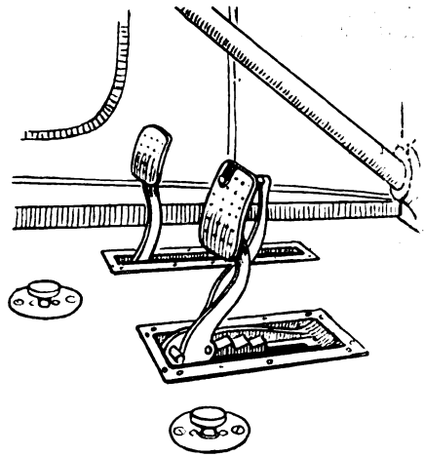
Attention to Poorly Clad or Youthful May Reveal Customer—Dealers Who Judged, One Right, One Wrong.

"'Tis not the clothes that make the man," has been harped on for so many centuries that some people really believe it, although there are many who still are prone to cater to creased trousers and patent leather shoes. Likewise the old saw may be remodeled for present usage and supplemented to read, "'Tis neither clothes nor age that make the individual a prospective buyer of an automobile." Doubters of the veracity of the revision might gain knowledge of its truth by inquiry among any one of the first half dozen automobile salesmen they encounter, for it is a man of limited experience indeed who has not had occasion to test its truth.

New York City has two automobile men, one of whom is thankful he did not become cross on a recent occasion, while the other regrets having made a false estimate of his callers. One of these dealers had a large, screaming yellow touring car in his window—in fact, he had had it in the window for so long that he had despaired of selling it.

The list price, which would acord him a commission of $500, was $2,500. One afternoon a couple of young girls strolled into the salesroom and asked what the dealer wanted for the car. As he saw them approaching they impressed him as what he termed "a pair of broilers looking for a ride."

But when asked, "How much do you want for that car?" he carelessly answered, "Two thousand dollars," supposing that mention of such an amount would put the girls to rout.



He was on the verge of collapse when one of the demurest of the maidens responded, "All right, we'll take it." And buy it they did. The false estimate and careless remark cost the dealer his commission of $500.

Another dealer was tempted to shout "Get out of here!" when two small but well dressed boys walked into his store one day and began to ask questions about a car. The dealer decided to act with discretion, however, and, although regarding it as wasted time, answered to the best of his ability the inquiries of the boys. The next day he found what the "wasted time" was worth, when the two boys and a man walked in and, as the dealer approached them the boys cried, "There, papa, there's the man who told us all about the car!"

Papa bought the car.

Little Known Features of Well Known Cars

Of the very many things which can enter into and make the driving of a car either a pleasure or a task, according to conditions, probably none is more assertive than the location of the control elements, and it is a fact that many cars which, praiseworthy for other details, have received "black eyes," so to speak, simply because the very essential levers which have to do with the manipulation of the machine were not conveniently located. And realizing that what

BUFFALO ELECTRIC PEDAL CONTROL

is true for the gasolene cars also is applicable to the electric vehicle, the designers of the Buffalo electric car have spared no pains to place the main control, which is, of course, the lever operating the motor controller, in a location where it can be moved with the greatest of ease—by a simple depression of the foot.

As is clearly shown in the accompanying sketch, the pedal which operates the rheostat is placed so as to be operated by the right foot; the pedal on the left side operates the brake. Provision is made for retaining the pedal in any position on the arc without the necessity of holding the foot on the pedal by the use of a dog engaging with a rack on the quadrant; the dog can be instantly released and the power cut off either by touching the button which passes through the pedal with the tip of the toe, or by applying the brake.

The Diamond Tire & Rubber Co. of Canton, O., has established a branch in Atlanta, Ga., at 221 Peachtree street. It is in charge of H. C. Ross, who for the past several years has represented the Diamond Rubber Co. in the South.

December 7-22, Paris, France — Paris Salon.

January 2-10, New York, N. Y.—Importers' salon in Hotel Astor.

January 4-11, Montreal, Can.—Annual automobile show in the Drill Hall and Armory, under the auspices of the Automobile Club of Canada.

January 6-11, Cleveland, Ohio—Cleveland Automobile Show Co.'s exhibit in the Central Armory.

January 11-18, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Pleasure cars only.

January 20-25, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the First and Third Regiment Armories.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

January 21-26, Toledo, Ohio—Annual show in the Exposition building under the auspices of the Toledo Automobile Shows Co.

January 25-February 1, Providence, R. I.—Annual show of the Rhode Island Automobile Dealers' Association in the Providence State Armory.

January 27-February 1, Ottawa, Can.—Annual show of the Ottawa Valley Motor Car Association in Howick Hall.

January 27-February 1, Scranton, Pa.—Third annual show of the Scranton Automobile Dealers' Association in the 13th Regiment Armory.

January 27-February 1, Detroit, Mich.—Detroit Automobile Dealers' Association's Show in the State Armory.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Pleasure cars only.

February 3-8, Washington, D. C.—Washington Automobile Show Co.'s exhibit in Convention Hall.

February 8-15, Hartford, Conn.—Sixth annual show of the Hartford Automobile Dealers' Association in the State Armory.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 7th Regiment Armory. Commercial vehicles only.

MAKING READY TO HANDLE PARCELS POST BUSINESS

Appropriation Made to Hire Automobiles to Deliver Packages—The Zone System; Rates and Regulations.

Whatever may be the effect of the parcels post system, which goes into effect on January 1, upon the automobile and allied industries, it is evident that motor vehicles are expected to play an important part in the operation of the plan, for an appropriation of half a million dollars has been set aside by Postmaster General Hitchcock to be used in part for renting automobiles to transport the packages that will be handed over to the Post Office Department for delivery, commencing January 1st.

Chicago will receive the biggest part of the appropriation, its share being $15,000; New York, Boston and Philadelphia get $10,000 each, Brooklyn $8,000, St. Louis $5,000, Pittsburg $4,000, and Baltimore, Cleveland and San Francisco $2,500 each. After these, the ten largest cities, come the rest of the 1,600 postoffices that enjoy the benefits of city delivery, each receiving an amount proportionate to its volume of business. Postmasters are to be authorized to employ as many temporary employes as may be necessary to take care of the additional work involved in the handling of packages mailed under the new system.

That the parcels post will be of benefit to dealers in automobile parts, supplies and accessories is indicated by the fact that any package may be mailed that does not weigh more than 11 pounds and that does not measure more than 72 inches in combined length and girth. For instance, a package measuring 10 inches wide, 6 inches thick and 40 inches long would be just within the limit of size; or it might be long and narrow—say 5 inches wide, 3 inches thick and 56 inches long. Besides conforming to the regulations as to weight and size, packages must be mailed under the special stamps to be provided for the purpose; no others can be used. All sorts of farm products and manufactured articles will be mailable, provided they are not of a character injurious to persons handling the packages or to other packages with which they may come in contact, and provided, further, that they are not perishable within the time ordinarily required for their delivery. Books are excluded. It is clear that there are comparatively few articles, coming within the specified limits, that cannot be mailed. Automobile lamps, ignition apparatus, tools, inner tubes, pumps, clothing, horns and a thousand other things can be conveniently and cheaply delivered to customers through the agency of the Post Office Department.

As to the all-important matter of charges for parcels post delivery, it is expected that the greatest benefits will be derived by those who send small parcels comparatively short distances—a class of service which is decidedly expensive to send by express. A package mailed and delivered within a given postal district will be charged for at the rate of 5 cents for the first pound and one cent extra for each additional pound. If a package is to be delivered outside of the postal district in which it is mailed, but within the first parcels post zone—that is to say, within a circle having a radius of 50 miles or a diameter of 100 miles—the charge will be 5 cents for the first pound and 3 cents extra for each additional pound. A ten-pound package mailed on Manhattan Island, to be delivered on Manhattan Island, will cost 14 cents, while the same package mailed to Yonkers would cost 32 cents, And for each zone that is crossed the cost increases.

The whole country included in the parcels post system is divided into areas of about 900 square miles each. In each of these districts a point is selected as a center, and from this point circles are drawn marking the zone limits. The first circle has a radius of 50 miles, the second of 150 miles, the third of 300, the fourth of 600, the fifth of 1,000, the sixth of 1,400, and the seventh of 1,800 miles. All territory outside of the 1,800 mile radius is considered as within the eighth zone. The Philippine Islands, for instance, are in the eighth zone. Of course, the rates to the eighth zone are the highest, and amount to 12 cents for the first pound and 12 cents extra for each additional pound, or a total of $1.32 for a package of the maximum weight of 11 pounds.

A good idea of the parcels post charges from a given point to the various zones may be obtained by taking the rates on a five-pound package as an example, as follows:

Within zone 1, 17 cents
Within zone 2, 22 cents
Within zone 3, 27 cents
Within zone 4, 32 cents
Within zone 5, 37 cents
Within zone 6, 46 cents
Within zone 7, 51 cents
Within zone 8, 60 cents

Nash Loving-Cupped and Twice Banqueted.

C. W. Nash, the newly elected president of the General Motors Co., was presented with a loving cup by his friends in Flint, Mich., at a banquet tendered by the Board of Commerce of that city on November 29th. Later, on December 3rd, Nash also was the guest of honor at a banquet given by the officers of the General Motors Co. of Detroit. Nash practically grew up in Flint, where he first was connected with the Durant-Dort Carriage Co., out of which evolved the Buick Motor Co., of which he had been general manager.

Unusual Body Question not Decided.

Whether a customer who looks at a car body in a salesroom and places an order for one buys the body at which he looks or buys one like it, was the point which would have been decided had the case of Marie Marcella Mills against Carl H. Page & Co., Chalmers dealers in New York City, gone to trial in the Supreme Court for New York county, instead of having been settled amicably and discontinued, as it was last week. The complainant claimed she bought a limousine body in the summer of 1911 for $1,000, a lower price being accepted as a sort of summer rate for enclosed bodies. She also bought a regular touring car and the Page company agreed to store the limousine body until she wished it.

Later in the fall she sold the limousine body, or attempted to, but insisted that she be given a certain body. She was told that the body at which she had looked had been sold and that the terms of the sale to her would be complied with if she were given one like the sample. This did not suit her, so she commenced an action for $1,400, the winter price of the body.

Croce Building Seaside Truck Factory.

The Croce Automobile Co. of Asbury Park, N. J., which grew out of the 1,500 pound truck built in Croce's machine shop in that city, has been incorporated under New Jersey laws with an authorized capital of $250,000. In advance of the formal organization, work had commenced on a two-story brick and steel factory, 140 x 80 feet, at First and Railroad avenues in Asbury Park, which is so well advanced that it will be in operation early next year.

In addition to the designer, those interested in the company are ex-Mayor T. Frank Appleby and Harry A. Watson, Henry C. Winsor, president of the Asbury Park and Ocean Grove bank; Col. John W. Aymar, Stuart Appleby, Theodore Appleby, Richard W. Herbert, County Tax Commissioner; Samuel A. Reeves, Councilman Charles R. Zacharias of the Zacharias Garage Company; Councilman Charles Rugarber, Albert Robbins and E. W. and J. Voorhees Krymer of Elizabeth, N. J.

National Branch to Have New Home.

For the occupancy of its Chicago branch, the National Motor Vehicle Co., of Indianapolis, has leased a two-story building, 40 x 100 feet, which is to be erected at 2430-32 Michigan boulevard, the cost of which will be between $35,000 and $40,000. The structure will be completed by February 1.

COURTESY AS A BUSINESS ASSET

Lack of It Is Responsible for Many an Unsold Machine—An Example: the Salesman "Didn't Know."

The prospective customer owned a car; he was a prospect, although the salesman did not know it. As a matter of fact, only the prospect himself knew it; he had become dissatisfied with his machine some two months before and was determined to sell it; he was much interested in a car that looked like big value to him—and the salesman who is the subject of this story would have been mighty eager to sell him if he but had a clue.

The P. C. dropped in to the garage frequently, for it was handily situated. He bought oil and gasolene there, frequently had his car washed, occasionally had it stored and all the time he was looking over the car sold there with the idea of making a deal in the spring. But of course the salesman did not know that, and because he was not a real salesman he did not even dream it. So instead of cultivating the P. C. in a friendly, helpful sort of way, looking after his interests when he came into the garage occasionally asking him in a sincere, really-want-to-know fashion if the service was all right, he merely gave him a nod and passed on his way, overlooking the sales opportunity that was staring him in the face three or four times a week.

Gradually the P. C., who was a friendly, approachable sort of a chap, began to feel that this salesman had something on his chest against him. He wondered what it was, and as the salesman took less and less notice of him he began to acquire a positive dislike toward the salesman. The culmination of it all was that the P. C. went into the garage office one night to inquire about a friends' car and the salesman, with his feet on the rail and a cigar in his mouth, leaned back in a dont-give-a-damn fashion and made his replies just as if it was a task for which he was receiving no money and therefore was not a bit interested. The information wanted was known to the salesman and he could have easily imparted it; but he lost sight of the fact that a real salesman is always on the job and always making friends, even though he may not see immediate chances of cashing in—and he was so short and snappy in his conversation that the P. C. then and there made up his mind that he would not care to have business dealings with him.

Gradually salesmen are beginning to realize the tremendous importance of friendliness and courtesy. It costs nothing; it wins friends and it makes sales. It is a business asset that grows with the expenditure of it.

VALUE OF CLEAN WINDOWS.

Keep your show windows clean. Too many windows will, from now on, be made a catch-all for everything that's loose. That is not good business nor is it wide-awake merchandising. Show windows cost just as big a share of the rent in winter as they do in summer and just as strong an effort should be made to cash in on them. And the first thing to do is to see that they are kept clean.

Clean windows are not only good business from the standpoint of letting the people see through them to what you are selling, but bright, clean windows always make people think of clean goods, business-like methods, up-to-dateness and a whole lot of other things that make for better business. How often have you heard your wife say, "I never like to go into Sleeper's store, the windows are so dirty. . . . I wonder how they do any business at all." Again, you are just as likely to hear her remark, "Lively's windows are so attractive! The windows are so clean and bright that everything looks good."

There is a temptation to be slack in winter months, for windows are hard to wash in winter. Let the other fellow neglect his windows if he wants to, but be sure yours are bright and clean.

DATES FOR DEMONSTRATIONS.

"Send me a catalogue and some literature about your car," said a gentleman to an automobile dealer. "Certainly," responded the dealer, and he did so.

A few days later he met the man.

"Going to have you give me a demonstration some time," said the man. "The catalogue description looks mighty good, and I am very much interested.

"We'll be glad to give you a demonstration at any time you set," was the response.

That was six weeks ago, and the demonstration has not been asked for yet and probably never will be

The lesson to be learned is the importance of setting a definite date for the demonstration when the prospect is in the mood and has just read the literature. Then is the time to settle the matter and get him thoroughly sold on the car. Delays are just as dangerous in such matters as at other crucial points in business deals. Make a definite appointment and see that it is kept.

PROMOTING SALES IN WINTER.

Radiator and bonnet "comforters" are now being generally used by winter motorists—and the number of those who drive all winter is constantly increasing. These "comforters" sell at prices running from $6 to $40, and there is a liberal profit in them for the automobile dealer. Most car owners are simply waiting for the suggestion to buy one. A word or a line to every customer probably would bring a liberal percentage of orders. Why not add to profits by seeking orders for them or for other essentially winter goods, or, better yet, for both?

AWAKE-NDISING WORLD

DEMONSTRATORS THAT REPEL

Poorly Kept Car Often Sufficient to Check Progress at Beginning of Sale—Getting the Customer's Viewpoint.

Real salesmanship is that which keeps always in mind the viewpoint of the purchaser and caters to it. There is no better way to "cultivate" a prospect than to invest him with a sense of ownership in a car, even though he has not yet signed the contract. And as few persons are partial to the ownership of an old mud-marred, rattling car it is the wise salesman who makes his first impression with a car that has lost none of its pristine loveliness. There is something wonderfully appealing about a new car that well may be turned to account. Everything is so beautifully clean and bright, so smart and glistening, that it catches attention and holds it. There is nothing quite so delightful to the prospective motorist as the sense of satisfaction that is bred of the soft, clean cushions and the knowledge that the car and its occupants are somewhere near the center of attraction. The prospect begins to feel a sense of pride and ownership, and it is this feeling that the salesman should cultivate. It is true of many men and all, or nearly all, women.

All of which is suggested by the experience of an electric car salesman who made use of an old demonstrator to convey a prospective woman purchaser from her home to the salesroom. The car looked dingy; it did not have the gloss of newness, and moreover it was not of the model that the salesman was trying to sell. When he arrived at the door, the lady was decked in her finest gown, and when she caught sight of the disreputable demonstrator the look of mingled disappointment and disgust that overspread her features was the most eloquent sermon that could ever be preached to salesmen. The one concerned resolved then and there that never again would he call for a prospect in an old car, for which he had to commence to apologize as soon as he reached his destination.

It is a fact that not a few sales have been killed by the sight of a rattling old demonstrator, when, on the other hand, they might have been brought to a successful conclusion with aid of a clean, up-to-date car. A demonstrating car always should be kept spotlessly clean and bright. And there is the other side of the question which must not be lost sight of: When you call for a lady in an old car that looks the worse for wear she is altogether likely to think that she has been slighted, in which case it is far wiser never to have called at all.

HUDSON'S "LIMOUSINE WEEK."

Emphasizing the desirability of limousines at the time when the cold weather is first at hand, was the subject of a considerable campaign by the Hudson Motor Car Co., of Detroit, which staged a "limousine week" in its branches and dealers' establishments throughout the country, the display of enclosed cars being made simultaneously in all cities. The "stunt" was to make limousines a feature in the salesrooms for a week and to draw attention to them through advertising of various forms. It is a selling idea on which the Hudson people hold no patent, and with obvious modifications is possible with cars of any type or any make.

KEEP INSURANCE POLICY ALIVE.

A recent fire in an up-to-date little Michigan town of some 2,000 inhabitants wiped out an entire business block, entailing a loss in excess of $50,000. One of the worst sufferers was an automobile dealer whose insurance policy had expired but a few days before. He had been there for years and never before had there been a fire of any magnitude. He took a chance, and the chance cost him more than he could afford.

Insurance policies should be renewed before maturity and the stock always protected, as every good business man knows.

CARS AS CHRISTMAS GIFTS.

The advent of Christmas furnishes the germ of a selling thought that may be applied to advantage by the enterprising dealer. Automobiles have been used as Christmas gifts in other Yuletide seasons, and there is every indication that they will be so utilized again. Generally or quite often the gift is by the husband to the wife, and in such case the car selected should be one appealing to the feminine taste. There are few cars that have not some selling points of this sort, and emphasizing them to the proper person in the proper way may yield a commission. Right here it may be added that the dealer in electrics has a particularly fruitful field. What could cause more joy in the feminine heart than an electric left at the curbstone or the door on Christmas morning?

MAKING THE MOST OF IDEAS.

Ideas are of no value unless they are used. When you see a good idea grasp it and put it into execution at once. Imbue your employes with the same spirit.

Ideas spring from many sources; they occur to everybody. Don't be afraid to adopt a good idea because you did not think of it first. Encourage employes to present ideas and it will stimulate their interest.

HEED THE TEN-CENT CUSTOMER.

In every business it is well to keep in mind that the ten-cent customer of to-day may be the big buyer of to-morrow. Dealers frequently need to remind themselves, as well as employes, of the fact. For there are all too many evidences that it is neglected if not altogether forgotten.

MIRRORS WILL REFLECT THE GARDEN'S GLORIES

Clever Decorative Scheme That Will Lend an Air of Spaciousness Without Sacrificing Beauteous Appearance—43 Pleasure Cars and Nearly 300 Accessory Exhibits for First Week.

It may interest those who care for statistics to know that some 200 tons of steel girders and more than a million feet of lumber will be used in transforming the interior of Madison Square Garden into a veritable bower for the reception of the cars that will form that part of the National automobile show which is to be held in the historic old building. At the new Grand Central Palace, where the other half of the forthcoming show, otherwise known as the Automobile Board of Trade's 13th annual automobile show, is to be held, for nearly every one now knows that the 1912 exhibition is to be the first New York show to be held simultaneously in "two buildings for two weeks," not quite so much steel and wood will be necessary, though there will be other trimmings and "fixings" galore.

Garden To Be a "Crystal Palace."

Of course, there will be other things besides steel girders and wooden beams in the decorative and constructive scheme at the Garden, and even though the whole of the scheme has not been disclosed, enough of it is known to ensure that the decorations will be "up to" those of the previous years, at least. In the first place, there are to be yards and yards of mirrors—square yards, of course—for which reason the designation "Crystal Palace" has been chosen by those who have the decorating in hand. The mirrors are to be placed all around the walls and their effect, it is expected, will be to lend a marked appearance of spaciousness—even if it can be obtained in no other way.

Also it has been decided that there will be no Turkish or other "rug" suspended over the heads of the spectators, and the roofs of the cars. Instead, it is promised, there will be an infinitely more pleasing "sky" of diaphanous blue material intended to convey the idea of light, fleecy clouds. In one respect the show will be very much like its immediate predecessor: The ornate lamp posts which last time did duty at regular intervals around the big hall will be brought out and dusted off and stood up in their customary places to mark off the exhibits. The signs, however, blazoning the names of exhibitors, will be slightly different and will be uniform with those used in Grand Central Palace. As heretofore, lattice-work and a superabundance of trellis will aid in creating the pleasing atmosphere which is sought.

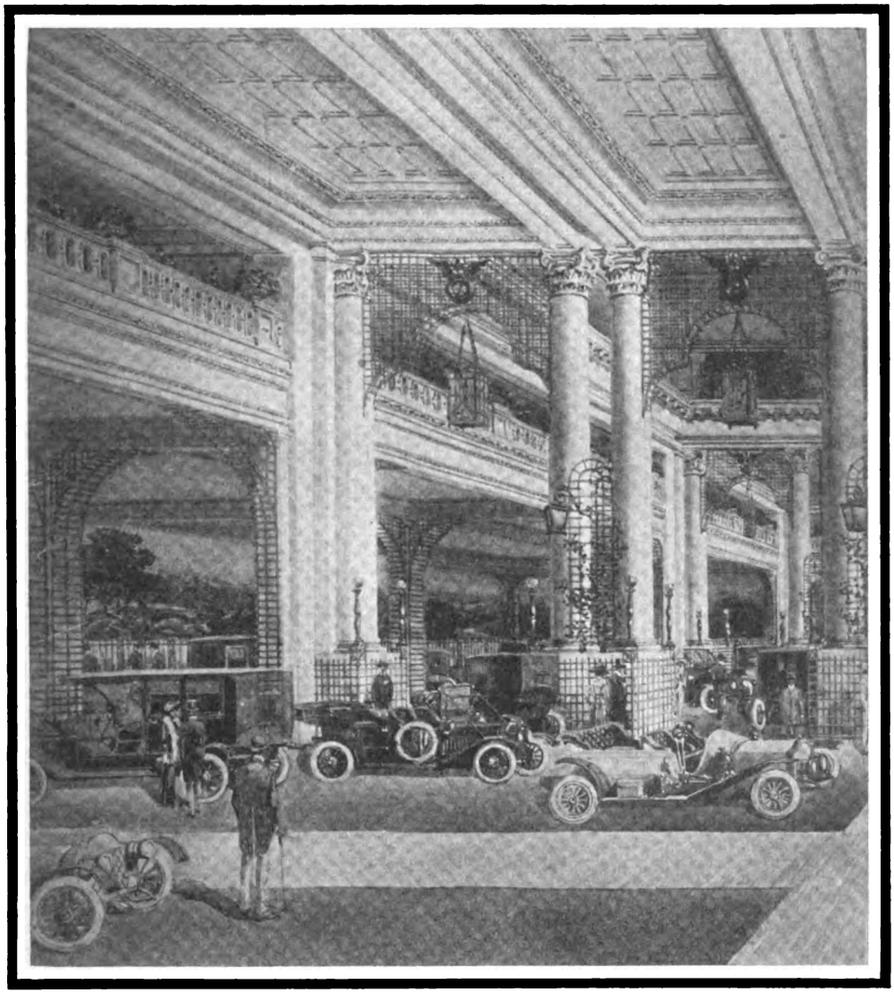
Splendor of the Palace "Fixings."

For the Palace, the decorative scheme approaches very much nearer to maturity, for already contracts have been let and scenery artists have been busy for several months defacing perfectly good canvas to form "background" and "sky" effects. According to present indications, the decorative scheme at the Palace will be far more gorgeous and far more pleasing than it was at the last shows in either of the two buildings; certainly it will be a great deal more pretentious.

"CRYSTAL PALACE" EFFECT FOR MADISON SQUARE GARDEN

Oil Paintings to Cover the Walls.

On the walls of the main floor of the Palace will be a number of typical Long Island scenes, as well as paintings depicting the beautiful Delaware River, views in the Berkshires and scenes along the picturesque Hudson near West Point. The walls of the mezzanine floor will be given over to Western views, including paintings of the Grand Canyon of the Colorado, the gorges and passes of the Rocky Mountains, California vistas and sections of the cattle countries and prairies. The Gallery will be devoted to the sunny South and appropriate paintings depicting the beach at Ormonde, Fla., where so many speed records have been made and of Jacksonville and other Dixie points of interest will decorate the walls. Much trellis work and flowers in profusion will help to give the coveted outdoor atmosphere and, to relieve the monotony of the cars and chassis and accessories.



More Than 500 Separate Exhibits.

When the doors of Madison Square Garden and Grand Central Palace are thrown open to the public on Saturday night January 11th for a run of two weeks, the pleasure car and accessory maker holding forth until the 18th, when a quick shift will be

PALACE TO BE A VERITABLE PICTURE GALLERY

Paintings That Will Transport Southern and Western Atmosphere to New York to Cover the Walls—Trellis Work and Greenery to Complete the Illusion—Exhibition Spaces Well Filled.

DECORATIVE TREATMENT ADOPTED FOR GRAND CENTRAL PALACE

made and trucks will replace the pleasure cars in both buildings and remain until the 25th, there will be some 530 complete and separate exhibits of cars and accessories on exhibit in the two buildings. From which it may be appreciated, in view of previous shows, that there is not a very great deal of space going to waste.

On the Garden list of the first week there are upward of 43 names of pleasure car makers and 272 names of accessory manufacturers. The list, therefore, is slightly smaller than was the case last year during the pleasure car week of the Garden show, though this fact is no indication that the exhibit will be any the less comprehensive. It is pretty well established that the deficiency in the number of individual makers will be more than made up by the greater variety of wares displayed by the smaller number of exhibitors. There is little reason to expect that there will be apparent any very great gaps in the well-ordered lines of exhibitors.

Exhibitors in Grand Central Palace.

Grand Central Palace, during the first week, will house at least 46 makers of pleasure cars in addition to 25 motorcycle displays and more than 100 separate exhibits of accessories This list also is smaller than was last year's, except with regard to accessories, of course, which were conspicuous by their absence at the last Palace show. During Part II of the mammoth show, designated as the commercial vehicle week, some 25 manufacturers of commercial vehicles will display their wares in the Garden and in the Palace the list of names already numbers 41. Taking the cue from last year's exhibition, it is altogether likely that these numbers will be slightly swelled, at least, when eleventh hour exhibitors at length make up their minds to sign space contracts. As was the case at the last show, nearly all of the accessory manufacturers will remain for both weeks of the show.

In the Palace, car and accessory exhibits will be confined to the main and mezzanine floors; accessories will be exhibited exclusively in the balcony.

Salesman's Commission Basis of Suit.

Probably nothing causes more dissension among automobile tradesmen than the matter of commissions, and one of the numerous altercations now is winding its way through the New York City Court, wherein the judges are asked to decide whether the Abbott-Detroit Motor Co. should pay a commission of $310, alleged to have been earned by Samuel Warrington. Warrington has assigned his claim to Frederick W. Sturzel and the latter is the plaintiff in the action.

Warrington's claim is that he was engaged in May, 1911, by the Abbott-Detroit company in New York City to secure prospective buyers of cars and that his services resulted in the sale of a $1,550 car to one D. C. Sanford; the commission, which he claims was the difference between $1,550 and $1,240, was demanded and refused. The Abbott-Detroit company enters a general denial. The cause was restored to the general calendar last week after having been permitted to lose the position which it originally held.

Delayed Delivery Costs Dealer $500.

Delaying the delivery and sale of a car from Saturday, 23d ult., to Monday, 25th ult., cost Wilfred H. Cote, a dealer in Fall River, Mass., $500. He was to have delivered the car to James Kershaw, but on Sunday, 24th ult., it was partially destroyed by fire, the damage amounting to $500. On Saturday Kershaw offered Cote a check for $2,400 in payment for the car, an Everitt "six," but Cote asked him to wait until the following Monday and Kershaw did so.

Truck Show, too, for Kansas City.

For the first time, the Kansas City Motor Car Dealers' Association, which promotes the annual show in the Missouri city for which it is named, is to draw a distinct line between its pleasure car and commercial vehicle exhibits. Pleasure cars will hold the boards from February 17 to February 22 and from February 24 to February 27 the space will be devoted to the display of commercial vehicles exclusively.

FLANDERS, OF PONTIAC, FAILS; TWO MILLIONS GONE TO WASTE

(Continued from page 6.)

bution. The committee, therefore, recommended the appointment of a receiver.

Many things combined to bring about the downfall of the Flanders enterprise. There are those who maintain, however, that the situation might have been saved had Flanders devoted proper attention to the business and not permitted his thirst for millions to carry him off his feet. He seemed not content to acquire them slowly and "he asked nothing better than a gambler's chance to play for big stakes," to quote the language of a not unfriendly acquaintance.

For two years, mergers have lain heavily on his brain as a short cut to the millions which he craved. Two mergers which he shaped up failed to come to a head, but undismayed, he was at work on another one which was to be the biggest and best of all when, as before, something happened The Studebaker interests held $200,000 worth of stock in the Flanders Mfg. Co. and with this biggest merger in view, and in order to assure control, Flanders within the last six months had purchased $150,000 worth of the Studebaker holdings at 50 cents on the dollar.

When his latest plans went awry, the reorganizers of the United States Motor Co., who know a thing or two about mergers and million-making, cast eyes in Flanders's direction, and it was not long before they "got together." In order to secure his services they agreed to take over the Flanders Motor Co., which is Flanders's very newest venture, which carried with it a once mysterious six-cylinder car in which more millions were seen.

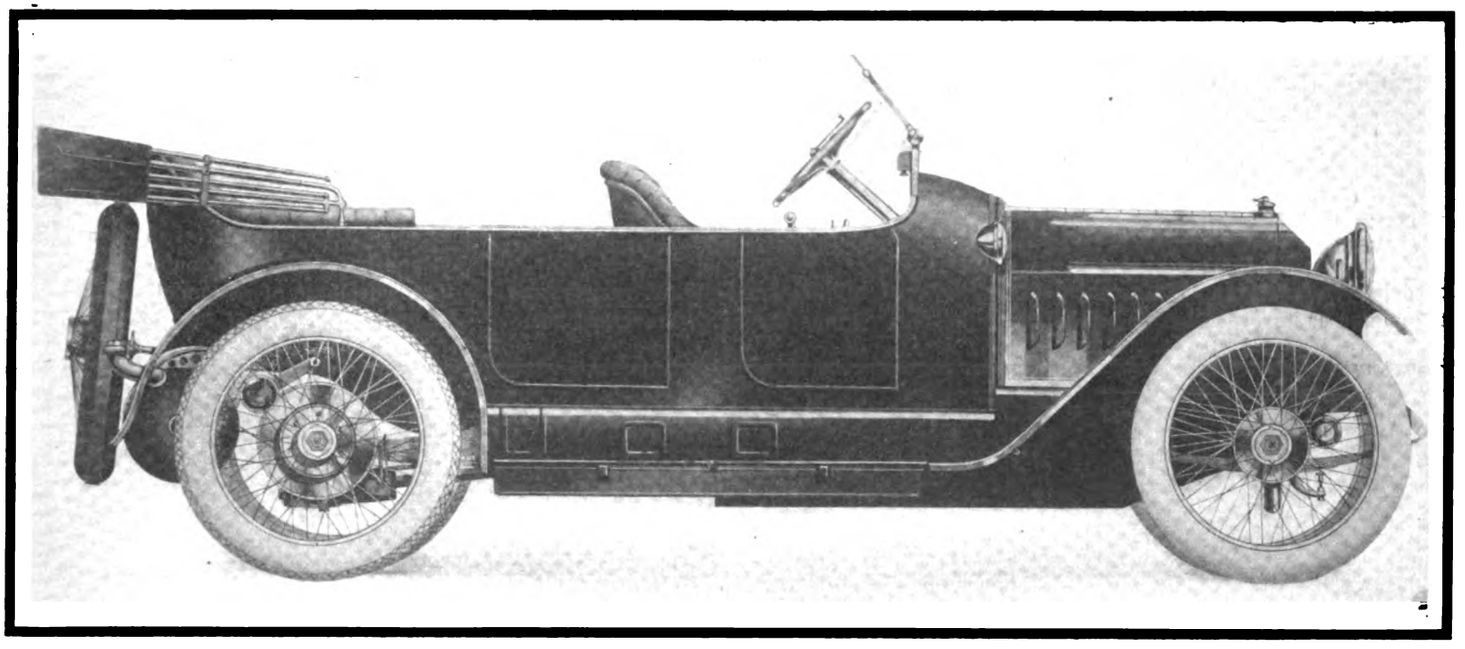
Directly and indirectly, the development of this "six" contributed to the undoing of the Flanders Mfg. Co. It was covertly developed while Flanders still was drawing $30,000 a year, plus royalties, from the Studebaker Corporation, and the fact did not add to the good feeling between the Studebakers and their highest priced employe. Before the tension became acute, the Flanders Mfg. Co. was making Studebaker parts to the value of $1,000,000 per year, but when the Studebakers discovered what was going on and recognized that Flanders was developing competition for them, they cancelled the parts contract and placed it elsewhere. The effect was felt almost immediately.

How the Flanders Mfg. Co. kept alive during the past year is more or less a mystery. It can be attributed only to the glamour with which uncommonly adroit pressagentry cast around the name Flanders. For at all times the manufacture of its most exploited productions, electric vehicles and motorcycles, has been near to the minimum, and those familiar with the situation were well aware that before the end of the company's first year, meeting the bi-monthly payroll often proved a soul-searing performance. But somehow the evil day was postponed until it could be postponed no longer; and all the while the debts piled higher and higher. However, not even pressagentry's last spectacular stunt—that of paying for the privilege of having a Flanders electric car "blaze a path" from Detroit through the mulish mud to New Orleans—could much longer delay the inevitable. Few know how great was the cost of that stunt, but it is known that the item of telegraph tolls alone amounted to nearly $7,000.

The Flanders Mfg. Co. represented the amalgamation in January, 1911, of five separate companies which Walter E. Flanders had fostered after emerging from a legal fight with the Studebaker interests, which netted him nearly a million dollars and more fame than ever he had known before, which good fortune was shared in lesser degree by several of those who were near to and who had aided him. Remaining in the service of the Studebakers, he formed first the Grant & Wood Machine Co., which acquired a somewhat historic factory in the little town of Chelsea, Mich., where it was to have produced special machinery and steel balls, but did not produce a great deal of either. Later, in Pontiac, he successively launched the Vulcan Gear Works, the Pontiac Drop Forge Co., the Pontiac Foundry Co. and the Pontiac Motorcycle Co., the latter capitalized at $600,000 and expected to prove the most profitable of the several undertakings. The authorized capital of the Flanders Mfg. Co. was $2,500,000. Flanders's personal attorney, who had guided him through the Studebaker fight, was made its president and general manager, but about a year ago they fell apart and since have gone separate ways. Flanders, who at all times maintained an office in the Pontiac factory and exercised general oversight, succeeded to the presidency and a young man who brought with him his own and his family's capital became general manager.

From its inception the Chelsea plant had proven a gigantic "white elephant." It is a large, imposing structure, originally built on an idealized scale with the funds of the taxpayers of Michigan by a defaulting state official; it contained a library, a theatre, a gymnasium, a swimming pool and other things designed to make the workmen happy, but for some reason or other none of its several owners have been able to lift it out of the slough of despond or make of it other than a liability.

Flanders himself is a big, hearty, overrated man, who, when he is not strenuously bellicose, is brimming with good nature of the sort that has won for him many friends and that helped his cimpony out of many holes when hope seemed vain. He is not easily swayed, but the one man who has swayed him most and oftenest is his press agent, E. Leroy Pelletier, who came through the Studebaker fight with him and who since has kept the Flanders halo burnished so brightly that on occasion it has caused men to blink. The two are physical contrasts. One is as small as the other is large, but the little fellow has a great head; he is fairly charged with nervous energy; is a brilliant, plausible, rapid-fire conversationalist and a clever writer, and is hospitable, ingratiating and likable to a degree and resourceful far, far beyond the average. In the course of a varied career, he has had experience in the Klondike and as an advance agent for a circus, which partly may be accountable for the fact that in the art of "putting them over" he has few peers. Even the great Barnum himself would have found him a valuable assistant. For he can almost make himself believe there are moonbeams in cucumbers—and induce others to share his near-beliefs.



He interested Flanders in motorcycles and when Flanders undertook to build them he had in mind the production of a twin-cylinder machine at the price of a single, which everyone since has believed would have brought a fortune to the Flanders coffer. But the first twin had no sooner been built than Flanders's "shadow" successively saw two rainbows in the sky with even more millions at their ends, one of them a $100 motorcycle. Both were mechanical or commercial impossibilities. Two or three hundred thousand dollars and a year's time had been frittered away before a purely conventional machine made its appearance, at a conventional price, and during the company's two years' existence less than 2,500 were produced when 30,000 or 40,000 had been planned. Despite this expensive "rainbow chasing," an electric vehicle appeared in the sky and promptly was pursued. It had worm drive and otherwise was mechanically radical, as also was the price. Some 3,000 orders were booked, but less than 100 cars have been produced. The first were full of "bugs," as was frankly admitted, and the radical price too low for profit; it became necessary to add $500 to it.

While the motorcycle and the electric vehicle broke the Flanders Mfg. Co.'s back, so to speak, they were not the only rainbows that were chased by Flanders and his intimates. A tree sprayer and a portable light-your-own-home-with-electricity outfit were among the things in which more millions were "seen" and many more thousands lost—no one knows how many.

EDWARDS-KNIGHT A CAR OF APPEALING FEATURES

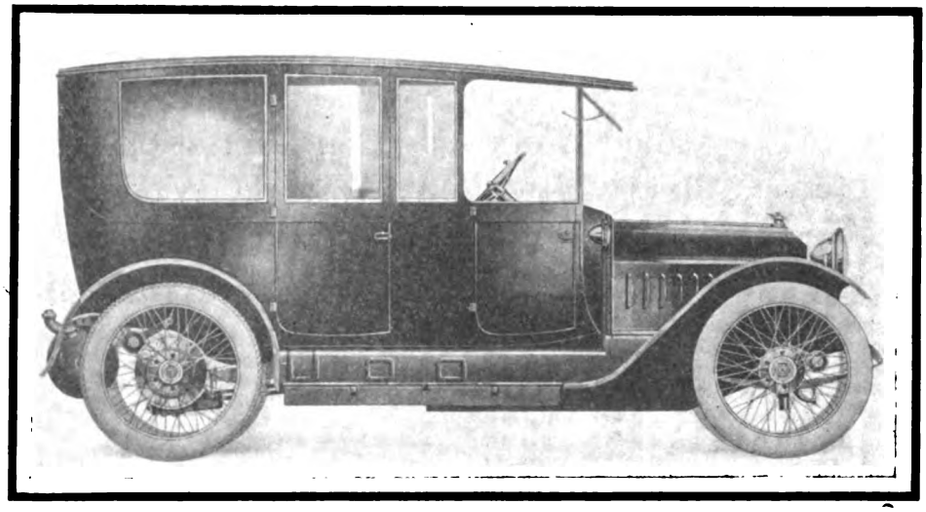
First Product of a New Company Reveals Numerous Characteristics Which Are Old Separately But New Collectively—Wire Wheels, Worm Drive, Lanchester Springs Distinguish All Models.

EDWARDS-KNIGHT FIVE-PASSENGER TOURING CAR WHICH SELLS COMPLETELY EQUIPPED FOR $3,500

After more than a year of careful preparation, the Edwards Motor Car Co., of 1790 Broadway, New York City, with factories just across the East River in Long Island City, at length has launched its first product—the Edwards-Knight car—and, as was to be expected, it is a car that is complete in every respect and one which, differing materially in a number of ways from every other American car, reflects what is considered by the makers to be the most modern exemplification of automobile building.

Due to the adoption of the Knight motor by a number of American manufacturers, this type of engine has ceased to be a novelty; it rapidly is becoming almost commonplace. Nor is the combination of Knight motor and worm drive as unusual as it was, for similar construction already has been introduced by at least one American manufacturer. Similarly, a variation of the Lanchester type springs with which the Edwards-Knight car is equipped also has become familiar on American roads, and wire wheels are becoming so common as to cause scarcely a turning of heads.

In the Edwards-Knight car, however, not two of these features, or even three, serve as distinguishing marks; all of them, and more, are incorporated in the car in such a way that the tout ensemble cannot well fail to attract attention. But one chassis is produced, though on it are mounted bodies in such variety as to leave little to be desired.



The bodies in each case are straight-line, flush-sided creations with deep scuttle dashes, and exhibit a careful blending of lines and proportions that tends to subdue the real size of the cars without in the least detracting from their unquestionable dignity. The five-passenger touring car and torpedo model, which are much the same except for a slight difference in lines, and the two-passenger roadster and speedster models list at $3,500; the limousine sells for $4,600 and the landaulet for $4,700

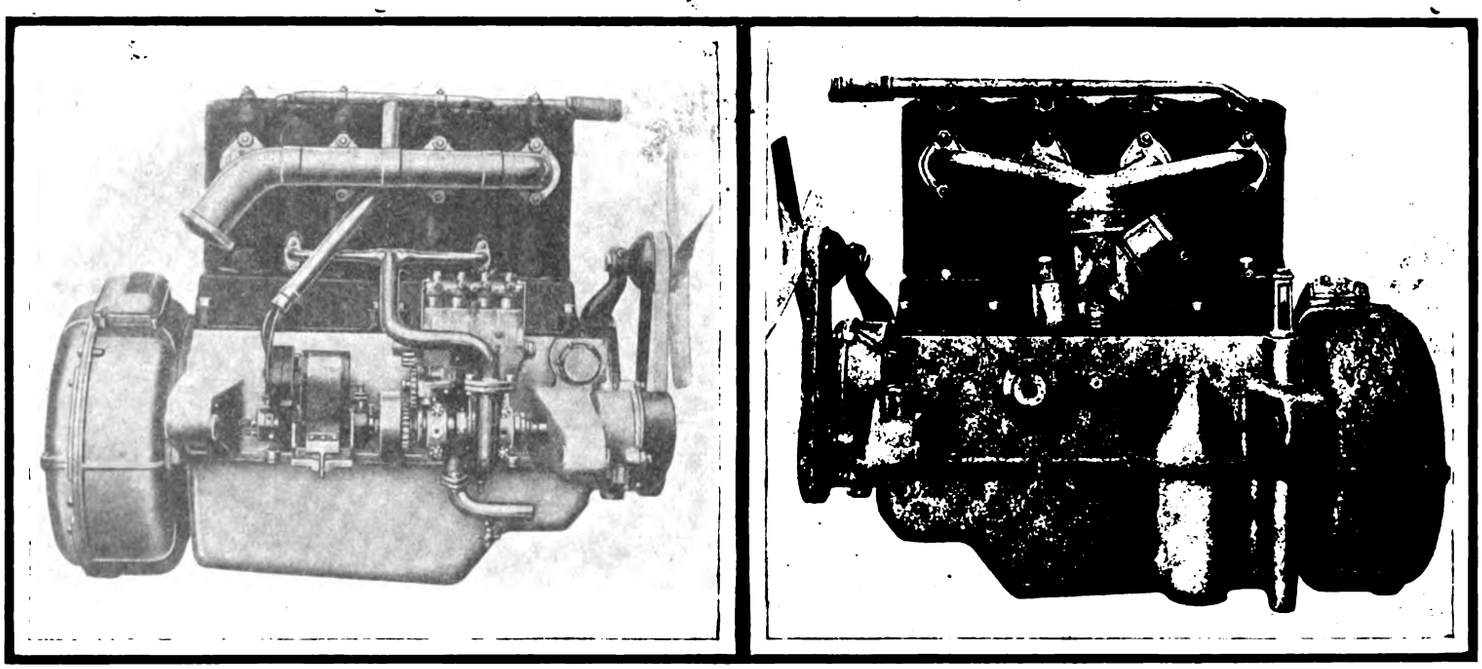
In common with modern practice, the prices include complete equipment as a matter of course, and quite as much as a matter of course the full equipment includes a combined electric lighting and engine starting system, the U. S. L. system, which embraces a combined generator and motor unit which takes the place of the flywheel, being used. Wire wheels, which with a number of other makes of car are listed as optional equipment, are standard equipment on the Edwards-Knight, with wooden artillery wheels offered as optional. The remainder of the equipment includes a Golde "one-man" top with envelope and side curtains, one-piece windshield, bulb and electric horns located under the engine hood, one extra wire wheel (quick detachable rims), tire irons, shock absorbers, power driven tire pump, full set of tools, including tire repair kit, pump and jack, robe and foot rails. Closed bodies include electric interior lights, as well as the usual toilet articles. Trimmings are in nickel plate.

In the design of the Knight motor that is used, there is little that departs specifically from the generally accepted construction that has become familiar. Cylinders are cast in pairs and measure 4 x 5½ inches. Though the horsepower rating thus is but a nominal 25, it is a characteristic of Knight motors, as it is with many others, that the actual brake horsepower developed is considerably in excess of the theoretical indication; the Edwards-Knight motor develops between 40 and 45 horsepower.

Ignition is effected by means of a high tension Simms magneto, of course, and mixture is furnished by an S. U. carburetter, the American rights for which some time ago were acquired by C. G. Stoddard, who is president of the Edwards company, and his associates. Lubrication of the motor is by means of a pressure feed system, the heart of which is a plunger pump. A dash oil gauge serves to indicate that the oiling system is operating properly The oil supply is regulated by interconnection with the throttle in such a way that the amount

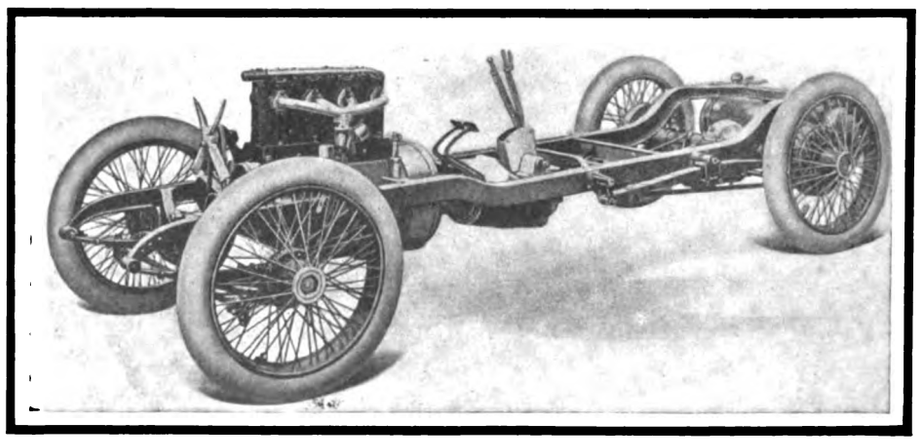
Digitized by Google

WELL-PROPORTIONED LINES OF EDWARDS-KNIGHT LIMOUSINE MODEL



of oil delivered is in proportion to the needs of the engine as governed by the size of the throttle opening. Efficient motor cooling is ensured by a circulating water system; the pump is of the centrifugal type and the radiator is of the "V" honeycomb type.

In the transmission elements, the clutch, which is of the dry multiple disk type with steel against Raybestos surfaces, is combined in a rigid unit with the gearset. The latter is hung in the waist of the chassis and provides four forward speeds in which direct drive is obtained on the third speed with fourth speed an "overstep." This location of the gearset makes simple the adoption of center control.



In designing the spring suspension of the car, cognizance has been taken of the necessity for maximum resiliency with the minimum of side sway and bounce, and at this end the front springs have been made of the conventional semi-elliptic variety and the rear springs are of the reversed semi-elliptic type, or, as they are better known, the Lanchester type. Further increasing the easy riding qualities of the cars, and their stability on rough roads, specially designed shock absorbers are fitted to both front and rear springs By way of permitting the rear springs full play, the drive is transmitted through radius rods.

The rear axle is of the conventional full-floating type, except that worm drive instead of the more familiar bevel drive is employed; the front axle is I-beam in section and is constructed to afford a more than ordinarily ample factor of safety. Both sets of brakes are carefully equalized and are mounted on rear axle drums measuring 14 x 2 inches; the emergency brakes are internal expanding and the service brakes are external contracting. The frame is formed of 3/16th inch steel in channel section and has a 4½-inch double drop.

The wheelbase of all models is 120 inches on a standard tread of 56½ inches and the wheels are shod with 36 x 4½-inch tires both front and rear.

REILLY HAS A LITTLE INTERVIEW WITH REILLY

Inspects Himself from the Standpoint of an Outsider with a View of Discovering Possible Defects—Shows the Sales Manager How These Inspections May Be Helpful to Dealers and Others.

Drizzling rain and a chill in the air may have had something to do with the quiet that prevailed in and about Reilly's salesrooms on this particular afternoon; since his return from dinner few cars had passed the door and pedestrians were almost as scarce. Not a person had crossed the threshold of the salesroom, and the only audible sounds were those which occasionally came from the repair shop and service department at the rear of the establishment.

Reilly's Meditation Interrupted.

Reilly sat at his desk deep in thought; the office girl, in her adjoining office, was lost in a book and the only perceptible movement was the smoke which now and then curled upwards from Reilly's vicinity. He did not hear the approach of the rubber-shod Sales Manager, who, tiring of railway travel on a day when the drizzle obscured all view of outdoors, had dropped off in an endeavor to put a little sunlight into an unpleasant afternoon by a call on his best dealer, and he was inside the door and halfway across the salesroom, headed for the office, before the proprietor was aware of his visitor's approach.

"Going out of business? What's the matter here to-day?" demanded the Sales Manager, as he invaded the office. "You look worried; what's on your mind? Wondering what you'll get for Christmas?"

"That won't require much wondering," asserted the dealer, as he arose and extended his hand in greeting.

"You certainly were having an awful think when I came in," went on the caller; "got something on your mind?"

"No, just thinking," was the reply.

"Of what?"

Explaining Theory of Self-Criticism.

"Myself," answered Reilly in a feigned falsetto.

"Getting egotistical in your old age, aren't you?" questioned the Sales Manager. "Can't you find a better occupation than thinking about yourself? You sure are a fine specimen for thought!"

"Don't you ever think about yourself?" asked Reilly seriously.

"I suppose I do, but I don't make a business of it."

"Well, that's where we differ; I make a business of it—at times."

"Getting worse every day," was the Sales Manager's bland comment, as he waved his hand toward the object of the remark.

"Oh, I don't know," said Reilly, as he tipped back in his chair and hooked his thumbs in the armholes of his vest. "If some people I know sat down and thought about themselves once in a while they'd

"I SET REILLY UP AND TOOK A GOOD LOOK AT HIM"

know more than they do—about a great many things."

"Some pet theory, I suppose."

"Good one, though," insisted Reilly. "Did you ever hear the old saying that a man's enemies are his best friends because they will tell him his faults, while his friends never mention his shortcomings? And once a man knows his faults he ought to be able to correct them. When you came in I was finding fault with myself, you might say. I was performing the little psychological stunt of coming out of my shell and looking at myself, just as other people see me, and learning just what sort of a fellow I am."

"Peculiar mind, that of yours," commented the Sales Manager. "Where did you acquire that kink?"

"I don't remember; I've had it a long time; but it's good," replied Reilly. "Why don't you try it?"

"Well, just how do you go about it—this 'getting out of your shell'?" queried the Sales Manager.

"We will now give a demonstration," said Reilly, with the bow of an actor who responds to an encore. "Here you are, sitting in your chair. You're Jim, the Sales Manager. You've been more or less successful, in a way, because you have worked up from salesman to a manager of salesmen. You're getting, let us say, $5,000 a year. If you have any personality at all you want to do better; everyone ought to want to climb in some direction.

Demonstrating on the Sales Manager.

"Let this be a sample of one line of thought: You look around and see what places there are to which you might aspire. For one thing, you might look for a better salary. How are you going to get it? By being worth it, of course. How are you going to be worth it? Right here is your chance to do some thinking. Look at the way Jim the Sales Manager does things and the things he does; see if you can't think of something he could do that he isn't doing, and that would be of value to the company; try to think of improvements on the way he is doing things now. Look over the little details, analyze the whole situation and see if there is room for improvement in any spot.

"I'll tell you confidentially what I was thinking of when you broke the couplings in my train of thought. Getting on, with me, consists of doing a better business; it's good now, but I want to make it better. There must be some way to make it better; what is that way? The general answer is to sell more cars, and I was trying to think some way of doing that; also, I was wondering whether a better stock of acccessories wouldn't help. I was only half through my think when you came in.

One Result of an Inspection.

"A man's personality is worthy of some consideration, too. I also had your friend Reilly on the inspection block and took a good look at him. I don't think he is such a disagreeable individual, but I thought of one little habit he has fallen into that he's

Digitized by Google

going to cut out. Several times lately when people were talking to him he has found himself letting his mind wander until for an instant he would lose track of what they were talking about. The result was that sometimes he had to ask to have a remark repeated. He's not going to do it any more; he's going to be an intent listener when anyone is talking to him."

"Since you are such an expert analyzer of personality, perhaps you can pick a few flaws in my makeup," suggested the Sales Manager. "It's your duty, anyway, if you're such a good friend of mine."

"You promise not to be offended?" questioned Reilly.

"By all means."

A Gruff Voice as a Fault.

"Well, for one thing," said the dealer, "you probably never have noticed the gruff tone of voice in which you talk over the telephone. When you are face to face with anyone and they can see you it doesn't sound at all bad, but when you start to talk over a telephone you sound as if you were a regular bear, in an awful hurry and ready to bite a man's head off. A timid person would hang up before he was half through with what he had to say. Your voice naturally is sharp, and you talk fast, which is the combination that is to blame. You never noticed that did you?"

"No," confessed the Sales Manager, "I didn't. But one thing leads to another, and without any 'fessing up' as to my personal shortcomings I will state that I have already thought of one or two other little things that might as well be remedied. Also, when I get back to the office or the house I'm going to walk around to the other side of the desk and take a good long look at myself. I'm going to suggest it to some other people, too."

"This self-inspection applies to any man living," continued the dealer. "There is no man who is perfect, and perhaps some of his defects are so small that no one would think to call them to his attention; but their elimination would do no harm. There may be an engineer in your factory who is not as thorough as he might be; if he has average intelligence he ought to be able to discover the fact, and if he cares at all he should be able to remedy it. The man who cannot improve himself or his work without the assistance of someone always will be an assistant; he'll never be a man who directs men or who tells them faults.

Getting the Disinterested Viewpoint.

"But it hardly can be called self-inspection; it can be made more than that. It isn't you looking at yourself; it's someone else looking at you. You have to transform yourself into another person and look at yourself from that absolutely impartial standpoint of a disinterested person. In your own mind you may believe that certain things you've done are red-hot stuff, but are they? Just take the view of a rank outsider, study these things, look them over from every point of view, compare them with what others may have done or what might be done and work out the unbiased opinion of a total stranger. You may be inclined to flatter yourself, but if you can get this 'other person's' opinion you may feel differently."

Wherein the Dealer May Benefit.

"But suppose this 'other person' flatters you," suggested the Sales Manager.

"If he's truthful, all right; but don't let it puff you up. So many dealers would be better dealers if they only indulged in a little self-criticism. They never try to put themselves in the position of the car owner and customer. The dealer or garageman naturally is inclined to believe his business is conducted very nearly as it should be. But is it? he should ask himself.

"I ALWAYS TRY TO PLACE MYSELF IN THE FACTORY'S POSITION"

A Fault That Reilly Overcame.

"Take my own business, for instance. In one moment of looking it over from an outside standpoint, I got to wondering how some of the public looked upon my house rule of making a charge for telephone calls. I am limited to so many calls a year, and while I seldom go much above the figure, I used to feel that strict business rules compelled me to make a charge when an outsider used the 'phone. I realized that this was offensive to some people, so I wiped out the rule and it hasn't made much difference in my bills, either. Also, there is this way of looking at it: it's worth something to get a man into my place of business where he can see my wares.

"I imagined myself to be one of the numerous public and imagined myself coming into the Reilly establishment and, while there, happening to remember I had an important call to make. Reilly said to me, 'We are compelled to make a five-cent charge for calls.' Of course, I paid, but I thought it pretty small. But that was years ago, when I first started in business, and it's a fool rule, anyway, in my case, at least.

"I wonder if your attitude is one reason why the factory gets along so well with you," interrupted the Sales Manager.

Imagining Oneself the Factory.

"Well," slowly responded Reilly, "I always try to place myself in the factory's position as nearly as I can whenever I am inclined to differ in opinion with the company. One point is this: Few men are absolutely unreasonable, and they generally have reasons for acting as they do. Instead of putting them down as on the wrong side, try to analyze the situation and see if you can't learn how your own attitude will be viewed. If a man really is unreasonable, you can only handle him as best you can, and let it go at that. I used to get sore over your deposit policy, but I can see now why you felt yourselves right, and you have a right to run your own business in your own way.

"Even the president of your company, if he doesn't do so now, could broaden his mind and possibly improve himself if he would endeavor to look at himself from the standpoint of those with whom he comes in contact. Maybe such a man is gruff and abrupt; does it do any good? One of the busiest men I ever had occasion to visit gave me but two minutes of his time, but he was so pleasant about it that I left under the impression that I and not he had terminated the interview.

One Other Method of Self-Inspection.

"If you can't 'get out of your shell' and make an unbiased inspection of yourself there is one other way: Find faults in other people—don't advertise them, of course—and then investigate and see if you have any of these same defects. You'll be surprised how imperfect you are."

"What great flaw is there in Mr. Reilly?" asked the Sales Manager.

"The principal thing," replied the dealer, "is the top of my head. Whenever I try to talk to anyone they keep looking at the top of my head and don't seem to pay much attention to what I say. I'm trying to grow a thatch."

"Huh!" was the sarcastic answer, "better practice on a smaller piece of ivory first."

Solutions of The Used Car Problem

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Best Four Articles Dealing With the Subject.

By C. M. STRIEBY, Chicago, Ill.

Good salesmanship and co-operation of both manufacturer and distributor will do more to solve the used car problem than anything else.

There seems to be a tendency to keep throwing the blame from one to another, without arriving at any conclusion, and as a matter of fact, all parties concerned--the customer, the agent, and the manufacturer—are really at fault.

It is impossible to put the customer's car on any given basis or percentage. One man will take greater care of his car than another. It is certainly unreasonable and unfair to expect an equal basis of trading in this instance.

The dealer prefers to place the blame on his competitors —other dealers—who, he claims, can allow higher values for used cars than he can—or he tries through trade associations to work out a basis of trading values, when he knows that just so ong as the world turns around, it would be impossible to get every dealer in his territory to think and act just as he does, and be strictly honest about it. Then again, the season of the year often influences the value of trading in cars.

The manufacturer, in many instances, prefers to lay the blame on the dealer, attributing it to over-zealousness in making sales, or possibly, the dealer's lack of business ability —to his not being a salesman; but if this same manufacturer were asked to come in and take over the business, and carry it along and show a profit, with so many cars to trade in, there is no doubt but that he would politely but firmly refuse the undertaking.

The owners of motor cars possibly keep in closer touch with the developments and improvements on the new models, as they appear, than in any other line of business. A desire for a new car is created in the owner's mind. His next thought is—"How much can I get for my old car?" And right here is where the remedy should be applied by salesmanship; for a man with this second throught standing out as prominently and clearly as it does in the usual buyer's mind, is in no fit condition for reasoning on price. It has been said in other articles, and is only too true, that even the best men will resort to all of the trickery and conniving that one can imagine in order to get a high price for their used cars. Just why this is so, it is unnecessary to discuss here, but the fact remains.

If the salesman will immediately start talking the many fine points of his new model; its advantages, etc., with the idea of creating in the customer's mind a further desire for the new car, he will at the same time, be automatically reducing in the customer's mind, the great necessity of securing an unreasonably high price for his used car to complete the sale. In other words, the salesman will be working along the lines of least resistance and reducing the number of factors required to complete the sale and get the money. This, of course, requires good salesmanship, for when the matter of value in trading cars comes up the second time, it must be treated effectively and quickly.

This can be backed up and strengthened by the dealer or agent creating for himself an impression on the buying public, that would show the average business man of today that it would be desirable for him to do business with his house. Attention, good service, a respectable and clean place in which to do business, will make boosters of the users of previous models or other makes of cars which the agent has sold.

As a matter of fact, and from a strictly business standpoint, one agent can do as well as another in the matter of value in trading cars, and no agent is doing his customer a favor, where he trades in a car at a prohibitive price, because it will only be a short time before that agent will not be there to look after the cars that he has sold.

Add to this the strength of the manufacturer's backing and co-operation, let him select for local representatives men of good business ability, men of good standing, and have this as a greater requirement, rather than those whose only asset is plenty of deposit money.

By W. A. CLEMENTS, Richmond, Ind.

The most efficient solution of the problem of used or second-hand cars, which is becoming a more serious one each year to both dealers and manufacturers, is to establish clearing houses for used cars.

These can be one to each town, or one to certain districts. They can be established either by dealers' associations; by one dealer as a side line; or by a new dealer who wishes to go into this phase of it particularly.

The valuation placed on cars should simply be a certain percentage of the list price for each year that the car has been out of the factory, this valuation, however, subject to a rigid examination of the car, and dependent, to a certain extent, to the use it has had and the distance it has been run. A certain mileage should be allowed for each year; i. e., supposing 4,000 miles each year, which is a rather liberal average, should be allowed; thus, a car in three years should be considered as having given 12,000 miles. If it has not given this amount of mileage, or has been given more, this amount should be taken as an arbitrary settlement.

There could be a committee appointed from dealers, or automobile experts, to decide on the cars' condition.

When a customer who has an old car wishes to buy a new one, he should take up the matter with the dealer, who will then take up the matter with the clearing house and allow a certain price on the used car, and no dealer should be allowed to make a larger allowance than the amount fixed by the clearing house officials. The dealer would know the exact amount to allow for the used car and the customer would know the exact amount to be allowed him.

A great point in favor of this system is the fact that there would be a central place for anyone desiring to purchase a used car to go and look over the entire list of cars which are purchasable. The writer knows personally of several cases where a man who simply wanted a used car and could not afford a new one, paid an extremely high price for a used car of poor quality and in poor condition, simply because he did not know of much better bargains which were offered and which he would have purchased had he known about them.

Two other points should be emphasized in this matter: The customer who has a used car should not expect too much for it. And the customer who buys a new car should pay as nearly list price as possible in order to get the service which can only be rendered by dealers who make enough profit to keep service up to the proper standard.

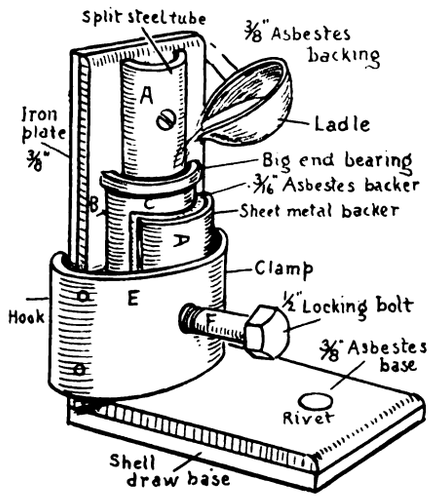
PUTTING NEW BEARINGS IN OLD CONNECTING RODS

Adjustable Jig That Is Easy to Make and Hard to Wear Out—Suitable for Any Rod.

When motor bearings of the babbit-lined type become worn to such an extent that adjustment no longer is practicable, the usual practice is to provide a new lining of the soft alloy, melting the metal and running it in. If the work of casting the lining is not carefully done there is a probability that the metal will contain blowholes and will not properly fill the spaces left for it. If the thickness of the lining is excessive, not only will there be an unnecessary amount of labor involved in the finishing process, but there will be a waste of babbitt, which, in the grades used for the bearings of high grade motors, is expensive.



In the accompanying illustration is shown a jig which not only prevents waste of metal, by properly regulating the thickness of the lining, but permits the production of close, sound work and, moreover, can be used for babbiting bearings of any of the ordinary sizes.

Design of a Babbiting Jig.

The foundation of this babbiting jig is a piece of flat iron ⅜ inch thick, 3½ or 4 inches wide and 12 inches long, bent at right angles in the middle so that each leg will be 6 inches long. The inside faces of the bed-plate thus made are lined with asbestos millboard ⅛ inch thick, riveted on, both pieces extending close into the corner. To form half-mandrels to limit the inside diameters of the linings a set of forms is made up of heavy drawn steel tubing in lengths of about 5½ inches and of diameters varying by quarter inches from ¾ inch to 2 inches, outside diameter. These tubes are split lengthwise and one-half of each is used. Each tube is drilled and countersunk for a ¼ inch machine screw and the bed-plate is drilled and tapped. A split tube is shown at A, the position of the screw being also clearly shown. A half-bearing in position for babbiting is shown at B; it is held in place by a ½ inch locking screw through a tapped hole in a bent plate E, with in-turned lips which extend about half an inch on each side over the back of the bed-plate. The end of the locking screw bears on a piece of curved iron, D, about ⅛ inch thick, and between the iron and the half-bushing there is a piece of asbestos ⅛ inch thick, and between the iron and the half-bushing there is a piece of asbestos ⅛ inch thick. The clamp E is made of ⅜ inch iron 2 inches wide and 8 or 9 inches long before bending.

Modus Operandi of the Device.

In setting up a half-bushing for babbiting the first thing to do is to select a split tube of the proper size, so that the lining, when poured, will be just thick enough to permit finishing with the least amount of waste. For instance, if the journal which runs in the bearing is 1⅞ inches in diameter the tube may be 1⅝ inches outside diameter, which will leave ⅛ inch to be removed all round. However, if the jig is carefully set up and the operator is familiar with the handling of babbitt, a larger split tube may be used, leaving, say, 1-16 inch to be taken off. The half-mandrel is screwed to the bed-plate and the half-bearing put in

SIMPLE BABBITING JIG

place as shown, its lower end resting on the asbestos lining of the lower leg of the bed-plate. Two or three strips of wood or metal, or wires of the proper diameter, may be used as temporary distance-pieces to keep the space between the bearing and the mandrel uniform while the clamp E is put on and the locking screw tightened against the iron and asbestos backing. The distance pieces, of course, must be removed before the metal is poured.

Heating That Ensures Clean Casts.

As it is impossible to obtain good results by pouring babbitt into cold moulds, the whole jig, when set up and the clamping screw tightened down, should be heated up with a blow-torch so that the metal will not be chilled, but will flow readily into all the space to be filled. A great deal of the success of babbiting bearings depends upon the proper heating of the soft metal, and as the most favorable temperatures for pouring differ in different brands of metal, the instructions of the metal makers should be carefully followed in this matter. Overheated babbit is liable to lose much of its good qualities through the evaporation of part of the alloy, while if the heat is insufficient the casting will be unsound and all the space will not be filled.

The only part of the jig that is likely to wear or give out is the asbestos, and it is a simple matter to renew this when it shows signs of overwork. The asbestos on the vertical leg of the jig should be smooth and firm so as to produce straight, square edges on the lining.

The jig, of course, can be made to handle bushings of any range of sizes by properly proportioning the various parts and providing a set of split tubes of suitable diameters. The dimensions here given, however, are suitable for the general run of automobile work, and if anything much larger or smaller is to be handled it will be found best to have two jigs to cover the range.

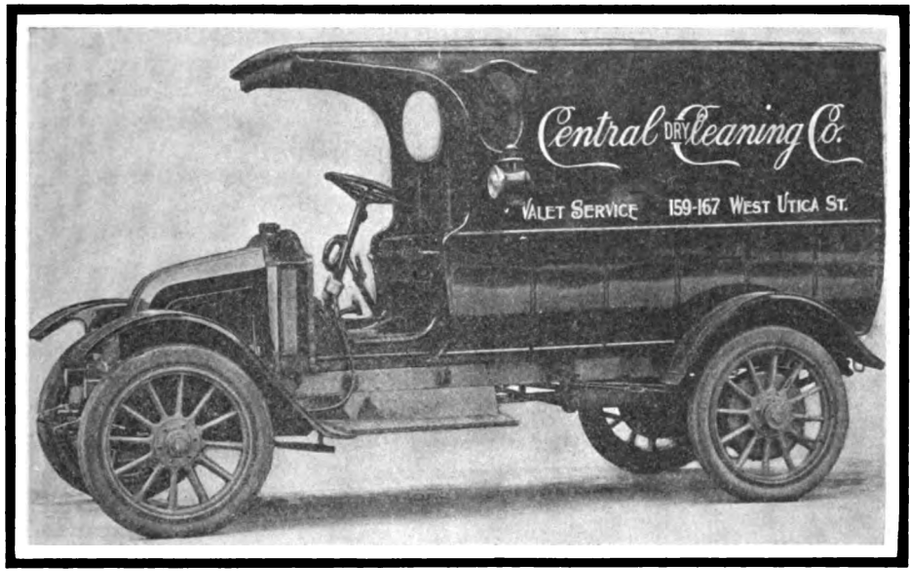
Telescope Joints for Copper Tubes.

In the absence of couplings or other means of making a joint, a copper tube can be very satisfactorily joined by telescoping. The end of one tube should be enlarged with a tapered tool, for which purpose the smooth shank of a center punch often can be used. Then taper the end of the other tube on the outside until the two will telescope. The end that is expanded must be well annealed to prevent cracking, and may require annealing twice or even more, if the tubing is thick. Work the two tubes into each other until a fairly good joint is obtained; then carefully tin the contacting surfaces and sweat them together by heating till the solder melts, holding them in position until it cools.

To Preserve Setting of Calipers.

The "setting" of a pair of calipers, either inside or outside, can be preserved, even if the calipers have to be shifted, by carefully marking two points, one on each leg, and setting a pair of good, sharp dividers to these marks. For instance, if a pair of inside calipers is used to measure an opening that has a restricted mouth, so that the legs have to be closed to get the calipers out, this method will make it possible to reset the calipers and get the scale measurement.

Tire Pump for Blowpipe Purposes.



The foot bellows generally used with small gas blowpipes is rather expensive, and a satisfactory substitute can be made by connecting an ordinary foot tire pump with the inner tube—or part of the tube—of a bicycle tire An envelope of cotton cloth large enough to give the rubber an expansion of about an inch in diameter will prevent its bursting or swelling unduly, and the pump can be rigged for pedal operation without much difficulty.

INCREASED MOTOR POWER IN LIPPARD-STEWART TRUCK

Also Bigger Pneumatic Tires and New Clutch and Gearset—Distinguishing Features Improved and Retained.

Still concentrating its energies on the production of a single chassis model of 1,500 pounds carrying capacity, upon which various types of bodies are mounted, the Lippard-Stewart Motor Car Co., of Buffalo, N. Y., in its "revised edition" has adhered to the distinctive features of construction that have characterized these cars in the past—the Renault type of hood with the radiator behind it, left steer and center control, pneumatic tires, coil springs to take the weight when the rear semi-elliptics are well compressed under load, and so on. A few changes have been made, however, with a view to improving the car as a whole, enabling it to do its work more easily, more quickly and more economically.

LIPPARD-STEWART 1,500-POUND DELIVERY WAGON WITH CLOSED BODY

Chief among the changes made is the substitution of a Continental motor of 30 horsepower, with cylinders of 3¾ inches bore and 5¼ inches stroke, for the 22 horsepower motor previously employed. Other improvements include the substitution of a leather-faced, spring-backed cone clutch for the multiple disk and the separating of the clutch unit from the transmission, with which it formerly was combined; the adoption of a Brown-Lipe gearset with gears of 1 inch face and shafts mounted on roller bearings; the lengthening of the rear semi-elliptic springs by 5 inches, which makes them 51 inches long; the substitution of semi-elliptic front springs 40 inches long for full elliptics; the strengthening and lengthening of the frame throughout; the use of a heavier steering gear, designed as suitable for 1-ton loads; the increasing of the pneumatic tires from 34 x 4 inches to 35 x 4½ inches, front and rear; and the enlargement of the gasolene tank, which now holds 14 gallons as against the 10 gallons of the old tank. The present motor is cooled by forced circulation; the thermo-syphon system was employed in the former engine.

The new motor is of the L-head type with block-cast cylinders, and is so located as to be extremely easy of access. Not only is there no radiator in front of the engine to be dodged, but the hood swings upward and backward and all the motor parts that are likely to require attention are readily gotten at from the front, between the frame ends. The removal of the cover of the timing gear casing is rendered easy by reason of the fact that the cross-member of the frame, carrying the starting crank, is removable by the withdrawal of four bolts, leaving the front end of the engine exposed completely. The engine support consists of four heavily webbed arms cast integral with the crank-case and extending to the main frames of the car.

The engine is protected from the inroads of dirt and water from underneath by a heavy sheet steel pan which, however, is very readily removed, should this be necessary, by the unfastening of special clamps, when the whole pan may be pulled forward and out.

Ignition is by a single system which derives its current from an Eiseman high-tension magneto. In order to guard against the trouble that not infrequently arises from the bungling way in which many drivers handle the spark advance lever, the time of ignition on the Lippard-Stewart car is fixed at the point which experiment and practice has demonstrated to give the best all-round results.

The cone clutch which replaces the old multiple disc clutch is of pressed steel, 15¾ inches in diameter with a face width of 2⅝ inches. The shifter fork, which is carried in a cross-shaft journaled on the main frames, has its ends fitted with hardened steel rollers. Grease cups are provided for the lubrication of the clutch shaft bearings. As already has been mentioned, the clutch is now a separate unit from the gearset, to which it drives through a shaft with universal joints. The gears give three speeds forward, with selective control, and are of chrome-nickel steel, heat treated. The shafts are of large diameter and run in Timken roller bearings. A special latch is placed in the reverse lever to make it impossible for the driver to shift into reverse while the car is in forward motion.

Final drive is by propeller shaft and bevel gears, the shaft, which is of nickel steel, being fitted with dust-proof and oil-tight Spicer universal joints, one at each end. The rear axle is a Timken, full-floating, roller bearing, with pressed steel housing; the roller bearings are of the adjustable type. Not only can the differential be inspected through an opening, with a cover, provided for the purpose in the rear of the housing, but it can be removed through the same orifice. Both internal expanding and external contracting brakes are carried on the rear axle ends; the drums are 17 inches in diameter and 2½ inches wide. For emergency braking the internal brakes are used, while the externals are employed as the service brakes.

Channel steel, heat-treated stock, is the material of which the main framing is built; the cross frames are of heavier section and are attached to the main frames by means of heavy webs. The front member is removable so that the engine can be inspected and, if necessary, removed from the car by sliding it forward on skids placed in front of the chassis. Where the greatest strain comes on the main members of the frame the channels are 5½ inches deep and 3¼ inches wide, tapering towards the ends. The front of the frame is narrowed to give maximum turning radius.

Left hand drive and center control, a feature of former Lippard-Stewart cars, is retained; the gear-shifting lever is mounted directly on the top of the heavy aluminum gearcase. The elimination of the spark control lever leaves only the throttle control on the steering wheel; the usual pedals for the service brake and clutch and lever for the emergency brake are provided.

On the single chassis model, which is fur-

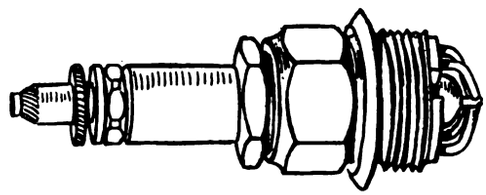
nished in two wheelbase lengths, 115 inches and 125 inches, are mounted bodies appropriate to the various classes of service for which a machine of 1,500 pounds capacity is adapted — platform stake, open express, screen express, full panel delivery, ambulance, omnibus, and so on. In the matter of painting and finish the Lippard-Stewart cars are given rather more attention than is usual in commercial vehicles, the painting process involving the application of ten coats. All metal trimmings are finished in nickel. Equipment, when commercial bodies are fitted, consists of three oil lamps, horn, tool kit, tire pump and tire repair outfit, while with ambulance, police patrol, omnibus and similar bodies acetylene tanks, headlights and other extra equipment, such as usually is supplied with such vehicles, is provided.

Russia to Test Motor Sleighs.

By way of discovering the suitability of self-propelled vehicles for transporting men and materials over the snowy wastes of Russia, what is styled an "international trial of motor sledges" is to be held under the auspices of the Imperial Russian Automobile Club on January 19th. The trial will take place close by St. Petersburg and will be held over a 3.3-mile course. In addition, the vehicles will be required to traverse two miles of untrodden snow under conditions such as would absolutely preclude the possibility of other motor or ordinary vehicles negotiating the passage. Afterwards, there will be a speed trial for those competitors who have passed the first part of the extremely strenuous tests to the satisfaction of the judges.

Columbus Y. M. C. A. Has Garage School.

The Young Men's Christian Association of Columbus, O., which has been conducting an automobile school for two years, has established a garage school, 31 x 65 feet, on East Chapel street; it is a two-story structure, contains a freight elevator and is otherwise well equipped for practical garage work. Robert F. Nadig, who has been the association's automobile instructor since the school was opened, will be in charge of this branch.



Goodyear Breaks One-Day Tire Record.

Five thousand two hundred finished tires were turned out by the Goodyear Tire & Rubber Co. of Akron, O., one day last week, and as the number constituted a high record for a single day's work it was decided the occasion was a fitting one for a "blow-out." The "blow-out" took the form of turning loose all the factory whistles and keeping them going until all Akron was agog and asking what the terrific clamor meant.

SPARK PLUG FROM THE WEST MARKS RADICAL DEPARTURE

Gas-Pocket Principle Disregarded and Firing End Made a Hemisphere of Lava—Insulation of Two Parts and Substances.

Ever since the manufacture of spark plugs assumed the dignity of an existence separate from the building of motors, all sorts of ideas have been brought to bear for the utilization of a more or less capacious chamber back of the sparking points, and much stress has been laid upon the efficacy of the outburst of burning gas from this chamber in igniting the main charge in the cylinder, and, through the alternate in-and-out currents, in keeping the lower end of the insulating core and the sparking points clear of deposits of oil and carbon.

RADICAL V-RAY PLUG

Judging by the number of such plugs in successful use, the gas-pocket plug has at least "made good." A new plug that just has been brought out by the Marshalltown Motor Material Mfg. Co., of Marshalltown, Iowa, however, has been designed with total disregard for tradition in this respect, for there is not a vestige of a chamber back of the points. On the contrary, the new V-Ray plug, which is the latest addition to a line of spark producers of that name, is provided with insulation which protrudes beow the steel shell in the form of a little hemisphere of lava, from the center of which projects the central electrode. Four equidistant points springing from the shell converge toward the central electrode, as the accompanying illustration clearly shows.

Not only is the plug peculiar in the lack of space behind the points, but the insulation is of unusual construction, being made in two parts and of two different substances. The lower part, which is exposed to the heat of the burning gases, is of hard lava, said to be indestructible, to all intents and purposes, and quite unaffected by heat. The upper part of the insulating core, which projects above the shell, is of mica and is formed of six layers of mica wrapped around the electrode and a complete covering of mica washers, compressed under great pressure. V-Ray plugs are made in all standard size threads, and, owing to the shortness of the firing end, require very little clearance in the cylinder or valve chamber.

Dealers Supply Keys for "Free Air."

"Free air" at garages and supply stores is in no wise a novelty and is properly rated as a valuable trade getter. Bumiller & Remlin, dealers at 412 Main street, Cincinnati, O., however, have improved on the ordinary air service and have inaugurated a "help yourself" system through which air is obtainable by the user of pneumatic tires, even should the place of business be locked up. The supply is made available through keys which are being distributed to owners of cars, motorcycles and bicycles; these keys control the outlet valve of an air reservoir, the air pipe extending to the curb. The pressure is obtained from an electric pump which automatically maintains a certain pressure in the tank.

Effect of Bodies on Increased Speed.

Taking some of the wind out of the sails of those who point with pride to the development and betterment which have permitted phenomenal speed to be obtained from comparatively small engines, a British tradesman whose name almost is a household word across the pond, is at pains to point out that not all of the increased speed can be traced to increased engine efficiency. Quite as much is due, he says, to the fact that greater attention now is paid to the factor of wind resistance, and that practically all of the cars that have shattered records during the present year have been fitted with bodies in which the "streamline" theory is their most conspicuous feature.

New Date for Shock Absorber Test.

The shock absorber competition which was to have been promoted by the Association Automobile de Belgique this month and at which a number of shock preventing devices, among them the Gabriel Rebound Snubber, was to have been tested, has been postponed to commence on January 6th, this date having been chosen by reason of its proximity to the date of the opening of the Brussels show. Already the manufacturers of eight different devices have entered their products.

Offers Prize for Gasolene Substitute.

Taking a leaf out of a British book, French motorists view the increasing price of "petrol" with alarm and, through the Automobile Club du Rhone, of Marseilles, have decided to offer a prize of 5,000 francs, which is equal to about $1,000, to the inventor who shall produce a fuel to take the place of the ordinary spirit.

ORIGINALITY IN AUTOMOBILE SALESMANSHIP

Brooklyn Dealer Builds Up Trade in a New Car Through Methods Which Are of His Own Invention—Varied Colored Bodies One Means of Publicity and Even Children Aid Him—Corset Experience That Helped.

Building a retail trade in automobiles is, with the great majority of dealers, more or less alike in the one respect that the dealer who to-day enters the trade generally signs up with a company whose product has been extensively advertised for a number of years and is more or less well known. Therefore the taking on of a car selling above $2,000 and which is new in the market developing a substantial trade, and making the car well known where before it was not known at all, and doing this without spending a small fortune in advertising and through those methods which are said by some to be necessary to a successful promotion may be said to be a worthy achievement.

Different Methods and Different Man.

However difficult it may appear, it has been done by E. J. Montigny of Brooklyn, N. Y., who deals in the comparatively new Stutz car at 1289-91 Bedford avenue. Just as his proposition may have been different, Montigny himself is different, but he is no more different from the majority of other dealers than are the methods he employed in building up his business. He declared that the Stutz is as well known as, if not better than, any other car in Brooklyn. The natural question was "Why?" and the Motor World man who talked with Montigny asked it. Montigny replied he did not know, and could not cite facts as productive of the result.

The Motor World man suggested that the answer was very concrete and was nothing else than Montigny himself. The dealer modestly denied this, but one familiar with his business must feel that another man, even with Montigny's methods, could not have done what this dealer has done.

Wherein Cars and Corsets Are Akin.

Lest some trade rival mention "corsets" at this point and tilt his nose somewhat satirically in the saying, it may be stated that Montigny has found that selling corsets and selling automobiles are not so widely variant as might be supposed. "The principles of selling both are the same," he declared. He used to be advertising manager of a New York corset house, and if there is any trade in which there is more opportunity for the study of human nature and salesmanship than there is in turning out a popular line of whalebone armor Montigny would like to school himself there for a while.

Selling Ideas and Their Results.

He has been Stutz dealer for some two years and is one of the successful dealers in Brooklyn, despite the fact that his salesroom is not big enough conveniently to accommodate more than two cars. The first year his sales were small, but in the year which closed August 1 last he sold 38 cars and during the 1913 season expects to dispose of 50; he has orders for one-third this number already.

How Montigny works is exemplified by one sample of his methods—the one that has made the 40 Stutz cars in Brooklyn look like 100. When he first opened his agency he realized that to get an opening for his cars he must get some of them on the streets—the more cars the better. He looked over the cars that passed his door and, as a rule, they looked rather commonplace and very much alike. That gave him an idea—he would have his cars look unusual. As the first orders were received he suggested to his customers that they take different colored bodies, as this, he explained, would make the car stand out from the multitude. The result is that most of the Stutz cars in Brooklyn are vermilion, green, yellow, dark blue, royal blue and gray, with a few black ones interspersed.

Magnifying the Number of Stutz Cars.

What is the result? A man sees a flaming red car on Fulton street or Bedford avenue and notices it because of its color; he recognizes it as a Stutz. Perhaps an hour later he sees the same car a mile away, and it again attracts his attention. Nine times out of ten he thinks he has seen two red Stutz cars. There are fifteen of these vermilion painted vehicles and, said Montigny, "They look like forty-five." This fleet of brightly colored cars makes the Stutz in Brooklyn stand out like one of those bright red United Cigar Store fronts in a row of last-generation haberdasheries.

Even the children of the neighborhood are Stutz boosters. Montigny is a genial individual and takes an interest in the youngsters and many of them like to talk with the dealer about the rakish little "pushmobiles" in which the boys speed around the streets. The children, and nearly everyone else in Brooklyn, know that the Stutz racer, No. 2, did good work at Brighton Beach this fall, so when they talk racing with Montigny he tells about the famous "Stutz 2" and recommends it as a name for the juveniles' racers. The result is that a multitude of these future motor car owners are raising the dust in Brooklyn with their little cars, each of which bears upon its bonnet the childlike scrawl. "Stutz 2." If "daddy" asks why this name was chosen the young De Palmas are quick to answer, "Huh! Fastest car in the world."

Automobile Trade as Seen by Outsiders.

Montigny as a dealer is doubly interesting because he illustrates the view of the automobile selling trade taken by the sound business men of other trades. He says there is a false glamor over the automobile trade that cannot be dispelled any too quickly for the trade's good.

"Everyone seems to have an idea," he said, "that the automobile trade is a gold mine, that all a man has to do is to get an agency, open a salesroom, sit down and the dollars will begin to pour in. That is wrong from the start. There has got to be some sound business sense injected into this business before it is placed on the proper basis.

"Too many young dealers are eager to sign up for any old line, and that accounts for the cocky attitude of the manufacturers. If I should quit this business to-morrow there would be a line of men waiting to take it up and sink their money here, whether they knew anything about the business or not."

Deplores Inefficiency of Salesmen.

Montigny's experiences with automobile salesmen are the theme of another line of discourse in which he classifies the majority of them in language such as he alone can control. In the colloquial expression of the day, his opinion of them is briefly expressed in the word "Mutts!" Since he has been in business he has had about 20 salesmen, each of whom lasted about that many days, some more, some less.

Digitized by Google

"Most of them," he asserted, "go to a prospect, tell a little tale about the car—which is all they know about a car—hand out a lot of bunk that doesn't amount to anything at all, and expect to make sales. They are as bad as the mechanics. I find the trouble with most mechanics is that they don't 'mechan'; one of them may know all about the southwestern part of the differential of one car, but show him the same section of the differential of another car and he's lost.

Salesmen Who Are "Also Rans."

"I had one salesman who telephoned me one night about 6 o'clock to know if he could have a demonstrator at a certain store at once. He insisted the prospect was ripe and about ready to close. I took the car down, and the salesman, the prospect and myself drove to the man's home. When we got there I sort of butted in and asked the man, without any preliminary discussion, the lowest price he would take for his old car. He said $500. I said, "I'll give it." The salesman, however, did not have gumption enough to take the cue and close the sale, and I have yet to learn why.

"The other evening I called at one of the best residences in Brooklyn. How many salesmen are there, do you suppopse, who could go into a home like that, make a presentable appearance, keep up their end of the conversation and still not let the object of their visit be lost sight of? A lot of them can't lead; they follow. They see a demonstrating car in front of a man's residence, get the number and at once there is a rush of dealers after that prospect. That's no way to do business. I sent a salesman around to a man's house one forenoon and he came back with the statement that the prospect would like a demonstration after lunch. When I drove around there after lunch there were three cars in front of the house. I didn't stay. The prospect already owned a car of the make sold by one dealer who was in the bunch, and he drove away with this man.

Where the Woman Comes in.

"I called on one man and talked with him, but didn't annoy him by running to the house and waging a regular campaign against him. He met me one day and said, 'You didn't come to see me again.' 'No,' I said, 'I don't do business in vestibules or with hired girls. This is my place of business, and if anyone really wants to find me they can get me here.' Those salesmen who go sneaking around a man's back door, talking to the hired girl and nosing for information, make me weary.

"Sub-dealers? I have none. All of Long Island is my territory, but the most of the would-be sub-dealers will not buy a demonstrating car. They hand around catalogues and expect to sell cars with pictures. I won't take a sub-dealer now unless he buys a demonstrating car."

Women are an important factor in the Montigny school of salesmanship.

"At what point does the woman come in?" said he, repeating the query. "All the way through the transaction; as soon as the husband or father decides upon a make of car or begins to look one over, the woman is interested, and it is well to draw her attention to those features which interest her. She is interested in how the car rides, and one point I always emphasize is that the Stutz has no sidesway, for I know that this motion in a car is quite likely to upset a woman's stomach. Many times I have had my introduction of this point followed by the exclamation, "That's fine! Anything that spoils riding for me is that swaying movement in a car!'

Appearances that Deceive.

"Another explanation I always make whenever a woman steps into a car while it is on the salesroom floor is that the woman thinks she is at least 18 inches higher up than she would appear were the car in the street. In the street, the sidewalk is about nine inches above the pavement and the cars, therefore, are lowered that much; but in the salesroom the floor is nine inches above the sidewalk and the sidewalk is nine inches above the street, which makes the woman think the car is hung away up in the air—but this forestalling explanation heads off any objection on that score."

Montigny's methods of demonstrating may be regarded as out of the ordinary in that he picks out the smoothest streets available; rough thoroughfares are rigorously avoided.

The Physician Who Drives.

"If I take a rough street," he explained, "I can explain all I want to that any bumps encountered are due to the street, but there is always a suspicion that the car is a rough rider. A woman does not want such a demonstration. She wants a nice, easy one, and that is the kind I always give. Such riding delights her. Sometimes the man will ask why I don't take a rough street, but the woman—never! Of course, if the man insists, I take the rough street, but I always ask him if he doesn't prefer to ride in comfort. Someone said that a woman can see only as far as the end of her nose; but you mustn't think women are fools, for they decidedly are not. However, with a woman, a car is as good as it is to-day, and if it is to impress her favorably it must make its impression to-day, and not have explained what it will do a week or a month from to-day. Neither are many women interested in the mechanics of a car."

This Broolyn dealer likewise is a believer in service, but declares that physicians who drive their own cars are a veritable thorn in the flesh, so far as service is concerned. Their cars get hard usage, and this naturally necessitates much repairing. Many little disputes contribute in making this part of the service disagreeable.

A Deal for a Demonstrator.

Used cars are handled on a more business-like basis than in any other agency which has offered a solution of the used car problem. It is so simple that the way some dealers throw away profits is pathetic. Montigny does not take a car in trade unless he is quite sure he can sell it at a profit, and there are few cases in which he doesn't. He used to depend upon mechanics for his estimate of values, but when he found, as he says, that "mechanics don't mechan," he educated himself in the values of used cars and now seldom makes a slip. The profits are not large, but they afford a commission on the resale.

Keeping posted on trade doings is another practice in this shop; he used to follow happenings in the corset trade, so why shouldn't he follow the automobile trade? When the Motor World man mentioned various stories that lately have appeared in trade papers, Montigny was well informed and able to discuss them intelligently. He differs from many in his disbelief in the value of associations. Since he has made good on the "go it alone" policy, he naturally believes in it. He also declares it his belief that other used car plans other than the one he employs are impracticable.

He will seldom depart from his plan to make a sale. But he did so in one case; he had a demonstrator for sale, and the prospect wanted to trade in an old car at $850. Montigny offered to sell the demonstrator for $1,700 cash and agreed to turn over $850 for the used car to the owner before April 15 next. He sold the used car, but had to take a smaller car in trade, and this smaller car was sold for part cash and a $200 note. The note was paid for with a check dated five days ahead, but the demonstrator had brought its orice.

Pouring Oil Through Breather Pipe.

In pouring oil into the crankcase of a motor through the breather pipes—a common method—care should be taken to see whether the crankcase is divided by a central partition or is practically a single chamber. If there is no division, all the oil can be poured through either one of the breathers, while if there is a partition an equal quantity will have to be run in through each.

LIGHTING AND STARTING SYSTEMS MADE PLAIN

How Starting Energy is Applied and the Necessity for Charging the Battery Explained—Remedial Measures for Unnatural Noises—Bijur System an Example of Preventive Practice.

(This is the twelfth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by the dealer and owner alike.)

There is no better way to visualize any of the electric lighting and engine starting systems on the market than to memorize the following essentials: (1) Energy for lighting and starting is obtained from the storage battery; (2) energy for charging the storage battery is obtained from the generator; (3) energy to drive the generator is obtained from the gasolene motor; (4) energy to start the gasolene motor is obtained from the electric motor. Every system, regardless of whether the motor and the generator are combined in a single unit or are separate units, is absolutely the same in these four essentials; there can be no variation whatsoever.

BIJUR GENERATOR, SHOWING BRUSH HOLDERS AND BRUSHES

Why Batteries Must Be Charged.

Consequently, it is quite necessary that the storage battery be maintained in as nearly a fully charged state as is possible, as it virtually is the heart of the system. Needless to add, all such systems will keep the battery properly charged under perfectly normal running conditions without the necessity for worry or bother on the part of the owner. There are conditions, however—they apply more particularly to the dealer—which call for circumspection, as a short digression, drawn from an actual occurrence, will serve to make plain.

A—, who is a dealer in one of the smaller cities, had received from the factory he represented one of the newer series cars which is equipped with an electric lighting and engine starting system. The system is simple in the extreme, as its disposition on a polished chassis showed very plainly. Quite naturally, the dealer was proud of the chassis and of the operation of the electric system and there were few moments in the day, and in the evening, when the motor was not in process of being started, and the powerful head lamps were not boring into the semi-obscurity of the back of the salesroom. For several months the starter and lighter were demonstrated almost literally to thousands with never a miss and never a flicker from the lamps. Then came a man who was in a hurry for a car; who would not, or could not, wait for a new car to come from the factory. A body was placed on the show chassis, and that evening the new owner drove away in a blaze of glory with every light burning and scarcely enough illumination to match his pride in his new possession.

Unhappy Result of Thoughtlessness.

Everything went well until the following day, when, after telephoning one of his neighbors to "ride down town," he hastily swallowed his matutinal cup of coffee and hurried to the garage, where the neighbor already was awaiting him. Both climbed into the forward compartment and, with a smile illuminating his countenance, the new owner depressed the starting pedal with the heel of his boot, and—nothing happened. The familiar, soft-toned growl that signalized the starting of the motor was singularly conspicuous by its absence. The starting gears went into mesh, the needle of the ammeter jogged merrily over to the "discharge" side, and still nothing happened. The motor simply would not start.

Reason for the Starter's Failure.

The reason for the failure to start—the lamps would light, but they threw but a pale beam—was perfectly plain and, couched in the terms of the garage attendant who was watching the proceedings with interest, it was simply a case of "no juice." In demonstrating the starter, the dealer had started the motor probably thousands of times. In order to start the motor for every new spectator, and two or three times for some of them, he had to stop it again almost immediately after it was started. The result was that the battery eventually became exhausted because after each start it was not permitted to run long enough to put back into the battery the energy that was drawn out of it; the motor seldom, if ever, got up to the speed where the charging process commenced. The final drain on the battery, when the new owner drove off with all his lights burning, was just sufficient to deplete the energy left in the battery to the point where it was insufficient to start the motor.

How to Obviate Faint Praise.

Of course, after the new owner had gotten out his once despised crank and started his engine, the charging process began, and it is altogether likely that by the time he reached his office he was very much surprised to discover that his engine starter was in good working order after all.

The moral to the story is plain: The battery must be charged; it is impossible to draw water out of a tank continuously without putting more into the tank. It does no harm to demonstrate any electric lighting and engine starting system from morning till night, and then far into the night. Quite the reverse, if the demonstration is properly conducted, it legitimately may be expected to be beneficial. But—every time the engine is started, it must be permitted to run for a few moments at normal touring speed in order to replenish the battery. Otherwise disappointment is imminent, and at a critical

Digitized by Google

moment someone is likely to damn the system with faint praise, or without any praise at all.

How Not to Eliminate Noise.

Another thing—some generators are quieter than others, though it is doubtful if any is silent in the literal definition of the word. However, none of them make an amount of noise that rightly may be termed nerve-racking or even annoying; generally, they emit the soft kind of a purr that indicates a kitten's perfect content with the world at large, bred of a full stomach. Where the noise is perhaps a little more persistent than circumstances would seem to warrant, it is altogether likely that it is due to insufficient lubrication of the driving gears. In the experience of one prominent manufacturer of lighting dynamos, however, too much lubrication may have the same effect. Consequently, it is wise to be governed exactly by the instruction of the manufacturer and not to experiment.

In any case, no one is warranted in taking the liberties that were taken by one dealer who was annoyed by even the very slight noise emanating from a brand new equipment. He eliminated the noise by a simple expedient of reversing the wires leading to the generator, thereby removing the load upon it. Naturally, with no load on it, the generator ran without a sound, which was exactly what the dealer in question wanted. But if that dealer had been wise he would have known that in removing the load from the generator he was removing its work, which is to charge the storage battery, and he would not have had to call in a factory expert to discover the "trouble."

"Hook-ups" that Can't be Changed.

Unfortunately for the dealer, that particular generator would not generate unless the wires were connected to it in the way specified by the manufacturer—nothing very funny about that. Some generators will perform their allotted work regardless of how the wires are "hooked up," but their number is small. In the majority of cases, the positive wire from the battery invariably must be connected to the positive terminal of the generator—a fact which has on more than one occasion been strongly emphasized in the eleven articles which have appeared in the eleven preceding issues of Motor World. In cases where the wires may be connected eitner way, the manufacturer never fails to make that point plain, for it is one of his "talking points." In other cases, the instructions of the manufacturer always must be followed with scrupulous care.

In proportion to those purchasers of cars already equipped with complete electric lighting and engine starting systems, the number who buy and install their own systems is very small. A number of manufacturers absolutely refuse to supply their equipment to individuals, and the instructions of very nearly all of them may be stated in the three words, "let it alone." In many cases, it is the better part of wisdom for the owner to take the makers' instructions literally and to let it severely alone, though in quite as many cases troubles which loom large really are small and can be successfully treated by almost anyone who has knowledge of the system which bears even remotely on the intimate.

Not Expected to "Let it Alone."

Such instructions, however, most specifically do not apply to the dealer, for he is the accredited agent of the maker and, as such, is expected, quite legitimately, to be familiar with the mechanism of the system he sells. He cannot well be expected to "let it alone," though, sad to relate, it might be better for all concerned if he did follow instructions minutely, provided he is not "up" on the system. However, dealers rapidly are coming to realize that in order to render service, which is the backbone of business, they must be equipped to handle complaints as well as to sing praises, and the number which at present is perfectly able to cope with such minor electrical troubles as might crop up is in marked contrast to the few dealers able to give intelligent aid not so very long ago.

In the products of not a few manufacturers of electric lighting and starting equipment, there is plainly evident a careful attempt to discourage anyone, even the dealer, from tampering with the mechanism in any way whatsoever. At the least, it is a tribute to the reliability and dependability of the apparatus that the maker is willing practically to seal it, secure in the knowledge that it will render faithful service for an indefinite time.

Special Tools Required for Dissection.

In the Bijur lighting dynamo, for instance—it is part of the electric lighting and starting system manufactured by the Bijur Motor Lighting Co. of 250 West 54th street, New York City—it is impossible for the dealer or the owner to touch anything other than the brushes; everything else is enclosed in a tight casing which cannot be opened without special tools—and the tools are not supplied with the apparatus. In developing the system, the makers have worked on the hypothesis that the brushes and the commutator are the only parts which are at all likely to give trouble or to require the care that can be given by other than an expert, and so everything else has been "sewed up tight," to use a colloquialism. The brushes and commutator can be gotten at by removing small brass plates on either side, the dynamo with one plate removed being shown by the accompanying illustration.

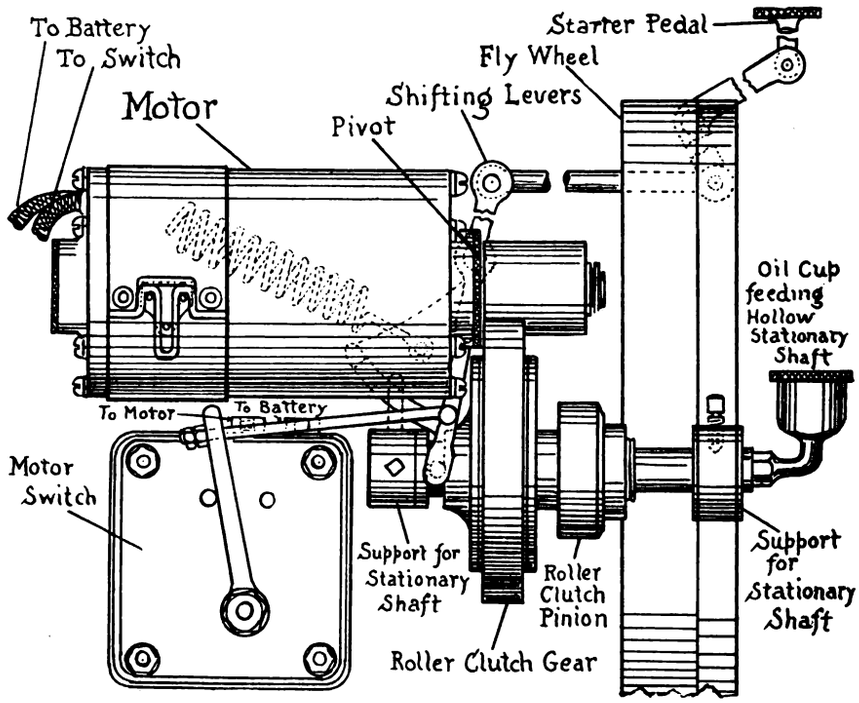

DIAGRAM SHOWING ARRANGEMENT OF BIJUR MOTOR STARTER

The Bijur system is of the type in which the dynamo and starting motor are separate units and is distinctive by reason of the fact that it is feasible to use the dynamo for lighting purposes without the necessity for "floating a battery on the line," as is usual; the battery must be used for starting, as a matter of course.

Digitized by Google

In order to permit the dynamo to be used direct for the lighting circuit, it is necessary, of course, that it be positively self-regulating, and this feature is obtained in the Bijur machine by simply varying the strength of the shunt winding by means of a magnetic device which inserts a single step of resistance in the field immediately the output exceeds a certain predetermined limit; when the output drops, the resistance automatically is removed. The mechanism by means of which this action is obtained is enclosed within the dynamo casing, as is the automatic cut-out which also is of the magnetic type. As it is impossible to get at either, much less to adjust or repair them, this fact may be taken as prima facia evidence that such attention is unnecessary. The motor in the Bijur system is no less tight and compact than the generator; it is of the simple series wound type in which the torque increases with the load.

How to Care for the Dynamo.

In caring for the Bijur system, it will only be necessary occasionally to remove the brass plates over the brushes and clean away accumulations of carbon dust or other foreign matter. The brushes may be cleaned with a cloth dampened, but not wet, with gasolene. After a considerable period of service it is well to remove the brushes and both side plates and sandpaper the commutator by inserting a strip of No. 00 sandpaper through the machine so that it bears lightly on the commutator while it is rotating. If the commutator exhibits a brownish, glazed appearance, however, it should not be touched, for it then is in the best of condition. The same kind of care, and no more, should be given the electric motor.

Within the Bijur system there is included a dash ammeter, and with all the lamps burning this should show at least 10 amperes if the dynamo is working properly. If the generator fails to generate after care has been taken to ensure that all the wiring connections are correct, the motor should be speeded up quickly just once. If this expedient fails to bring results apparent in the ammeter the generator should be polarized, as it is expressed in electrical engineer's parlance, though the operation is neither difficult nor laborious.

Testing for Current Explained.

The ignition ground should first be disconnected, after which the gray fiber cap projecting near the outer edge of the front of the dynamo should be removed. Then with the motor running at fair speed and the battery ground open (this is important) a momentary connection should be made between the lower brass post from which the fiber cap has been removed and the brass nut above it, from the center of which the line wire emerges. A silver quarter, or any other small piece of metal, will serve to make the connection, which should be productive of a spark.

After such treatment, the generator should generate, which fact will be made plain by the ammeter. If it does not generate the trouble must be either in the automatic cut-out, which may fail to establish connection between the dynamo and the line as it should, or in the brushes and commutator, which are dirty and therefore prevent good commutation. In order to detect such troubles, a "detector lamp" is an excellent device. It consists of nothing more than an ordinary lamp socket holding a standard size lamp and fitted with two wires approximately two feet long.

If one of the wires is held on the brass screw disclosed by the removal of the fiber cap, and the other is held in the brass nut above it, the lamp should light, thus giving evidence that the generator is generating but that the automatic cut-out is inoperative. As it is impossible to get at the latter device, the only alternative is to return the whole machine to the maker for adjustment. Sometimes, however, it is possible to free the contacts, which may have become stuck together, by striking the casing of the dynamo a few light blows with a rigid instrument. Needless to add, great care must be taken not to fracture the casing.

Troubles that Lurk in Brushes.

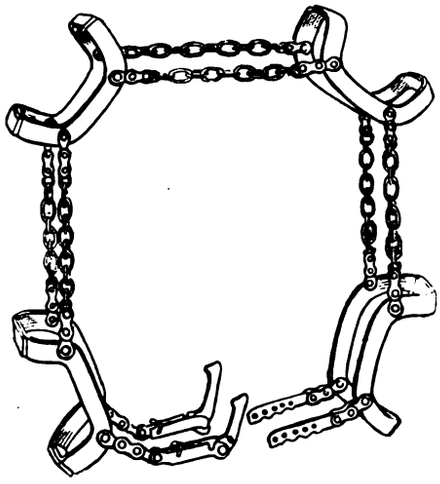
If, when the terminals of the detector lamp are placed as previously advised, the lamp fails to light, the generator is not generating, in which case the brushes and commutator should be examined to make sure that the brushes touch the commutator, that there are no short circuits and that the commutator is as clean as it should be. If the ends of the brushes exhibit a highly glazed appearance, they should be sandpapered gently, holding a small piece of fine sandpaper, preferably No. 0000, though No. 00 will serve, over the end of a finger tip. With a little practice the ends may be cleaned without impairing the curvature, which corresponds to the curvature of the commutator. However, it is not absolutely essential that the whole surface of the end of the brush touch the commutator, though a larger surface is better than a smaller one to start.

It should be remembered that the brush holding fingers must work freely on their hinges; if they do not work freely, the brushes may not be held properly against the commutator. If they bind slightly, a tiny drop of oil may be placed on their hinges, care being taken that no oil gets onto the brushes themselves. It is just as important, of course, that the brushes work freely in their holders, and as an accumulation of carbon dust or other foreign matter is about the only thing that can make them stick, they should be cleaned periodically. In replacing the brushes, care must be taken to see that sharp edge is uppermost.

Operation of the Motor Made Plain.

There is nothing in the motor, other than the brushes and commutator, the care of which already has been outlined, or in any other part of the system barring the storage battery, that will require attention. The location of the starting motor may vary according to the design of the engine and the facility with which it may be placed, a typical mounting being shown herewith in plan. In the installation pictured, the motor drives the gasolene engine through the intermediary of double reduction gearing carried on the clutch shaft. Depressing the starter pedal first connects the motor to the battery through a resistance causing the gears to spin and facilitating their engagement. Further depression of the pedal cuts out the resistance in the circuit and permits the full strength of the battery to flow to the motor—the systems are made to operate on either 6 or 12 volts. The drive is through a roller clutch, which effectually prevents damage in the event of a back fire. The starting pedal is spring returned to its normal position immediately the pressure upon it is released.

Soft Soap in Automobile Manufacture.



That such a homely commodity as soft soap enters into the process by which an automobile is built may cause a slight lifting of eyebrows among the uninitiated, and yet the Ford Motor Co. of Detroit, Mich., for instance, uses nearly half a million barrels of soft soap a year—and none of it is used for cleansing purposes It is used to lubricate the thousands of drills in the immense Ford shops, though it scarcely would be recognized for soft soap in the condition in which it is employed. Ford chemists have devised a formula for mixing into solution soft soap, which is purchased in 500-pound barrels, hot water and mineralized lard oil, and one man spends his entire time proportioning the mixture. Afterward, it is pumped around the shops through a pipe line to each of the machines and permitted to run continuously over the work and down into a hollow base in each machine, whence it is pumped back over the work continually. When it is "worn out" it is permitted to drain away through the sewer. The mineralized lard oil also is consumed at the rate of approximately 50 gallons a day.

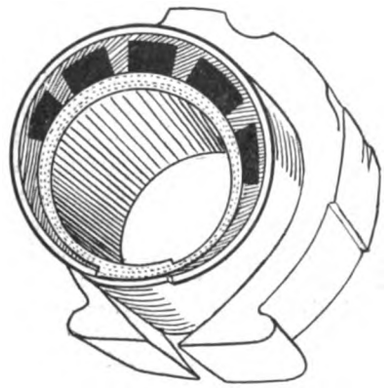
To Prevent the Truck from Skidding.

A motor truck that cannot move is at least as bad as no truck at all, and a machine with smooth-tired wheels spinning helplessly in mud, snow or on ice or other "anti-friction" road material is without doubt a useless vehicle, so far as delivering the goods is concerned. Among the newest of the devices designed to render the truck immune from such troubles is the Federal grip, the product of the Federal Chain & Mfg. Co., of Springfield, Mass., which acquired and manufactures the Gaylor grip, also.

As the accompanying illustration shows, the Federal device consists of a set of grips, curved to fit the tire and held in position by connecting chains; an adjustable toggle lock form the connecting link for attaching and detaching. No tools are required for putting on or taking off the grips, and when not in use they fold into compact bundles, which are readily stowed

FEDERAL TRUCK TIRE GRIP



away. Two minutes is said to be the average time required for attachment. The cross-bars are made of high-grade alloy steel, doubled in thickness where the road wear comes, and are practically indestructible. To avoid cutting the tires the under surfaces of the cross-members are smoothly rounded.

Care that Preserves Automobile Tops.

While automobile tops do not require a great deal of care to keep them in good condition, there are a few precautions that should be carefully observed For instance, if a car is not to be used for some time the top will be kept in the best condition if it is left open; otherwise it will become creased, perhaps permanently. Folding a top while it is wet is more than likely to result in the appearance of mildew, which will at least make unsightly and permanent spots, and not improbably will cause leaks and holes. Neither gasolene nor kerosene should be used on tops or curtains; a very weak solution of ammonia and water, applied with a soft brush, is the best thing for pantasote, while mohair requires nothing more, ordinarily, than brushing and dusting to keep it clean.

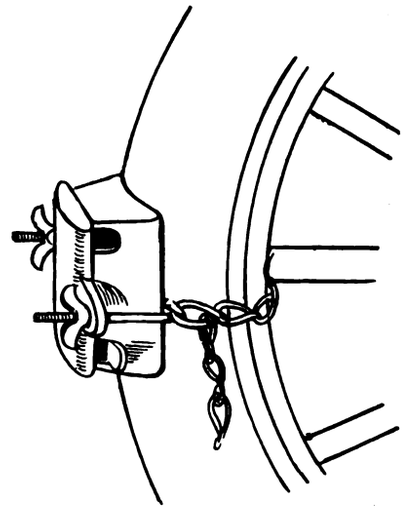
Inner Tube that has Two Skins.

As long as tires are made of rubber and fillings of air, the search for some means of preventing the perforation of the former and the escape of the latter will go on untiringly--unless the problem is so effectually solved that there no longer is any question in the matter. Meanwhile, the tentative solutions are many and ingenious, and not the least ingenious and one of the

REASON CELLULAR TUBE

most recent is that of the Reason Tire Co., of Pontiac, Mich., which manufactures an inner tube that is double-skinned, with a system of cells between the two skins, like a modern steamship's hull.

The accompanying illustration shows the construction of the Reason cellular inner tube so clearly that detailed description really is unnecessary. The materials used in its construction are the best quality Para rubber, and fabrics made by a patented process, said to render the tube puncture-proof. The compound tube is inserted in the tire in exactly the same manner as an ordinary tube, and it is inflated in the usual way. Not only do the manufactuerrs claim for the device immunity from punctures and blow-outs, greatly increased tire mileage and the ability to stand up in old casings that are too far gone for further use with ordinary tubes, but they state that, while the weight is somewhat greater than that of the usual type, it is at least as resilient as a tire with an orthodox type of tube, of similar dimensions.



Removing "Overhang" from Cold Chisels.

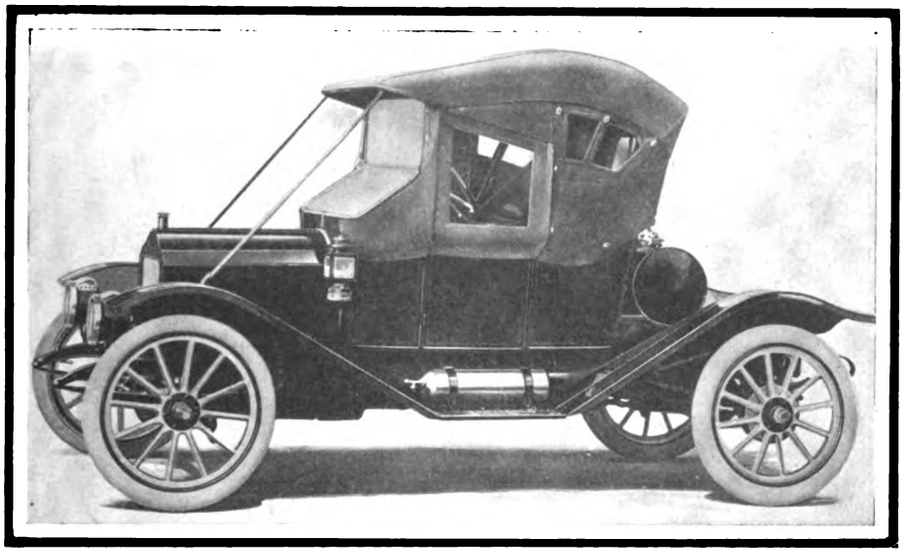
The head of a much-used cold chisel is apt to spread considerably under vigorous blows of the hammer. The mushroom-like overhang should be ground or filed off, for it is apt to chip off under the hammer or to cut the hand with its sharp points—and, besides, it looks extremely "sloppy"

Simple Portable Vulcanizer.

The severity of the stresses to which automobile tires are subjected renders the ordinary cold-cement method of making repairs decidedly inadequate, so far as obtaining permanent results is concerned, and this fact accounts for the activity that has been displayed in devising vulcanizers which, though of small size, light weight and simple construction, will achieve practical results. In the accompanying illustration is shown an up-to-date instrument of the car type—that is, one designed to be carried in the tool-box; its weight is only about three pounds. The "B'Co" vulcanizer is manufactured by the Brown Co., of Syracuse, N. Y.; the heat for its operation is generated by burning gasolene.

The "B'Co" vulcanizer consists essentially of an iron box with a number of integrally cast spikes or rods rising from the bottom.

B'CO GASOLENE VULCANIZER



These are to provide sufficient heat-absorbing surface to carry heat to the bottom, through which it passes to the rubber. A cover plate, a pair of clamps and a measuring cup complete the outfit. When a cut on a tread is to be vulcanized the apparatus is attached as shown in the illustration, with the cover plate held on by the clamps which hold the whole in position on the tire. The measuring cup, which fits in a receptacle in the vulcanizer, is half filled with gasolene which is ignited and allowed to burn for 11 minutes—just enough to complete the work. For inner tube work the vulcanizer is used horizontally and the cover plate is placed under the bottom to hold the tube in place against the heated surface. Gasolene is poured directly into the box and ignited; the heat is absorbed by the spikes and carried down. The outfit consists of the vulcanizer, with its cover, cup, clamps, and chain, finished in nickel plate, vulcanizing rubber and scissors, packed in a box and sold for $2.

STUDEBAKER ENGINEERS DESIGN STORM CURTAINS

Big Corporation's Designers Turn to Weatherproofing Problem—Swinging Door-Sections to Facilitate Entrance and Exit.

An open car with the top up, the side curtains properly buttoned down and the windshield in position, gives a certain amount of protection from the elements, and, at least, is a whole lot better than no protection at all. There are drawbacks to this arrangement, however, which manifest themselves when driving rain or snow finds sundry crevices and cracks and works through, or when, after a stop in cold weather, it is necessary to reach out through an opening with the bare hand and wrestle with an invisible and refractory fastener—and there are other things that anyone who has done much cold weather driving can call to mind without half trying.

STUDEBAKER CURTAINS WHICH OPEN AND CLOSE WITH THE DOORS

An arrangement of curtains that appears to eliminate most of the troubles of the ordinary type is shown in the accompanying illustration of a Studebaker "20" roadster equipped with the protective outfit that has been designed by the Studebaker force for the use of doctors, contractors and others whose business takes them out in all sorts of weather. The principal feature is that the side curtains swing with the doors, to which they are attached by fastenings that are easily removed when the car is to be used without the protection of the curtains. A flap depending from the top clips the top of the windshield and leaves no opening at this point. In fact, the whole covering is tightly closed, with the exception of two openings, in the rear upper corners of the top, left for ventilation.

Kansas Sheriff Moves a Garage.

P. T. Shortall, who formerly conducted a garage in Kansas City, Kan., at 829 Minnesota avenue, under the style West Side Garage, is still proprietor of that garage, but it is not in the same place. Roy Shipp, however, now has a garage at 829 Minnesota avenue and Shortall is on Nugent avenue, all because of a legal fight and a quick-change scene in which the sheriff engineered the change.

Shortall had conducted a garage at the disputed location for two years at a rental of $100 a month and claimed the lease provided that in case the owner of the building, the Huppe estate, decided to raise the rent Shortall was to be given an opportunity to accept the higher rate. Last August, however, Shipp offered a higher figure for the garage premises and was given a lease, and since then has been trying to get Shortall out and himself in. Attorneys advised a peaceable removal, but Shortall stood pat and continued doing business at his old stand. He insisted upon the soundness of the old maxim that possession is nine points of the law, and inasmuch as he did not care to leave the location he declared he would stay unless put out.

The court, however, when called on decided that Shipp was entitled to the premises. As a result, one night last week, when car owners went to the garage to get their cars they found their 23 automobiles lined up at the curb while the sheriff and a gang of negroes were stripping the interior of the building, even to the calendars on the walls. Shortall smilingly admitted himself beaten, hurriedly rented a building on Nugent avenue and inside of an hour or two was open for business in the new place.

REDUCING DETERIORATION BY COMMON SENSE METHODS

Smooth Running That May Disguise Defects—Annual Overhauling Need Not Be Extensive—"Stitches" That May Save "Nine."

There are many cars that will run, and plenty that do run, for two, three, or even more seasons, without what usually is termed a general overhauling. The machines seem to keep going, and the owners take a certain pride in calling attention to the fact that their cars have not been overhauled since such and such a time—nothing done to them but things that cropped up occasionally and called imperatively for attention. There is no doubt that this way of doing things is entirely wrong, unless the car is used so little that there really is no necessity for an annual overhauling—which rarely is the case.

There is no mechanism that will run for an indefinite period without suffering more or less deterioration in some way, and this is particularly true of a machine as complex and as delicately balanced as is an automobile. Oil gums and forms partial obstructions; parts wear, more or less, and even if they do not wear to the point where actual adjustment or replacement may be necessary, it is entirely logical to assume that a worn part is less efficient than one that is a perfect fit; bolts, nuts, screws and other fastenings loosen up, and ordinarily do not attract attention. Oil works into places where it is not wanted, and works out of places where it should be retained; ignition apparatus deteriorates through the running down of the insulation, and the occurrence of slight electrical leaks, to say nothing of mechanical wear of various moving parts. In fact, even if the car continues to operate in a manner that seems satisfactory, it will be found, almost invariably, that after a year's use there are usually many respects in which it has fallen off from its original prime condition. A comparison with a new car of the same type often will throw more light on such matters than anything else.

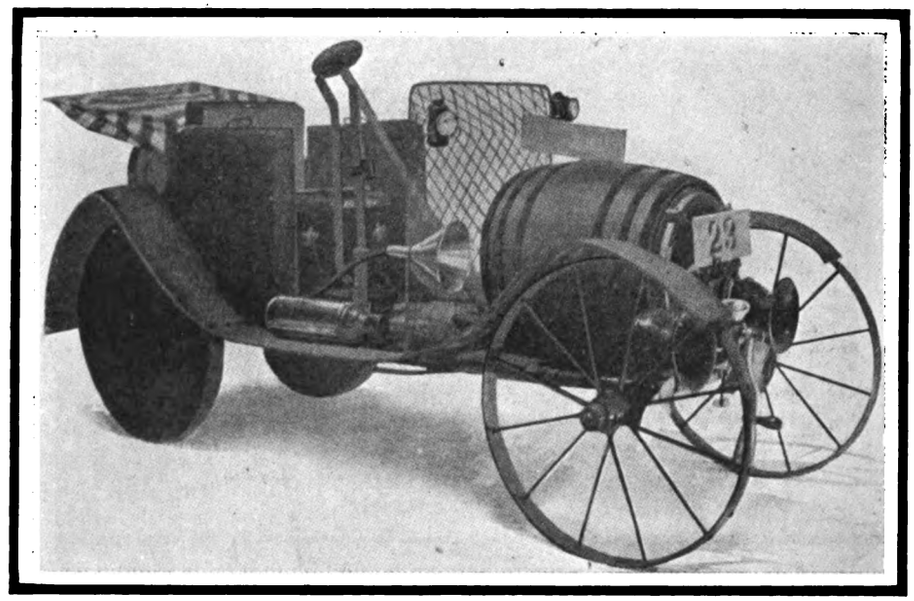
An annual overhauling does not necessarily mean that the car must be reduced to a collection of separate parts, and each miscroscopically examined, nor is it necessarily a long, tedious job. It means that the car should be carefully inspected in all its working parts, the body being removed to give easy access, and then, if there are indications of a need for delving, the delving can be done. As a matter of fact, such an inspection is valuable largely as a means of bringing to light indications of approaching

Digitized by Google

trouble that might not come to light in any other way. Of course, a car that is in a more or less run down condition ought to be taken down and its details thoroughly gone into; but a car that is running fairly well, that has been well cared for and driven in a reasonable manner, ought not to require the expenditure of a great deal of time or labor to make it practically as good as at the beginning of the season, barring, of course, the inevitable general depreciation. Even this depreciation is considerably reduced by intelligent annual inspections and tuning up.

A dealer or repairman who suggests to a car owner that an annual overhauling is the best thing for the car, when, in the opinion of the owner, the car really does not need it, is apt to be looked upon as seeking business with an eye single to the making of profits. There must be many cases, however, where automobile men are in a position to explain that two annual overhauls of a car in fairly good condition are likely to be very much less expensive than bi-annual overhaul of a much run-down machine. Besides the lesser cost of the work and the probable reduction in general deterioration resulting from annual overhauling, there certainly is no small satisfaction in having the car in top-notch shape at least once a year. Of course, no one would think of accusing the majority of motor car repairmen of being in the business merely for the sake of the beneficial effects on their physical welfare; but, on the other hand, the car and its owner stand to gain more than the repairman does by a proper yearly grooming.

Factory Instruction Lasting Two Years.



Although automobile schools where pupils are required to pay for the privilege of learning are fairly common, the reverse is the case where not only is free tuition provided under the guidance of qualified expert mechanics but good wages are paid the learners as well. It is true that one or two such schools exist, though none is so pretentious as the school maintained by the Ford Motor Co., of Detroit, Mich., where the "class" consists of 200 and the course covers a period of two years. As each pupil becomes familiar with one machine or one operation in the construction of a car, he is shifted to another, and so on right through the shops, until at the end of the two years' course he is assured of at least the rudiments of the trade.

A copying pencil forms a valuable adjunct to a repair kit. The indelible lead forms a practically inerasible mark, which is particularly useful in designating the location of punctures in inner tubes and in ensuring that the patch is properly centered.

BUILDS A CAR OF HARDWARE STOCK FOR WINDOW DISPLAY

Dealer Exhibits Clever Product of Window Dressing Talent—Exemplifies What Ingenuity Can Accomplish.

Vehicles and other pieces of machinery constructed by assembling various articles vended by a merchant and the finished product set up as an attraction in a show window are not uncommon, but one which has been evolved by W. W. Merriwether & Son, hardware dealers in Paragould, Ark., is so distinctive and cleverly constructed as to fairly compel notice, as the accompanying illustration suggests. The completed product is an automobile, or it at least has the outlines of such a vehicle, and is called the "Buttermilk Special." It is made of some 19 or 20 articles and outside of the fact that it will not run and is what might be termed an extreme in standardization is quite a car.

WINDOW DISPLAY FEATURE CONSTRUCTED BY INGENIOUS DEALER

The hardware used in its make-up is as follows:

Front wheels, stag sulky plow; rear wheels, 500 feet length garden hose; frame, Keen Kutter garden hoes; power house, barrel churn; headlight, two brass cuspidors; crank, Keen Cutter food chopper; dash and windshield, fireplace screen; side light, two Baldwin's miner's lamps; Prest-O-Lite tank, Icy-Hot bottle; horn, two-quart tin funnels; steering wheel, wood churn dash; control levers, steel buggy jack; seat, two burner clipper gasolene stove (the chauffeur was arrested for scorching); seat body, three drip pans; fuel tank, four-gallon tin churn; top, Wm. Enders grass catcher for lawn mower; fenders, 6-inch giant stitched rubber belt; number, Arkansas license tag, No. 23; ignition, door bell button.

Starter Designed for Ford Cars.

No very great amount of physical exertion is required to start the motor of a small car, and for this reason starters of the muscle-exempting sorts on little cars have not been greatly in evidence. Even a small motor can "kick back," however, and there are many occasions when, owing to mud or dust, for instance, it is decidedly unpleasant to stand in front of a machine to crank it, and it is just this consideration that prompted the Bremer-Wilson Mfg. Co., of 1256 Michigan Boulevard, Chicago, to bring out its "Triplex" engine starter for Ford cars.

Briefly, the starter, which is of the mechanical type, consists of a clutch device located on the motor shaft between the fan and the forward end of the crankcase, connected by means of a chain, turning over a pulley-guide, and a rod, to a handle on the dashboard. A pull on the handle rotates the crankshaft and a spring returns the clutch and the handle to their original positions when the handle is released. The clutch is so constructed that, in case of a back-kick, it will let go; in any case, however, a kick could do no harm to the operator, because the handle is not of the crank variety, but is simply pulled straight back and returned to the starting point. The regular starting crank is not displaced or in any way interfered with. The starter can be attached in about an hour's time and involves no complex or difficult mechanical work. The price complete is $11.50

LOS ANGELES INSURGENTS THROW HATS "INTO RING"

Launch Auto Contest Association of America and "Serve Notice" on A. A. A.—All Sins To Be Abolished.

Apparently there are in Southern California a number of men interested in the promotion of motor car contests, who believe that the laws governing the sport in other parts of the country should not be applied to Southern California or Southern Californians. This spirit, which was very much in evidence last July, when several of those who had to do with the running of the Santa Monica road race on May 4th last were disciplined by the contest board of the A. A. A. for irregularities which cropped up in connection with the contest, is again running high as a result of the automatic suspension of "Teddy" Tetzlaff, who, like others before him, partook of the "forbidden fruit" by participating in an unsanctioned meet at San Fernando on Thanksgiving Day.

Although many other men have similarly disqualified themselves, the California insurgents consider it another "outrage."

Frank A. Garbutt, of Los Angeles, is the man who appears to have been most seriously acected by the turn of events. His feeling stirred him so deeply that, in response to a call which he issued, 24 residents of Los Angeles met in the Los Angeles Automobile Club rooms on Saturday afternoon last, 7th inst., at which time they fairly ripped the A. A. A. up the back and down the front. It was accused of all manner of intrigue and double-crossing, and one man, almost consumed by his own flaming indignation, practically charged that the A. A. A. was guilty of murder, apparnetly because Bruce-Brown met his death while preparing for the Vanderbilt and Grand Prize road races on the Milwaukee course.

The upshot of the meeting was a decision to organize the Automobile Contest Association of America, with Garbutt as temporary chairman and Earl Booth as temporary secretary. The chairman was authorized to appoint a committee of 10 to formulate rules and regulations, which apparently will eliminate intrigue, double-crossing, murder, arson, highway robbery and all other crimes.

A long telegram was sent to the American Automobile Association advising it of the result of the meeting, and, oddly enough, expressing the wish to "co-operate with the A. A. A. to the fullest extent possible that our mutual interests will permit in order that there may be no unnecessary conflict of authority."

Despite the imposing title, Automobile Contest Association of America, Garbutt, who signed the telegram, assured the A. A. A. that "we propose, if the matter is agreeable to you, to confine our field to the West, feeling that unless future developments rendered it imperative that it would not be politic nor conservative for us to invade a field so far from the seat of our organization."

Garbutt also ingeniously added: "If there should develop an occasional individual of this section who is not with us heart and soul it will be because he is not acquainted with the situation as we see it, or because he has some petty ax of his own to grind."

Massachusetts Registrations Gain 29%.

Automobiles to the number of 50,049 were registered in the State of Massachusetts during the fiscal year terminating December 1 last, which, as compared with the 38,633 registered in the fiscal year of 1911, is an increase of 11,416, or 29 per cent. Of this number 1,092 were manufacturers' or dealers' registrations and the non-resident certificates number 858. Approximately 5,000 were re-registrations of cars which changed hands, but this figure is slightly offset by the number of cars covered by the manufacturers' licenses, so that the gross figure is approximately correct. The 1912 registration of commercial vehicles was 4,036, as compared with 2,189 for 1911.

The fees paid amounted to $614,665 and the fines to $29,108, the total increase being $139,580, or about 26 per cent. About 40 per cent. of the cars registered were in the 20-30 horsepower division, but 25 per cent. were in the above-30 class.

Chicago Regulars Down Progressives.

Once more "Bull Mooseism" has had a setback. The more recent occasion was at the annual election of officers of the Chicago Motor Club, on Tuesday evening, December 3rd, when N. H. Van Sicklen, candidate for president on the regular ticket, was elected by a majority of 90 votes over F. E. Edwards, the "Progressive" candidate; the total tally was: Van Sicklen, 295 votes; Edwards, 205 votes. Henry Bosch, regular nominee for first vice-president, also was elected. T. J. Hay and W. E. Stalnacker, who were candidates for the respective offices of second vice-president and secretary on both tickets, were, of course, unanimously elected, and A. M. Cobb, "Progressive" nominee for treasurer, nosed out his "regular" opponent, H T. Hollingshead, by five votes. The new board of directors comprises: L. A. Watts, W. J. Zucker, W. D. Foreman, E. G. Westlake, and Dan Boone.

EMPLOYER, DRIVING, LIABLE FOR INJURY TO CHAUFFEUR

High Court Sustains Verdict Awarded to Widow of Employe—Defense Set Up by Employer Which Availed Nothing.

When the owner of an automobile takes the wheel of a car and drives and his chauffeur sits at his side, he is liable for the injuries to the employe in case accident occurs, is the substance of a ruling rendered last week by the Appellate Division of the Supreme Court in New York City in the case of Katherine Daly against Arthur Weisbecker, a prominent New York business man; the higher court upheld a verdict of $10,000 and costs which had been awarded to Mrs. Daly, whose husband met death while in a car driven by Weisbecker.

According to the complaint in the case, Walter A. Daly and Weisbecker, his employer, were driving on Broadway at 232d street at 5 o'clock on the morning of July 14, 1911, and the allegation is made that Weisbecker had been up all night and had been drinking and was driving recklessly; at 232d street the car collided with a steel "L" pillar and Daly was almost instantly killed.

As to his death and the fact that he was employed by Weisbecker there was little dispute, the difference being as to whether he was in the car at the direction of his employer or had asked to be allowed to ride; the defense claimed he had asked permission to ride and therefore assumed all risk. The plaintiff stated that Weisbecker had directed Daly to sit at his employer's side while the latter drove the car. Mrs. Daly, as administratrix, asked $25,000 for herself and two children, but the Supreme Court for New York county awarded two-fifths of this amount and Weisbecker then appealed.

Ralph De Palma to Re-enter the Ring.

Ralph De Palma has decided to risk his neck again. He almost lost it at Milwaukee, as every one knows, though it has not feazed him even a little bit. Also, he almost won the last 500-mile International Sweepstakes race on the Indianapolis Speedway. Everybody knows that, too. And now he figures that with the old No. 4 Mercedes "fixed up" to make it eligible for the next 500-mile race under the reduced piston displacement restrictions, he has a pretty good chance to win. Anyway, the car has been sent back to its makers for "adjustment" and De Palma is going to follow it soon after the first of the year and once more join the chase for gold and glory.

1,019,886. Ignition Timer and Detector. Thomas C. Forbes, Los Angeles, Cal., assignor to Los Angeles Rotary Gas Engine Company, Los Angeles, Cal., a Corporation of California. Filed June 9, 1910. Serial No. 566,110. Means for determining the firing cylinder and forming spark in same applicable to rotary cylinder motors.

1,019,896. Vehicle Wheel. Hayes W. Henry, Melvern, Kan. Filed Aug. 31, 1910. Serial No. 579,797. Helical springs incorporated in the spokes.

1,019,916. Process for Making Radiators. Joseph Porzel, Buffalo, N. Y. Filed July 8, 1910. Serial No. 571,002. Radiator shell formed by electroplating a fusible mold which is removed from the finished shell by the application of heat.

1,019,961. Headlight for Automobiles. Joseph M. Hixon, Attica, Ind. Filed May 1, 1911. Serial No. 624,278. Steering gear connection makes lights dirigible.

1,019,973. Automobile Tire. John F. Lieb, Philadelphia, Pa. Filed Feb. 6, 1911. Serial No. 606,966. Adjustable helical spring bearing on shoe in casing.

1,019,976. Dirigible Headlight. James L. Lowe, Moore, Mont. Filed Nov. 29, 1910. Serial No. 594,626. Link from axle stub end to lever on spring, other end of which operates lamp.

1,020,006. Spark Plug. George Wright, Auburn, N. Y., assignor to Harriet J. Wright, Auburn, N. Y. Filed Oct. 1, 1910. Serial No. 584,873. Chamber between shell and bushing.

1,020,007. Lubricating System for Internal Combustion and Other Engines. William J. Wright, Franklin, Pa. Filed June 7, 1910. Serial No. 565,518. Oil sprayed into crankcase.

1,020,043. Supplementary Spring Attachment and Shock Absorber for Automobiles. John A. Mauck, Princeton, Ind. Filed Aug. 9, 1911. Serial No. 643,165. Helical spring attaching to end of leaf spring and to car frame.

1,020,054. Means for Lubricating the Transmission Gear of Motor Vehicles. Louis Renault, Billancourt, France. Filed Apr. 9, 1910. Serial No. 554,548. Flexible tube connecting gearset and universal joint cases, and means for inducing flow of oil through propeller shaft housing.

1,020,059. Carburetter. Walter F. Schulz, New York, N. Y. Filed Nov. 11, 1910. Serial No. 591,751. Means for admitting air to fuel chamber.

1,020,080. Control Mechanism for Electric Vehicles. Clyde E. Cochran, Cleveland, O., assignor to Anderson Electric Car Company, Detroit, Mich., a Corporation of Michigan. Filed July 28, 1911. Serial No. 640,993. Means for operating the rheostat and reverse switch.

1,020,081. Gas Engine. Harry G. Dahl, Tarrytown, N. Y., assignor to Maxwell-Briscoe Motor Company, Tarrytown, N. Y., a Corporation of New York. Filed Aug. 22, 1911. Serial No. 645,385. Frame for carrying push rod sleeves.

1,020,106. Automobile Starter. Hiram Percy Maxim, Hartford, Conn. Filed Oct. 15, 1910. Serial No. 587,166. Pneumatic starter using burned gases from the motor.

1,020,126. Locking Device for Detachably Securing a Rim to the Felly of a Wheel. Henry N. Carragher, Fall River, Mass. Filed Mar. 20, 1911. Serial No. 615,723. Right angle feathers hold rim in position.

1,020,128. Internal Combustion Engine. David H. Coles, Brooklyn, N. Y., and Frederick Charavay, Jersey City, N. J., assignors, by mesne assignments, to Requa Motor Company, a Corporation of New York. Filed May 13, 1910. Serial No. 561,035. Two cycle motor with rotary distributer valves.

1,020,140. Removable Rim for Vehicle Wheels. Carroll D. Galvin, Merchanville N. J., assignor of one-sixth to Amandus F. Jorss, one-sixth to Charles Jacobsen, and one-sixth to Eugene S. Cochran, Washington, D. C Filed Dec. 6, 1911. Serial No. 664,139. Inflatable tube placed between wheel rim and felloe.

1,020,163. Exhaust Muffler. George F. Swain, Chicago, Ill. Filed Apr. 6, 1910. Serial No. 553,689. Baffle plates with alternate central and eccentric holes.

1,020,209. Spring Vehicle. Richard Liebau, Watervliet, N. Y. Filed July 27, 1910. Serial No. 574,159. Pneumatic suspension.

1,020,260. Spring Wheel. Elisha W. Burner, Luray, Va. Filed May 22, 1911. Serial No. 628,677. Pneumatic wheel comprising a number of intercommunicating cylinders provided with pistons which support the weight.

1,020,270. Carburetter. Royal J. Dunn, Port Huron, Mich. Filed Jan. 9, 1911. Serial No. 601,625. Rotation of air inlet valve causes fuel valve to open according to the speed of the motor.

1,020,288. Tire Tool. Patrick E. Kenney, Celina, Ohio. Filed Feb. 4, 1911. Serial No. 606,662. Pliers for facilitating placing of tire retaining rings.

1,020,328. Spring Wheel. A. J. Swartz, Kent, Wash. Filed June 21, 1911. Serial No. 634,496. Helical springs in tension between felloe and wheel rim.

1,020,336. Windshield. Herbert H. White, Brookline, Mass., assignor to Auto Wind Shield Company, Cambridge, Mass., a Corportaion of Massachusetts. Filed Jan. 3, 1910. Serial No. 536,128. Flexible wind shield.

1,020,338. Vehicle Wheel. Otto G. Worsley, Bangor, Mich. Filed May 25, 1911. Serial No. 629,455. Helical springs in compression incorporated in the spokes, and sections of hollow elastic tubing between rim and felloe.

1,020,375. Automobile. Robert Symmonds, Jr., Kenosha, Wis., assignor to Thomas B. Jeffery, Kenosha, Wis.; Kate E. Jeffery, Charles T. Jeffery, and Harold W. Jeffery, executors of said Thomas B. Jeffery, deceased. Filed Mar. 11, 1908. Serial No. 420,320. Means of supporting transmission members.

1,020,376. Adjustable Steering Post for Automobiles. Robert Symmonds, Jr., Kenosha, Wis., assignor to Thomas B. Jeffery, Kenosha, Wis.; Kate E. Jeffery, Charles T. Jeffery, and Harold W. Jeffery, executors of said Thomas B. Jeffery, deceased. Filed July 22, 1909. Serial No. 508,937. Toothed segments provide the means of adjustment.

1,020,379. Throttle Valve for Carburetters. Mathias Weiwoda, New York, N. Y., assignor to George W. Stevens, New York, N. Y. Original application filed Feb. 20, 1909, Serial No. 479,045. Divided and this application filed Feb. 15, 1910. Serial No. 543,913. Rotatable sleeve.

1,020,385. Road Vehicle Suspension Arrangement. Leonard Eugene Cowey, Kew Gardens, England. Original application filed Feb. 6, 1909, Serial No. 476,551. Divided and this application filed Oct. 24, 1910. Serial No. 588,867. Helical spring operating on bell crank lever, adjustment being obtained by shifting the point of application of the spring.

1,020,417. Differential Gear. Guy M. Hartley, Dighton, Mich. Filed Mar. 18, 1911. Serial No. 615,287. Free wheels driven through the intermediary of double acting pawls and cogs.

1,020,437. Radiator Cap for Automobiles. Edmund B. Nelson, Cadiz, Ohio. Filed Feb. 10, 1910. Serial No. 543,143. Cap with cover held open by spring when bolt is not engaged.

1,020,523. Roller Bearing. Ernest J. Taylor, Highlandville, Mass. Filed May 17, 1907, Serial No. 374,305. Renewed Aug. 7, 1911. Serial No. 642,820. Separating rollers of smaller diameter between the load bearing rollers.

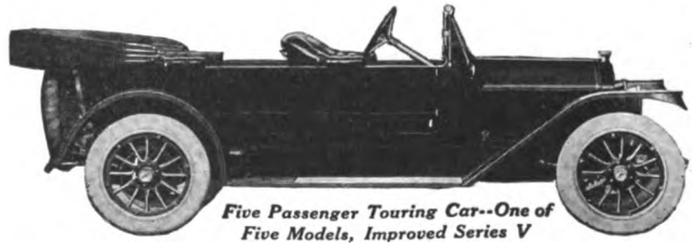
STOCK CHAMPION INTERNATIONAL CHAMPION



National 40

Defender of America—Conqueror of Europe

The National leads both Hemispheres in actual demonstration of power, speed reliability and stamina.

But for the reliable National car—and its consistent work in winning the International 500-Mile Sweepstakes Race in 1912, the foreign cars would stand supreme leaders. But the National won—while every other race of 250 miles or more went to the foreign invaders. The 500-mile race was the only 1912 race entered by the National builders.

First in Utility and Luxury

Five Passenger Touring Car--One of Five Models, Improved Series V

Five Models $2750 to $3400

We Claim the Greatest Value Today Is the National Improved Series V Cars

Long stroke motor (4⅞x6); left-side drive, center control, Gray & Davis electric starter, Gray & Davis dynamo electric lighting system, Bosch double dual magneto, multiple jet carburetor, 12-inch Turkish upholstery, tire pump integral part of motor, 128-inch wheel base, Hoffecker speedometer, full floating rear axle, concealed baggage compartments, tire carriers, full heavy nickel trimmings, powerful brakes, perfect oiling system, robe rail, foot rest, foot mat in running board, concealed tool box, electric horn, top, curtains, adjustable ventilating and rain vision windshield.

CONFUSING TECHNICAL TALK

of the kind that is sometimes used, tells the average man nothing. What you want to know is, how many hours (clock hours) will the GLBA Storage Battery light all the lamps on a car. There is just one way to find out; hook up your Electric Lighting Outfit with an GLBA Battery, to your lamps, push the button and keep accurate tab on the time it takes to discharge battery. Do it yourself, don't take our word for it. You'll be surprised to learn how much better—and longer—your lights will burn than with other Batteries claimed to be "just as good." But always BE SURE IT'S AN

SHELDON

The axles that come equipped with a choice of the finest bearings.

It's one thing to make axles equipped with one type of bearing. It's another thing to make axles of splendid mechanical construction adapted to every possible use.

The Sheldon Axle Company offers in its most complete line of excellently constructed axles for 1913, Steel Wheels, or hubs for wood wheels, with your choice of the following high class bearings:

Standard Taper Roller Bearings
Bower Straight Roller Bearings
Rhineland Double Row Annular Bearings
New Departure Double Row Annular Bearings
Hess-Bright Single Row Bearings
New Departure Single Row, Radax or Norma Ball Bearings

Will There be a

JONES RECORDING SPEEDOMETER

On Your New Car?

The Last Word in Speedometer Construction

You could search the whole world over and you could not find a more fascinating instrument for the automobile, than the NEW JONES RECORDER, which shows the speed, season mileage and trip mileage, the time of day, and a permanent record of every movement, speed and distance attained by the car.

This is the new Jones Recording Speedometer.

The very latest thing on the market and just ready for Christmas delivery.

You will say that it is the most wonderful instrument you have ever seen.

The CONOVER
"The Dependable Safe-Guard"

A NEW SAFE-GUARD

THE Conover was not made just to supply a "bumper" with another name—nor one with added "wrinkles."

IT begins all over again.

FIRST, a massive channel-bar with a broad, flat protection surface—made to take blows, and to be hammered easily back into shape, if dented.

SECOND, heavy, semi-elliptic springs (not spiral ones) with four (not two) contact points.

THIRD, an unreserved guarantee by its makers—to replace it free of charge if broken any time from any cause within a period of two years.

THE idea is absolute protection for the costly and vital front parts of a car—parts which otherwise are *bound*, sooner or later, to be damaged—for simply the original price of *one* safeguard.

HERE is certain insurance—economy—satisfaction.

Best quality Steel heavily enameled in Black, Royal Blue, French Gray or Maroon. One size only: bar 2 inches wide . . . . . (Any other color of enamel $5.00 extra)	$15.00
Best quality Steel, Brass or Nickel plated. One size only: bar 2 inches wide . . .	17.50
Solid Bronze finished in either Brass or Nickel. Two sizes: bar 2 or 2¾ inches wide . .	25.00

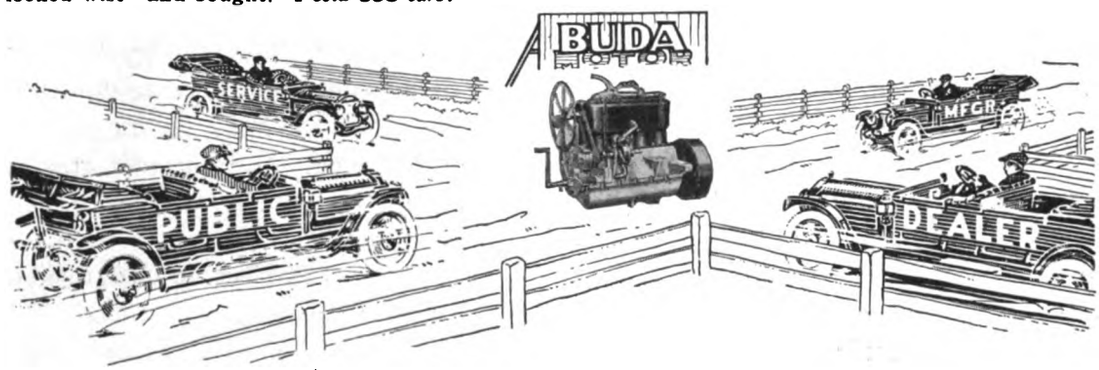
The Cross Roads Where They All MUST Meet



Here are two stories that indicate it:

The Salesmanager of a prominent Automobile manufacturer told us the first. He said that during a recent contest which he inaugurated among his salesmen, he analyzed the sales methods of his men to determine the comparative value of *general* statements and *specific* statements. The final markings ran all the way from 29% to 94%. And the significant fact was that only one of those salesmen who used the *General Claim* method got above the 50% line (and he was a peculiarly magnetic personality)—and the lowest one of those who used the *Specific Claim* method was only 56%. *General Claims* in this case were "best carburetor," "superior motor efficiency," etc. Specific claims were the_____carburetor, the_____magneto, and the

BUDA MOTOR

The other story comes from a dealer.

We quote his words as we recollect them: "Last year I sold 196 cars—and I went on the basis that the public didn't give a d.... about technical facts because they couldn't undertsand them. This year I sold my cars as a combination of a ..... body, a ..... magneto, ... tires, a ..... Carburetor and a..... (it was a Buda) motor. Whether my customers understood all this jabber I have my doubts, but they looked wise—and bought! *I sold 358 cars!*"

The Buda crossroads is now where the manufacturers and dealers must go to meet the Public demand. It is there that the Public finds Service. It is there that the Public has learned to look for

—demonstrated efficiency (in thousands of cars now in daily use)
—the choice of a score of most prominent manufacturers
—that Buda special oiling device
—that Buda exclusive get-at-ableness
—that Buda progressiveness which made it the PIONEER IN THE "CAST-IN-BLOCK" METHOD IN U. S.
—the assurance of always being able to obtain interchangeable parts from a company so well established and safely financed.
—and the following 1913 specifications.

SHOW NOTICE

Be sure and see our exhibits at the Automobile shows, as follows—
Grand Central Palace, New York, January 11th to January 25th. Space No. 304, located in the Balcony.
Madison Square Garden, New York, January 11th to January 25th. Space No. 326, located in the Concert Hall.
Coliseum, Chicago, February 1st to February 15th. Spaces Nos. 102, 103, 104, located in Coliseum Annex, 2nd floor.

THE present demand for self-starting and lighting equipment has created a demand for an ignition system capable of producing a hot, dynamic spark independent of the engine speed.

This demand is being successfully met by

The Atwater Kent Ignition System

the starting button of which produces, not a few weak sparks, but a single heavy flame-like spark, thus insuring at all times the perfect ignition of any mixture that will burn.

Other salient features of the Atwater Kent System are the extreme simplicity of mechanism, only three moving parts, one contact, one adjustment and one non-vibrating coil.

While the Atwater Kent System is high in value and reputation, it is not high in price. In fact, it will cost less than half as much as a good magneto and will give superior results at a much less cost of upkeep.

We can now furnish two types of the Atwater Kent System for use on cars as sole ignition in place of the magneto, in conjunction with lighting and starting equipment.

***Type "F"* without Automatic Spark Control.**

***Type "K"* with Automatic Spark Control and insulated primary circuit.**

No matter what the requirements, the Atwater Kent System of Ignition affords ideal ignition.

Write today for detailed information and illustrated booklet "D."

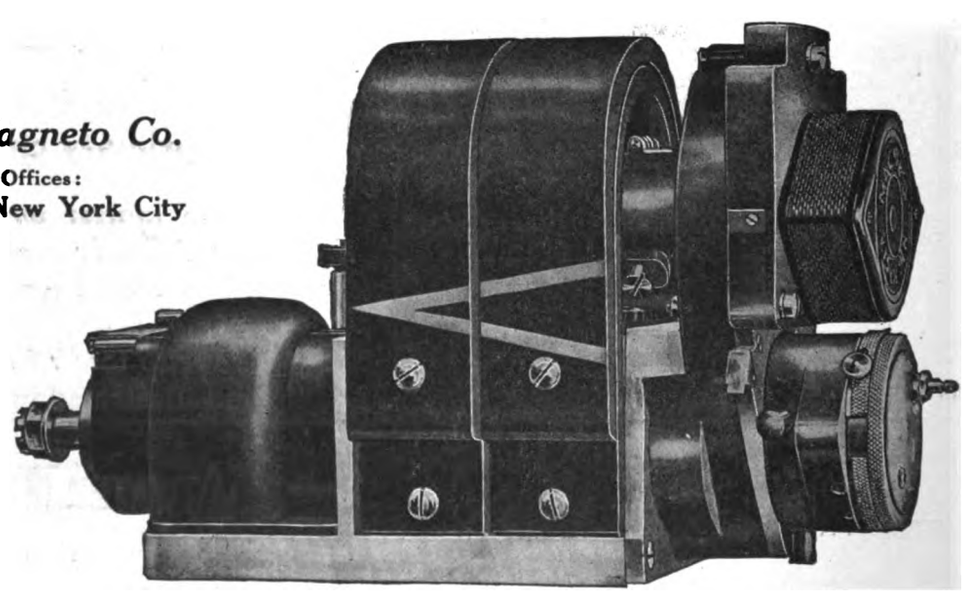
EISEMANN

Here's sound advice to Motor Truck Dealers and Manufacturers, too.



Eisemann Magnetos with automatic spark control assist you greatly in getting repeat orders.

IF you want disinterested confirmation of this statement we ask you to communicate with any of the many prominent makers who use Eisemann Magnetos with automatic spark control on their output—or any of the successful dealers who handle these trucks.

We know what the answer will be, for these same people have told us unreservedly that this type instrument has done more to solve the ignition problem in motor truck manufacture than any one other invention ever brought out.

Of course automatic spark control with its attendant simplifying of the car control—its enforced economy of operation, and increase of motor life is desirable on pleasure cars as well as upon commercial cars. But in the commercial field you must show economy—you must show simplicity—you must show low upkeep cost. So of necessity the automatic spark control magneto is more valuable as a sales asset in the commercial field than in the pleasure field.

It is, however, no greater asset to the car mechanically one place than the other, and every high grade car should be equipped with this masterpiece of Eisemann production.

Hyatt Quiet Bearings

Hyatt Flexible Rollers will not crush under load because of their being hollow. The strength of these rollers is dependent upon the section of the steel out of which it is formed as well as the elastic limit of that material.

Every size bearing is capable of carrying a certain load at a certain speed. If the carrying capacity is greatly overreached, the bearing cannot be depended upon to give permanent satisfaction. Any other automobile member subjected to excessive stress will fail under similar conditions. It is simply a matter of proper engineering.

When reasonably well mounted and operated under its proper duty, the Hyatt Roller Bearing lends itself to practical conditions as no other can. When subjected to faulty mounting—imperfect alignment—unreasonable abuse—and over-loading, no other bearing is even comparable.

Knox

MARTIN TRACTOR

Maximum Carrying Capacity
Minimum First Cost
Minimum Maintenance
Minimum Turning Radius

What It Is

Not a Theory But a Proven Success in a Year's Gruelling Work. Many in Successful Operation. 5 to 10 Ton Capacity. Full Details Explained in Tractor Catalog. Send Today.

A motor unit that may be attached to any heavy vehicle designed to be drawn by horses; the combination making a five-wheeled motor-drawn vehicle.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE COST OF RUBBER TIRES. Wagons have been doing good work for many years on steel tires and there is no reason why they will not continue to do so when drawn by the tractor; the heaviest part of the load is always carried on steel tires.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO EXCESSIVE VIBRATION ON STIFF SPRINGS. All working parts of the tractor are carried on springs as resilient as those of a pleasure car.

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO SUDDEN STARTING OR STOPPING OF HEAVY LOADS. The cushioning of the shock between the engine and the load is one of the most important advantages gained, (fully explained in catalog).

IT SAVES HEAVY MAINTENANCE CHARGES DUE TO NEGLECT ON ACCOUNT OF INACCESSIBILITY OF PARTS—all parts of the tractor being more accessible than on a touring car.

IT SAVES HEAVY MAINTENANCE CHARGES due to frame twist. The tractor accommodates itself to all road unevenness.

The single front wheel can be turned at 80 degrees angle, enabling the driver to back to any position or turn completely around in a narrow street.

Send for further information and prices

KNOX AUTOMOBILE COMPANY (Tractor Department) Springfield, Mass.

Prest-O-Starter

Starts your engine (old or new) quickly and easily in coldest weather

For Four Cylinders $20

For Six Cylinders $25

$1.50 extra for two-way valve necessary when the same Prest-O-Lite is used for both starting and lighting.

Here's a starter that adds practically no weight to your car, is perfectly simple and is as durable as the engine itself. Easily applied to any engine, old or new, very economical in the use of gas, and requires no expert repairing.

How Prest-O-Starter Works

The principle of starting a motor with Prest-O-Starter is the same as "starting on compression." A measure of acetylene, at low pressure, is pumped from your Prest-O-Lite into the cylinders.

Touch your spark—your engine starts.

Unlike "gasoline priming," it is not affected by heat or cold. It is certain.

In cool weather, by opening a valve on the dash, you can feed gas at low pressure into the intake manifold. This allows your engine to run on acetylene until it is warm enough to run to gasoline.

If the Prest-O-Starter did no more than prime your engine in this way during cold weather, this convenience would be well worth the price.

But Prest-O-Starter is more than a primer. When installed properly, it will start your engine, summer or winter, almost invariably without recourse to the crank.

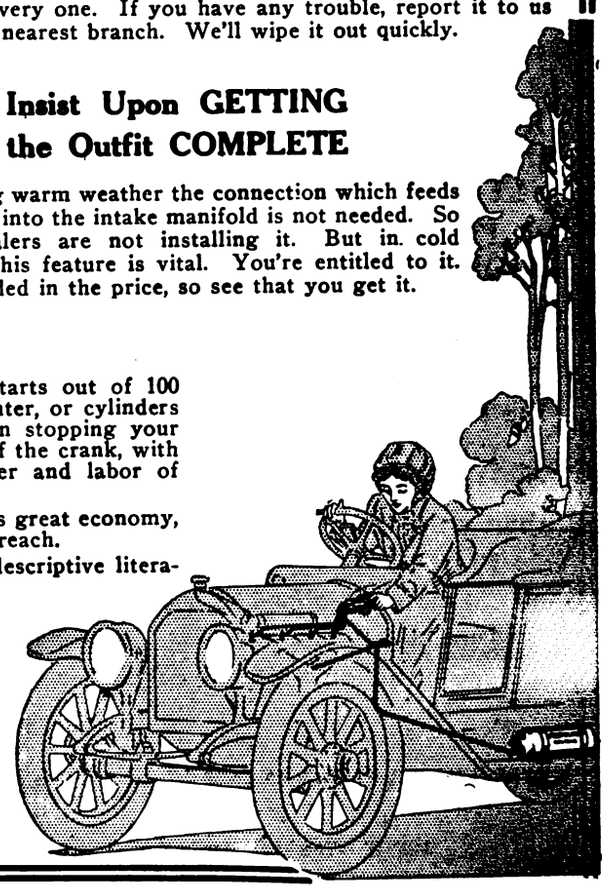
Make Sure Your Starter Is Installed CORRECTLY — Look It Over!

The Prest-O-Starter is easy to install correctly. In fact, it's so very easy to install that some good factories and garages install it with utter carelessness, overlooking the one or two simple features vital to success in operation. Fortunately this is an easy matter for the car owner to correct, even if he isn't a mechanic.

Our literature tells you exactly how the Prest-O-Starter is installed, and how to adjust it. Anyone can give it the slight attention it may need or quickly tell a dealer where the trouble lies.

Every Prest-O-Starter is sold with the assurance of satisfactory service. The entire Prest-O-Lite Organization is back of every one. If you have any trouble, report it to us or to our nearest branch. We'll wipe it out quickly.

Insist Upon GETTING the Outfit COMPLETE



During warm weather the connection which feeds acetylene into the intake manifold is not needed. So some dealers are not installing it. But in cold weather this feature is vital. You're entitled to it. It's included in the price, so see that you get it.

Now—More Than Ever—You Need One

Your Prest-O-Starter, properly installed, will average better than 95 starts out of 100 attempts. The few failures are caused by your motor stopping on dead center, or cylinders filled with burnt gas. Both of these conditions can be easily avoided when stopping your motor. But should either or both happen, an eighth or a quarter turn of the crank, with the switch at neutral, will remedy the trouble at once, with all the danger and labor of cranking eliminated.

Rest assured that no other starter can give you as high efficiency with as great economy, durability and freedom from mechanical trouble. The price is within easy reach.

Get in touch with any of our branches—or your dealer—or write us for descriptive literature.

Right Here is a Crucial Point of Your Car

The front axle of your car must not give way.

It's the part that protects your life and the lives of your friends.

Head on, it meets all the shocks from rough roads and withstands the constant vibration.

Human safety demands the utmost in good axle and bearing construction.

TIMKEN
AXLES & BEARINGS
ARE MEETING THE TEST

They are found at the front of a majority of the leading makes of motor cars—pleasure and commercial.

Doing valiant service. Protecting thousands of lives.

Giving comfort and satisfaction in driving.

Why Timken Axles and Bearings are Meeting the Test

Timken-Detroit Axles are made by an organization of men absolutely, and wholly devoted to *one idea*—good axle building.

Men who work together—in unison—who have worked together for years—whose experience goes way back into the era of horse-drawn vehicles.

Men who built successful axles for the earliest motor cars—both pleasure and commercial.

Men who have added to their own the experience of all the thousands of users of Timken-Detroit Axles.

Men who make a special study of axle design in the light of all domestic and foreign practice.

Men who care so much for the reputation of Timken-Detroit Axles that they do not neglect the least element of design nor risk imperfection in the smallest part.

The integrity and ideals of such an organization are the best guarantee to the builder and owner of a motor car.

Materials, methods—the finished product are but the expression of that integrity and those ideals.

Timken Tapered Roller Bearings owe their superiority to the principles of their design.

They are correct in theory—proven in practice.

The ideal motor-car bearing must do four things:

1. *It must reduce friction loss to the minimum.* Timken Bearings do reduce it to a negligible quantity.

2. *It must carry the heaviest possible load in proportion to its size.* Timken Bearings do this because they carry the load on the *whole length* of rollers, instead of the points of balls.

3. *It must meet side pressure or end thrust.* The rollers in a Timken Bearing carry end thrust, too, along their whole length—because they are tapered and revolve at an angle to the shaft.

4. *It must be adjustable for wear.* The Timken Bearing is the one bearing that can be adjusted to take up the minute wear *without sacrificing any of its characteristics.*

You can get the whole story of axle and bearing importance and construction by writing to either address below for the Timken Primers. T-3 "On the Care and Character of Bearings," and T-4 "On the Anatomy of Automobile Axles."

TRIPLEX

A FUEL SAVER and A MONEY SAVER

Increases Power
Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets all the power all the time—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon. For further information write us.

Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

Price $1.00 Each
Ready for Delivery Now

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers and the dealers, or

Marion

Of Particular Interest to Dealers and Garagemen

The handsomest automobile posters of the season are just off the presses—a brilliant lithograph hanger in five colors and a beautiful half-tone sheet in three colors. They are ready for immediate distribution—bound in tin for hanging.

We've made a limited number, two thousand of each. If you'll clip the coupon at the bottom or write on your business stationery, we'll send you one of each—as long as they last.

Don't miss seeing these posters and hang them in your show windows. They'll make people look in.

Model 37A, complete, $1475.

Marion cars were good ten years ago. They have been better each succeeding year. They are better now than ever. Four models in the 1913 line—37-A, 30-40 h.p. touring car, $1475; 48-A 48 h.p. touring car with electric starter, $1850; 36-A Bobcat speedster, 30-40 h.p., $1425; 38-A enclosed roadster, 30-40 h.p., $1475. All cars fully equipped —self-starter, electric lights, Q. D. demountable rims, Warner speedometer, windshield, silk mohair top, etc.

Write for literature, our fair sales agreement for dealers and see Marion cars at the shows.

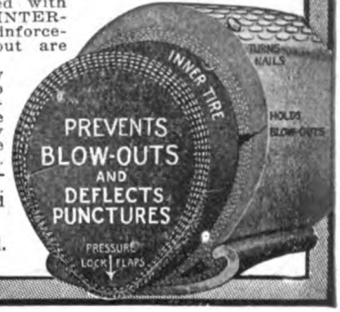
INTERLOCK INNER TIRES

Stop Tire Troubles

INVESTIGATE AND LEARN WHY SO MANY THOUSANDS OF MOTORISTS ARE DISCARDING INNER SHOES, RELINERS, FILLERS, AND OTHER MAKESHIFTS FOR INTERLOCK INNER TIRES—AND WHY INTERLOCKS ARE HANDLED AND RECOMMENDED BY THE BEST SUPPLY DEALERS AND TIRE HOUSES ALL OVER THE COUNTRY.

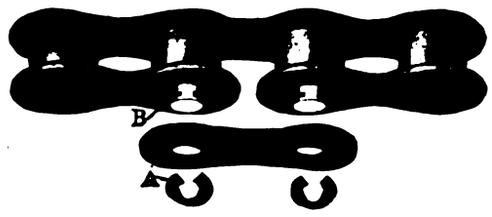
One weak point of the automobile to-day is that you can't depend on its tires. INTERLOCKS revolutionize this condition by making your tires so strong that blowouts become practically impossible. INTERLOCKS save half your tire expense—save repair bills—double your mileage—prevent punctures and completely free you from all fear of tire trouble.

What INTERLOCKS Are.—The INTERLOCK is a complete inner tire (not an inner shoe) which is placed between the outer casing and the inner tube to strengthen the outer casing and protect the tube. It is the only reinforcement which is locked by air pressure to the rim and which becomes an integral part of the tires, and, therefore, cannot heat or chafe. Even if the tire is broken the INTERLOCK will hold.



INTERLOCKS Insure Safety.—You know that the sudden blowing out of a tire may easily ditch any car when going at fair speed—the safety of INTERLOCKS should appeal to you.

Reduce Your Tire Expense.—You can have the tires on your new car equipped with INTERLOCKS if you specify them. INTERLOCKS are the only perfect tire reinforcement. They cost a little more but are cheapest in the long run.



For your present car—ask any dealer or supply house, or write to us for the name of your nearest supply source. INTERLOCKS will make any fairly sound tire more than carry you through the season. They are easily placed and are made in all sizes.

We Want Dealers Everywhere.—Write for Special 30 Day Offer. Booklets, Prices, Records of Road Tests and Testimonials of users.

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Wire or write us, no matter where you are.

Our PRICES compete with LEADING AMERICAN makes.

The Motor Lamps with Distinctive Features

There are no other motor lamps on the market with the advantages of Solar Lamps. Solars are always exclusive in style and in quality. They are the strongest lamps as well as the most effective.

In no other lamps can you obtain the Solar Special Short Focus Lead Glass Lens Mirror Reflector—the patented system of double ray light projection which gives two distinct fields of light for town and country use—or the new and exclusive black finish with a metallic lustre which is unaffected by heat or moisture. All of these features are exclusively "Solar."

Do not equip your car or specify equipment to the maker until you have seen all of the Solar advantages. See Solars at any live dealer's or write for the catalog.

Solars are made in all styles for oil, electricity, gas and in combinations.

SPECIAL METAL STAMPINGS

Standard Universal Rims

fit any style or make of tires. The side rings are reversible, they curve outward on one side to fit a straight side tire, inward on the other to accommodate a clincher. Two turns of a nut unlocks the rim for demounting, two more turns locks the rim in place. Write for catalog 607, which explains fully.

THE UNITED RIM COMPANY, Akron, Ohio

Repairing Casing

TIRE CUTS ruin casings. They admit moisture to the carcass, cause the fabric to rot and weaken, grow larger—end in blowouts.

You can repair **CASINGS** and **INNER TUBES** anywhere in 15 minutes, better than a Repair Shop can do—and for *one cent.*

Universal Auto-Vulcanizer

Patented

A practical vulcanizing outfit complete, with enough repair gum to make 40 patches. It weighs 3 pounds and can be carried in the tool box. **Simplest and most satisfactory device for eliminating tire troubles that has ever been devised.**

Absolutely automatic. Place the patch—attach the Vulcanizer—put in the gasoline light it. No further attention required. In 15 minutes the job is done.

It *can't burn, scorch* or *injure* tube or casing. It *can't* get out of order. It *can't* fail to do its work. So simple, anyone can operate it. The Universal Auto-Vulcanizer saves its cost a *hundred times* over in trouble and expense.

Price Complete. **$4.00** Ready for Instant Use
Guaranteed Satisfactory or Money Refunded

Weed Chains

The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires
Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

Recommended and sold by all reputable dealers

DO you wish to better your position? If your character and ability will stand investigation we can place you in any occupation, anywhere. Enclose 50c. for registration with references. Fee returned if unsuccessful. Address DEPT. F, BLUE LIST EMPLOYMENT EXCH., 250 West 87th St., New York City.

STUCK deep in mud or sand? My new appliance will help you out. A Xmas present. E. I. SPENCER, 3201 E. Douglas Ave., Wichita, Kan.

MAILING LISTS—Automobile owners, dealers, garages, repair shops, commercial car owners, or any make of car. OWNERS AUTO LIST CO., Albany, N. Y.

FOR SALE—Two worm drive rear axles, designed to carry 5,000 lbs. load—made by Morse-Williams Division of Otis Elevator Co., Philadelphia, Pa. Have never been in service. Make us an offer for them. SHELDON AXLE CO., Wilkes-Barre, Pa.

PEERLESS AUTO TOP DRESSING.
A waterproof dressing for leaking mohair and duck tops and curtains. Makes old and faded tops look like new. Ask your garage and supply dealer for it.
The Columbus Varnish Co., Columbus, O.

$225. Maxwell Runabout, 1911 model, top, windshield, Prest-O-Lite tanks, lamps; just overhauled. 624 California Ave., Avalon, Pa.

BROKEN CRANKSHAFTS, cylinders, crankcases, flywheels, gear teeth, pistons, perfectly welded and machined ready to replace. Guaranteed and references. Machinery up to 5 tons welded. ATLAS WELDING WORKS, 74-76-78 Irving St., Rahway, N. J.

PEERLESS EXTRA FINE BLACK JAPAN.
Covers solid one coat for enameling lamps, radiators and fenders. No undercoat required. Heat does not affect it. Ask your garage and supply dealer.
The Columbus Varnish Co., Columbus, O.

ARE YOU in need of any additional help in any department of your business? Are you out of employment or looking for a better connection? Have you second-hand apparatus of any kind or do you want to buy second-hand material, Have you a factory site for sale or do you want to buy one? If so, use the Want and For Sale column of the Motor World. Seven words to the line, fifteen cents a line. Advertisements can be inserted over a number when it is desired and identity of the advertiser will be kept confidential.

PEERLESS BACK AND CUSHION DRESSING.
Softens the leather and will not crack, wash or rub off. Makes old leather look like new. Dries in twenty minutes. Ask your garage or supply dealer.
The Columbus Varnish Co., Columbus, O.

AUTOMOBILE CYLINDERS reground, new pistons and rings fitted. Garage air compressors. CAST IRON BRAZING CO., Manchester, N. H.

SALESMEN, one who is now visiting automobile trade or owners. Good money made on a very attractive proposition. STURDY MFG. CO., 2637 Michigan Ave., Chicago, Ill.

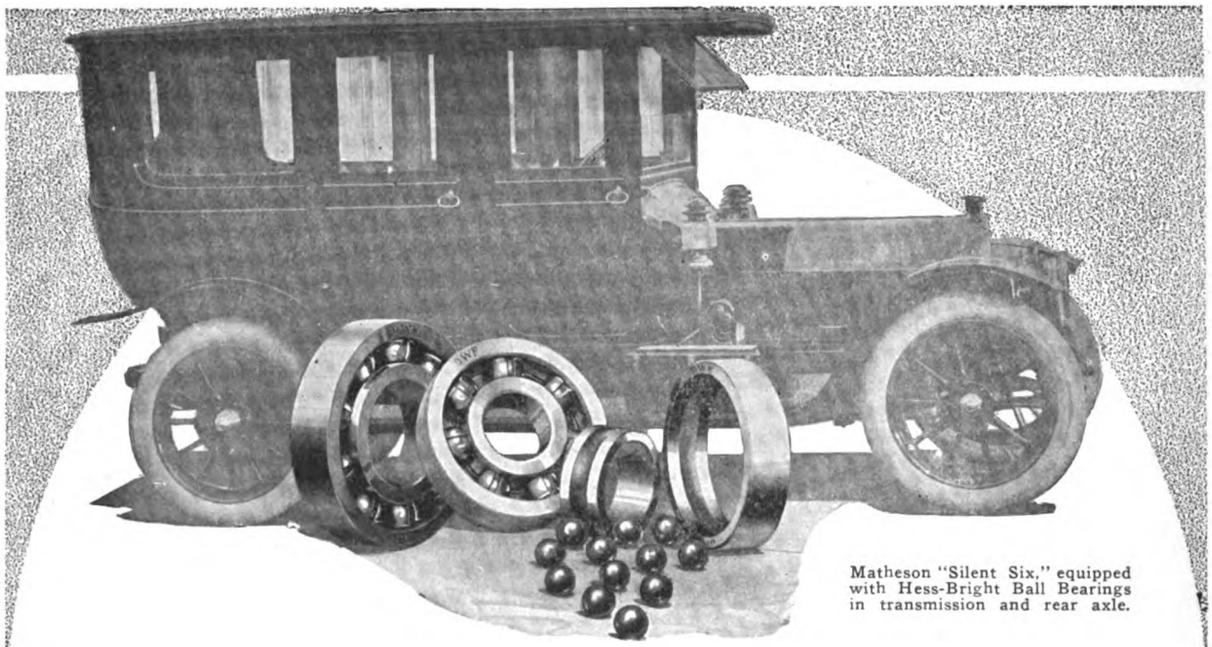
WANTED—A first-class man to take the agency for the latest invention on the market, a rubber cover for automobile handles called Steerease; write for full particulars. Address DEPARTMENT E, GOODYEAR RUBBER HOSE AND PACKING CO., 221 Chestnut St., Philadelphia, Pa.

PEERLESS LINING DYE.
Dyes the cloth linings of tops and curtains a black, uniform color, covering up water stains and grease spots. Does not wash off. Ask your garage and supply dealer.
The Columbus Varnish Co., Columbus, O.

PEERLESS LEATHER TOP DRESSING
An oil preparation that softens the leather and pantasote. Makes old tops look like new. Ask your garage and supply dealer for it.
The Columbus Varnish Co., Columbus, O.

LOZIER Type H 4-cylinder touring car. Absolutely new. Demountables. Regular guarantee and equipment. Cost, $5,000. Make cash offer. 1012 N. Grand Ave., St. Louis, Mo.

FOR SALE—One 2-ton Garford truck, with body and top, nearly new, in first class condition. Change of business reason for selling. SPRINGFIELD CREAMERY, Springfield, Mass.



AUTO LISTS, owners, etc., of any State. S. H. CARROLL, JR., Albany, N. Y.

WANTED—Cylinder or chassis of two-cylinder Oldsmobile, Model G. R. H. JAMES. Martinsville, Ohio.

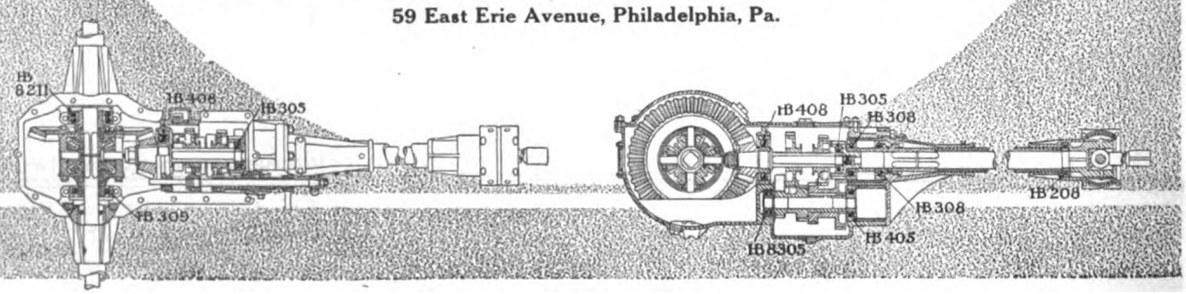
Matheson "Silent Six," equipped with Hess-Bright Ball Bearings in transmission and rear axle.

Grain and Hardness

in Ball Bearings

Homogeneity and uniformity of grain are of particular importance in ball bearings. As the load is carried on points of microscopic area with no cushioning oil film, it follows that extreme hardness is required in both balls and races.

But hardness implies small compressibility. If a ball and its race together compress only four or five ten-thousandths of an inch at their points of contact, it follows that an added compression of two ten-thousandths, due to a soft spot, will appreciably reduce the ball's ability to take its due share of the work.



That is the reason why Hess-Bright balls are hardened clear through, not merely case hardened.

Still, there are degrees of density even in balls hardened clear through. A fractured Hess-Bright ball (we fracture them by special apparatus in our laboratory, since they are not breakable by ordinary means) shows a texture finer than the finest china, and perfectly uniform from circumference to center. It is the very perfection of metallurgy applied to the making of steel balls.

And the Hess-Bright races are equally hard and tough, and are hardened clear through like the balls.

Are the Cars You Represent R.I.V. Equipped?

¶ In the matter of design, materials and construction, R.I.V. bearings stand high in the estimation of the manufacturers of quality cars. Increased demand in the face of the slightly higher cost, is significant. ¶ Here are the reasons: ¶ First, standardized quality and uniformity of material used in the construction of R.I.V. Bearings. Second, accurate manufacturing methods which positively preclude variation in measurement. Third, structural qualifications of the various parts as dictated by R.I.V. design. ¶ These structural advantages include the elimination of excessive side play—the use of machine cut ball retainers and the consequent accuracy of spaces—the greatest possible number of balls in the raceways permitted by our special methods of construction. ¶ That portion of the trade interested in ball bearings will find succeeding advertising of this company to be unusually instructive.

To Car Manufacturers:

When You Deliver a Car as Fully Equipped—Do You Include Gilmer Tire Repair Pliers?

Many of the better manufacturers will include them in 1913, for the really successful builder is not slow to recognize the value of REAL SERVICE to the owner.

Every new model of your make shows new improvements and refinements, but isn't it a fact that your tool kit equipment of today is about the same as you furnished with your first models?

One may expect to receive a tool kit with a lawn mower, sewing machine or bicycle, and while the kit you furnish is undoubtedly adequate to cure most mechanical ailments, you are simply adhering to an ancient custom if you fail to furnish the purchaser of **your** car with reasonable protection against his one large item of expense, TIRES.

A set of Gilmer Tire Repair Pliers included as general equipment means a real saving to the purchaser of your car and will go a long ways to establish the sort of service that future buyers will demand and will receive from the BETTER BUILDERS.

The matter of cost cannot receive serious consideration, as your actual expenditure is measured in CENTS, but the added prestige plus that ONE EXTRA SALES ARGUMENT will produce dollars. May I quote you in quantity?

Mr. Automobilist:

Your tire maker is very anxious to impress upon you the importance of

Tires Inflated to the Right Pressure

He insists that this is tire economy and

Saves You Money

How do you know what pressure you have in your tires? A

SCHRADER
UNIVERSAL
Tire Pressure Gauge

(Trade Mark Registered in U. S. Patent Office)

(Patented March, 1898—Other Patents Pending)

will tell the exact pressure in your tires at any time, day or night, by simply holding this Gauge to your Valve for a second. Its recording sleeve remains in place, showing the exact pressure in the tire so that the Gauge can be taken anywhere and read, at night to the front of the car into the light of the lamps. After the pressure has been ascertained the Indicating Sleeve can be pushed back into the Gauge with your finger. No catches or snaps to operate or get out of order. This Gauge is 2½ inches long over all, short enough to apply easily to the smallest diameter of wheel and can easily be carried in the vest pocket or the change pocket of your trousers.

Price $1.00 Each

Completely Equipped

Overland

$985

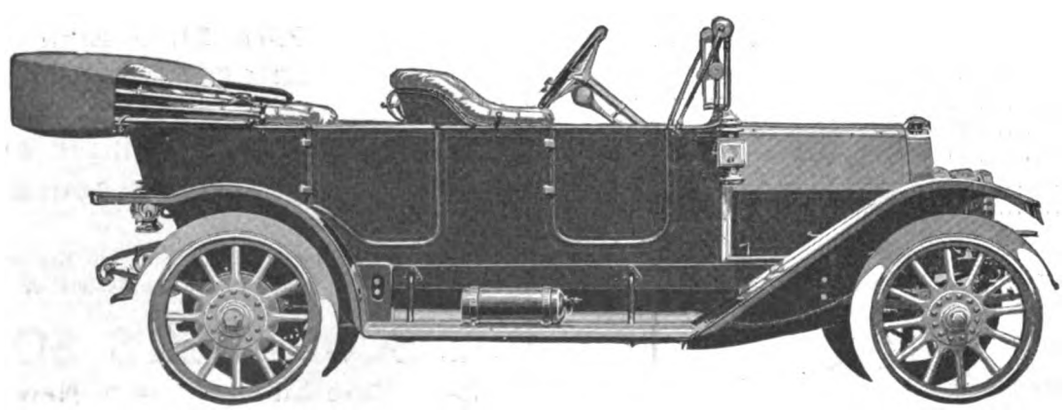
Completely Equipped

High-Priced Feature No. 8

The Overland Model 69-T possesses greater horsepower, greater speed and quieter action than any other car you can buy less than $1200.

It has a big 30 horsepower engine with a 4 x 4½ bore and stroke.

This motor is built with the utmost care; parts are ground to the 1-1000th of an inch. Those which are off-size are immediately rejected by the machinists. Each gear, each cylinder, each camshaft, every part of the 69-T motor is tested with a "go or not go" gauge.



The design and size of the nickel and carbon steel Overland valves force the motor to develop 15 per cent more horsepower than any other motor of similar size.

Here are other high priced features of the Model 69-T motor: three point suspension, one-piece, five bearing crankshaft (only car of its class possessing such), diagonally cut timing gears for silence, water-jacketed cylinders cast singly, and 100 per cent efficient Thermo-Syphon cooling system.

Arrange for an immediate inspection at the local dealer's. He will point out dozens of other features you can not get elsewhere less than $1200.

A post card will bring a catalogue. Please address Dept. 50.

MOTOR WORLD

Vol. XXXIII New York, U. S. A., Thursday, December 19, 1912 No. 13

WESTERN ELECTRIC TAKES UP AUTOMOBILE APPARATUS

Giant Corporation Forms Alliance With Pittsfield Company—Will Market Latter's Productions and Add to Number.

One of the most unexpected transactions of the season, of which only small rumors had been permitted to escape, just has been consummated between the giant Western Electric Co., of New York, and the Pittsfield Spark Coil Co., of Dalton, Mass., whereby the former will take over the sale of the Pittsfield productions, although for a limited period the Pittsfield company will sell its magnetos direct to the trade. In due course, the magnetos also will be marketed by the Western Electric Co., which, on January 1st, will inaugurate a widespread campaign for the sale of the "Western Electric-Pittsfield" coils, spark plugs, timers and switches, as the goods hereafter will be styled. It also is understood that there very shortly will be forthcoming a combined lighting and starting system.

The personnel of both companies will remain unchanged, but the Pittsfield scope will be very considerably increased. In addition to the present line, and apart from the starting and lighting system, there will be added to the Pittsfield output a fixed spark magneto for use on trucks and small cars, several new types of spark coils and a number of new Jewel spark plugs. Up to the present time, the latter have been made only with mica insulation, but henceforth a choice of mica, porcelain or a combination of porcelain and mica plugs will be offered.

The Western Electric Co. maintains 28 distributing houses, in each of which large stocks of the Western Electric-Pittsfield productions will be carried at all times.

While two others of the gigantic electrical companies have produced either electric motors or magnetos for the automobile trade, the Western Electric Co., whose business amounts to $70,000,000 a year, is the first to take up all of the several branches of electrical apparatus designed for automobile use.

Lasher Incorporates $750,000 Company.

W. B. Lasher, who owns the Weed Chain Tire Grip Co., this week incorporated the American Chain Co. of Sherrill, N. Y., which he formed last summer when he took over the chain business of the Oneida Community. The incorporation of the company, with an authorized capital of $750,000, is largely a legal formality, the ownership still reposing with Lasher, as is the case with the Weed company, a part of whose chains are made under contract at the Sherrill factory, which for some 40 years has produced hardware specialties and chains of many sorts. It is possible that the scope of the American Chain Co. ultimately may be greatly enlarged in respect to tire chains, the enlargement, however, depending on certain negotiations which now are in progress.

Hardie Buys Into the Miller Car.

James M. Hardie, the Chicago sales representative of the Miller Motor Car Co., of Detroit, has acquired an interest in the company and becomes its secretary, treasurer and general manager. C. E. Green remains president and Enos McMillan vice-president. The company will continue to manufacture the Miller "30" and is maturing plans for a greatly increased output.

Willys and Chapin Succeed Briscoe.

Benjamin Briscoe, former president of the United States Motor Co., who was a director and also secretary of the Automobile Board of Trade and who is now in Europe, has resigned those offices. The vacancies have been filled by the election of John N. Willys, of the Willys-Overland Co., as a director, and Roy D. Chapin, of the Hudson Motor Car Co., as secretary.

GERMAN DAIMLER COMES TO AID OF OWNERS IN AMERICA

Enjoins Its American Manufacturing Licensee from Exacting Fees from Owners of Imported Mercedes —Case May be Settled.

Although the Daimler Mfg. Co., which has the exclusive right to manufacture Mercedes cars in the United States, caused some stir about two months ago, when it published advertisements and mailed letters to owners of those cars purchased in Germany and brought into this country notifying them to step up and pay a license fee within seven days, or stand suit, the licensing business has been given a setback in the Supreme Court for New York county, which has granted the Daimler Motoren Gesellschaft, the parent German company, a preliminary injunction restraining the Daimler Mfg. Co. from interfering with Mercedes owners in America.

While the injunction is holding only pending the argument on a show cause order, it is said that negotiations have been opened and the matter never may be fought out in open court. The foundation for the unexpected action of the German company comprises two contracts, one entered into in July, 1910, whereby the Daimler Motoren Gesellschaft, of Unterturkheim, Germany, licensed the Daimler Mfg. Co. to make the Mercedes cars in the United States, and the other, executed at the same time, giving to the Daimler Mfg. Co., or to "such other company as should be formed for that purpose," the exclusive right to import Mercedes cars into the United States.

The application for the injunction is based upon a clause in the import contract which specifies that owners who make bona fide purchases of Mercedes cars are not to be molested within the territory allotted to the importing company, which territory is the United States. The "such company as

Digitized by Google

may be organized" is the Daimler Import Co., which recently became involved in bankruptcy proceedings and in which it is said a settlement with creditors probably will be made.

Following the bankruptcy of the Daimler Import Co. the manufacturing company announced broadcast its intention of collecting license fees from Mercedes owners. The range of fees, including those asked and accepted or offered to be accepted, are said to have ranged from $150 to $1,500. These notices sent a storm of Mercedes owners to the attorneys for the German company and resulted in the court proceedings.

The license fee proceedings were said to have been directed only at those owners who had bought their cars abroad and brought them to America themselves. In answer to this contention, the German company states that the excepting clause in the importing contract removes owners in the United States from any liability of annoyance and compels the Daimler Mfg. Co., in case it considers that any cars have been brought in by subterfuge or in a roundabout manner, to take this matter up with the Daimler Motoren Gesellschaft and to seek redress from that source.

Warner-Stewart Case to Be Retried.

After having once tried their case in the United States District Court for the Southern District of New York, the Warner Instrument Co., of Beloit, Wis., and the New York corporation of the Stewart & Clark Mfg. Co., which are involved in patent litigation, are about to retry the issue. This has been made necessary by the serious illness of Judge Platt, who heard the case in April last and whose illness makes it impossible for him to render a decision. The case was on the equity calendar last week but was so near the end that it was made first for trial at the January term.

The Warner company is the complainant, and alleges that the Stewart & Clark company has infringed patent No. 823,237, granted June 12, 1906, to Arthur P. and Charles H. Warner, and under which Warner speedometers are made. Particular emphasis in the pleadings is laid upon that part of the patent which covers a device for regulating the electrical effect in varying atmospheric temperatures. The citing of many foreign patents by the defense was followed by the taking of extensive testimony abroad last winter.

Two Co-related Companies to Dissolve.

The Manhattan Top & Body Co. and the Manhattan Wheel Works, both of 221 West 64th street, New York City, and which are co-related, are preparing to dissolve. A formal meeting for the purpose will be held on January 7th next.

$30,000,000 BUSINESS DONE BY GOODYEAR IN PAST YEAR

Sales of Preceding Twelve Months More Than Doubled—Net Income $3,000,000—Assets Exceed $13,-000,000—Financial Statement.

According to its annual statement, made public last week, the gross sales of the Goodyear Tire & Rubber Co. of Akron, O., during the fiscal year ending October 31st last, amounted to approximately $30,000,000, as compared with $13,262,265 last year, $9,-560,144 in 1910 and $4,277,067 in 1909. The net income totaled $3,001,294. After allowing for the preferred dividend and other deductions, there remained a net surplus of $1,856,888, or 36 per cent. on the outstanding common stock.

The balance sheet shows cash of $1,268,-539 on hand as of October 31, and current assets (including inventory of $4,398,384), aggregating $8,884,882. Current liabilities were $1,116,406, subject to a contingent liability of $1,626,594 for notes receivable discounted, and the guarantee of a $300,000 loan made to the Goodyear Tire & Rubber Co. of Canada by Canadian bankers.

During the year the authorized capital stock was increased from $6,000,000 to $15,-000,000, the new total consisting of $5,000,-000 7 per cent. cumulative preferred and $10,000,000 common. All the preferred is outstanding, but only $5,026,700 of the junior shares.

During the twelve-month there was paid a common stock dividend of $2,289,100; also a 7 per cent. cash dividend ($139,604) on the preferred.

The general balance sheet as of October 31, 1912, in which, as will be noted, the item of Patents, Goodwill, etc., is carried at the purely nominal sum of $1, is as follows:

ASSETS.

Plant	$3,855,569
Patents, trademarks, etc	1
Securities owned	490,075
Notes reserved from employes secured by stock	212,589
Inventory and current assets	8,884,883
Suspended assets	195,564
Prepaid interest, rentals, etc	179,533
Total	$13,818,214

LIABILITIES.

Common stock	$5,026,700
Preferred stock	5,000,000
Current liabilities	1,116,407
Reserves	818,219
Surplus	1,856,888
Total	$13,818,214

Lion to be Disposed of at Auction.

The machinery, tools, patterns and other personal property of the bankrupt Lion Motor Co., of Adrian, Mich., will be sold by the receiver to-morrow, 20th inst. The early sale of the assets was rendered possible by the action of the Lion company in permitting itself to be adjudged a voluntary bankrupt, which action prevented the delay which would have resulted had the creditors, who had previously filed an involuntary petition in bankruptcy, pressed their case.

Raymond to Make a $445 Touring Car.

The production of a 22-horsepower, four-cylinder touring car at the startlingly low price of $445 is the purpose of the Raymond Engine Co., which, organized in August, 1911, only recently matured its plans and acquired a factory in Hudson, Mass. The plant is a two-story brick building, 140 x 80 feet, which has a capacity of 20 cars per day, but it is not the intention of the company to "crowd things," and its output for the 1913 season may not exceed 1,000 cars.

The car, as stated, will mount a four-cylinder, 22-horsepower engine. It will have a wheelbase of 100 inches, wheels 30 x 3 inches, and will employ a special transmission in which some original ideas are incorporated.

The company is capitalized at $150,000, under the laws of Massachusetts. Its officers are: Arthur B. Raymond, president; J. A. Haley, treasurer and manager; C. E. Clement, assistant manager; E. V. Henderson and Joseph L. Donovan, directors.

One Ever Ready to Change its Name.

Just as the case was about to go to trial last week, the Ever Ready Electrical Co., which had been sued for infringing on the title of the American Ever Ready Co., deemed it wise to enter into an agreement to drop the Ever Ready part of its title and find something "just as good." As a result the proceedings in the New York court were discontinued. The American Ever Ready Co., which makes automobile accessories and electrical specialties, was originally incorporated in 1897. The Ever Ready Electrical Co. was formed during May of the present year, and the similarity of names and productions naturally led to considerable confusion. The Ever Ready Electrical Co. is composed of Samuel Halpe, Adolph Cohen and Morris Janigar, who also were named as defendants in the suit.

New Departure Secures Whitlock Plant.

Negotiations of the New Departure Mfg. Co., of Bristol, Conn., for the plant of the Whitlock Coil Pipe Co., in Hartford, practically were completed yesterday, when the stockholders of the Whitlock company empowered the directors to make the sale. Final details will be completed within a few days. It is the intention of the New Departure company to use the Whitlock plant for the manufacture of ball bearings.

INSIDE SYNDICATE ADVANCED INTERNATIONAL MOTOR LOAN

Million and a Half Not from Morgan Bankers—Lenders Acquire 55 Per Cent. of Stock—Company's Conditions.

It is not a "syndicate of Morgan bankers," as first reports made appear, but a syndicate made up of "certain stockholders" of the company itself who have come to the rescue of the International Motor Co., of New York, and acquired control by advancing the sum of $1,500,000.

It is not denied that there was pressing necessity for the loan. An official communication to the stockholders admits it and remarks that the only compensation, except 6 per cent. interest, which will be obtained by the "inside syndicate" is represented by the trifling amount of 55 per cent. of the common stock, which carries with it control of the company. Each member of the "syndicate" will contribute the same percentage of his own holdings in common stock, and the company itself will add about 750 shares which it owns. The outside stockholders are expected to contribute sufficient to make up the 55 per cent., the "syndicate" generously permitting all of the other stockholders to participate in the loan if they so desire.

The conditions of the loan stipulate that no dividends on the preferred stock shall be paid for a period of two years, except that any dividends which may be earned and properly declared within that period may be paid in scrip subsequently exchangeable for preferred stock.

The condition of the International company, as disclosed to the stockholders, shows that there are banking loans maturing in December, January and February which aggregate $1,325,000, of which $400,000 is secured by bills receivable. There are also outstanding discounted notes, which fall due during December, January, February and March, to the amount of $527,500. The $1,500,000 loan will enable the company to purchase all of the notes and about one-third of the unsecured bank loan, and to continue all such notes and loans, amounting to about $900,000, at 6 per cent., as outstanding obligations of the company. This will leave approximately $600,000 in cash for working capital, which it is believed will prove sufficient to save the situation.

The financial stringency of the International Motor Co., which about two years ago took over the Saurer, Mack and Hewitt trucks, is due, according to President Coleman, "not to lack of business or of profits but wholly because the company had outgrown its available cash resources."

Appeal in U. S. Motor Case Delayed.

Efforts of minority stockholders in the Columbia Motor Car Co. to intervene in the receivership proceedings and prevent the sale of the United States Motor Co., on January 8, were not productive of definite results when their appeal in the United States Circuit Court of Appeals in New York City Monday last, 16th inst., was the subject of two motions, neither of which was granted. The appeal is from an order of the District Court denying the minority stockholders the right to intervene.

On Monday the minority's attorney moved that the appeal be so placed on the calendar that it could be argued before the date fixed for the sale, but this the court denied. The receivers' attorney then moved that the appeal be dismissed on the grounds that the matter is not appealable, but this the court also declined to do, saying it would hear the latter motion when the appeal is reached, which will not be until some time after January 1 and probably not until after the date of sale. The Columbia minority's attorney, however, stated that even if the sale were made before the appeal is reached it would not affect the rights of his clients inasmuch as the appeal is on the calendar of the higher court, which has the power to overrule the lower tribunal, if necessary.

Motsinger Adds Radical Carburetter.

The Motsinger Device Mfg. Co., of Lafayette, Ind., which heretofore has devoted itself to the production of ignition apparatus, quietly has been developing a carburetter which will be added to its manufactures. While admitting that it is radical in many respects, because of patent requirements, the Motsinger people will give little information concerning the new device. They declare, however, that it is their present intention to sell it with a guarantee that it will give more mileage per gallon than any carburetter made in the country.

Dealers Agree to Pay for Demonstrator.

William M. Redfield and Maurice Levi, who at one time traded in Imperial cars in New York City under the style Redfield & Levi, consented that judgment be taken this week in the Supreme Court for New York county in an action brought by the Imperial Automobile Co., of Port Huron, Mich., to recover the value of a demonstrating car; the judgment allowed was for $1,100, $700 less than was asked in the Imperial company's complaint. The claim was that the demonstrator, which was shipped from Port Huron in October, 1911, was not paid for, although it had been sold by the dealers.

GROSSMAN AND EAGLE AIR THEIR TROUBLES IN COURT

New York Concern Demands $30,000 as Aftermath of Windshield Contract—Enumerates Ten Different Grievances.

Some of the reasons, not heretofore made public, why the Emil Grossman Co., of New York City, and the Eagle Co., of Newark, N. J., a subsidiary of the Standard Co., of Torrington, Conn., parted company about a year ago are made plain in the formal complaint which, after about two months' delay, has been filed in the United States District Court for the Southern District of New York in an action for nearly $30,000 brought by the Grossman company against the Eagle concern. The complaint is made up of ten separate causes of action, all growing out of a contract entered into by the Grossman and Standard companies, whereby the latter was to manufacture windshields for the New York concern.

The contract was signed January 31, 1910, and required that the Standard Co. manufacture windshields exclusively for Grossman and that during the term of the contract, which was to run from May 1, 1910, to May 1, 1911, Grossman was to have windshields manufactured by no other company; the agreement specified exclusiveness on both sides. Prices for certain types were named in the contract, and these figures were made contingent upon certain limits of variation in the price of materials. The two types which enter largely into the litigation are those known as the Hydraulic and the Springaction.

After the execution of the contract the Eagle Co., the Standard subsidiary, took it over by oral agreement, the complaint alleges. Having repeated the contract and various other essential but cumbersome legal terms, the Grossman company enumerates its causes for complaint.

It alleges that before September 15, 1910, the agreement was so altered that the Eagle Co. was to ship direct to Grossman's customers, was to collect the bills and was to remit to the Grossman house the difference between the cost and selling price. On this score, for unremitted profits, there is a claim for $15,000. Also, Grossman claims $359.80 due on discounts of 5 per cent. for cash.

The third cause states that for bills paid by the 15th of the month following the month of shipment there was to be a discount of 2 per cent., and this is figured out as giving a claim of $336.70. On bills discounted by the Grossman customers between October 1, 1910, and April 1, 1911, on

Digitized by Google

a 2 per cent. basis, there is set up another claim for $459.50.

In the contract, it is stated, it was specified that if reductions in price were to be made to anyone the Grossman company was to have advantage of such lesser rates, but the allegation is made that the Eagle company sold to others than Grossman and at a lower rate than that allowed to the latter, which forms the basis for an overcharge claim of $672.75. In this connection there appears a similar item of $50.

Arriving at the fifth cause, Grossman tells of the sale and delivery to the Eagle Co. of windshield demonstrating stands to the value of $1,588.40, on which, it is alleged, but $1,409.80 was paid, leaving a balance of $178.60.

January 25, 1911, a new agreement appears to have been made whereby the Grossman Co. was to be entitled to a commission of 7½ per cent. on all goods manufactured by the defendant and sold at distributers' or manufacturers' prices. This agreement, between February 1 and July 1, 1911, serves to produce a claim for $699.90.

The Eagle Co.'s exhibit at the 1911 automobile show in Madison Square Garden figures in the seventh cause of action; the Grossman company claims that the Eagle company agreed to pay one-third the rental price of the Grossman space for being permitted to exhibit therein and this amount—$126—is claimed to be unpaid.

The court may have some difficulty if called upon to decide the eighth cause. This states that the Eagle Co. so conducted its business that quite a number of orders from Grossman customers were not received until after the contract expired, and that this is easily worth $5,000.

Adding one more item, the Grossman company charges the Eagle company with having accumulated a greater stock of windshields than was necessary, with the result that the manufacturing concern became panic-stricken and sold large quantities at a heavy sacrifice, causing Grossman to lose an average of $1.50 per shield. This totals $7,500.

The tenth and last grievance is that the Eagle Co. shipped defective goods to the Pacific Sales Corporation of San Francisco and that because of their condition the Grossman company, after consulting counsel, took back the goods and settled the San Francisco company's claim. The windshields afterwards were sold, but the transaction is used as the basis for a claim of $1,583.54.

The whole reaches the figure of $31,936.79, but credits allowed reduce this by $2,630.43, leaving the actual amount of the judgment demanded $29,306.36. No answer has been filed, but a firm of attorneys has entered an appearance for the purpose of having the bill of complaint dismissed on the grounds of lack of jurisdiction; the law firm does not appear for any other purpose. The alleged lack of jurisdiction may arise from the fact that the Eagle Co. is located in New Jersey and is a corporation of that State.

Gray & Davis Acquire Ingenious Gear.

Gray & Davis, Inc., of Boston, Mass., have acquired from the Gray Engine Starter Co., of Indianapolis, Ind., the rights to an ingenious internal gear which the well-known Bostonians believe is particularly adapted to their electric starting motor and which, they intimate, will cause the industry to sit up and take notice when it makes its appearance in their device for the 1914 season.

The gear is the invention of Thomas J. Gray, of Broad Ripple, Ind., and patents on it are about to issue. Gray & Davis frankly admit that they themselves were working on something of the sort when they discovered the Gray invention, which they found to be so entirely new and so much better than their own that they made haste to become possessed of it. Gray & Davis have not yet actually commenced to make the gear and, as stated, it will not be incorporated in their starting motors until late next year or in 1914.

The Gray Engine Starter Co. itself was incorporated only last week, under the laws of Indiana, with an authorized capital of $300,000. In addition to the inventor, Thos. J. Gray, the directors are Dr. Robert C. Light, Henry M. Spaan, William Bosson, Henry Rosenberg, Mason B. Light and Robert W. Bosson.

Favery Tire Locates in Middletown.

Incorporated three years ago, and having perfected its unusual cushion tire meanwhile, the Favery Tire Co., of New York City, finally has acquired a plant in Middletown, N. Y., and has its plans so well advanced that tires will be coming through the factory about January 1st. The company is composed of Ethelbert Favery, the inventor; H. C. Cryder and M. W. Brashears. The tire, which already has been considerably exploited, comprises a concentric series of endless bands of specially woven fabric and rubber supported, so that they will not touch each other on the wheel rim, by aluminum blocks quite closely spaced.

Weed Fails to Hasten Suit.

Efforts of the Weed Chain Tire Grip Co. to hasten proceedings in the United States Circuit Court of Appeals in New York City, where the E. J. Willis Co. is appealing from an injunction granted to the Weed company, were blocked last week when the court declined to permit the appeal to be accelerated, and it now cannot be reached for a year.

Had the printed appeal been filed before the present calendar was made up the case could have been tried this winter, but since the appeal was not filed by October 1 it cannot now find place on a calendar until next October. The Weed motion was to have the appeal filed and the case placed on the present calendar, but the court ruled that if an exception were made and rules brushed aside in this case there would be a deluge of such requests. The Willis company sold the Whittaker tire chains, which are claimed to infringe the Parsons patent, No. 723,299.

Light and Telephone Bills Unpaid.

Claiming a bill for electric current supplied to the Mid-Town Auto Storage Co., of 245 West 12th street, New York City, the New York Edison Co. last week filed judgment in the New York county clerk's office; the amount is $208.45. Failure to pay a telephone rental bill amounting to $105.87 also was the cause of a judgment rendered against the Ditmar Auto Sales Co. in favor of the New York Telephone Co. The New York Edison Co. also filed judgment for $19.41 against the Anglo Tire Co.

Endurance Takes Judgment on Tire Bill.

Judgment for $164.55 was filed this week in the New York county clerk's office by the Endurance Tire & Rubber Co. against the Frank Dunham Co., which at one time operated a garage and was dealer in a well known line of cars. The bill represents the unpaid balance of a bill for tires.

American to Manage Belgium Plant.

D. G. Baker, former factory manager of the Olds Motor Works, has engaged with the Carel Freres Co. to serve as director general of its plant in Ghent, Belgium, where Diesel engines in considerable quantities are manufactured. Baker sailed last week to assume his new duties.

Court Orders Sale of Findlay Plant.

The plant of the embarrassed Findlay Motor Car Co., of Findlay, O., which has been idle for many months, has been ordered sold on January 16th next. The Federal court which ordered the sale stipulated that no bids for less than $50,000 will be accepted.

Wisconsin Capital in Michigan Venture.

The Hoff Mfg. Co. has been organized in Detroit and has commenced preliminary work on a light chassis at 268 Jefferson avenue. Wisconsin capital is understood to be back of the venture, in which the active men are the Hoffmeier brothers.

The Week's Incorporations

Springfield, Mo.—Ozark Motor Co., under Missouri laws; authorized capital, $5,000; to deal in motor cars.

Des Moines, Ia.—Union Motor Car Co., under Iowa laws; authorized capital, $10,000; to deal in motor cars.

Gloucester, Mass.—Twin Light Garage Co., under Massachusetts laws; authorized capital, $10.000; to operate a garage.

Dover, Del.—Hatch Oil Engine Co., under Delaware laws; authorized capital, $500,000; to manufacture oil engines.

Grand Rapids, Mich.—Peninsular Tire & Rubber Co., under Michigan laws; authorized capital, $1,000; to deal in motor car tires.

Annapolis, Md.—Auto Air Appliance Co., under Maryland laws; authorized capital, $200,000; to manufacture motor car devices.

Youngstown, Ohio—Cartercar Sales Co., under Ohio laws; authorized capital, $10,000; to deal in motor cars. Corporators—Wm. Beight and others.

Camden, N. J.—Starr Garage, under New Jersey laws; authorized capital, $50,000; to operate a garage. Corporators—F. L. Starr, H. H. Grace, T. P. Curley.

Milan, Mich.—Gauntlett Auto Sales Co., under Michigan laws; authorized capital, $50,000; to deal in motor cars. Corporators—Elon Gauntlett, C. M. Knowles.

Cedar Rapids, Ia.—Beck Auto Transfer Co., under Iowa laws; authorized capital, $10,000; to operate a motor delivery. Corporators—Martin J. Beck and others.

Jacksonville, Fla.—Atkinson Tire & Supply Co., under Florida laws; authorized capital, $25,000; to deal in motor car suppplies. Corporators—R. L. Atkinson and others.

Indianapolis, Ind.—Tone Car Corporation, under Indiana laws; authorized capital, $200,000; to manufacture motor vehicles. Corporators—Fred I. Tone, Mark H. Miller.

Detroit, Mich.—Detroit Autoheater Co., under Michigan laws; authorized capital, $2,000; to manufacture motor car accessories. Corporators—Oswald Zahn and others.

Boston, Mass.—Motor Supply Shop, Inc., under Massachusetts laws; authorized capital, $25,000; to deal in motor car supplies. Corporators—Walter E. McDaniel and others.

Minneapolis, Minn.—Broadway Garage Co., under Minnesota laws; authorized capital, $4,000; to operate a garage. Corporators—George J. Dahm, J. A. Cramer, and others.

New York, N. Y.—Queensboro Garage, Inc., under New York laws; authorized capital, $10,000; to operate a garage. Corporators—Frank I. Jockers, Augusta Jockers, 110 14th street, Flushing; Daniel J. Stack, College Point.

Chicago, Ill.—A. W. Greiner Auto Sales Co., under Illinois laws; authorized capital, $25,000; to deal in motor cars. Corporators—A. W. Greiner, Michael Feinberg, C. E. Becker.

Buffalo, N. Y.—Velie Motor Sales Co., under New York laws; authorized capital, $20,000; to deal in motor cars. Corporators—Ernest F. Snyder, John J. Finerty, Frank Sherwin.

Buffalo, N. Y.—Glide Sales Co., Inc., under New York laws; authorized capital, $10,000; to deal in motor cars. Corporators—J. Francis Lynch, Louis P. Fuhrmann, Edward T. Danahy.

New York, N. Y.—Blair Motor Truck Co., under New York laws; authorized capital, $5,000; to deal in motor trucks. Corporators—Howard O. Lente, Frank W. Dix, H. Otis Lente, 94 Park Place.

New York, N. Y.—K. & K. Motor Car Co., under New York laws; authorized capital, $10,000; to deal in motor cars. Corporators—Agnes E. Killian, Stapleton, S. I.; Frank B. Killian, Lillian E. Killian, New Dorp, S. I.

New York, N. Y.—Schacht Motor Car Co. of New York, Inc., under New York laws; authorized capital, $60,000; to deal in motor cars. Corporators—Bela Cukor,

WHERE THE CROXTON $3,000 "SIX" WILL BE MANUFACTURED

CROXTON MOTOR CAR CO.'S NEW CONCRETE PLANT, 500 x 120 FEET, IN WASHINGTON, PA.

Henry V. Radonitz, Clair J. T. Terrill, 1700 Broadway.

New York, N. Y.—Motor Trading Co., under New York laws, authorized capital, $10,000; to deal in motor cars. Corporators—William A. Shepard, 200 Cathedral Parkway; Robert W. Tindall, 346 East 195th street; Albert Donces, 170 West 83rd street.

Glen Cove, N. Y.—Glen Cove Garage, Inc., under New York laws; authorized capital, $1,000; to operate a garage. Corporators—Thomas F. Meade, 683 Lafayette avenue, Brooklyn; Edward Lewis, Lillian Lewis, Flushing.

New York, N. Y.—F. W. Ofeldt & Sons, Inc., under New York laws; authorized capital, $20,000; to deal in motor vehicles. Corporators — Edward Y. Eltonhead, 2508 Broadway; Ernest G. Ofeldt, Frank A. Ofeldt, Nyack, N. Y.

Rochester, N. Y.—Rochester Macandaruba Tire Filler Co., under New York laws; authorized capital, $10,000; to manufacture tire filler. Corporators—Charles S. Morris, Nunda, N. Y.; John S. Crosier and Albert C. Olp, Rochester.

New York, N. Y.—United Rubberine Supply Co., under New York laws; authorized capital, $200,000; to deal in tire fillers. Corporators — Herman Mayer, 331 West 83rd street; Thomas H. Royce, Borough Park; Charles L. Bookheim, Hastings, N.Y.

Brooklyn, N. Y.—Mel Stringer's Garage Corporation, under New York laws; authorized capital, $10,000; to operate a garage. Corporators—Frederick R. Huntington, 20 Broad street, New York City; Mel Stringer and Jas. Culleeny, 342 Flatbush avenue, Brooklyn.

New York, N. Y.—Rolaff Oil Carburetter Co., under New York laws; authorized capital, $25,000; to manufacture carburetters. Corporators—Richard Wolfsky, 312 West 114th street; Joseph W. Stone, North Pelham, N. Y.; William G. Van Vleck, 66 Broadway.

New York, N. Y.—Motor Dealers' Contest Association, Inc., under New York laws; authorized capital, $30,000; to promote motor contests. Corporators—Inglis M. Uppercu, 1819 Broadway; Emanuel Lascaris, 1649 Broadway; James C. Nichols, 1671 Broadway.

Changes of Capitalization.

Springfield, Ohio—Victor Rubber Co. from $69,000 to $150,000.

Washington, Pa.—Croxton Motor Car Co. from $300,000 to $400,000.

Clintonville, Wis.—Four Wheel Drive Auto Co. from $110,000 to $250,000.

Cleveland, Ohio—Standard Pump & Engine Co. from $25,000 to $100,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve To Place Many Workers In New Places—Few Leave the Industry.

L. B. Johns has been appointed New England manager of the General Motors Truck Co. He will make his headquarters in Boston.

B. C. Spitzley and W. T. Bush, respectively assistant general manager and sales manager of the Abbott Motor Co. of Detroit, have resigned those offices.

John R. Thomas has been promoted to the management of the Philadelphia branch of the United Motor Co. Previously he managed the branch in Washington, D. C.

R. E. Paris, until recently sales manager of the Olds Motor Works, has joined the Reo Motor Truck Co. of Lansing, Mich. He will have to do with the sales department.

B. D. Arthur, formerly Western sales manager for the Ohio Motor Car Co. of Cincinnati, O., has been elected vice-president of the Croxton Motor Car Co. of Washington, Pa.

George T. Howard has been appointed manager of the Goodyear branch in Washington, D. C. He succeeds Wade Powers, who was promoted to the management of the Philadelphia branch.

R. O. Gresham has been promoted to the post of sales manager of the Warren Motor Car Co., of Detroit. Previously he was the company's superintendent of agencies for the South and Middle West.

John H. Mowe, manager of the Firestone branch in Detroit, has resigned that office to join the Goodyear Tire & Rubber Co. He will take up his new duties about January 1st. Mowe has been succeeded by H. A. Coffin, formerly with the Warren Motor Car Co.

Orin S. Wilson, former manager of the Studebaker branches in Denver and Des Moines and a veteran in the Studebaker service, has been transferred to the eastern half of the country, where he will act as direct representative in the East and South. He will make his headquarters in New York City.

Charles S. Shuman has been appointed sales manager of the Automobile Supply Mfg. Co. of Brooklyn, N. Y., which makes the Newtone electric and bulb horns. At one time, Shuman was connected with the Lovell-McConnell Mfg. Co., but more recently has been serving with the Burn-Boston Battery & Mfg. Co.

On January 1st next, Peyton R. Janney will become general manager of the R-C-H Corporation in Detroit, succeeding J. F. Hartz, who has been treasurer and acting general manager for the past two months and who will retain the office of treasurer. Janney is at present manager of the Peninsular Motor Co., which makes the Marquette car in Saginaw, Mich.

W. J. Leisaw, who for many years traveled Michigan in the interests of the Buick Motor Co., has resigned that connection to become district sales manager of the Abbott Motor Co. for the states of Michigan, Ohio and Indiana. R. S. Bowman, formerly an Imperial representative in the South, also has become an Abbott-Detroit district sales manager. He will cover the States of Iowa, Nebraska and Western Illinois.

John A. Graham, of Boston, has been engaged as general manager for the recently organized Maritime Motor Car Co., Ltd., of St. John, N. B., whose factory near Holbrook, two miles from St. John, is nearing completion. Graham at various times has been connected with the Packard, Brightwood and Westfield companies. The Maritime company will produce a 40-horsepower six-cylinder car which will list at about $3,000.

H. G. Deupree, for two years assistant sales and advertising manager of the Remy Electric Co. of Anderson, Ind., has resigned to become vice-president of the Sourbier-Emrick Realty Co. of Indianapolis. Edward G. Sourbier, the president of the company, was the founder of the Marion Motor Car Co., and only several months since disposed of his holdings in the Ideal Motor Car Co., of Indianapolis, which he helped to organize.

Minor Business Troubles.

Engene Vatet has been appointed receiver for the Dolson Co., of Munice, Ind.; the company operated a garage and automobile supply station.

The George F. Wallin Co., dealer in accessories at 226 West 58th street, New York City, which recently assigned for the benefit of its creditors, has filed schedules; they show liabilities of $6,587, nominal assets of $5,633 and actual assets of $5,131.

Wheel Inventor Purchases a Factory.

John W. Wilson and Philip C. Smith have purchased a former creamery building in Lawrenceburg, Ind., which will be converted into a modern plant for the manufacture of automobile wheels. Wilson is the inventor of a wheel on which a patent is pending, and when issued the wheel will be produced in the Lawrenceburg factory.

In the RETAIL WORLD

Bruce Champion has opened a garage in Osage, Ia.

Kail & Larson have opened a garage in Lohrville, Ia.

George Fisher is having a garage built in Newberry, Pa.

C. O. Kittleson is building a garage in Forest City, Ia.

Joseph Piper is about to open a garage in Shenandoah, Ia.

The O'Harrow Auto Co. is having a new garage erected in Charles City, Ia.

John W. Bowser is building a garage in Seabright, N. J.

Christopher Brisen has opened a garage in San Juan, Cal.

Guy R. Kennedy is building a new garage in Chico, Cal.

Cyrus Everett is making ready to build a garage in Sydney, O.

The Orono (Me.) Motor Co. has opened a garage on Pine street.

E. M. Atwell is about to establish a garage and agency in Gaines, Pa.

Charles J. Moody has established a garage on River street, Elgin, Ill.

H. M. Penn is making ready to enter the garage trade in Madison, S. D.

The Ryan Garage in Montevideo, Minn., has been bought by J. C. Flinn.

J. B. Roach is about to open a garage and machine shop in Van Buren, Ark.

Charles Winters and Walter M. Merle have opened a garage in Garwin, Ia.

Joseph Schmidt of Delleplaine, Ia., is about to build a garage, 60 x 25 feet.

Henry and Hugo Abramson purpose building a garage in Oakland, Cal.

The Coleman-Blank Co., of Albuquerque, N. M., is erecting a garage on 6th street.

John Fowler is building a garage on Lake avenue, St. Louis, Mo. The cost is $9,200.

Frank Cook has taken over the McCue & Beecroft Co.'s garage in Lakewood, N. J.

Paul McAinich has entered the trade in Sedalia, Mo. He has the Overland agency.

S. J. Snittjer has had plans prepared for a garage and salesrooms in Grundy Center, Ia.

A garage is being erected in Springfield, Tenn., for Dolan & Lewis; it will cost $8,000.

Klassen Bros., in McPherson, Kan., have fitted up a former Methodist church as a garage.

Robert Molke of Brooklyn, N. Y., is having a garage erected on Johnson street; the cost is $7,000.

Dayre Courtney has entered the garage trade in New London, Ia. He will also sell cars and supplies.

The Co-operative Motors Co. plans to erect a garage in Long Beach, Cal., at 115 American avenue.

C. C. and J. C. Dorman are principals in a new dealership business at 508 Washington street, Gary, Ind.

Morris H. Wilcher has established a garage in Rock Island, Ill. It is located at 1516 Fourth avenue.

Carson & Granger, of San Jose, Cal., have erected a new garage; they also have taken the Haynes agency.

William Michaelson of San Francisco, Cal., has purchased an interest in the garage business of Joseph Zillianit.

A. Parker, of Baltimore, Md., has let the contract for a garage to be erected at 1018 Morton street; it will cost $1,200.

Jerry Coughlin & Son is the style under which a new garage firm is about to commence business in Fort Dodge, Ia.

The Worcester (Mass.) Automobile Co. just has completed a garage on Vine street; the company deals in Studebakers.

C. M. Marshall & Co. have had plans prepared for a garage to be erected in Lexington, Ky., at 277 North Upper street.

W. N. Bell, proprietor of the Auto Repair Co., in Chattanooga, Tenn., has taken on cars; he will handle the Marion.

Frank Cliber and Andrew Stone, Jr., have opened a garage in Hollidaysburg, Pa. Central Garage is the style of the business.

Fillow Auto Co. is the name under which a new business has been established in Danbury, Conn. Homer Fillow is president.

Ewald W. Lester is building a garage, 40 x 74 feet, in Waseca, Minn. Lester formerly was in charge of W. J. Priebe's garage.

Fred Conrad and others purpose erecting a garage in Baltimore, Md. The site secured is at 1215 North Carolina avenue.

C. C. Worthington is having a garage built in Stroudsburg, Pa. He also is interested in the Buckwood Inn, in that city.

William S. Kreiger is about to establish a tire and accessory store in St. Louis, Mo. He will locatae at 209 North 12th street.

J. M. McCoach and S. P. Hager have established an agency in Huntington, W. Va. They will handle the Abbott-Detroit.

Charles W. Loos & Sons will open salesrooms on Main street, Coshocton, O. Their line includes Overland, Rambler and Ford cars.

Budy Klinkhammer, formerly of Union Hill, Minn., is preparing to build a concrete garage in Belleplaine, in the same State.

W. H. Thompson, of Canaan, Conn., has become a dealer; he has the Ford representation in Canaan and Norfolk, in the same State.

A. D. Woodke of Storm Lake, Ia., has purchased the interest of B. G. Gould in Gould & Woodke; the firm conducts an agency.

A garage firm, in which Warren S. Lee is a principal, has been formed in Altoona, Pa. A garage will be constructed on Green avenue.

Thomas Scheutz of Quanah, Tex., has leased the building occupied by the Panhandle Garage & Sales Co. He will operate a garage.

Thomas Hughes, of Lansdowne, Pa., has leased a building at 18 Crosby street and will remodel it as a garage; he has the Ford agency.

S. E. Vanderveen and Henry Moser have established a garage in Grand Rapids, Mich., at 415 Lafayette avenue; Hill Garage is the style.

W. H. Tyler, Eli E. Tyler and Henry H. Kober have formed a partnership in Pueblo, Col. They propose to do a general automobile business.

The Elyria (O.) Auto Sales Co. is building new quarters on East Broad street; they will include a repair shop, storage rooms and salesrooms.

George O. Jameson, formerly manager of the Interstate Auto & Supply Co., of Des Moines, Ia., has purchased the accessory business of that company; he has transferred it to the Capital City Commercial College Building.

The C. B. Johnston Co. has been formed in Boston, Mass., and will open up in the Motor Mart as dealer in Stewart trucks and Pullman and Ames cars. The officers are: President, H. A. Geuineau; treasurer, C. B. Johnston; secretary, A. M. Johnston.

Wayne P. Zent, who held a controlling interest in the Sterling Garage, Schenectady, N. Y., has sold his interest in that business and will establish a garage and salesroom under his own name at 16 South College street; he will handle the underslung American and the Flanders "six."

T. Jay Holdridge, of the Kansas Flour Mills Co., of Wichita, Kan., has embarked in the automobile business; he has purchased the Cadillac agency in Wichita, which handles fourteen counties. The sale was made by George W. Denton and Chas. H. Smyth, who had owned the agency since its former owner, Bert Richards, died several months ago.

Following the entry of Charles F. Miller into the V. R. Hall Automobile Co., of Cleveland, O., the name has been changed to the Hall-Miller Automobile Co. The company will continue to handle Cartercars and Hatfield trucks; Miller, who formerly was secretary of the Cleveland Grays, will attend to affairs in Cleveland, while Hall will circulate in the territory which the company controls.

The Roberts-Sherburne Co., which recently was formed in Boston to handle American cars, and a company headed by Frank F. Wentworth, dealer in Marion cars in that city, have given way to a consolidation of interests which is styled American-Marion Boston Co. The Roberts-Sherburne Co., which was located on Copley Square, will be dissolved and the new business will be carried on in Wentworth's location at 1002 Commonwealth avenue. Wentworth will act as president of the new company and Frank L. Roberts, of the Roberts-Sherburne, also will hold office. J. I. Handley, head of the American and Marion manufacturing companies, will be a director.

Recent Losses by Fire.

Louisville, Ga.—E. H. Rhodes, garage destroyed. Loss $4,000.

Westfield, Mass.—Elm Street Garage and 25 cars destroyed. Loss, $40,000.

Yarmouth, N. S.—Burrows Garage, Central street, destroyed. Loss not given.

Shreveport, La.—Avery & Spence, 114 Milan street, garage damaged. Loss, $2,000.

Trenton, N. J.—Empire Rubber Co., North Clinton avenue, plant damaged. Loss, $8,000.

Buffalo, N. Y.—Overland Automobile Co., 918-20 Main street, stock damaged. Loss, $20,000. Building loss not given.

NEW YORK DEALER EVOLVES INSTALLMENT SELLING PLAN

Retails Overland Cars for Cash Payment and Six Months of Installments—Ten Per Cent. Added to Latter Amounts.

In selected cases, not a few dealers have sold automobiles on installments, but, so far as known, C. T. Silver, who is practically the C. T. Silver Motor Co., Inc., of New York, is the first to offer automobiles to the general public on the easy payment plan. Silver, who handles the Overland car in New York, Brooklyn, Newark and Asbury Park, has formed the Overland Part Payment Co. to facilitate his operations. It is a co-partnership of two men, of whom Silver is one; the other prefers not to reveal his identity. The Part Payment company has offices in Silver's store at 1601 Broadway.

The system adopted requires the payment in cash of not less than one-half the purchase price of the car selected, 10 per cent. being added to the balance due. For instance, if an Overland delivery wagon, priced at $1,000 f. o. b. Toledo, is chosen, $35 freight charges first are added to the price, making the total cost $1,035. A first payment of $500 reduces the amount to $535, which, plus 10 per cent., makes the total cost to the installment purchaser $1,088.50. The remainder—$588.50—is payable in monthly installments extending over a period of six months.

The only conditions of purchase are the usual ones that obtain in installment sales—i. e., that the buyer maintain insurance upon the car and that title to it remain with the Overland Part Payment Co. until the full purchase price is paid.

Silver naively remarks, however, that there is no rule prohibiting purchasers from paying more than $500 as a first installment, if so inclined. A small saving, of course, results. If, for example, $600 is paid, it would leave a balance of $440—that is, $400 plus 10 per cent., and so on down the financial scale.

Judgment Against Adjuster-Repairman.

The defense of Walter H. Stearns, a former New York City repairman, that not himself but the Walter H. Stearns Co., an incorporation, should have been the defendant in an action brought by the Couple Gear Freight Wheel Co., of Grand Rapids, Mich., apparently availed little, as judgment against him was recorded last week in the Supreme Court for New York county for $397.65, the full amount asked. The Couple Gear's complaint was that more than a year ago, when a Couple Gear truck, owned by the Curtiss-Blaisdell Co., was damaged, Stearns acted as insurance adjuster and then performed the work of repairman, buying parts from the Couple Gear company and also utilizing a factory mechanic. The failure to pay the bill resulted in the suit.

Grabowsky Schedules $759,000 Assets.

Schedules in bankruptcy of the Grabowsky Power Wagon Co., for which a receiver was appointed on November 7th, places its assets at $759,376.48 and the liabilities at $389,758.85.

The chief assets are: Real estate, factory buildings, etc., $168,552.98; cash on hand, $17,324.11; bills, promissory notes and securities, $63,959.12; machinery, tools, etc., $109,273.12; patents, $150,000; other personal property, $122,967.79; debts due on open accounts, $126,011.36; insurance policy, $1,000; unliquidated claims, $238. The debts are made up of: Taxes due, $5,492.64; wages, $792.95; unsecured claims, $339,586.97; notes and bills which should be paid by other parties, $43,706.29.

To Produce Wet Batteries in Galena.

Having acquired the necessary financial support, E. E. Winters and J. W. Hake, of Chicago, who have developed a storage battery of considerable merit, have formed the Galena Battery & Vehicle Co., which shortly will commence operations in Galena, Ill. In addition to the inventors, the company is composed of W. H. Harris of Indianapolis and Gus E. Brown of Galena

Thermoid Sues for Unpaid Account.

An alleged unpaid bill of $153 for goods sold and delivered is the cause of an action instituted this week in the Supreme Court for New York county by the Thermoid Rubber Co., of Trenton, N. J., against George H. Sprague, trading as the Sprague Auto Supply Co. He is located in Hewletts, Nassau county, N. Y.

Garage Consents to Oil Bill Judgment.

The action brought in the Cupreme Court for New York county by the Texas Co. against the Mohawk Garage Co., of Brooklyn, N. Y., on a bill for oil, was not tried when it was reached, Tuesday last, 17th inst. When the case was called the Mohawk permitted judgment to be taken in the amount of $778.61.

Streator Failure Involves Body Builders.

F. F., Al and Oscar Zimmermann, who built automobile bodies at Waupun, Wis., have filed a petition in bankruptcy. They were brought down by the recent failure of the Streator Motor Car Co. of Streator, Ill., for whose Halladay car the Zimmermanns made bodies.

CAR MAKERS AND CARBURETTERS.

If need be, let this be considered an appeal for the unknown or the little known carburetter. There are many of them, we well know—probably much chaff and surely some wheat; but good or bad, their makers have a difficult time securing the ears, much less the real attention and support, of the car manufacturers whom they seek to interest.

It is not meant to say that the well known and well established carburetters are lacking; but it is meant to say that many of the unknowns and little knowns hold promise of results that justify more than polite notice.

It is a fact that individual owners have almost revolutionized the performance of their cars by simply changing carburetters. In many instances, the results achieved have been not short of marvelous. The cars have gone faster, climbed better and handled more flexibly and more economically in almost every direction.

The car manufacturer, however, remains wedded to one, or two, or three, or four particular carburetters and more or less resolutely refuses to have to do with that which is new. Perhaps his attitude is born of experience; perhaps it is born of price; but whatever the cause, the belief is spreading that while all engines will work with any carburetter, they will work very much better with a particular carburetter, and in many instances the improvement is prodigious and far-reaching.

As indicated by individual experiences, it does not seem fair to those who purchase his productions that any car manufacturer should lift a deprecating hand toward any carburetter, however new or little known. It will not be denied that the carburetter is a vital factor—possibly the most vital one—in the performance of any car, and since no manufacturer should be satisfied with less than the best possible performance he should welcome whatever offers to that end.

The new carburetter that is gratuitiously presented to him should not be suffered to accumulate dust and cobwebs on the shelf; it should be put to use and tried out thoroughly in the only school worth while—the school of actual road use.

It is fair to believe that so many cars can be made so much better by a mere change of carburetters that the wonder is that a narrow policy should prevail in any factory in which automobiles are produced.

STEEL WHEELS AND WOOD ONES.

As was perfectly natural, the materials employed in the construction of early automobiles were the materials used in carriage and wagon building at the time, and they were the best materials then known for the purpose. By degrees, however, the wood and wrought iron of horse-drawn vehicles gave way to steels of various kinds and qualities, until now there is little of the typical chassis that is not built of steel, excepting the engine, of course, and the wheels, which in the great majority of cases are of wood.

Whether wood will remain in the ascendancy for wheel construction, however, is a question that can be decided only by time and the process of elimination and the survival of the fittest. It seems certain that there will be an increase in the employment of steel wheels, which are made in a number of forms and types. Steel wire wheels, which were used on many early machines, only to be abandoned in favor of wood, again have become popular in Europe and are attaining popularity here. Pressed steel wheels are and have been for years in use on light commercial vehicles. Cast steel wheels are finding favor in the eyes of manufacturers of heavy trucks. Tubular steel wheels, having the outward appearance of wood wheels, have been built for years and have much to recommend them.

While the claims of wood wheel manufacturers, in effect that the wood wheel is the best wheel, are given great weight by the fact that the wood wheel is now the standard type, it is said, on the other hand, that the demand for the very high grade of timber necessary for the wheelwright's purposes is increasing so fast that the supply cannot keep pace with it. Such being the case, the inevitable result will be a movement in the direction of steel, which is becoming cheaper to buy and cheaper to manufacture as time goes on. And it seems probable that in the case of wheels as in the case of many other things, steel construction eventually will embody all the advantages of wood and combine them with its own peculiar virtues. And last, but not least, doubtless the manufacturers of wood wheels will gradually change over, with the demand, to the building of steel wheels, just as many former manufacturers of horse-drawn vehicles have gradually turned from the old to the new and now are full-fledged automobile manufacturers.

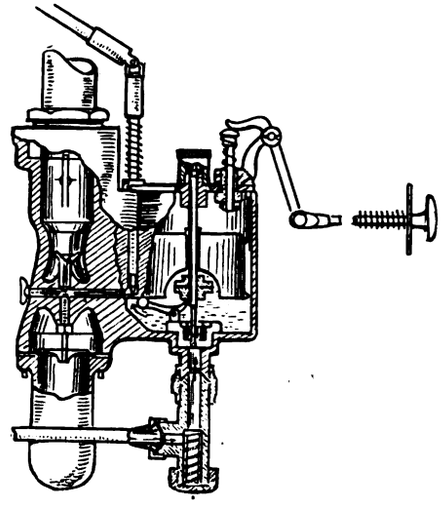
CHRISTMAS SPIRIT ENTERS INTERNATIONAL "LEAGUE"

Proof of it Spread on Directors' Minutes—Crying Demand of "Hundreds of Members" is Generously Granted.

There was a momentous meeting in Buffalo one day last week—a meeting of the International Automobile League, Inc. It is probable that all of the four men who comprise the "league" were present, and it is not impossible that they chuckled quietly at the success they have met in inducing full-grown persons to pay an annual fee for the remarkable privilege of buying goods which they have for sale. At any rate, it is certain that they considered a very serious subject; they desire to have it believed that they considered it only in response to the "request of hundreds of members," which is the touching definition applied to the fee-givers.

These alleged "requests" of the alleged "hundreds" of alleged "members" induced the "league," in solemn session, to adopt and spread on the minutes of the meeting the following motion:

"Moved, seconded and carried that all members of the League be permitted to buy any article listed in our catalog for their friends for holiday presents until January 1, 1913."



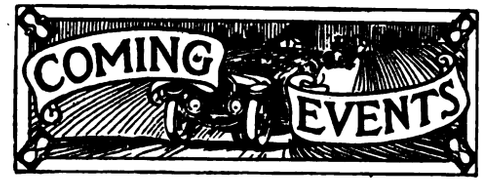
The "hundreds of members" who made the "request," and many others who did not make it, have been gracefully informed of the granting of this generous dispensation, the information being conveyed on a pretty letterhead which at its top bears a reproduction of the yellow flag which the "league" has adopted as its hallmark, and at its foot a delicately engraved annotation, "This letter was dictated to the dictaphone, but not re-read." The "league" is nothing if not circumspect, even when addressing its "members." At last accounts, however, Santa Claus had not designated the Buffalo institution as a dispensary of Christmas gifts for any of his "friends."

Price of Platinum Continues to Soar.

It is probable that if those persons who are wont ruthlessly to file the platinum contacts of their magnetos knew the present market price of the metal they would be less favorably disposed toward the file as a cleansing implement. Unlike other precious metals, platinum continues to increase in cost, and at the present time the top notch price recorded in Maiden Lane, New York City, is $47.50 an ounce for the hard metal, such as is used for contacts, and $45 an ounce for the soft metal. No satisfactory substitute for the metal ever has been found, and the present chief source of supply, which is in the Ural mountains in Russia, scarcely is more than sufficient to fill the demand.

Little Known Features of Well Known Cars

That variations in temperature and in humidity each have an effect upon the operation of a motor is a fact that is only too well known to the veriest novice at motor car operation. Altered atmospheric conditions naturally mean altered proportions of



FRANKLIN NEEDLE VALVE CONTROL

air and fuel which enter the cylinders, provided carburetter adjustments have not been changed, and any change in the relative quantities of air and fuel effects the operation of the motor. For these reasons not a few designers of motor cars believe such a thing as an adjustmentless carburetter, while it may operate and give really good results, to be not a little inferior to the type wherein the relative proportions of gas and air can be manually altered.

Such is the belief of the designers of the Franklin car, and it is responsible for the production of the carburetter shown in the accompanying illustration, the feature of which is the facility with which the flow of gasolene to the single jet can be increased or decreased simply by turning a small lever on the end of a shaft which protrudes through the dash. Naturally the shaft is a continuation, or better, an addition to the needle valve stem, the valve being operated through the intermediary of a universal joint. Adjustment can be made without the driver leaving his seat.

Depression of a pedal closes the starting switch and the electric motor turns the gasolene motor over at high speed until the engine takes up its own cycle of operations.

December 7-22, Paris, France — Paris Salon.

January 2-10, New York, N. Y.—Importers' salon in Hotel Astor.

"SELLING STUDEBAKER CARS" DONE BY SALESMEN-ACTORS

Corporation's Branch Managers, in Conference at Factory, Stage a Play with a Purpose—Novel Means of Education.

As carefully staged as a Broadway play and with an "all-star cast," carefully coached in the individual roles, a group of men prominent in the automobile trade held an audience in Detroit one day last week with a production, the nature of which was absolutely unique.

"Selling a Studebaker Car" was the subject. The members of the cast were picked from the Studebaker Corporation's corps of branch managers ,assembled in annual conference.

The play was in two acts, the first treating of the sale of a Studebaker "35," while the second concerned itself with the lighter car of the line—a Studebaker "25." The star part was naturally that of the salesman. This was taken, respectively, by Geo. H. Phelps, manager of the Studebaker automobile branch in New York, and by L. J. Ollier, who has charge of the firm's branch in Los Angeles. The prospective buyers were well-posted Detroit business men, not connected with the Studebaker organization and representing as nearly as possible the typical automobile "prospect."

Particularly novel was the choice of a "stage villain." This part was taken in a collective way by other branch managers, each of whom had been instructed to argue the merits of some competing car. Arthur I. Philp, assistant sales manager, acted as stage manager.

Both the branch managers chosen for the star parts are famous in the Studebaker organization for their intelligent enthusiasm over the Studebaker product. They had carefully studied their problem to make the demonstration as near the ideal as possible. The "approach" was adroit, and applause was frequent as the members of the audience recognized the application of basic principles of the salesmen's art.

The fun began, however, when the "heavy" characters butted into the dialogue by advancing the arguments of alleged superiority on behalf of rival cars. This was done, of course, to illustrate many easy methods of refutation. Some of the most expensive types on the market were represented by men thoroughly familiar with them. When the debate had been ended, the star seized the opportunity in approved style, and closed his "sale" by prompt production of a fountain pen.

A further touch of realism was given the sales drama by one of the "buyers" who, although playing a role in the play, was so impressed by the points of superiority demonstrated for the Studebaker car that he visited the Detroit branch the next day and entered a real order for one of them.

While the dramatic production was one of the most interesting features of the big Detroit conference, it was only a part of a systematic, studious week which the Studebaker men spent at Detroit along plans formed by Sales Manager Ernest R. Benson. Morning and afternoon sessions were held and sales policies thoroughly discussed. One day was devoted to a clinic on the new models, during which Chief Engineer J. G. Heaslet held the floor for six hours, explaining the mechanical details. One day was spent at the Studebaker vehicle factories at South Bend, Ind.

Prior to their departure, the branch managers joined in presenting General Manager Gunn with a handsome catseye diamond scarfpin, as a token of their appreciation on the first anniversary of his connection with the company. During this period Mr. Gunn has virtually reorganized the sales and manufacturing methods of the Studebaker automobile division.

Court Rules on Point in Bankruptcy.

That a trustee in bankruptcy may be sued for debts which he contracts as trustee was held to be the case on Tuesday of this week, 10th inst., by Judge Holt of the Federal court in New York City, in the case of the Dorian Remountable Rim Co., which has been in the bankruptcy court for several months. The decision was a denial of a motion made by the trustee, Joseph M. Conklin, asking that the Standard Nut & Bolt Co. be enjoined from suing him for an account of $300.54.

This amount represents the price of goods ordered by Conklin but which he states he refused to accept because the delivery was delayed. The bolt company, which has brought suit in the Municipal court, declares its claim is bona fide. The court denied Conklin's motion with the statement that it had no authority to forbid the bolt company continuing its suit, inasmuch as the debt was contracted following the filing of the petition in bankruptcy. Had the debt been contracted perviously, the suit could not be brought without the permission of the Federal court.

Collars to Match Prominent Cars.

In a haberdashery in Springfield, Mass., Packard and Pierce-Arrow collars are being offered for sale, presumably as a bid for the patronage of the owners of those cars. Carried to its logical conclusion, it is possible shirts, neckties and socks to match the names of cars will soon appear.

TIME AS CAPITAL AND WAYS OF ELIMINATING ITS WASTE

Careful Planning Can Conserve That Which Is One of Salesman's Greatest Assets—"Waits" That Cut Holes in Profits.

Selling expense is a big item in the book of every dealer. Often it is **the** big expense. How to get greater efficiency out of yourself and out of your salesman is a problem worthy of your most concentrated thought.

It means planning your time carefully, going over each detail carefully in advance, thinking about every probability, scanning the situation backwards and forwards, the taking of pencil and paper and putting things down, the making of appointments and keeping them, **the elimination of as** many "waits" as possible. It means making others appreciate the value of your time by handling it as if you yourself set a distinct value on it.

Time is the salesman's capital. This has been remarked before; it probably will be said and written a good many more times before everyone grows wise to the fact that there is much more than a commonplace statement in that sentence. Time is the salesman's "wealth employed in or available for production"; in that respect time is the salesman's "capital."

When you see a demonstrating car resting easily at the curb of a popular billiard room you are very much inclined to question how much of the salesman's wealth is "employed in and available for production." Indeed, you are quite likely to think of sales leaks and losses. Such appearances are not always conclusive; nevertheless, the thought is inevitable.

Too many salesmen waste their time. They "cash in" enough to pay a profit, perhaps, but not anywhere near their full possibilities, simply because they do not conserve their time—their capital, if you will —by carefully planning for every moment of its use in advance of the demand.

Just as a bill once broken disappears rapidly, so a day not well planned and the plan stuck to, is frittered away; thus, at the close, instead of feeling glad because of a good day's work done, we are quite likely to say with the late Cecil Rhodes of South Africa, "So much to do; so little done!"

The Krit Motor Car Co., of Detroit, has established a branch in Oklahoma City, from which the States of Oklahoma, Texas and Arkansas will be handled. It is in charge of R. B. Fremont, as district man-

PERSISTENCY AS SALES HELP

Close Following Up of Prospective Buyer and Urgent Argument May Prove Convincing—One Unusual Method.

"It took me two years to sell an automatic water heater to Mr. Connover," said a salesman on board a train the other day. "I nearly ran my legs off after him the first year; but for various reasons he put off having it installed. I had called at his office time and time again. He had always given me a courteous reception and listened attentively to what I had to say; but I could not seem to get his order, even though he seemed interested.

"One September day I fine-tooth-combed my list of prospects; the only one that it seemed to me would be ready to do business was Connover. I decided to sell him or bust. I 'phoned to his office; he was not there. They told me he was at home. There was a street car strike on, so I walked to his home—four and a half miles away. It was one of the hardest walks I ever undertook.

"When I got to the house I found Connover was laid up. He had experienced a peculiar accident—cranked his car with the high gear in mesh and the car had knocked him down and run over him. He was just getting up—had his dressing gown on—and when my card was taken to him he walked to the top of the stairs and called down that he would be glad to see me some other time.

"I replied that I had walked four miles and a half to see him. I had to sell a water heater that day, and he was my one prospect that I thought ought to have an automatic water heater at once; so I had come out to get his order. I finished up by telling him that I was so tired from my long walk that I was going to stop and rest, anyway—and was going to stay till I got his order. Connover smiled and said, 'Well, old man, you write the order and I'll sign it.'"

It is the last little push that brings the name on the dotted line. Everyone admires grit, and the man who will dare a nine-mile walk on a hot day to get an order is almost certain to get it if his goods are right.

Fortunately, the automobile salesman does not have to walk; but he often gets a chance to display the same qualities that make for success in other lines, where competition is still keener; persistence and determination are well worth developing to a high pitch.

SPECIAL TRAINS THAT FOLLOWED A STRIKING AD.

When L. J. Ollier, manager of the Studebaker branch in Los Angeles, Cal., received word of a five-page announcement that the Studebaker Corporation was to publish in the Saturday Evening Post he got busy.

Every dealer in his territory was notified. Every sub-dealer was likewise notified, so that every man interested knew what was coming and had a chance to plan accordingly.

Everybody was watching for the advertisement when it appeared; every dealer had staged the advertisement by means of posters furnished by the manufacturer, so that everyone worth while in all towns reached by these dealers knew that the advertisement was coming out on a certain date. Naturally when they got their copy of the Saturday Evening Post the first thing they did was to turn to the Studebaker announcement.

As a result of this careful planning, it is a matter of history that when the new Studebaker models arrived in Los Angeles the sub-dealers had lined up out-of-town prospects to the number of twelve hundred who came in three special trains loaded with people eager to see the new models on their arrival.

Such a thing is unprecedented in the history of any kind of merchandising and shows what can be done where every detail is worked out in advance, interest aroused and then people invited to do a definite thing. In this case the definite thing was "come and see"—and have dinner at the expense of the branch.

SHOW WINDOWS AND BOOK COVERS ARE VERY MUCH ALIKE.

One way of getting the outsider's viewpoint of a place of business is by conjuring an analogy between show windows and book covers. Every business man knows the difference between show windows and book covers. Every business man knows the difference a book's exterior appearance makes with its attractiveness in the mind of a prospective reader—or buyer. The poorly gotten up cover is taken as an indication of an uninteresting piece of reading, and while the book itself may be one of the best, its biggest handicap in the race for popularity is its cover. That a very average book has an attractive cover may serve to cause a prospective reader to start reading and complete the story. Likewise a better book may be completely ignored because of its exterior appearance.

The show window and store front are the covers of the store; they act as do the covers of a book. The primary function of a store front is to form a barrier between the interior of the store and the outside world, and that—protection—was the original idea in the book cover, and both still retain their original use. But book makers realize the value of pretty and attractive covers and act accordingly. Dealers may do the same, if they but will. However fine the line of goods may be the man who is unacquainted with what is inside is going to make a bee line for the attractive and up-to-date front where the show windows are show windows in reality and not a repository for junk.

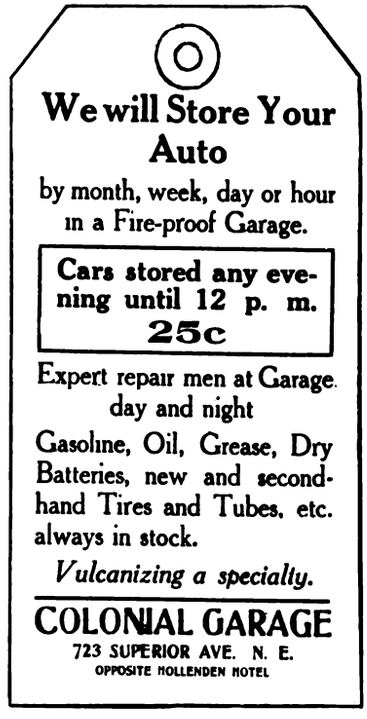
AWAKE N DISING WORLD

MAKING SERVICE UNDERSTOOD

Term Often Vague in Mind of Car Owner—Explaining It Enlightens Customer and Proves Trade Winning Story.

Too many electric car salesmen talk about service without giving the prospective customer a real insight into what it means. The word "service" is an intangible thing so long as it is unexplained. The man who talks about "service" should have something definite to offer and should not wait till he is pinned down to explain just what he and his concern mean by "service."



Service is such an important item in the sale of an electric car that it can well be emphasized when making a sale. Indeed, unless it is properly explained in detail, the prospective customer may wonder why garaging at an electric car garage costs so much more than the flat storage rate paid by gasolene car owners.

A dealer in electrics who has a complete service station says: "Our service is as complete as we know how to make it. We charge a rate of $42 a month for complete service. We deliver and call for customers' cars. He sets the time, and on the dot his car is waiting for him at the curb. At night when he is through with it he 'phones and someone calls for it and brings it to the garage. Here all the cushions are taken out and the car thoroughly cleaned with air brushes. The car is then placed on the washing rack and afterwards given a chamois-skin rub-down. This is done every night, so that your electric is just as neat and clean and spotless every day as any part of your house. Batteries are inspected every week and charged as often as needed. Any defects or irregularities in batteries are immediately discovered and everything kept in perfect repair. If you want a flat storage rate we charge exactly the same as any gasolene garage. But, consider that you have absolutely no expense except for tires or accidents that is not covered by our complete service charge."

If all electric car salesmen would be as careful to drive home all these points they would find it highly profitable.

TAG THAT HELPED A GARAGE.

Advertising a garage in a large city is not the simplest problem in the world. Generally speaking, each garage depends for its patronage on the automobile owners residing in its immediate vicinity, which means that advertising in the daily press entails an expense that is out of reason to the probable results. Perforce, the garage proprietor must resort to other means for drawing new trade.

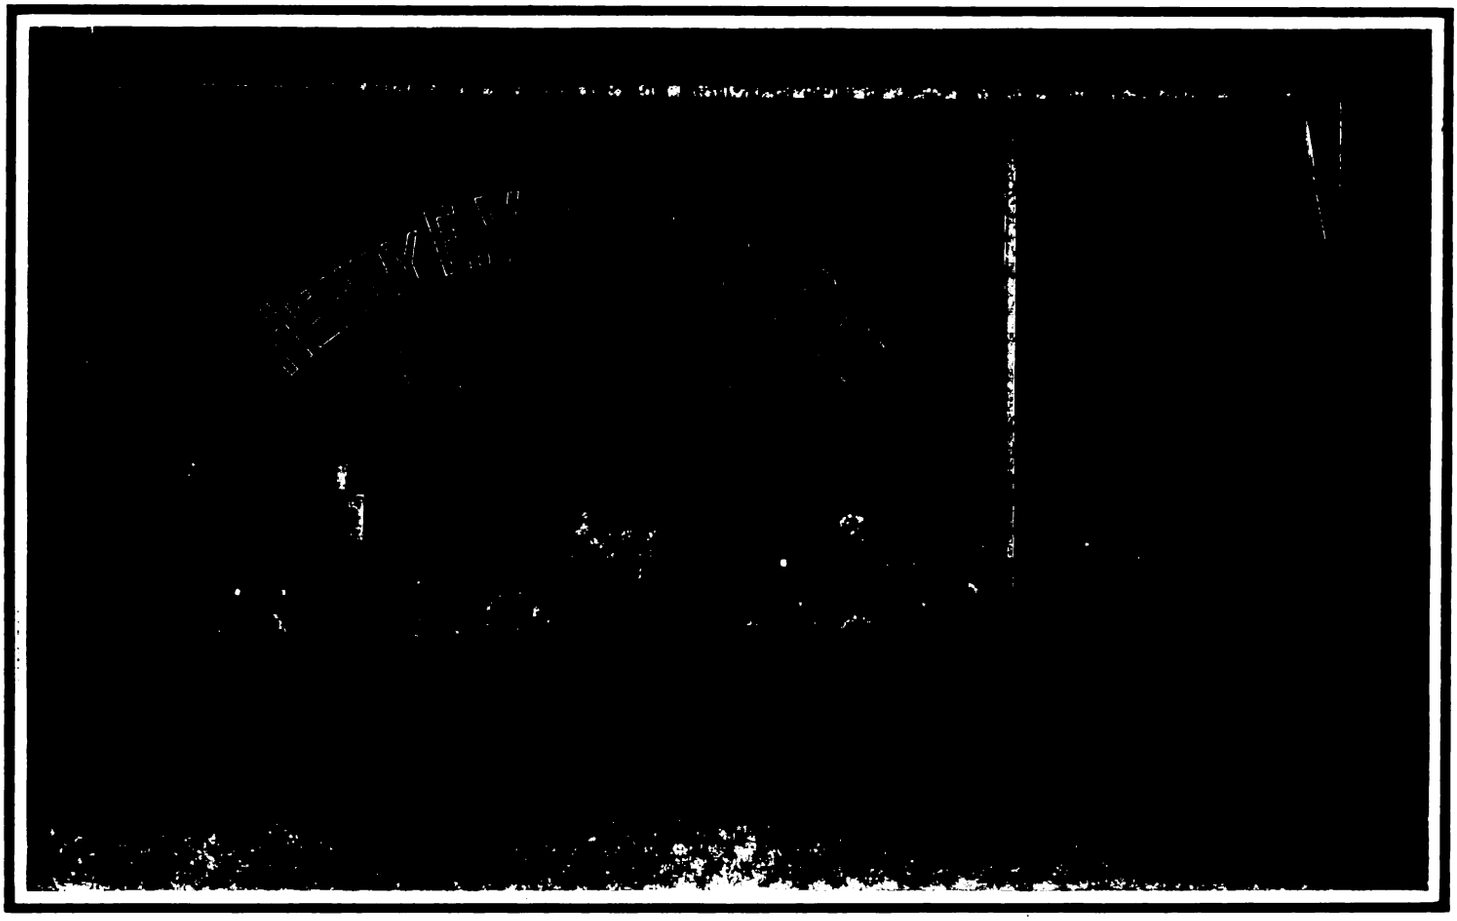
In Cleveland, O., the Colonial Garage Co., which is located at 723 Superior street, North East, has found the tag, reproduced herewith, an economical and effective business-bringer. During the absence of the owners, it is tied to the steering wheels of cars which Colonial garagemen find standing outside of office buildings, theaters and hotels in the immediate vicinity, which procedure means that it can not be blown away, or thrown away, without attracting notice of some sort.

The fact that the tag also names a special rate for storage up to 12 P. M. makes a direct appeal to theater-goers, and to others who appreciate the difference between safely storing their cars in a reputable garage and leaving them unattended at the curb.

CHRISTMAS SUGGESTIONS.

Christmas will be here in six days. What kind of display are you going to have? Will you have a little of the Christmas spirit felt in your salesroom by means of appropriate decorations? Why not "fix up" a little for Christmas and then extend invitations to some of the people whom you know intend buying a car with a view to their making it a Christmas present to their family?

It would not work with everyone, of course. But it's worth trying—and you can never tell how good an idea it is until you have tried it. Suppose you try it.



EVIDENCE OF WIDEAWAKENESS.

Immediately after the appearance of the last issue of Motor World, one "live wire" Detroit dealer followed its suggestion of putting up a big "anti freeze" sign in the garage. Another one put a sign on the garage entrance so that everyone coming in would see it. And another was observed with a window sign reading "Orders for Hood Covers Taken Here." One of the surest indications of the real merchant is the quickness with which he adopts good suggestions.

WEAVING CHRISTMAS SPIRIT INTO ACCESSORIES

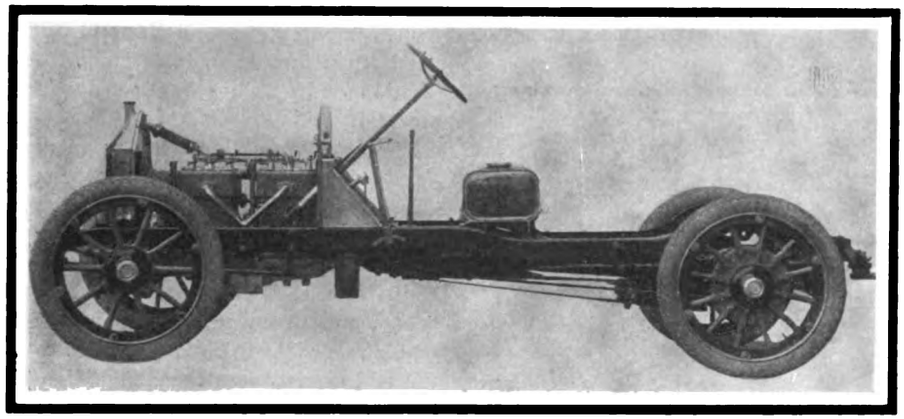
Dealer Catches the Public Eye by a Yuletide Show Window—Santa Claus Causes Passersby to Stop and Smile—Clever Display Which Shows That Seasonability in Window Dressing Is Easily Possible.

BROOKLYN ACCESSORY DEALER'S WINDOW DRESSED FOR THE YULETIDE SEASON

Putting the Christmas spirit into a show window display during the holiday season, having a Fourth-of-July dressing at that time of year; bringing out a Thanksgiving Day effect when this holiday is at hand, and in every instance maintaining a seasonable setting for wares displayed is recognized by wideawake merchants as one of the basic principles of window dressing. Unfortunately, not a great many of those who sell automobiles or automobile accessories strive for such effects. One of those who does so and who has taken advantage of the Christmas season as an advertising asset is the firm of Henry E Vaughan & Son of 1168 edford avenue, Brooklyn, N. Y. Leo H. Vaughan, now the active member of the firm, is the "Son," and while he is accredited with being the business head of the house, he admits he was assisted by his wife and his mother in evolving an attractive Christmas show window

Vaughan has succeeded in getting a striking effect, shows a large quantity of goods, and still does not give the window the too usual appearance of being overcrowded; no photograph is capable of presenting the window as it is seen by the passerby, but a reproduction serves to illustrate the general scheme, even though the picture does not show the glistening snow and bright accessories which make up the whole.

What first strikes the eye is a miniature house with snow-covered roof, standing in the midst of a snow-blanketed landscape which sparkles like the light, new-fallen snow of winter. The snow is nothing more nor less than cotton batting sprinkled with ground mica. This house has upon its roof a Santa Claus, with a pack, about to descend the chimney. In the front yard are his reindeers, somewhat startled in this atmosphere of horselessness; at the left of the house, viewed from the street, is a little garage containing a limousine, while two tires stand beside the doors. Lawn shrubbery accentuates the air of reality.



Back of the house, not detracting from the beauty of the scene but nevertheless asserting its right to a part in the display, is a black, circular tire trunk. At each side of the window three glass shelves are arranged in steps, and upon them are placed goggles, small tools, speedometers, clocks and an innumerable number of polished articles. The shelves at the left are banked with boxes of polish, and this section, while it may be said to be the least attractive part of the layout, is cleverly grouped and harmonizes well. Horns, mirrors and bright metal pieces are strewn with a designed carelessness over the landscape and over all is a sprinkling of mica. The mica on these polished parts gives an effect which is peculiar and striking and calculated to attract attention.

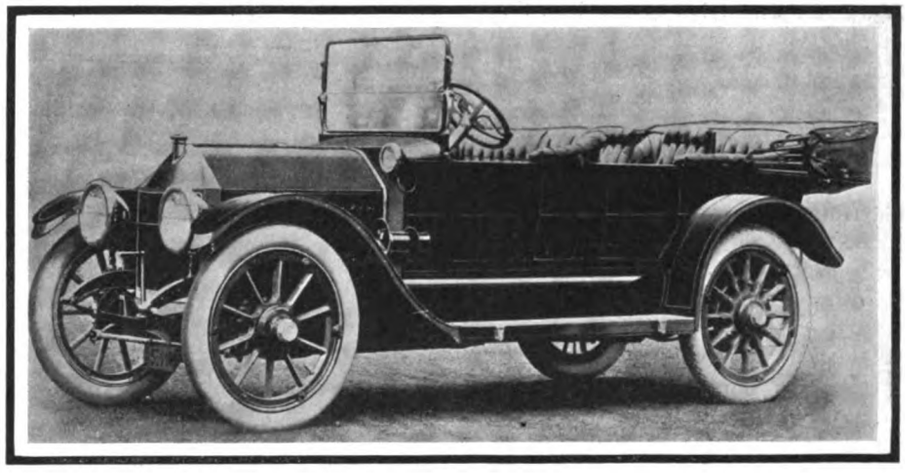
FIRST OF THE CHEVROLET "SIXES" MAKES ITS DEBUT

Proves Exceptionally Quiet and Flexible in Demonstration—New Air Starting Device with Rotary Motor.

Embodying a number of unusual constructional ideas that give some slight evidence of foreign inspiration, the first product of the Chevrolet Motor Co., of Detroit, Mich., which is the smaller of the two "sixes" that eventually will go to make up the line and is styled the Chevrolet "40," at length is ready for distribution, after having been in active course of preparation for more than a year.

CHEVROLET "SIX" CHASSIS, SHOWING INTAKE SIDE OF MOTOR

In fact, as long ago as June of the present year, the first cars came through the factory, and though they were merely experimental vehicles, their appearance and their operation under demonstration in the streets of Detroit and environs left little to be desired. Under the guidance of Louis Chevrolet, who is the accredited designer of the car and for whom it is named, the car was put through its paces for the benefit of a Motor World man, and the manner in which it could be made alternately to crawl along at less than two miles an hour—on high gear, of course,—and to skim over the highways and country roads at better than 50 miles an hour was nothing if not remarkable.



Time after time the motor was throttled down so that it barely turned over, and with high gear enmeshed the throttle was opened suddenly to the limit without eliciting the usual choking and missing that generally accompanies such practice with a great number of motors. Instead, the motor "picked up" quickly and steadily, until, at approximately 55 miles an hour, it was necessary to apply the brakes by reason of the threatened activity of the police. Vibration was singularly conspicuous because of its absence. In fact, it is doubtful if any one feature of the car is calculated to impress to a greater degree than the absence of vibration, unless, perhaps, it is its quietness. Even at high speed on intermediate gear, the vibration was nil, and the motor was no noisier than it was at 10 miles an hour.

Later, when the car had been returned to the factory floor, Chevrolet successfully balanced a lead pencil on the motor, the while increasing the speed until 2,000 revolutions a minute was registered by the tachometer. At the time, the tires were pumped up to 85 pounds pressure and the car stood on a comparatively flexible wooden floor that was calculated to induce rather than to reduce vibration.

The reason for the absence of vibration, it is pointed out by Chevrolet with a considerable degree of pride, is due to the shape and construction of the crankshaft quite as much as to the careful manner in which the weight of reciprocating parts has been kept down to the minimum and the care that is taken in assembly. The crankshaft is a drop-forging and is peculiar in that it has semi-circular counterweights forged integral with it, the result being that they act as supplementary flywheels, in a sense, and ensure positive continuity of motion without interruption of balance. The weights are so shaped and located that, if the crankshaft were to be placed on an inclined plane, it would roll down it by gravity, the semi-circular pieces supporting it alternately.

The motor is an unusually compact design, with its six T-head cylinders cast in blocks of three, the bore and stroke being 39/16 inches and 5 inches, respectively. From which it may be judged that there can be no doubt of the aptness of the designation long-stroke. The motor is supported at three points in the chassis frame. Connecting rods are drop-forged I-beam section with die-cast babbitt bearings, and the pistons are of the convex type. The main engine bearings also are die-cast babbitt and measure 2 x 37/16 for the front, 25/16 x 3⅛ for the center and 2¼ x 4½ for the rear bearings. The crankcase is aluminum and the camshafts are drop forged with the cams integral.

By way of reducing necessary noises to the minimum, the timing gears have been made of the helical type and run in oil. Ignition is effected by means of a dual high tension magneto system and cooling is by centrifugal pump circulated water. The lubrication system is a combination of force feed and splash, in which great pains have been taken to ensure against the possibility of smoking. "Mixture" is furnished by a float feed carburetter, especially developed for the motor and fitted with an exhaust gas heating arrangement.

CHEVROLET SIX-CYLINDER "40" SIX-PASSENGER MODEL

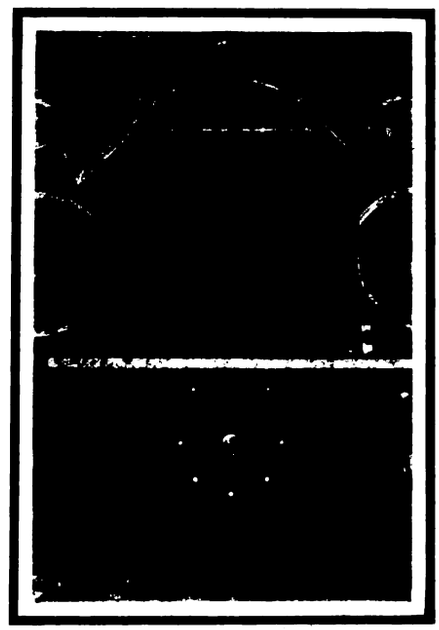
For motor starting purposes and also to inflate the tires, the English compressed air system has been adopted. In its simplest aspect it consists of a twin opposed air compressor which is hung beneath the propeller shaft and driven through gears from it, an air tank, and a small rotary air motor which is hung beneath the chassis frame and drives the gasolene motor through the intermediary of gearing cut on the peri-

Digitized by Google

phery of the flywheel. A pedal, conveniently located near the driver's foot, serves to place the air compressor in operation for the short time necessary to obtain the required pressure. The lever which controls the air starting motor is located on the dash. In operation, the turning of the lever serves first to enmesh the gears between the air motor and the engine and in the same instant to turn on the air, thus "spinning" the motor at a fairly high rate of speed. Immediately the motor picks up its own cycle of operations, the gears automatically are "kicked" out of engagement, nor is it possible to engage them with the gasolene motor running.

From the motor, power is transmitted to full-floating rear axles through the intermediary of a large diameter, leather-faced cone clutch and a three-speed selectively operated gearset with the control lever located in the center of the footboard. The steering wheel is placed at the left side with the emergency brake lever, which is unusual in construction, at the left. In designing the emergency brake lever cognizance has been taken of the desirability, or, rather, the necessity, of being able to get quick action. To this end, the lever is cranked about six inches from its upper end, the handle portion projecting toward the driver. Its position, therefore, is nearer than ordinarily would be the case, and the construction is such as to permit a perfectly straight pull-back with minimum exertion.

The front of the chassis is supported on the orthodox pattern of semi-elliptic springs and the rear is supported on three-quarter platform members, which type was chosen by reason of its greater resiliency and reduced tendency toward side sway. Both sets of brakes are equalized and are located in 16-inch rear wheel drums which are lined with Raybestos and carefully protected from dirt. Service brakes are pedal operated. The wheelbase is 120 inches and the wheels are shod with 35 x 4½-inch tires mounted on demountable rims.



In external appearance, the Chevrolet car is distinctive by reason of the use of a V-radiator, and is low-hung with high, flush sides unmarred by such projections as door handles and latches. The running boards are clear and the lines are well blended both at the rear of the tonneau and at the junction of engine hood and dash. Trimmings are in nickel plate and black enamel; electric lights are used throughout.

In the matter of equipment there is little that is missing; the price of the car, which is $2,100, includes mohair top with envelope and side curtains, windshield, speedometer, dynamo electric lighting system, compressed air engine starting system and the usual equipment of tools, spare parts, pump, jack, horn, tire repair kit, etc.

HARTFORD STARTER MADE APPLICABLE TO USED CARS

Ingeniously Adapted Literally to Take the Place of the Crank —Size and Weight Facilitate Matters.

Working on the theory that there is just as big a field for the exploitation of the electric engine starter among users of cars which are not so fitted as there is among producers of new cars, the Hartford Suspension Co., of Jersey City, has placed upon the market a "revised" edition of the Hartford starter which is intended for attachment to any car, whether new or old, with a minimum of labor; placing the device involves no changes in the car mechanism other than the removal of the starting crank.

HARTFORD EXTERNAL STARTER

The starting unit, which embraces a 1/3 horsepower motor and a double worm reduction gear, attaches to the crankshaft in place of the starting crank, the weight of the motor, which is but 24 pounds, being carried by a bracket riveted to the front cross member of the frame. The dynamo, which is a separate unit, can engage with the engine at the most convenient point; it can be frictional driven from the flywheel, or belt driven from the propeller shaft or fan belt wheel, according to conditions. It is of the constant speed type, the speed being regulated by means of a friction clutch operated by a centrifugal governor which disconnects the dynamo shaft from the driving shaft when the speed of the latter exceeds a predetermined limit. With the addition of a magnetic cut-out for the purpose of disconnecting the battery from the dynamo at such times as the electromotive force of the dynamo is below that of the battery, and which is positioned on the dash, and a 12-volt, 35-ampere-hour battery, the system is complete.

Low Develops a "Forced Induction" Four.

After introduction to the motoring public in the form of a single cylinder motorcycle engine and subsequent extensive experimentation, Dr. A. M. Low, who is a British inventor, has further perfected his "forced induction petrol" motor, his latest design being a four-cylinder automobile engine which, according to all accounts, gave a more than ordinarily convincing demonstration of its ability on Brooklands track recently.

The new four-cylinder motor operates on exactly the same principle as the smaller "single" that was illustrated and described in Motor World under date of April 4th, "petrol" being contained in what in other engines is the water jacket, where it is heated and expanded, thus creating considerable pressure, which is employed to inject the fuel directly into the combustion chamber somewhat after the manner of a Diesel engine. Compression is approximately 150 pounds to the square inch.

Despite the fact that the engine is rated at 16 horsepower, according to the R. A. C. formula, it is said to be capable of developing no less than 100 horsepower at the phenomenal speed of 3,000 revolutions a minute. Among the other claims that are made for it are that it is exceptionally flexible, that it may be throttled lower than the ordinary engine without danger of "stalling," and that its requirements in the way of fuel are so exceedingly modest as to occasion surprise, as many as 40 miles to the gallon of "petrol," which is the British name for gasolene, having been obtained.

Effect of Porus Nickel Plating.

Nickel plating not infrequently is porus to a considerable degree, and therefore is permeable to moisture. If the metal plated is iron or steel, water penetrating porus nickel plating may easily cause rust, which passes through the pores of the nickel discolors the finish and gives rise, sometimes, to the idea that nickel itself will rust. The formation of rust under the conditions referred to is, of course, destructive to the plating.

Weakening Rivets by Hammering.

Too much hammering in heading a rivet often is worse than not enough, because the metal will be so weakened that the head will be broken off under comparatively slight strain.

REILLY CLAIMS TO BE THE ORIGINAL "SPUG"

Sales Manager Encounters Dealer in Shopping Crowd and Reilly Tells How Many Profits Are Given Away—Enumerates Useless Giving With Which He Has Long Since Dispensed.

Reilly had remained close to the side of his wife in the turmoil and battle in the big department store, having entered with a heart full of the true Christmas spirit, but now he felt like one of the Kilkenny cats in the last round of that memorable battle wherein "they fought till they ate each other up," and, deciding that discretion was the better part of what wilting valor he still possessed, he began to slip along the counter. He thought himself free, but just then the counter-rushers executed a flank movement, with a portly bundle-burdened warrior in the lead; the diminutive automobile dealer began to have visions of slow moving black horses and floral wreaths, when he was surprised to see himself pop out from between the counter and the heavy woman like a wet bean that is pinched between thumb and finger.

Shopping Causes Reilly's Downfall.

What he bumped into in the semi-open space he did not know; he was endeavoring to find his hat and get his bearings when a merry laugh and his hat slapped down onto his head caused him to look up; there were the factory sales manager and his wife enjoying the scrabble and the downfall of the little male shopper.

"Why don't you stay in your own town and shop? What brings you down here?" good naturedly demanded the Sales Manager.

"What?" repeated Reilly in a tone of disgust. "My wife." And as he spoke he peered critically into the struggling mass of humanity in search of that half of which in this case had proved to be the better by long odds.

"Where is she?" asked the Sales Manager with a smile.

The dealer's only answer was to point to the crowd which just then gave an extra surge, and Mrs. Reilly burst through; her hat was awry and there were other disheveled details, but her face beamed in triumph, for in her arms she clutched one more bundle than she had when she and her husband went into the contest.

"You look all in, Reilly," said the Sales Manager, interrupting the animated conversation of the two women.

"I am," he hastened to admit. "Wouldn't you women like to shop together for a while?" he added. "I'm feeling faint; I need air."

Men Shoppers Get Leave of Absence.

The women smiled skeptically, but permitted Reilly and the Sales Manager to take possession of what spoils already had been collected and the men departed, but under promise to be at the shirtwaist counter in an hour.

The air in the street did not prove appealing, and almost by instinct the pair sought the atmosphere of a nearby rathskeller where, at least, they could find a place to lay the bundles. As the waiter began to hover about in a waiterlike way the Sales Manager remarked, "You ought to be a Spug, Reilly."

"Spug! What's that?"

"Latest thing, you know," explained the Sales Manager. "Society for the Prevention of Useless Giving, S-P-U-G, Spug. May save your life yet."

"Useless giving, eh? Well, if that's what it is I'm the original Spug, but never knew what to call myself."

"If you are, what are you doing here?" queried the salesman.

"Protecting my wife—at least, I tried to," sheepishly answered Reilly. "She never got this spugitis."

"But I began to cut out useless giving in every way several years ago," continued the dealer, "in business, Christmas gifts and every——"

"What kind of creature is a Spug business man?" interrupted the Sales Manager with curiosity.

Reilly Discusses Spug Principles.

"A good kind," asserted Reilly, as he reached for a little green glass that had somehow found its way to the table in front of him. "This Spug stuff may be new, but the principle is older than Adam's grandfather. You may not think of business as a method of giving away things, but too many men make it such. I've cut it out myself and will have the job complete if I can only get my wife inoculated with spugitis."

"Where did you ever give anything away in business?"

"Where? A great many places," replied Reilly. "I used to go on the assumption that in order to do business I had to give away my profits, while all the time I never realized that real business doesn't consist of giving away profits. Without profits, it isn't business.

"There are ways too numerous to enumerate. What probably is the greatest example of useless giving is in trading cars. How much profit do you suppose is given away right there? A man wants a new car and wants to trade in an old one; he wants to get more for the old one than you want to pay. He is only asking you to give him that much money. What would you do if a man came into your salesroom, if you were a dealer, and agreed to buy a car on condition that after he had paid for it you would hand him back about $200? You'd laugh at him. And yet, that is just what so many dealers do; they don't hand over the present in money, but they might as well do so, for when they take the old car in for $200 more than it's worth they not only lose that amount but have to store the old car for some length of time.

Defines One Form of Useless Giving.

"That sort of giving is absolutely useless. The man who buys the car wouldn't think any better of you if he understood what a fool business move you had made—and what does this giving get for you? Nothing at all. If you want to give something useful, give service; that counts. But if you give $200 uselessly to the man when he buys his car you can't afford to give him service which is a useful gift—and a necessary one.

"On the other hand, I don't want useless gifts for myself. When I do trade a car I trade in a businesslike way, so that I can't lose; but sometimes may gain a little—expenses, for instance. I don't ask the customer to trade in his car on such a basis that he is making me a gift of $200, and I refuse absolutely to give any such amount to him."

"Everybody knows that," interrupted the Sales Manager, "and if that's the only in-

Digitized by Google

stance you can cite your claim to being the original Spug is——"

"But it isn't," came back Reilly. "I once thought that I didn't dare assert my rights in anything. If a man came in for repair work and the work really was worth a considerable sum I used to cut it away down in an effort to please him. It didn't pan out at that, and he generally kicked just as hard, if he was of the kicking kind. After I had thrown away a nice bunch of profits in useless gifts of this kind I decided that what I was entitled to I was going to have; I evolved a system that showed a man just what was done on his car, and that went into his bill. I used to give him what should have been my profits in an effort to keep him for a customer, but I made up my mind that if I couldn't make a profit on him I didn't want him for a customer. Giving away profits for such a purpose was more than useless—it was criminal! And, as in the other case, I do not want a man to make me a gift through an overcharge.

Giving Through Program Advertising.

"There are—I was going to say—a million other ways of parting with profits in the automobile business. One of the banes of the business man's life in our town is program advertising; it's been done to death. Every time any club, society, factory or even private party arranges a dance, a program is gotten up and the business men are besieged with requests that they buy so much space. Most of it is money thrown away. You practically give whatever amount you pay to those who get up the program, and give it uselessly in a majority of instances."

"I saw your 'ad' in a program last week," contradicted the Sales Manager.

"Sure! But what was it?" The Sales Manager said he didn't remember, but Reilly explained that it was a fraternal order affair. "In that case," he stated, "I considered the 'ad' well placed; it was seen by people, all of whom can afford to buy cars, and I didn't merely run a card saying my name is Reilly and that I am at a certain location. I ran a read 'ad' with a real argument. That particular expenditure I regard as being in a position to bring some return. But these dances that don't amount to as much as a man in a shopping crowd are easily within the useless gift class.

Discriminating in Charity Work.

"Charity is another thing. There are more kinds of charity than there are objects of charity. There isn't a week that I don't get a request to give somebody something. It isn't parting with the money that I dislike, but it's giving to anything and anybody that comes along under the guise of a charity worker. I make charitable contributions every year, but I like to know where they go and be halfway certain that they are going for a useful purpose.

"A dealer, also, can give away considerable in the course of a year in gasolene and general depreciation by giving useless demonstrations. There are people who hint around about liking the car and who drop little remarks that are calculated to make a dealer jump at the chance of giving them a demonstration. They're looking for a joy ride, that's all. If I believe I can sell a man a car by giving him a demonstration or can get a start toward a sale, I'll ask him myself to have a demonstration, or arrange in some way to give him one. Also, if a man is looking for a car he has no hesitation in asking for a demonstration, but these penniless would-be joy-riders are on my blacklist."

The Fallacy of Cheap Labor.

"Terribly stingy, aren't you?" suggested the Sales Manager.

"Yes," retorted Reilly, "systematically stingy, if you can derive any meaning from that. And here's another way: I once thought I could make more money by hiring cheap men, but I didn't labor long under that delusion. I can hire cheap men for about $2.50 a day in the shop. Good men cost $4 or $4.50. One day when I waked up to the fact that one good man can do almost as much as two cheap men and do it better, I began to weed out the cheap and unskilled men. I had been giving away 50 cents or a dollar a day to unskilled mechanics. I fail to see any usefulness in such gifts; it certainly was not useful to me—as I discovered when several jobs were botched.

"I used to give my customers a percent of my profits after gasolene started to go up. They had been accustomed to 18 cents a gallon, and when the wholesale got to 16 I kept the price at 18 until I discovered the profit was not paying for the handling. I raised. There was some objection, but those customers who are worth having were quick to see the justice of it when it was explained to them.

Service the Greatest Gift of All.

"There are so many, many ways, Jim, but it all amounts to using sense. I'll give service to the limit, and any other thing that a man is entitled to, but I won't make him presents of what he is not entitled to, and what he won't appreciate if you do give it to him. The most useful gift for any dealer is service, and it should be the kind"——

"Don't you think we'd better start, if we're going to get back there by the time our hour is up?" interrupted the Sales Manager, as he looked at his watch.

The two hurriedly picked up their bundles and departed. At the department store door a little man, also bundle-laden, was being inhumanly jostled in the Yuletide throng. The sight brought unpleasant remembrances. Reilly hesitated slightly. Then he pulled his hat on firmly with a half-free arm and, as he prepared to charge the crowd, half thought and half muttered, "Gee, but I hate to go back in there!"

Garage Owners Mulcted for Wrecked Car.

Deciding that Knight S. Jordan and Wilfred Walters, proprietors of the Alco Garage in Palo Alto (Cal.) did not exercise proper care in keeping an automobile which was taken without permission by an employe and wrecked by a freight train near Menlo Park, Judge J. E. Richards of San Jose has awarded Peter Mullen, the owner of the machine, damages to the extent of $900.

The garage proprietors sought to prove that on the night in question, August 17, 1911, the garage was broken into feloniously by certain persons who thereupon entered and took therefrom the automobile without the knowledge or consent of the defendants. The defense also contended that Mullen had not been damaged to the extent of $1,320 and that the machine at the most was worth no more than $800.

Washington Dealers Once More Organized.

To prevent a repetition of the occurrence of last year, when the Washington (D. C.) automobile show which was to have been staged in Convention Hall was "called off" at the eleventh hour, the Automobile Dealers' Association of Washington, Inc., has been formed, and will manage the exhibit which is slated for the week beginning February 3rd. The officers are: President, T. O. Probey; vice-president, Charles W. Semmes; secretary, E. A. Garlock; treasurer, F. C. Sibbald. The board of directors comprises Arthur Foraker, J. H. Miller, I. J. Henderson, J. H. Earle, R. B. Emerson.

Cobb Heads Fresno Association.

The Fresno Automobile Dealers' Association has been formed in the California city of that name, with these officers: President, Charles H. Cobb; vice-president, George S. Waterman; secretary, Ernest Johnson; treasurer, C. W. Hobson. The executive committee comprises: C. H. Cobb, C. E. Gray, G. S. Waterman, J. F. Gurley, H. B. Odell, W. Scott, Ernest Johnson. Twelve dealers are enrolled in the organization

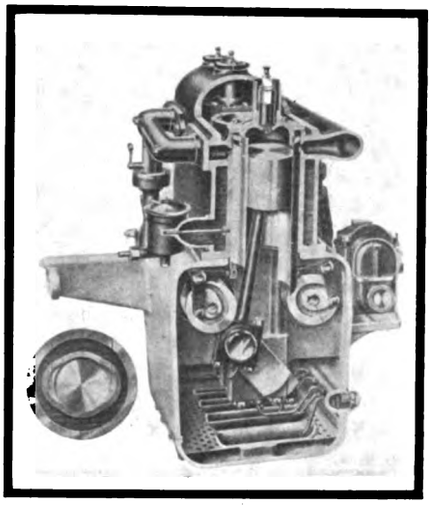
ACQUIRES RIGHTS FOR SWISS "POPPET-VALVELESS" MOTOR

Fisher Engine, Renamed "Magic," to be Controlled by New York Company—Employs Sliding Crescent Valves.

Although it has been known ever since the organization several months ago of the Motor Gear & Improvement Co. of New York City, that a new type of poppet valveless automobile motor shortly was to make its debut into American circles, the motor itself has been more or less hedged about with mystery, and the fog of uncertainty regarding its construction and operation was dissipated late last week by the reading of a paper before the Detroit Section of the

SHOWING SLEEVES AND PORTS

Society of Automobile Engineers by Lewis B. Brown, president of the company.



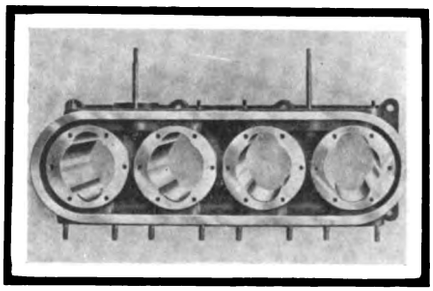
American Rights to Fisher Motor.

The motor, it transpires, is none other than the Fisher, which for some time has attracted attention abroad, principally in France, where it recently was put through a comprehensive test by the Automobile Club of France, subsequent to which it was illustrated and briefly described in Motor World for October 10th. The Motor Gear & Improvement Co., which is located at 250 West 54th street, New York City, has obtained the American rights to manufacture the engine, which is the invention of Martin Fisher, of Zurich, Switzerland, and which in America will be styled "Magic." The company was incorporated in September with $1,200,000 capital, with Lewis B. Brown and Dwight Partridge as president and treasurer, respectively, both of whom are intimately connected with the Aristos Co. Ralph Pulitzer, chief owner of the New York World, is one of a number of prominent stockholders whose names have not been divulged.

Prior to the reading of the paper in which the construction and characteristics of the motor were made plain, a convincing demonstration of its capabilities was given a number of prominent automobile engineers, among whom were Howard Coffin, chief engineer of the Hudson company, under whose guidance subsequent laboratory tests were made; F. H. Baker, of the Atlas Engine Works; J. Heinze, chief engineer of the Northway Motor Co.; C. C. Hinkley, chief engineer of the Chalmers Motor Co., and a number of others.

Marked Flexibility Shown in Test.

The motor, which, as may be seen by the accompanying illustrations, is singularly clear of projections and presents an unusually plain exterior, was demonstrated in a chassis from which an ordinary poppet valve motor had been removed. The chassis mounted a six-passenger touring body



MAGIC MOTOR IN SECTION

weighing complete 3,000 pounds, and it appeared to the Motor World man who was present at the demonstration that the motor is extraordinarily flexible, had unusual accelerative powers, is free from vibration at speeds up to 50 miles an hour, and that it has pulling powers which might not be suspected from an inspection of its comparatively small size. The latter feature is amply borne out by the results of the laboratory tests, in which it was shown that the horsepower curve ascended in an unbroken line up to 2,000 revolutions a minute and that the power developed was in direct proportion to the speed up to 1,500 revolutions. In gasolene and oil consumption it was no less remarkable, 160 miles to the pint of oil and 20 miles to the gallon of fuel being obtained; the records are based on an extended run of some 11,000 miles.

In general constructional details, the motor partakes in a measure of the features of the Knight motor and is not unlike Miss Margaret Knight's K-D crescent-valve engine, which made its appearance at the Boston show last March. Its resemblance to both these motors ceases, however, with the fact that it employs sliding sleeve valves. They are neither concentric with the piston nor do they entirely encircle the piston. Instead, they are crescent-shaped and, strictly speaking, are eccentric to the piston, the construction being made plain by the accompanying sectional pictures.

Sleeves Operated by Box Cams.

The crescent-shaped valves are let into the cylinder walls on either side of the piston, each taking up about 69 degrees of the wall circumference. Another peculiar feature of the motor is the method employed to impart the proper motion to the sleeves. They are actuated by means of box cams, thus ensuring positive motion in both directions and eliminating the necessity for springs. The cams themselves are actuated by means of Coventry "silent" chains much after the manner employed in driving the eccentric shafts of the Knight motor. The

TOP VIEW OF CYLINDERS

slides, which are of cast iron, extend the whole length of the cylinders and continue about two inches below them for connection to the actuating mechanism. At their upper extremities they are slotted, the slots registering with ports in the detachable cylinder heads leading to the intake and exhaust passages.

Advantage Claimed for Construction.

Like the Knight motor, the combustion chamber is sealed by means of a wide "junk" or "bull" ring in the cylinder heads. The length of travel of the sleeves is one-half inch in each direction, and it is pointed out that the use of the box cam mechanism instead of eccentric drive permits the valves to function much after the manner of the valves on a poppet valve motor which permit a characteristic "dwell" after the closing of the ports, the result being that the sleeves are stationary during the compression and explosion strokes. Cylinder heads are detachable.

Despite the fact that the bore and stroke of the motor are but 3 5/16 and 4¾, respectively, or, to be more exact, 85 mm. and 120 mm., the power developed by the engine at 1,000 revolutions a minute is 18 horsepower, whence it increases steadily up to

Digitized by Google

35 horsepower at 1,900 revolutions. The actual power developed, therefore, exceeds the S. A. E. rating by approximately 140 per cent., as against the usual 120 per cent. fairly common with poppet valve motors.

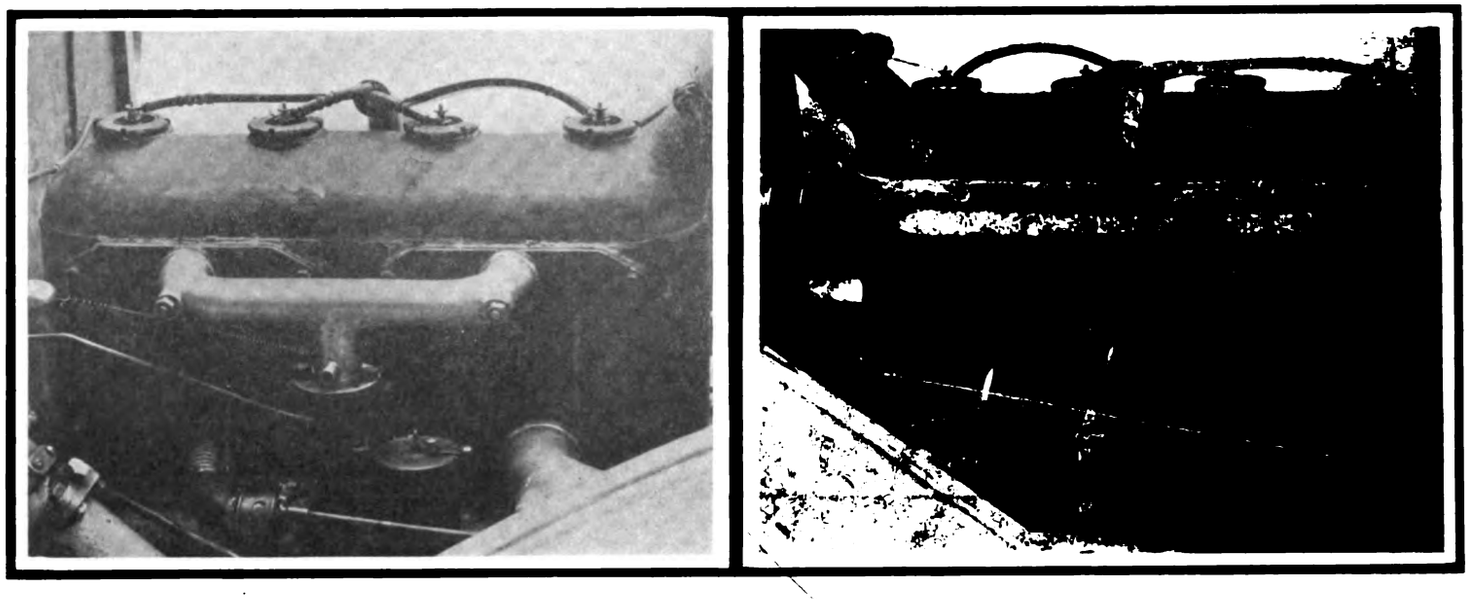
In explanation of the unusual power development, it is pointed out that the compression space is but 18 per cent. of the cylinder volume and that the compression is correspondingly higher than that of a poppet valve motor. Pre-ignition is avoided, it is explained, by reason of the symmetrical shape of the combustion chamber and the fact that the maximum possible proportion of it comes in direct contact with the cooling water.

In general construction, the Magic motor is of the block type. It is sparked by a high tension magneto and cooled in the orthodox manner on the thermo-siphonic system. Lubrication is effected by means of a combined splash and force feed system in which the pump forces the oil direct to the main bearings, whence the overflow drains into troughs beneath the connecting rod big end bearings and keeps them full. Scoops on the connecting rods convey the oil to the connecting rod bearings and splash the lubricant onto the cylinder walls and sleeves, whence the excess is drained back into the sump, to be re-circulated by the pump.

Softening Clamps Hardened by Use.

Copper and brass vise clamps, intended to protect finished metal surfaces from injury when held in the vise, are apt to become hardened from constant use, and therefore occasionally should be softened by being heated to a dull red and quenched in water. The heating alone will make the metal soft, but the quenching helps the process slightly.

FRANKLIN SERIES THREE HAS ELECTRIC STARTERS



Entz Lighting and Starting System Adopted for Six-Cylinder Models —No Other Constructional Changes.

Except that a complete, self-contained electric lighting and engine starting system has been added to the equipment of the six-cylinder "series three" Franklin cars that now are coming through the factory of the Franklin Automobile Co. of Syracuse, N. Y., and which are worthy successors of the "series two" cars that preceded them, very few alterations in either design or construction have been made. Another addition to the equipment is a Warner speedometer.

The lighting and engine starting system that has been adopted for a place on all Franklin six-cylinder cars is the Entz, which in its simplest aspects—and there can be no doubt that it is simple—consists of a combination motor-generator, a Willard storage battery of liberal capacity and a single switch which serves also as an ignition switch. In fact, it is because this one switch serves a dual purpose that the electrical equipment may be—and is—simple, for by reason of the connections it permits, it has been found possible to eliminate all mechanical regulating devices, to say nothing of the automatic cut-out that generally is employed between the generator and the battery.

The motor-generator unit is permanently and positively connected to the gasolene motor eliminating gears and, as it operates alternately as a motor and a generator, according to whether it is driven or is driving, it is merely necessary to turn the ignition switch to the "on" position to start the engine. The single action breaks the magneto short circuit and connects the battery to the motor-generator in one operation. Similarly, turning the ignition switch to the "off" position simultaneously short-circuits the magneto and breaks the connection between the motor-generator and the battery. As there is no automatic cut-out between the motor-generator and the battery, if the motor is throttled down to the speed where it ordinarily would stall, the electric unit automatically becomes a motor by reason of the slow rotative speed of the armature, and, drawing current from the battery, assists the gasolene engine or automatically starts it. Under normal touring conditions, the motor-generator changes the battery against its future use.

The series three line, complete, consists of two-passenger victoria-phaeton and five-passenger bodies mounted on the "Little Six" chassis, four-passenger phaeton, five- and seven-passenger touring bodies mounted on the "thirty-eight-six" chassis and two four-cylinder chassis mounting roadster and five-passenger touring bodies.

INTAKE AND EXHAUST SIDES OF MAGIC CRESCENT VALVE MOTOR AS IT APPEARS IN CHASSIS

Handy Chuck, Economically Made.

A fairly good chuck or holder for drills, taps or the like can be made by drilling a hole in the threaded end of a bolt, lengthwise, splitting the bolt for about an inch and a half by two hacksaw cuts at right angles to each other, and shaping the other end of the bolt either to go into the spindle of a lathe or drill-press, or to take a tap-wrench. The drill or other tool to be held is placed in the hole, which should be a shade smaller than the tool, and the nut screwed up toward the end of the chuck.

EMPLOYING QUICK WIT IN PROSECUTING SALES

Brooklyn Dealer Exemplifies the Sort of Emergency Work That Is Not Founded on Prearranged Arguments—Two Sales, Made by Spur-of-the-Moment Methods—"Cuss Words" That Helped.

Approaching the prospective buyer of an automobile is one of the vital points in motor car salesmanship, and in schools where the merchandising of cars is taught, the student is given the rudiments of sales openings as best the instructor can teach him; but the instructors, themselves, are only too well aware of the fact that unless a man has the qualities of salesmanship within himself he never can aspire to be much more than a mere order taker.

Planned and Extemporaneous Argument.

Whether a line of talk or argument, carefully prepared in advance, is advantageous in approaching a prospective purchaser is a mooted point; everyone concedes that the salesman ought to be able to keep up his end of the conversation but supposing the prepared campaign does not fit in with the turn conversation actually takes — what then? At this point the manufactured salesman fails; the salesman with inherent qualities takes the situation in hand on the spur of the moment—and wins. Adopting a baseball term, he might be termed a "pinch-hitter."

That preparing a line of talk in advance is poor policy is a radical statement, but that he can do better without such a plan is the declaration of Joseph D. Rourk, who deals in Haynes cars at 1001 Bedford avenue, Brooklyn, N. Y. Rourk is an excellent example of the salesman with mental ability; he might be called a man with wits—a "pinch-hitter." He has ideas of his own about selling, and his ideas may be said to develop automatically as occasion demands. His peculiar makeup in this respect has consummated many sales, and each time his mental ability is left to extricate him from a tight corner it seems to become more efficient. Rourk has little faith in the salesman who learns his song by heart and when he has finished it has no more to say—unless he starts at the beginning and recites the oration again.

Prospect Who Wanted Too Many Rides.

A sale that Rourk once made is illustrative of strenuous salesmanship in a tight corner, and it also is a method, Rourk himself says, that probably would result in failure 999 times in every 1,000. The prospect in this case was a physician, and Rourk had been trying to sell him for some time. Demonstrating had become so frequent that Rourk was beginning to wonder who owned the car—himself or the prospect. One wintry morning, when the snow was deep on the ground the physician telephoned to Rourk and said, "I have to go out to the King's County Hospital this morning. If you want to give a demonstration you can take me out."

Street car traffic was in bad shape from the snow, and Rourk mentally was perturbed when the doctor's proposal began to sink into his mind. The dealer had about given up selling the car, and then to have the prospect work him for a demonstration and on such a morning did not line up well with his ideas of salesmanship. But he smothered his wrath and cranked up the car.

Rourk Tries Radical Salesmanship.

When Rourk stopped in the snow in front of the physician's residence and the latter climbed in Rourk suddenly determined to cast all mild forms of salesmanship to the winds and try a new sort. He considered the sale as good as lost anyway, so grabbed at this last straw as a surgeon resorts to a dangerous operation as a last resort. The doctor was hardly seated when Rourk said, "Doctor, you're a damned fool!"

This floored the physician and he attempted to reply; but before he could get his conversational apparatus in operation Rourk followed up his bomb-like statement with the assertion, "I also think your're a damned fourflusher!"

Unusual Method of Arousing Interest.

The physician was almost in the sputtering stage by this time, and as he tried to expostulate Rourk added: "You don't want to buy a car. What you want to do is to go along the row and get two or three demonstrations from each dealer, and that will take you over into next year. Then the new cars will be out and you can start all over again; you don't want to buy a car; it's a waste of money. After all the rides you've had in this car, I call it downright presumption for you to ask me to drive you out to the King's County Hospital—three miles and back—on a day like this."

The physician was taken aback but did not become over-angry, and endeavored to assert that Rourk's conversation was not at all proper.

Demands Look at First Payment.

"I don't believe you've got money enough to make a deposit on the car," continued Rourk. "But I'll tell you what I'll do. I'll drive you down to the bank, and if you can show me you even have enough to make a deposit I'll drive you out to the hospital and never say another word. I don't ask you to pay me the money; just show me you've got that much. What bank is your money in?"

The physician named a bank; Rourk started the car and drove to the bank. The physician went in and in a few minutes returned with $200—the required amount. He handed it to Rourk, who calmly took the roll and counted it to see if there really was $200 in it. He handed it back to the physician, who pocketed it, and started to climb into the car. "Aren't you going to put it back in the bank?" asked Rourk.

"No, I guess not," replied the physician.

"King's County the first stop?" asked Rourk in a semi-genial tone, as the two started out again.

"You might stop at the house first," replied the physician, and when the car reached his residence he said, "Won't you come in the house a minute?"

Why the Method Was Successful.

Rourk went in and, to his surprise, the physician signed a contract then and there and paid the deposit. The trip to the hospital was made with Rourk as driver, but the car was the physician's. The doctor has been one of Rourk's best friends ever since. He even tells the story of how he bought his first car and laughs with his hearers. He says that when Rourk began to express his private opinion to the doctor's face the latter thought in this wise: "If Rourk is truthful and honest enough to tell me what he thinks of me, right to my face, instead of going behind my back to do it, he must be pretty square, and therefore what he has said about the good qualities of his car must be true."

It was strenuous salesmanship that would fail in almost every instance, but it illus-

Digitized by Google

trates the kind of spur-of-the-moment generalship that overcomes a trying situation. All of Rourk's carefully planned sales talk had gone for naught; he says such talks do not ring true, anyhow.

Grabbing a Sale from the Fire.

On another occasion a man whom he knew well and who he thought might some day purchase a car went across the river to New York to buy a $4,000 car. Rourk learned of his intention 40 minutes after the man had left Brooklyn. The dealer had believed all along that when the man was ready to buy a car he would at least give him a look-in. He first telephoned the man's residence and verified the "tip" that the man was in New York to place his order.

Action had to be quick. Rourk got the New York salesrooms in question by telephone and asked if Mr. ——— was there. They did not know. Rourk then described him, and the person at the other end said there was such an appearing man there. Rourk asked that he be called to the telephone, and said: "It doesn't make any difference to you whether you close that deal to-day or to-morrow, and I've a proposition I'd like to make to you before you buy. Better drop in and see me." The man said he would.

He came sooner than expected, turning up with his chauffeur in about a half hour. He was none too cordial when he entered, whereas he always had been very friendly before, and to get him and the chauffeur to sit down, Rourk having exhausted all the salesmanship he possessed, was compelled to ask the two point blank to have chairs. When they were seated Rourk was still at a loss as to how to act. He opened up by asking the chauffeur what he thought of the A——— car. The chauffeur named an objection. Rourk then asked the driver his opinion of the B——— car, and the C——— car, and the D——— car. Each time the chauffeur named an objection, and also named one in the E——— car—the one his employer had started to buy.

Closes Deal Without a Demonstrator.

Rourk had not even a demonstrating car in the place, but after he had gone through the list of high priced cars and the chauffeur had named an objection to each one, Rourk picked up a catalogue and said: "I'll defy you, or you," and he pointed his finger at driver and employer, "to find any of those faults in this car." The man leaned back in his chair and smiled. He also signed a contract which Rourk laid on his desk in front of him. He promised to make the deposit the next day, but by taking the two home in a little old car he had in his repair shop Rourk managed to get the deposit the same day. His emergency work had earned him $500 or $600 in less than an hour.

Everyone in Rourk's employ seems to have absorbed these emergency-meeting methods. One day the wife of a prospect on whom Rourk had worked for two years telephoned and asked to have Rourk call. Rourk was out of town and would not be back for several days, and the office girl realized that waiting might lose a sale. She hurried a salesman to the residence in question and he sold a car. Also, this salesman is a very busy man. As Rourk expressed it, "I make the balls and he shoots 'em."

Prospective Buyers Followed Months.

It is nothing in the Rourk establishment to follow up a prospect for months or years, if he looks good; but if investigation shows there is practically no chance of "selling him" he is dropped. Also, men who literally slam the door in a salesman's face are left alone unless future developments warrant action.

One man who at present is regarded as near the buying point has been handled as follows: "Asked for catalogue November 15, 1911; mailed catalogue November 16, 1911; called at house with car January 3, 1912; gave demonstration January 20; telephoned him January 24; called at store January 25, not in; telephoned him January 26, said he had just invested some money and would see Rourk at Brooklyn automobile show; telephoned prospect's son March 20, said father was trying to get more than $800 for old car; telephoned him March 25, said he had no ready money; telephoned him August 29 to tell him new cars were in; demonstration September 11, pleased; telephoned him September 12, said he would have money later, and it is thought he will surely buy in the spring." All this is contained in a card index, which is an important item in Rourk's selling system.

Even Present Owners Not Forgotten.

Prospects who buy other cars are left alone for a time.

"If a man buys a car for about $1,000," said Rourk, "I leave him alone for a year, as I consider he will want a new car about that time. If he has bought a $2,000 car I give him two years before he considers he has got his money's worth and thinks he can afford a new car--but we never lose track of a man unless he gives us to understand that he wants to be let alone. In that case we do our best to accommodate him."

Most prospects are gained through owners of cars Rourk has sold. Although he admits the value of advertising, he says he does not think it would pay him. He says he can trace 90 per cent. of his sales to former owners, thus leaving but 10 per cent. to other sources, and since he sells 75 or 85 cars a year he says he does not think the increase from advertising would bring a just return. Some newspaper advertising of Haynes cars has been done in Brooklyn, but Rourk says he never has been able to trace a sale to it.

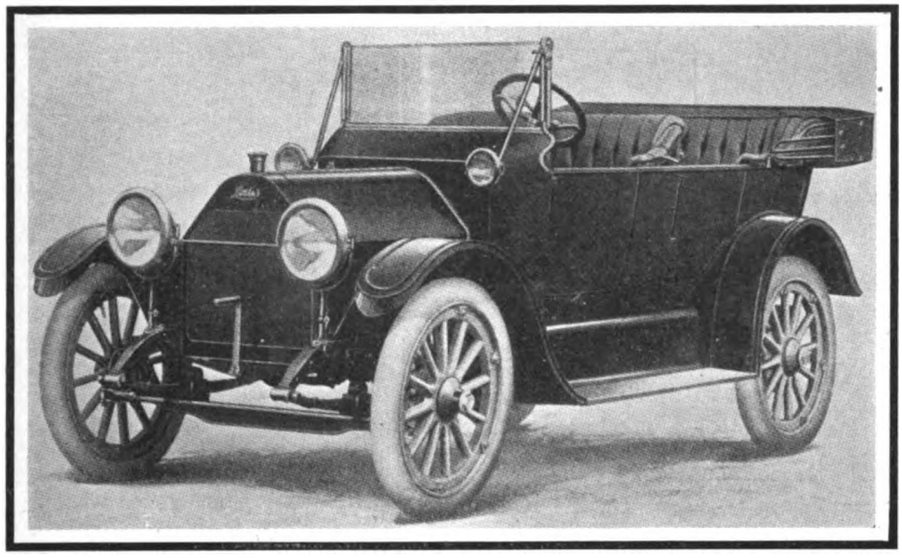
Rourk's Policy of Advertising.

"Anyone will concede that advertising helps," said Rourk, "but the question in my case is, Does it pay? I could spend $50 a week for three months and I do not think I would get my money back. What would pay in my case, if anything would bring a return, would be a small ad run every day. A big ad run once a week is not of much value to me; a man looks at it and throws it away without reading it. If a small ad is used every day it gradually forces itself upon the attention of the reader."

On the used car proposition Rourk follows that sensible plan which, all other things aside, seems to be one of the greatest advantages to the dealer. He trades, but allows prices which he is quite sure will permit a slight profit on the re-sale, rather than a loss. Throwing away profits through trading, he says, is doubly damaging, because it does not permit the rendering of service, and service, he rightfully says, is the backbone of the business.

He is about to move from his present location to 1170 Bedford avenue, which is more within "automobile row." He used to be in the row, but it has moved away from him. When asked his new number, however, he hurriedly looked at his lease and said: "This is the first time I happened to think of it, but, thank heaven! it's 1170. I though first it was 1192, and 9 is my hoodoo number. I never took out a car yet with a number 9 on it that I didn't have bad luck. Thirteen is my lucky number. I've won contests with it and always have good luck with it. In fact, it's such a good number that I signed my lease for the new place on Friday, the 13th of December."

Disapproves of Evening Calling.



One thing of which Rourk does not approve is calling on a prospect in the evening, he says it never has gained him good results. He believes there are many men like himself, who prefer to do their business at their stores or offices. His theory in this respect is that the business man, when he gets home at night, likes to enjoy a quiet evening, and Rourk appreciates the feelings of such a man when his evening is broken up, for Rourk himself is one of the quiet-evening type.

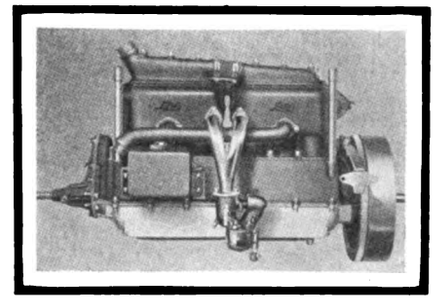
LITTLE "SIX" LITTLE IN PRICE BUT BIG IN VALUE

Lowest Priced of all the "Sixes" Has Unusual Features—Sells for $1,285 Completely Equipped.

Having "felt out" the market with the aid of its "Little four," which now has been on the market for the better part of a year, during which time it has made quite a name for itself, the Little Motor Car Co., of Flint, Mich., which, with the Chevrolet Motor Car Co., of Detroit, is under the guiding hand of W. C. Durant, has brought its "six" to the state of perfection where it is ready for the market, and the additional

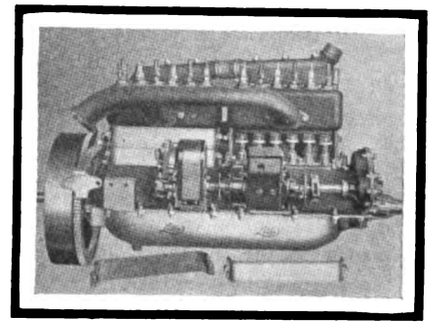
LITTLE "SIX" TOURING MODEL WHICH SELLS FOR $1,285

details regarding its design and construction which now are available reveal that it is virtually a smaller edition of the first of the Chevrolet "sixes" placed on the market simultaneously with it. It is a well-designed car, built in but one touring model, that sells for the unusually low price of $1,285, despite the fact that it is fully equipped.



As is but natural, in view of the close relationship between the Little and Chevrolet companies, the motor in the Little "six," which is little in name only and really is an average sized and commodious touring car with seats for five persons, bears striking resemblance to the Chevrolet motor. It has the same peculiar type of semi-circular counterweighted crankshaft, for instance, which is said to be the principal reason for the smooth operation of the Chevrolet motor, and its other features are much the same. The cylinders are cast in blocks of three though they are of the L-head type with valve mechanism carefully enclosed by means of light removable metallic covers. The bore is 3 5/16 inches, 4/16th less than the Chevrolet, and it employs the same type of domed pistons; the stroke also is somewhat less—namely, 4¼ inches—though this motor, too, is of the long-stroke type.

Connecting rods are drop-forged I-beam in section and operate in die-cast babbitt bearings, as does the crankshaft; bearings in each case are more than ordinarily liberal and provision for taking up wear is made. The timing gears are of the helical type and operate in oil, though the motor lubrication system is slightly different from that employed in the Chevrolet motor and operates on what is known as the vacuum principle. That is to say, the oil level in the crankcase automatically is maintained at the same height by the uncovering of a port as the level drops. The oil enters the crankcase by gravity until the port is covered, when the vacuum in the reservoir is sufficient to stop the flow until more air is permitted to enter the reservoir through the port. Ignition is effected by means of a special high tension magneto and the carburetter is exhaust heated and thoroughly automatic. Thermo-siphon cooling is employed, aided by a belt-driven fan.



For lighting purposes, a complete dynamo electric system is supplied as regular equipment, the dynamo being mounted on the engine on a special bracket and driven by a straight-through shaft from the timing gear train to the magneto. At the option of the purchaser the equipment will be made more complete by the addition of a Gray & Davis electric starter, though its specification slightly increases the cost.

The clutch is of the leather-faced cone variety and is fitted with adjustable compensating spring inserts to ensure smooth action without gripping or slipping; it is 15⅛ inches in diameter. The gearset is of the selective type and provides three forward speeds and reverse, obtained with the usual hand lever located in the center of the footboard. The steering wheel is located at the left side with the emergency brake lever, which is of the same cranked type used in the Chevrolet, located at the left. Its position, however, and its construction are such that the left side front door is not obstructed. Similarly, the gear shift lever is placed as close as possible to the seats in order not to obstruct the right door.

The chassis frame is formed of pressed steel and is supported in front on wide semi-elliptic springs and in the rear on practically the same type of three-quarter platform springs as are used in the Chevrolet car. The rear axle is of the semi-floating type and the front axle is drop-forged I-beam in section. Two independent sets of brakes are supplied, both internal expanding in Raybestos lined drums 12 inches in diameter and both carefully equalized. The service set is operated by the usual left pedal and the emergency set is operated by hand lever. Wheels are of the artillery type with twelve 1⅜-inch spokes in front and rear and the hub flanges covered by shields. The wheelbase of the standard model is 106 inches on either 56 or 60 inches tread, and the wheels are shod with 32 x 4-inch tires.

INTAKE SIDE LITTLE "SIX"

VALVE SIDE, SHOWING DYNAMO

Like the Chevrolet, the Little "six" is completely equipped, the equipment including tailored mohair top with envelope and side curtains, windshield, speedometer, demountable rims, tire carriers at the back of the tonneau, dynamo electric lighting system, electric horn, and tools, etc.

Solutions of The Used Car Problem

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Best Four Articles Dealing With the Subject.

(Owing to an influx of "Solutions," received just prior to the closing date of this contest—December 16—it will not be possible to print all of them in season to permit of their being turned over to the three judges on January 2d, as first announced. The date for such action is therefore extended to February 6th.)

By FREMONT D. PALMER, New York City.

The used car problem interests both manufacturers and sales agencies as never before, due possibly to the stockholders of different organizations being confronted by the terrible losses sustained during the current year instead of the promised dividends. And all because these same companies have been carrying traded in or second-hand cars as assets at fictitious values.

For various reasons the majority of sales agencies attempt to handle the sale of the traded-in car in conjunction with that of the new one—that is, the same salesmen, generally on a commission basis, is permitted to place the value of the car offered in part payment for the new model—and he waxes eloquent as he works hard—possibly harder—with the management than with the customer to put over the deal which means a few dollars in commission to him and later a loss to the people who harbor him. The car traded in is then placed with others of its kind for sale in some remote part of the building, in competition, where the best and easiest scellers are picked out by the same salesmen, the junk being allowed to accumulate. Here its value rapidly decreases, though on the inventory it remains at a prohibitive figure as an asset, until the crying need for operating cash becomes so insistent a number of these derelicts are bunched and turned over to the professional dealer in second-hand cars at his price, and here vanishes the season's profits.

A few progressive dealers are meeting these conditdions in the proper manner and are not worrying about the future, by maintaining a used car department. And in order to make a used car department wholly successful, it must be entirely separated from the new and its business treated as it deserves to be treated, i. e., with proper consideration.

A capable manager should be fully entrusted with the task of passing on the value of the car offered in exchange. According to his judgment he should put it in condidtion for sale and market it. I cannot understand why more manufacturers do not realize the immense advertising possibilities in the guaranteed factory overhauled used car. Is it lack of confidence in their product that they fear to perpetuate an old model? Or do they think that their duty to their trade ceases on the delivery of the new car?

Why isn't protection to the trade, protection and advertisement to the manufacturer and dealer? How does the individual owner feel when he drops in to look over the new model and casually asks what he will be allowed for the car which he has used but a few months, and is blandly referred by the salesman to some one of the numerous second-hand dealers, who in turn informs him that the car has deteriorated 75 per cent., this in less than one year?

It is not very much of an incentive for him to purchase another of the same make—is it?

And yet 90 per cent. of those who are in the market for second-hand cars prefer to buy of the factory or its representative, and are willing to pay a reasonable price under such conditions as inspire them with confidence.

Here, then, is the solution of the used car problem:

A well organized used car department, with an efficient force of mechanics.

Allow a reasonable amount for the car offered in trade; replace the worn parts with new at cost and actual cost of mechanics' time, and painting it if necessary.

It has then an actual value of not less than 65 per cent. of its original cost and it will bring the price and a profit instead of loss.

By this method the manufacturer can soon control the market valuation of his own products, and the sale of them to the discomfiture of the second-hand dealer who is actually undermining the industry by his more or less unscrupulous methods.

By A. E. GADBOIS, Montreal, Canada.

As a dealer I would suggest as a solution of the used car problem, that an agreement be made at once by all the big companies of motor cars, the agreement to be as follows:

1. Appoint good agents with good standing and good backing.

2. Accept as agents only those who will guarantee not to take a used car in exchange for a new one.

3. Have the N. A. A. M. require a bond of $5,000 on every said agent so to be sure that he will fulfill his promises in this respect.

4. Have the premium paid by the maker or dealer.

If the man who has a certain make of car and wants to change it for a new one, sees that he cannot get rid of it through an agent because they are all combined, he will have to sell it at its real price to his brother or friend or elsewhere, then you will have the used car problem solved.

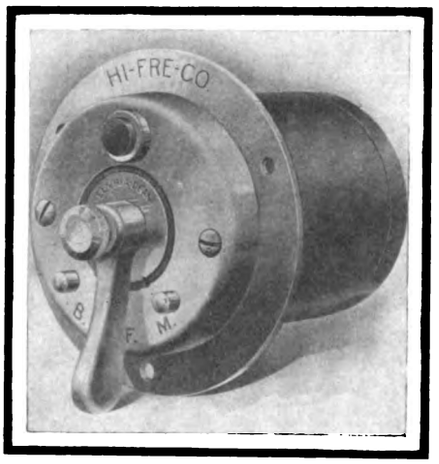
HIGH FREQUENCY IGNITION MARKS RADICAL DEPARTURE

Employs Low Tension Magneto and No High Tension Current is Carried by Wiring—Dean's System Made Ready.

When Nikola Tesla first became interested in matters electrical and some years ago developed what has come to be known as the Tesla coil for the generation of high frequency currents, he discovered, among other things, that high frequency current has a number of characteristics that are peculiar to itself and that are readily adaptable to commercial uses.

Latterly, it was demonstrated that its peculiarities make it particularly advantageous

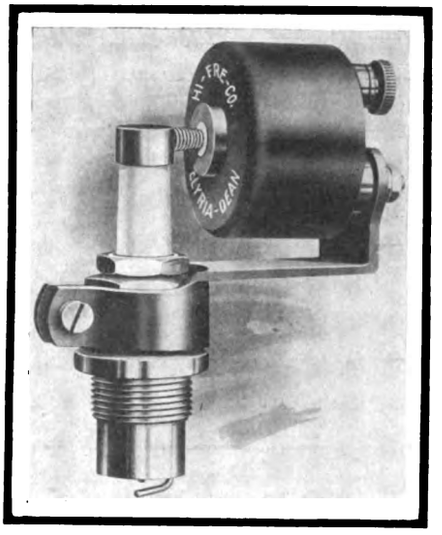


HI-FRE-CO LOW TENSION MAGNETO

for ignition purposes, as was pointed out in a paper which was read by Ray H. Manson before the last meeting of the Detroit Section of the Society of Automobile Engineers, reproduced in extract in Motor World for November 28th, and which proved the forerunner of formal announcement to the effect that the Dean Electric Co. of Elyria, O., had acquired the right to manufacture ignition apparatus of the kind.

Strictly speaking, the application of high frequency current to ignition apparatus is not new, as was explained by Manson in his paper. To refresh the memories of those who may have forgotten it, it was developed about seven years ago and was produced in limited quantity by a California company. This is the first time, however, that any concerted effort has been made to introduce the apparatus generally and in quantity, though in taking up its manufacture the Dean company will in no whit curtail its production of Tuto and Rexo horns, its new speedometer and the Elyria-Dean electric lighting and engine starting system or the Otho lighting and starting system, the manufacturing rights for which recently were acquired.

The essential difference between the orthodox high tension ignition apparatus generally familiar and the high frequency apparatus which is produced by the Dean company is that in the latter no high tension magneto is used. The magneto is of the plain low tension type and, as the current which is led to the spark plugs is of the low tension variety, it may be appreciated there is considerably less likelihood of leakage and that the danger of painful, if not harmful, shocks received in handling the plugs and wiring is eliminated.



SWITCH AND "KICK" COIL

From the low tension magneto distributer, wires lead directly to miniature Tesla transformer coils, otherwise known as resonators, which are placed directly on the spark plugs, to which they are connected by means of extremely short wires, as shown by the accompanying illustration. The purpose of the resonators is to transform the low frequency discharge from the condensor in the magneto into a high frequency discharge with oscillations approximating 1,000,000 a second; in other words, the resonators "step up" the current from low tension and low frequency to high tension and high frequency.

It is in the "stepping up" process that the current takes on the characteristics which have proven so valuable for ignition purposes. The appearance of the spark that is produced across the spark gaps of the plugs, for instance, is comparatively thin and blue and is in marked contrast to the thick, yellow "flame" generated by the ordinary high tension magneto. Despite this fact, however, its igniting properties are every bit as good as the igniting properties of the plain high tension magneto spark and in certain instances are claimed to be better. In explanation of this seeming paradox, it is pointed out that the high frequency current throws off invisible rays, much akin to X-rays, which are particularly operative in causing the ignition of gas under pressure. Incidentally, as the length of the spark governs only slightly its efficiency in igniting the charge, it makes little difference what the length of the spark plug gap may be within limits up to approximately 1/32 of an inch.

As a further advantage of the high frequency spark as against the high tension spark, it is pointed out that the disruptive discharge of the former tends to prevent fouling or accumulations of carbon on the plug points and also ignites poor mixtures, whether too lean or too rich in gasolene, with greater facility.

The resonators themselves, which virtually are the heart of the system, consist of 1,200 turns of very fine wire, No. 36,

PLUG RESONATOR IN PLACE

placed on a spool without a magnetic core. Over the secondary or fine wiring there is placed a primary consisting of 7½ turns of very heavy wire, No. 19. They therefore virtually are miniature induction coils without the core and circuit breaker that has served to familiarize the induction coils used for ignition purposes. After the winding is complete, the whole is treated with high resistance, heat resisting varnish. The resonators then are encased in a tough moulding composition which is heat, moisture and oil proof, making them practically indestructible and well-nigh inderangeable, to coin a word. Still, should they become broken, it is a simple matter to replace them, spare resonators being carried for the purpose. Incidentally, it is advantageous that the derangement of one resonator does not effect the others.

Altogether, there are three types of Hi-Fre-Co apparatus produced: the magneto system described, a dual system employing

Digitized by Google

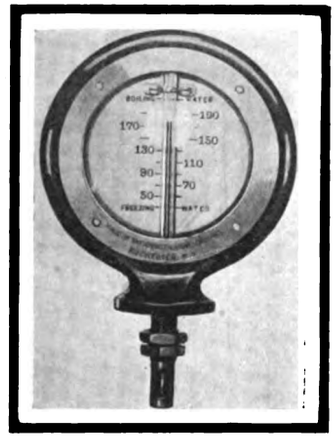
a dash "kick" coil and battery as auxiliary for starting, etc., and a straight battery system employing the dash "kick" coil and switch and a separate distributer. The coil that is used with the dual and battery systems is exactly similar to the coil commonly used for low tension ignition and gas lighting work. It consists merely of a number of turns of fairly heavy wire over an iron wire core. It is incorporated in a casing which serves also to mount the switch and occupies a place on the dash, appearing much the same as the ordinary high tension system switch. The switch serves merely to short-circuit the magneto, as is the case with high tension systems, or to break the battery circuit, as the case may be.

High Court Favors Taxicab Operators.

Upholding the decision of the Supreme Court for New York county, the Appellate Division on Friday last, 13th inst., declined to grant to the American Taximeter Co. an injunction pendente lite against John Hefferon and John Kavanaugh, operating as the Circle Taxicab Co., and the International Taxameter Co., restraining the taxicab men from buying or using International meters and restraining the International company from selling meters to the taxicab men.

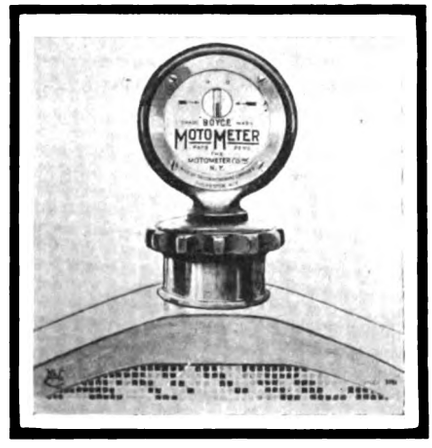
The American's case was based upon a contract made with Hefferon and Kavanaugh whereby they agreed to rent taximeters of it for three years at $6 a month per meter, and to use no other meter during that time; the company claimed, however, that the taxicab operators had violated the terms of this contract in using the International's meters and asked a restraining order to be made effective during the trial of the action.

The taxicab men claimed that because of a delinquency in paying rental on the meters the American company had refused to supply them with a sufficient number and that, since the city ordinances require some form of meter equipment, they had been obliged to use the International's. The lower court, whose decision was upheld, refused to grant the injunction, declaring that such an action would practically put Hefferon and Kavanaugh out of business during the suit, and that the taximeter company could have resorted to civil proceedings as a method of rental collections.



Labor that Does Damage to Motors.

A motor should not be permitted to labor, even if it can be kept going. When running very slowly the sudden blows of the explosions, acting against the resistance of the slow moving crankshaft, set up tremendous stresses that are as dangerous as they are unnecessary.



TAKING THE TEMPERATURE WHILE THE MOTOR RUNS

"Feeling the Radiator" Eliminated by an Ingenious Thermometer — Looks Like a "Mascot" and May Prove One.

One of the things that not infrequently causes the brow of the automobile driver to wrinkle with anxiety is the temperature of his motor and its cooling water, particularly when driving under conditions that are such as to produce heating tendencies. It is a nuisance to have to get out and feel the radiator; but it is anything but desirable to wait until overheating is indicated by a whiff or two of "high-temperature smell" from under the hood, or an unusual temperature rise by the actual boiling of the water, and an instrument that will indicate the condition of affairs, so far as heat is concerned, as does the appliance shown in the accompanying illustration, is a distinctly useful addition to the equipment of a car with a water-cooled motor.

MOTO-METER SCALE

REVERSE SIDE OF MOTO-METER

The motometer, as the instrument for indicating the temperature of the motor is called, just has been introduced by the Motometer Co., Inc., of 1784 Broadway, recently incorporated under New York laws. George Townsend, 2d, a well-known amateur racing driver who, however, has forsaken the quest for speed, is president and Harrison Boyce, the inventor of the instrument, secretary. Incidentally, Boyce is said to be the inventor of a well-known safety razor, a demountable rim, a horn and a shock absorber, so that he may be said to have qualified as an eliminator of some of the troubles that beset mankind.

The motometer consists essentially of a thermometer of highly specialized construction with its bulb, well protected, extending downward about an inch through a hole in the radiator cap into the air space above the waterline in the radiator. A pair of beveled glass crystals, framed in a substantial metal ring, enclose that part of the thermometer which projects above the radiator cap and also the silvered disk upon which the figures of the scale are marked. The thermometer tube, which contains a specially prepared red liquid, is vertical, extending from the top to the bottom of the metal case.

A round hole, the upper edge of which is just at the line indicating the boiling point of water, enables the driver to see the red column, which becomes visible over the lower edge of the round hole when the temperature reaches a little over 130 degrees Fahr. The thermometer tube is so formed that the red column is greatly magnified and is plainly visible to the driver, even at night, when the light from street or window lamps ahead of the car causes the red line to stand out boldly and clearly. The metal ring and the little base which rests on the radiator cap are gold-plated to match brass-trimmed cars and nickeled when the trimmings of the car have a nickel finish.

With a motometer installed on the radiator of a car the temperature fluctuations due to varying conditions of operation can be watched as they occur. Not only can the overheating of the motor be anticipated, but excessive cooling, such as is quite common in cold weather, will make itself apparent. The breaking of a fan belt will be marked by a rapid rise in temperature, as will the derangement of any other part of the cooling system, and the effect of various throttle openings and carburetter adjustments on temperature can be observed. As the scale goes clear down to the freezing point, it is easy to tell when the water in a standing car is getting too cold for safety, and warming-up measures can be taken at once to prevent the disastrous congelation of the water. The price of the motometer is $10.

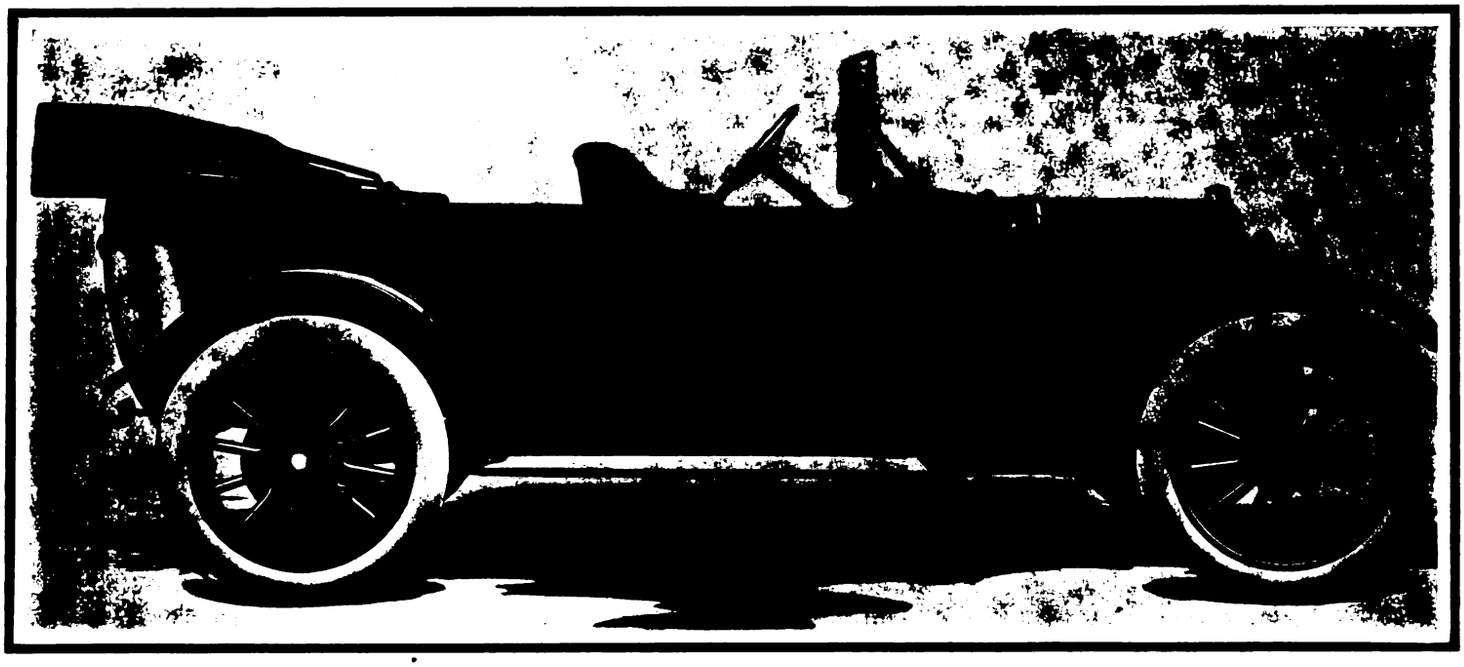
NEWER AMES CARS WELL STANDARDIZED PRODUCTS

Two Body Styles on One Chassis, with Left Drive and Center Control, Complete Line — "Six to be Added Later.



Although indication is made that an exceedingly attractive "six" shortly will be added to the line of cars produced by the Ames Motor Car Co. of Owensboro, Ky., activities for the present will be centered upon the distribution of two four-cylinder models, one a roadster and the other a touring car, both of which are mounted on the same chassis. In common with the products of a number of other manufacturers who apparently have seen the bright light of the times, both cars are of the left drive and centrally controlled variety and their accoutrements are such as to leave little to be desired.

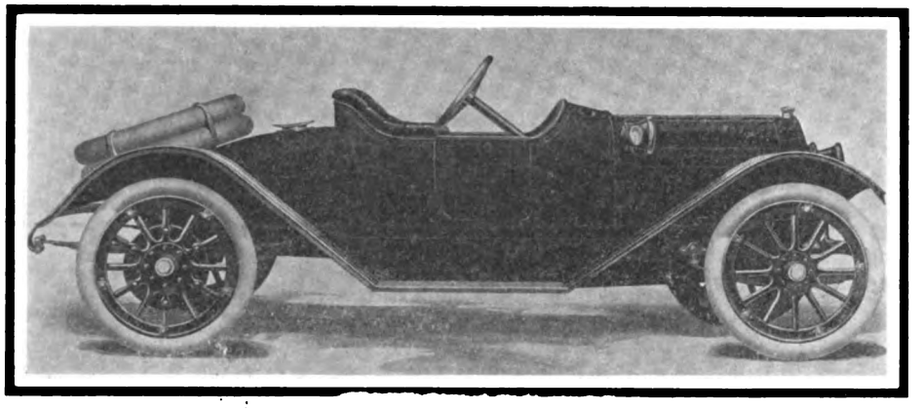
As becomes the products of old line carriage makers whose horse-drawn vehicles have made a name for themselves by reason of their beauty of outline and their finish, bodies are cleverly proportioned creations in which the severity of straight lines is offset by gracefully curved and well-fitting fenders and a careful blending of lines at the dash and tonneau. Both the roadster and the touring car have deep skuttle dashes, the roadster being of the "cruiser" type in which the gasolene tank is beneath a gently sloping after "deck," which serves also to mount the spare tires.

The price of both models is the same—$1,595—and includes complete equipment. Both are electrically lighted throughout by means of a dynamo-battery system of the orthodox pattern and both are equipped with an efficient type of compressed air engine starter; its action is positive. The electric light equipment includes 12-inch head lamps, 7-inch side lamps and a 6-inch tail lamp. The nominal equipment that is furnished with both models includes a top of best quality mohair on a substantial frame and complete with slip cover and side curtains; a Universal ventilating windshield, demountable rims, the usual robe and foot rails, pump, jack, tools, and tire repair kit.

The Ames company is only one of many which prefers to build up its cars from the products of parts makers of recognized ability, and considerable pride is taken in the fact the motor is a Continental of the long-stroke variety. The bore is 4⅛ inches with 5¼ inches piston travel and, though the horsepower rating is nominal, it is a matter of common knowledge that actual power considerably in excess of the rating invariably is produced. Cylinders are cast in a single block with the valves all on the same side, which arrangement makes it a comparatively simple matter to enclose all the mechanism easily by means of a single removable metal cover; valves measure two inches in diameter. Cooling is effected by water centrifugal pump circulated, and a draft is induced through the radiator with a fast-running ball-bearing mounted fan. Lubrication is by combined splash and force feed and ignition is by Remy dual high tension magneto system.

As is the case with the motor, clutch and gearset elements also bear the nameplates of well-known makers, both coming from the Warner company. The clutch is of the multiple disk type with Raybestos faced disks, and operates without oil. The gearset is of the selectively operated type and provides three speeds forward and reverse. Both clutch and gearset are contained in a unit housing which serves to enclose the flywheel, thereby imparting rigidity to the structure and ensuring against the ingress of dirt or other foreign matter. Control levers are attached directly to a housing on the gear case, thus permitting center control without undue complications. Two Spicer universal joints transmit the power to the rear axle.

FIVE-PASSENGER, FOUR-CYLINDER AMES TOURING MODEL WHICH SELLS FOR $1595 EQUIPPED



Having chosen accessibility as a fetish, it is carried clear back to the rear axle, which is of the full-floating type and is produced by the Hess Spring & Axle Co. Annular ball bearings are employed throughout. The front axle is drop-forged I-beam in section and supports the chassis through the intermediary of semi-elliptic springs. Rear springs are of the three-quarter elliptic type. The front springs measure 36 x 2 inches and the rear springs measure 48 x 2 inches. Two sets of brakes are provided, and both are carefully equalized. Both are internal expanding and operate in 14 x 2-inch drums bolted to the rear wheels. The wheelbase of the standard chassis, upon which both models are built, is 118 inches, tires being Goodyear "No-Rim-Cut" and measuring 34 x 4 both front and rear; they are mounted on Baker bolted-on rims.

One of the little details which goes far toward indicating the care which has entered into the designing is that though the

Digitized by Google

gasolene tank is located under the front seats, permitting gravity fuel feed, it is not necessary to remove the cushions to refill the tank. The filler pipe is arranged to protrude into the glove or goggle compartment between the seats. Another small feature which is suggestive is that, instead of being fastened with screws which may or may not catch in passenger's clothing, the body molding is fastened to the body on each side underneath; consequently there are no projections, unsightly or otherwise.

In designing the upholstery of both models, the Ames engineers have worked on the hypothesis that it is not practical, for rough, out-door use, to attempt to build into a car the luxurious type of down and goatskin cushions made famous by certain British morocco-leather upholsterers. Similarly, it is impossible, in the opinion of Ames upholsterers, to depend entirely upon the filling about which the cushions are built. For this reason, Ames cushions are built up of carefully selected springs, which have been chosen for their resiliency, backed up with filler which is calculated to give long life to the cushions and to cause them to hold their shape indefinitely under hard usage rather than to give it an unnecessary degree of luxuriousness.

AMES ROADSTER WHICH IS OF "CRUISER" TYPE

"Cycle Car" is Officially Defined.

Speculation which has been rife regarding just what is a "cycle car" and just what is not a "cycle car," that hybrid form of vehicle which is neither an automobile nor a motor cycle, at length has been set at rest by a joint ruling defining the term which has been issued by the British Auto-Cycle Union to the Royal Automobile Club of Great Britain. In it, it is pointed out that the chassis weight of a cycle car "must not exceed 600 pounds, inclusive of the weight of the tires, or, in the case of those vehicles the bodies of which are not separate from the chassis, the total weight, all on and ready for the road, but without fuel, oil or water, must not exceed a total of 700 pounds."

VALUE OF ALCOHOL FUEL COMPARED WITH GASOLENE

Greater Power Despite Lower Heat Value Made Plain by Government Report—Not Suitable for Ordinary Engines.

With the price of gasolene already high and threatening to go higher, added interest naturally attaches to the oft-reiterated possibility of employing denatured alcohol for fuel, if for no other reason than that relief in the form of an efficient carburetting device employing kerosene seems remote at present. In fact, for a number of years the Federal government has been experimenting with denatured alcohol with a view to determining conclusively its value as a fuel for internal combustion motors as compared with gasolene, and at length the results have been made public in a volume compiled by R. M. Strong and Lauson Stone and published by the Bureau of Mines of the Department of the Interior. It is entitled "Comparative Fuel Values of Denaturel Alcohol and Gasoline in Internal Combustion Engines," and is virtually a summary and supplement to a small bulletin on the same subject published by the government in 1909.

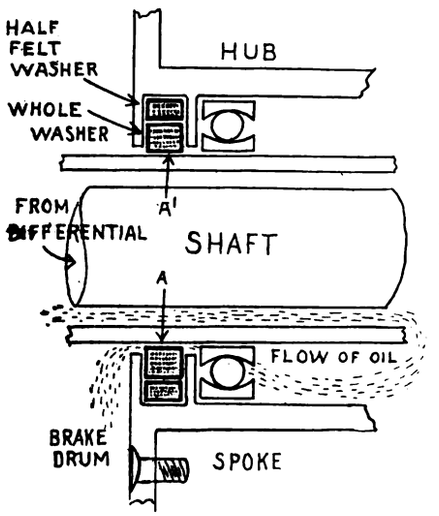
For those who are not familiar with the meaning of the term "denatured" alcohol, it is defined as grain alcohol made poisonous and repulsive by the addition of other ingredients, the generally accepted formula being: Grain alcohol, 100 parts; wood alcohol, 10 parts; benzine, 10 parts. Among a number of other interesting things pointed out in the report is that, contrary to the general conception the heating value of denatured alcohol is approximately half that of gasolene of a specific gravity of .71 to .73, the former containing 71,900 British Thermal Units to the gallon and the latter containing 115 800 B. T. U. in the same quantity.

Extracting from the more interesting portions of the introduction, it is interesting to note that "a gasolene engine having a compression pressure of 70 pounds, but otherwise as well suited to the economical use of denatured alcohol as gasolene, will, when using alcohol, have an available horsepower about 10 per cent. greater than when using gasolene. When the fuels for which the respective engines are designed are used to the same advantage, the maximum available horsepower of an alcohol engine having a compression pressure of 180 pounds is about 30 per cent. greater than that of a gasolene engine having a compression pressure of 70 pounds, but of the same cylinder diameter, stroke and speed. . . .

"A gasolene engine working at the degree of compression ordinarily used for gasolene mixtures will, in general, require 50 per cent. more denatured alcohol than gasolene per brake horsepower. Gasolene and alcohol engines of similar construction working at degrees of compression best suited to the fuel supplied, in general require approximately equal volumes of gasolene and denatured alcohol respectively per brake horsepower-hour. . . .

"The relative hazard involved in the storage and handling of gasolene and denatured alcohol is of particular importance in considering their use as fuels. . . . In accordance with the general concensus of opinion of those experienced in handling gasolene, kerosene and alcohol, statistics indicate that the hazard involved in the use of denatured alcohol is much less than that in the use of gasolene and possibly less than that in the use of kerosene. . . .

"The price of denatured alcohol is greater than that of gasolene, and the quantity of alcohol consumed by an alcohol engine as ordinarily constructed and operated is, in general, relatively greater than the quantity of gasolene consumed by a gasolene engine of the same type. Considerable attention is being given to the development of processes for the manufacture of alcohol from cheap materials that are generally available, and the expectation seems reasonable that the price of denatured alcohol may eventually become as low as, or lower than, the price of gasolene, especially if the price of gasolene advances. It also seems reasonable to expect a greater general improvement in alcohol engines than in gasolene engines."



The report in detail covers 242 pages and consists principally of tables and graphs giving performances of a number of both alcohol and gasolene engines on both fuels. A detailed description of the equipment used, the methods of procedure and complete logs and deductions from the various tests also is included in the volume, which is unusually complete.

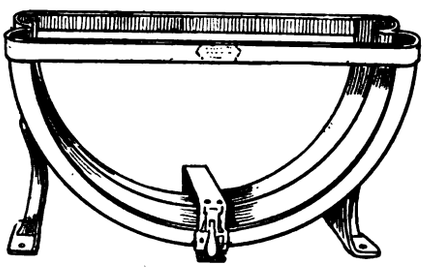
KEEPING LUBRICATING OIL AWAY FROM BRAKE DRUMS

How Oil-Retainers Deteriorate and How They Can Be Improved—Washers that Automatically Compensate for Wear.

However important lubrication may be to bearing surfaces that should be as nearly without friction as possible, there are places where oil is distinctly out of place, to say the least, notwithstanding the fact that much friction may be caused by its absence. Which is as much as to say that the braking surfaces of a car are no places for oil, especially when the bands are lined with the asbestos fabrics that are so com-

OIL RETAINING SCHEME



monly employed for the purpose. Felt washers are very commonly used to prevent the leakage of oil from the ends of live axles onto the brakes, and while such washers answer the purpose fairly well, at least when new, they become compressed in time, and are subject to wear, eventually allowing oil to work past.

In rear axles of the floating type, in which the wheel bearings are mounted on the axle tubes, there must, of course, be a certain amount of clearance between the shafts and the tube bore; unless special means are taken to prevent it, there will be a gradual seepage of oil or grease—or both—from the differential housing along the tube and out between the shaft and tube. The accompanying illustration shows the condition of affairs in a diagrammatic and exaggerated way. The oil that works along the axle serves a useful purpose in that it lubricates the bearings, as shown; but the trouble is that too often it does not stop there, but passes on to the brake drums;

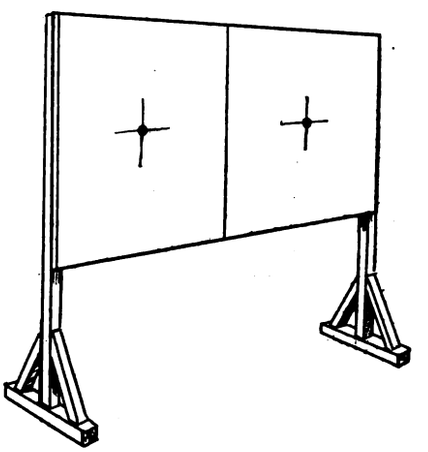
The illustration shows a method of remedying the trouble. This plan has proved in actual service to be well worth trying. The wheel should be removed from the axle and the felt washer reduced to half its original thickness—that is to say, the central opening should be increased by half the width of the felt ring. A new felt washer should be made of exactly the same dimensions as the original washer before being cut down. The new washer is put in place and the old one, which has been cut down, is forced on outside of the new one, which thus is pressed down on the tube firmly, preventing the passage of oil; considerable wear must occur before there can be sufficient opening for the leakage of oil. Both washers should be saturated with oil before they are put in place. Hard, green piano felt is the best material for the purpose, as it is of excellent quality, not too soft, and wears much better than ordinary felt.

Perfecting the Spare Tire Holder.

There can be no question whatever as to the satisfaction that is felt when a blow-

SLY "PERFECT" TIRE CARRIER

out occurs, and there is a spare tire on the car to take the place of the crippled pneumatic; but when it comes to the problem of carrying the tire, there is a question—how to make the best disposal of a decidedly clumsy article, not marring the appearance of the car more than can be helped and not taking up space that might better be used otherwise, and yet placing the tire so that it can be reached without delay and holding it securely while it is waiting for the emergency for which it is provided.



One of the more recent of the many ideas for carrying spare tires is embodied in the device shown in the accompanying illustration, the Sly "Perfect" tire holder, made by the W. W. Sly Mfg. Co, of Cleveland, O. Designed to be attached to the running-board of the car, the body is not in any way marred by the holder or its fastenings. The tire or tires, as the case may be —the holder is made either for one of two —bed down snugly and without looseness and are held firmly in place by a steel hasp with a toggle lock which will not jar loose. The material used is stamped steel, finished in durable black enamel. Sizes are made to fit all standard tires, both in single and double patterns.

CORRECTING LAMP FOCUS WITH A HOMEMADE DEVICE

Simple Method of "Lining Up" Diverging Light Beams—Bent Mudguards That May Cause Unsuspected Effects.

It is a fact recognized by the majority of electric lighting apparatus manufacturers that much of the trouble experienced with head lamps can be traced to improper focusing or adjustment that has gotten out of kilter through one fault or another. Generally, head lamp brackets are tied to the mud guards by means of short rods and turnbuckles, the purpose of the connection being to steady the lamps and in some cases to brace the guards.

In such cases, it is natural to assume that

LAMP FOCUSING STANDARD

a slight collision with another car or with some stationary object which results in one or the other of the guards being bent will throw one or both of the headlamps out of line, and possibly out of focus. The deflection of the lamps due to the bent mudguard may not be perceptible in the lamps themselves, though it is practically certain to make itself known by the divergence or convergence of the light beams when the lamps are lighted. Similarly, the lamps may be tilted either up or down and in any case they cannot be as useful or as efficient as they are supposed to be and will be if they are properly focused and set.

Where the lamps are tied to the mudguards by means of rods and turnbuckles it should be a simple matter to "line them up" merely by turning the screws of the turnbuckles—provided, of course, that the mudguards are not so badly bent as to make imperative their straightening. In order to make sure that the lamps really are straight and that they are properly focused a simple stand like the one shown in the picture is valuable. It consists of a

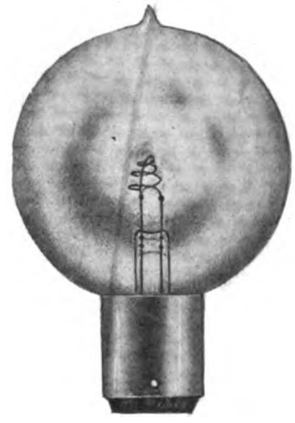
Digitized by Google

wooden framework on which is tacked a large sheet of white paper, or, preferably, Bristol board. Two large black dots are placed on the cardboard at a height from the floor equal to the distance from the floor to the centers of the lamps; the distance between them is equal to the distance between the centers of the lamps.

The car should be placed about 25 feet away from the board with the lamps lighted and pointed at it. Of course, it is quite feasible to dispense with the board and place the marks on any convenient wall or fence. The convenience of the stand, however, lies in the fact that it is easier to move the stand in order to get it squarely in front of the car that it is to manouver the car to get it "square" with the wall. With the car and the stand in the positions outlined, the lights should throw circular light patches devoid of dark rings with the centers of the patches directly over the black dots. If the beams do not strike the board in the right place, the lamp brackets can be adjusted by means of the turnbuckles, or, if none are used, the brackets can be bent quite easily with a large wrench. Care must be taken, however, that the wrench does not slip and break the lamps. In focusing the lamps, the bulbs should be moved backward and forward (adjustment generally is provided) until the light appears in two clear circles without any dark encircling rings. It is best to focus each lamp separately, shutting off the light of the other with a dark cloth.

Sleeve to Assist Coupler Assemblage.

To catch the thread on a union on a piece of copper tubing when the joint is to be made in a "tight place" is an exasperating job, but when the rotatable member will persist in sliding along the pipe and jamming behind some projection each time it is released for a second, it becomes even more trying. A good plan is to solder a sleeve around the pipe about four inches from the end so as to limit the travel of the member; if the pipe is made up, a couple of layers of bare copper wire soldered in place will answer admirably.



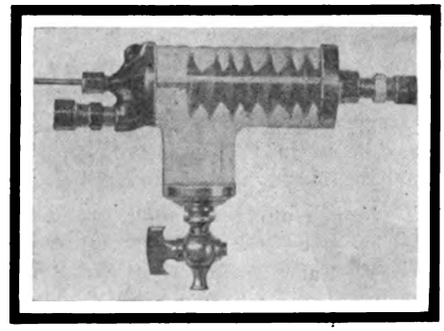
Metallic Cement for Filling Blow-holes.

A metallic cement which, applied when plastic, will harden perfectly in a few hours, is made by moistening 20 parts of precipitated copper with sulphuric acid and adding to the paste 70 parts of mercury, constantly stirring the mixture. When the copper has amalgamated with the mercury, the acid is washed out with boiling water and the cement is applied to the work. The cement is ideal for filling sand or blow-holes, and is unaffected by the action of water or dilute acids. The surfaces to which it is applied should be thoroughly clean.

Reducing Waste in Electric Lights.

The extended adoption of electric lighting for automobiles has proved an incentive to lamp specialists to overcome the difficulties that lie in the way of producing lamps that are both efficient and economical, and among the pioneers in the manufacture of small, high-efficiency bulbs is the firm of H. J. Jaeger & Co., Terminal Building, Hoboken, N. J., whose most recently developed tapered spiral filament Tungsten lamp is shown in the accompanying illustration.

In the Jaeger lamp, which is made for 6,



JAEGER TUNGSTEN LAMP

8 and 10 volt currents, the Tungsten filament is in the form of a spiral, the result being that it does not cast shadows or radiate light unevenly, which makes it especially suitable for electric headlight work. The current economy of the Tungsten filament has been combined with a resistance to vibration that was not a characteristic of early Tungsten lamps, a certain flexibility of the Tungsten wire being in part responsible for this fact.

Filtering Gasolene in the Fuel Line.

The peculiar effectiveness of chamois as a filtering medium for gasolene has been

"PERFECT" GASOLENE FILTER

cleverly taken advantage of in a device that just has been placed on the market by the Gasolene Filter Co., 10 West 62nd street, New York City. The "Perfect" filter, as the attachment is called, is shown in the accompanying illustration, which is a "ghost" picture showing the "insides" of the ingenious device.

The inlet from the gasolene tank is on the left and the outlet to the carburetter on the right; the outlet can be reached by the gasolene only after passing through a sort of bellows of chamois and wire gauze which effectually excludes any water and solid matter that may be in the fuel. Impurities fall into the cup which forms the lower part of the instrument and may be drawn off through the usual pet-cock at the bottom. In course of time a certain amount of foreign matter is likely to accumulate on the strainer; it is readily dislodged, however, by pushing in the little rod that projects from the left end of the filter, just above the gasolene pipe connection. The rod is attached to the end of the bellows and when pushed it causes it to fold up; the gasolene inside is forced back through the chamois and gauze, washing off the dirt.

There is no tendency to feed gasolene too slowly, as there might be if only a small area of chamois were employed; the bellows has an area of about 20 square inches, and this is sufficient to permit a free and unimpeded flow of fuel. Compression couplings, which do not require soldering, are used for attachment, so that the filter can be installed by merely cutting five inches out of the line and gripping the pipe ends in the couplings by means of the compression nuts. The filter is finished in nickel and the price is $5.

Vanadium's Effect on Cylinder Castings.

A foundry which produces gasolene motor cylinders of peculiarly difficult form, from a founder's point of view, is reported to have reduced the percentage of loss in discarded castings from 6 per cent. to 1.4 per cent. by the use of vanadium in the iron. At the same time the tensile strength of the iron has been increased some 15 per cent. and the hardness also has been augmented.

Loose Bulbs Cause of Lamp Trouble.

A possible cause of the breakage of incandescent lamp filaments in either inside or outside automobile lamps is looseness of the bulbs in their sockets. The rattling of the lamps is accompanied by a series of sharp little raps, which hasten the destruction of the filaments. It often is possible for such looseness to exist without interrupting the flow of current.

Brine Bath for Tempering Steel.

If maximum hardness is required of a piece of steel, it should be quenched after heating in strong brine. This cools the metal with great rapidity, and the steel so hardened will be of glassy density, though of course extremely brittle.

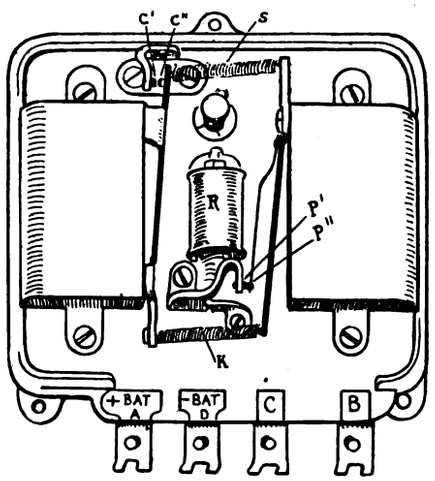
KEEPING PACE WITH LIGHTERS AND STARTERS

Actual Amount of Care That Is Required to Maintain Average Electrical Equipment in the Proper Condition to Render Best Service—The Ward Leonard System as an Example of Simplicity.

(This is the thirteenth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by the dealer and owner alike.)

Like everything else that has been intimately connected with the development and perfection of the modern automobile, the electric lighting and engine starting system has, of necessity, passed through a period of adolescence. And, like the growing child, it has played pranks apparently without reason and been disciplined, so to speak, and in some quarters it has gained a name that has not been good and that has not been conducive to the peace of mind of its progenitors. But electric lighting and engine starting now has "grown up"—its growth during the past year has been almost marvelous and its simplification and efficiency have kept pace with it.



Perfection Responsible for Adoption.

In all probability it was the pranks played by early systems that have been responsible for the comparatively slow death of natural feelings of distrust bred of the indeterminate action of generators and batteries built primarily for stationary use and more or less out of place on automobiles. It required a very considerable time for the knowledge to seep in that for successful operation on an automobile under automobile conditions, generators must be built especially for the work and with all the phases of the work in view. It was small wonder that some of the early systems worked at all, let alone gave the degree of satisfaction they did give.

It is obvious, of course, that conditions are different now; that the modern electric lighting and engine starting system is so nearly perfect that there is comparatively little room for improvement, for if this were not so it is extremely doubtful if so many well-known automobile manufacturers with established reputations for conservatism and care in the choice of accessories would have adopted them and given to them their unqualified recommendation. This fact is in itself a guarantee that they will work and work well without the necessity for continual attention at the hands of an expert electrician or engineer.

Technical Education Unnecessary.

Apparently, however, those who are inclined to look at electrical systems askance have overlooked this all important feature. It stands to reason that no reputable automobile manufacturer would equip his products with devices about which doubt exists And it is reasonable to expect, also, that no manufacturer would add weight to his cars by placing on them accessories likely to become not much more than dead weight by reason of continual functional derangement. Which is to say, the average electric lighting and engine starting system as it comes from the manufacturer to-day is as nearly perfect as present intelligence can make it and will remain dependable in the

WARD LEONARD REGULATOR

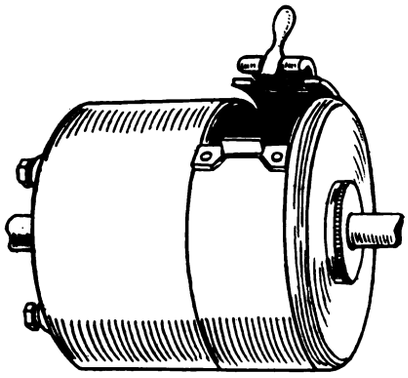
majority of cases if it is let alone. Of course, it will require a purely nominal amount of care—every piece of machinery requires it—although the care that is necessary does not require a technical education to back it up. The technical education already has been supplied by the manufacturer, and the only remaining requisite is common sense—and a knowledge of the construction and working of the system.

Opportunities That Dealers Overlook.

One of the first things a skilled mechanic endeavors to find out when he is called in to doctor a piece of 'sick" mechanism is just how it ought to operate when in prime condition. With that knowledge, it is a comparatively simple matter for him to diagnose the trouble and remedy it. But he must know in the first place just how the wheels go around and why they go around before he can tell why they don't go around and start them again on their merry whirls. It is exactly the same with the electric lighting and engine starting system, as has been told several times in the twelve preceding articles on the same subject which have appeared in Motor World. The owner may not feel inclined to spend the few moments daily necessary for him to become acquainted with his system, though it will be his own loss if he does not, but there can be no excuse for the dealer slighting his customers and himself by remaining in ignorance. The dealer has every day a better chance to become thoroughly acquainted with his own system then the owner ever has, for the dealer very probably is dealing in hundreds—perhaps thousands—whereas the owner comes in contact with only one. It is to the dealer that the owner appeals when in distress, and if the dealer has improved his idle moments by acquiring information about his system, he is just that much further along in the world.

Development of a Pioneer System.

All electric lighting and engine starting systems really are simple if the owner and the dealer will only come to know it. Apparently, however, they prefer to take it for granted that present day systems are as complicated and as unreliable as were those of a few years ago. They do not stop to think that if such were the case it would not be possible to dispose of them, for the manufacturer of the car would be the first to object and it is doubtful if any manufacturer of electrical equipment could hope to prosper without the aid of the car manufacturer. Few manufacturers of electrical equipment make any attempt to market their wares direct, for which reason the regret becomes more real that they do not insist upon more perfect knowledge of their systems by the car builder, for they must rely upon him to a certain extent, and it would be better if they could rely upon him with greater faith in his ability to adjust to better all around advantage such slight mechanical troubles as are likely to develop in even the best of mechanism.



When electric lighting for automobiles was in its earliest infancy, as long ago as 1906, H. Ward Leonard, then and now

Digitized by Google

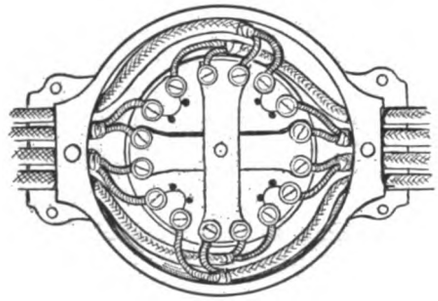
head of the old-established Ward Leonard Electric Co. of Bronxville, N. Y., was putting the finishing touches to his electric lighting system for motor cars, more than 20 years having been spent in developing and perfecting the control elements around which it was built. Two years later, in 1908, the first complete Ward Leonard electric lighting system was placed on a car and thoroughly tested in an extended trip from New York to a point near Lake Nipissing, in Canada. Suffice it to say that it finished the run without the slightest trouble and that since then it has been still further perfected and refined, until brought to its present form. Since, the system has been amplified by the addition of a starting motor.

Three Essentials of Simple System.

In its essentials the Ward Leonard system differs in no wise from other systems. There is a generator, an automatic cut-out,

WARD LEONARD GENERATOR

a storage battery, a switch, and a motor. The generator, which is shown by the accompanying picture, is of the plain shunt type and there is only one moving part in it—the armature. The automatic cut-out is of the electro-magnetic type and is contained in a tight casing on the dash; the switch is a combined junction box and switch and is of the rotary type; the motor is a plain series wound type in which the torque increases with the load.



Ingenious Regulating Mechanism.

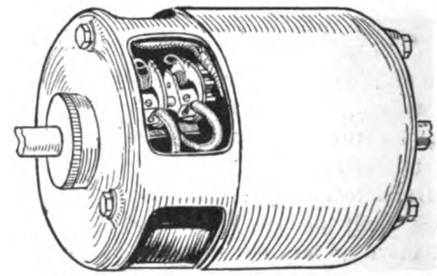
The manner of regulating the output of the generator is unusual and is peculiar to the Ward Leonard system; it is covered by patents. The machine is of the constant current type. That is to say, the output in amperes is maintained constant within very narrow limits, regardless of the speed of the armature and the manner in which this characteristic is obtained is simple in the extreme.

Like the cut-out, the regulator is of the electro-magnetic type and is enclosed in the same dash-mounted casing as the former. Both are shown by the accompanying picture, which depicts the whole mechanism with the cover removed. In this case there are two electro-magnets and a tiny resistance coil, the magnet on the left in the picture being the cut-out and the one on the right being the regulator. The tiny resistance coil (R) is placed between the two magnets.

How Constant Current is Obtained.

In operation, as soon as the speed of the armature becomes such as to cause the generation of voltage in excess of the voltage of the battery, two contacts (C' and C") are brought together by the attraction of the cut-out magnet for the armature which carries one of the contacts. As long as the amperage of the generator remains less than 9.9 nothing else happens. Immediately

SWITCH-JUNCTION BOX



the amperage exceeds 10, however, the current becomes strong enough to attract the arm of the other magnet (in the regulator), with the result that the contacts P' and P" are separated, thereby placing the resistance coil (R) in the field circuit of the dynamo. As the field is weakened by the insertion of resistance which permits less current to pass through it, the amperage drops and immediately the contacts come together again, removing the resistance and permitting the field to build up to its original strength. The arm of the regulator is spring-returned (K) and therefore vibrates continually, maintaining the amperage to all intents and purposes absolutely constant. Its rate of vibration is such, however, that it is not appreciable in any flickering of the lamps.

Care of the Regulator Made Plain.

There is nothing in either the regulator or the cut-out that should require attention. The contacts are formed of hard material calculated to withstand indefinite service, and there are only two moving parts—namely, the armatures. These are hinged to their supports by means of flexible metal straps, there being no movable joints. Hence, it is not even necessary to apply a drop of oil occasionally.

About the only thing that could happen to the mechanism would be slight corrosion of the contacts due to the presence of oil or water; the possibility is remote, however. If the contacts should become corroded or dirty, thereby partly impeding the passage of current, it is a simple matter to clean them with a couple of small pieces of emery cloth glued to opposite sides of a piece of thin Bristol board.

The operation of either the cut-out or the regulator can be watched quite easily by removing the aluminum cover which encases them. When the car speed reaches approximately seven miles an hour, the cut-out contacts should come together and remain together until the speed is reduced, when they should separate promptly. Naturally, if they stick together, which is unlikely by reason of the fact that the passage of current through the magnets in the reverse direction acts to "kick" the armature off, the battery will exhaust itself through the generator. Similarly, if they do not come together when they should, the battery will gradually exhaust itself because no more "juice" will be put into it. Either trouble is indicated by the symptom of gradually dimming lamps, and is easy of correction. Owing to the fact that the

MOTOR, SHOWING BRUSHES

mechanism is very carefully adjusted at the factory for a predetermined current, no attempt ever should be made to alter the adjustments.

Rotary Switch and Junction Box.

The switch, as has been pointed out, is also a junction box, or a central point to which all the wires lead and from which they are connected to the lamps. The portion of the switch which is illustrated is fitted to the back of the dash with the switch handle passing through to the driver's side. Manipulation of the switch permits the lighting of all the lamps or of any combination at the will of the operator. As the complete system comes from the factory, it is carefully wired with armored cable with all terminals marked in a plain manner to make their proper connection a simple matter that can be done by anyone. Any of the cables may be removed without the necessity for disturbing any of the others.

The dynamo and the motor in the Ward Leonard system virtually are duplicates, ex-

Digitized by Google

cept as regards their wiring and size. In both, the brushes are of the radial type, which type, in the experience of the manufacturers, is best suited to withstand the vibration and hard use necessary in an automobile. The brushes are formed of a special material which is calculated to run for indefinite periods without wear and without lubrication. Commutators are solidly constructed of hard drawn copper and are well insulated.

How to Get at the Brushes.

Commutators and brush holding mechanism are accessible through openings in the casing casting, which are closed under ordinary conditions by means of continuous bands of metal which are held in place by simple catches. Loosening the catches serves to permit the removal of the metal bands.

In the care of any electric lighting and engine starting system experience has proven that commutators and brushes generally are productive of nearly all troubles that may arise to harrass the owner. Such troubles easily can be obviated, however, by periodical inspection and intelligent care. Generally commutators will run at least for a season before they require to be touched, though it is the better part of wisdom occasionally to inspect them and it will do more good than harm, for the inspection serves as a good excuse to remove any accumulations of dirt and dust or oil that may have collected. A soft camel's hair brush should be used, preferably, for the purpose. Never replace the straps that close the openings before carefully wiping them with a cloth dampened with gasolene and removing dust which may cling to the edges of the straps.

As the armature shaft rotates in ball bearings its needs in the matter of lubrication will be exceedingly moderate. In no case should more than one or two drops of fine machine oil be placed in the holes provided for the purpose more than once in two or three weeks. Too much oil will be thrown out by centrifugal force and will collect on the brushes and commutator and cause trouble. Incidentally, if it comes in contact with the wiring it may have a bad effect on the insulation. All of which applies with equal force to both the motor and the generator.

What a Brownish Glaze Indicates.

If, in the inspection of the commutator and the brushes, the former exhibits a brownish, glazed appearance and the brushes are not perceptibly worn, neither should be touched, for they then are in the best of condition. If, however, the commutator appears dry and caked, or scratched, No. 00 sandpaper should be held lightly against it while the armature is rotating and after the brushes have been removed. In cases where the commutator appears badly cut or scratched, the brushes should be examined to make certain that they are of the proper length and that they bear on the commutator with proper strength. If they bear too lightly, sparking is likely to result, and if they bear too heavily, they may cut the comparatively soft copper. Adjustments should not be changed, however, unless there is an unmistakable evidence that the pressure is not correct. Brushes have been known to contain tiny, hard particles which have scratched commutators and, though they are of infrequent occurrence, it will do no harm to make sure that they are not present when making the inspection. Sometimes it is well gently to sandpaper the ends of the brushes where they press against the commutator, though when this is done care must be taken not to disturb the curvature any more than can be helped. It is not necessary that the curvature be restored exactly, as the brushes soon will wear until they have a perfect contact.

Motors Require Little Attention.

Naturally, as the generator is in operation all the time the motor is running, its commutator and brushes will be subjected to greater wear than will those of the motor and, consequently, they will require more frequent inspection. As the motor is used at infrequent intervals and is inoperative when not actually in use, its brushes and commutator should not require to be touched from one season's end to the next. When they finally do give evidence of requiring attention, they should be treated exactly the same as those of the generator.

One feature to which not sufficient attention is paid by owners and dealers is that brushes often are run too short. It is false economy to attempt to make brushes last "just a little longer" when they ought to be replaced with new ones. Short brushes reduce the tension on the brush holder springs and, as the brushes do not then make proper contact with the commutator, sparking results. The better way is to replace brushes immediately they have worn down perceptibly, spare brushes, which cost but a few cents, being carried for the purpose.

New Randerson Bumper Developed.

When an automobile comes into collision with anything there is considerable liability of damage being done either to the front ends of the springs and frames or to the fragile radiator—to say nothing of the damage that may be sustained by the object with which the car collides. To eliminate, or at least minimize, the results of such shocks, many varieties of "bumpers" have been brought out, one of the firms that has been prominent in this line of manufacture being the Randerson Auto Parts Co., of 110 West 34th street, New York, which recently has added to its line a bumper, model M, which embodies some improvements over the older models.

Ther new Randerson bumper has two forward rails, one behind the other, attached to rearwardly projecting arms of steel having at their rear ends means for attachment to the car. These arms are not continuous, however, but consist of a cylinder-and-piston arrangement, the cylinder being on one section and the piston on the other, the two fitting together without shake or rattle. The piston in each arm is backed by heavy coiled steel springs, which are compressed in case of shock.

The Randerson bumpers are made in two general types. In one the front rails are designed to turn either up or down, so as to be out of the way of the starting crank or of repairing operations, etc. In the other the hinge arrangement is absent. The materials used are manganese bronze and steel for the supporting arms, reinforced brass-covered steel tubing for round rails and T-iron for T-shaped rails; the rails may be had in either form. Either single or double front rails are furnished. Round rails are finished in polished brass and T-section rails in nickel on copper, or in hard rubber enamel, baked on.

To Keep Valve Parts Out of Motor.

One of the most unpleasant of the little things that happen in the course of tinkering about a motor is the dropping of a valve lifter into an inaccessible crankcase when the guide is removed for any reason. The lower end of the lifter rests on the cam, and when the guide is moved sufficiently to let the roller clear the cam, down it goes, unless there is something to stop it. To prevent such vexations, a piece of stiff wire twisted around the adjusting screw, or anything that will not pass through the opening, should be put on as a safeguard before the holding-down nuts are removed. Of course, there are engines with crankcases so accessible that little inconvenience is caused by the dropping of parts inside; but other are less conveniently built, especially old models.

Light Spring that Aids Valve Grinding.

In regrinding valves, it is advisable to use a light spring under the valve head, acting to raise the valve from the seat; the valve should be worked up and down so as to work the abrasive material onto the seat. In grinding, the valve should be rotated with a reciprocating motion, not turned continually in one direction, else ridges will be formed.

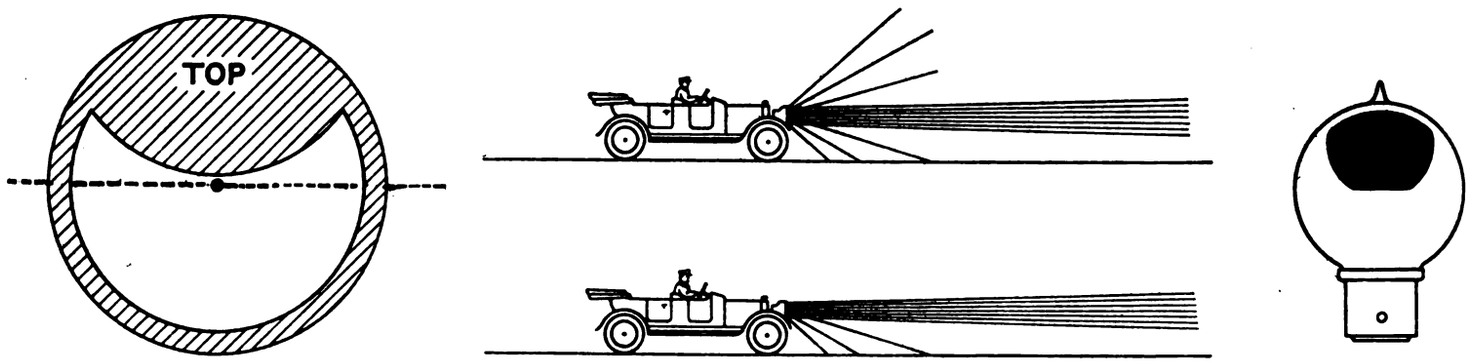
FORCING THE HEADLIGHTS TO SHINE THROUGH FOG

Stray Rays That Are Worse Than Useless—Simple Methods of Suppressing Them—Reflectors and Colored Screens.

In night driving when the air is clear it is a comparatively simple matter to provide sufficient light to adequately illuminate the road ahead of the car; good acetylene or electric headlights are numerous and the amount of light, within reasonable limits, is dependent only on the size of the lighting apparatus one is willing or is able to purchase.

When, however, fog prevails the conditions are entirely different. The stronger the light, the better, of course, but the only rays that are of any use are those which are thrown directly on the road ahead. Upwardly diffused light, which is not noticeable when the air is clear, has the effect of making the fog appear considerably more dense than it really is, the light being reflected back to the observer's eyes; the angle of incidence and the angle of reflection are equal, and most of the upwardly diffused light is reflected to the driver's eyes from a point between him and the road a short distance ahead, and the effect is so pronounced that in some cases it is easier to drive without the headlights than with them.



Red and yellow rays are considerably more penetrative of fog than white rays, and for this reason it has been suggested that colored screens or gold-plated reflectors might help matters—in fact, they have been tried abroad. As either of these methods would so greatly reduce the available quantity of light as to more than offset the advantages, in all probability, the most reasonable and, at the same time, the easiest plan is to cut off the upwardly diffused light and eliminate in this way the blinding effect of its reflection.

Two methods of doing this are shown in the accompanying illustrations, from "The Car." In the case of an acetylene headlight a mask is cut from sheet metal, and in the case of an electric light the material used may be cardboard; in either case the masks are finished with dead black paint, outside; the inner side will be better left white in the case of cardboard, and bright in the case of metal. If tin is used the bright surface will act as a reflector and the loss of a certain amount of illumination will thus be avoided.

The lower edge of the main body of the mask should be a little above the center of the glass. The circular rim and the top section will prevent light being thrown anywhere but ahead, and the beam will seem to penetrate the fog much better than without the masks, even though the amount of light is somewhat less than with the lamp front open. The mask is sprung into the door frame back of the glass. If it should show a disposition to shift, it can be "tacked" to the door frame with solder.

An arrangement that is somewhat neater and at the same time rather more economical of light is one that has been adopted by an English maker of electric headlights; but the plan obviously is applicable only to incandescent lamps. As shown in the illustration, a small shield of black material is attached to the upper part of the bulb of the headlight, not only shutting off the rays thrown out directly by the filament, but also turning back upwardly reflected rays. The side next to the glass of the lamp is silvered and acts as a reflector; the loss of light, therefore, is not as great as might be imagined, for part of it is turned back and sent out in the long-distance beam.

The use of sidelights in a fog is apt to make things unpleasant for the driver by diffusing light that is reflected back to his eyes from various points, giving him the feeling of being surrounded by a wall of impenetrable white. Of course, there is a great deal of difference in side lights in this respect. There are some that radiate light in a wide arc that produces a maximum of the blinding effect that is so exasperating —especially if the driver is in a hurry—while others act more like the headlights, which they resemble. In any case, however, the side lights, owing to their comparatively high position, are apt to be a source of trouble in this respect. Yellow glass screens will be of assistance, if it is desired to keep the side lights burning; the driver will be relieved of the back-thrown glare, while the lights will be visible from ahead.

CUTTING OFF LIGHT BEAMS THAT MAKE DRIVING DIFFICULT IN FOGGY WEATHER

Wichita Has Anti-Motor Thief Association.

When next an automobile thief in Wichita, Kan., makes away with a car he is going to stir up some excitement and also is due for the liveliest few hours he has put in in some time, for he will be pursued by a half hundred angry men on motorcycles and the thief will have to be acquainted with some secluded hole in the ground to evade capture.

The Wichita Anti-Motor Thief Association is the instrument designed to make this form of stealing unpopular. The motorcyclists of the city conceived the idea, and straightaway proceeded to put it into effect; and now C. M. Tucker, the city's automobile policeman, is seeking to get the automobile owners to form a similar body, after which the two may be merged. Insurance companies and car and motorcycle owners are to be requested to help defray the expenses of the work.

Provisions of the association are that when a car or motorcycle is stolen a posse of fifty or more motorcyclists will set out in every direction with the number and description of the car and cover every street and country road in search for the thief.

Freak Bet Tourist Now in Georgia.

Dr. H. Benton Young, of Trenton, N. J., a dentist, who wagered in July last that he could start with a capital of $5, make $10 in every town where he stopped, and complete the trip with a total of at least 10,000 miles within a year, is really performing the "stunt." He is now in Georgia, and last week had totaled nearly 6,000 miles. He expects to go to California and return to Trenton by March.

STATE ASSOCIATION CHECKS THE NEW YORK TINKERING

Proposed Amendments Suppressed—Deer Re-elected President—Road Reform Advocated and "Corruption Fund" Hinted at.

If the New York State Automobile Association can prevent it, there will be no tinkering with the automobile law at the forthcoming session of the legislature. Despite the fact that some industrious member of the organization had drafted and outlined a long list of amendments which it was suppposed to have introduced, at its annual meeting in Utica on the 11th and 12th inst. wiser counsel prevailed and the amendments, and all talk of them, were suppressed. Melvin Bender, chairman of the association's legislation committee, who is stationed in Albany and who keeps an eye on the legislature, was the chief factor in snuffing out the movement to amend the law. He gave as his opinion that the present statute is admirably serving its purpose and counseled that it be left alone, which sentiment prevailed almost unanimously.

The association, however, entered into a considerable discussion of the State highway system, as it exists, and placed itself on record as favoring the amendment of the present highway law, to the end that the present highway system be abolished and that there be substituted a non-partisan highway commission of at least three members to serve not less than six years. The great increase in the cost of highway construction was remarked, and it was stated that quiet investigation had revealed that the present cost of $14,000 to $16,000 per mile is due to the use of "patented processes," which consist largely of simple methods for mixing crushed rock and asphalt, in which connection there was also talk of a "corruption fund."

Considerable dissatisfaction was expressed with the present form of apportioning the annual dues, whereby the national A. A. A. exacts 25 cents each year from each member of the state organization, but Laurens Enos, the new president of the A. A. A., who was present, poured oil on the troubled waters and averted unpleasant action which was threatened.

A. J. Deer, of Hornell, was re-elected president of the association; in fact, practically all of the other officers were re-elected, as follows: First vice-president, H. G. Strong, Rochester; second vice-president, Howard Martin of Albany; third vice-president, A. B. Maynard of Utica; treasurer, A. C. Parsons of Troy; secretary, F. D. Lyon of Albany; delegates at large, H. G. Meldrum of Buffalo, A. G. Batchelder and Charles Thaddeus of the "three A's."

Troy was selected as the place for the 1913 meeting.

Moose Jaw Rules on Lighting Idle Car.

Various courts and authorities in different parts of the country have ruled on the question as to whether a car which is standing in the street at night shall have its lamps lighted and not all are agreed; Moose Jaw, Saskatchewan, is the latest town to appear with a decision on this matter. Magistrate Dunn, sitting in Police Court, was called upon to try Richard Loney, whose car was found standing in the street at night without the number plate being illuminated. Attorneys quoted various sections of the Motor Vehicle law and offered interpretations both ways, but the judge used his own judgment and discharged the prisoner.

Paris Considering More Drastic Law.

The Municipal Council of the French capital is at present considering a series of new motor vehicle regulations which would impose drastic measures, to say the least, on law breakers. The proposed regulations provide that no one shall be permitted to drive a car on the public highways unless insured in an approved society; that a recording speedometer be fitted to every car; that in case of accidents the driver of the car be held responsible if the speed recorder registers a greater speed than 15 miles an hour; and that any driver who is convicted of causing an accident shall be deprived of his license for two years.

Boston Club Decides to Build.

It is altogether probable that before this time next year the Massachusetts Automobile Club, with present headquarters on Boylston street, Boston, will be housed in a brand new building, six stories in height and providing accommodations for some 400 cars in addition to the space required for the club rooms. It has been voted to open negotiations immediately to obtain the necessary land at the corner of Stuart and Clarendon streets and to proceed with the erection of the building which, it is estimated, will cost in the neighborhood of $450,000, and will measure 150 x 120 feet.

Herrmann New Head of Long Island Club.

Charles Herrmann, who for the past year has been vice-president of the organization, has been chosen to fill the higher office in the Long Island Automobile Club. The other officers elected are: Vice-president, Herbert G. Andrews; treasurer, J. S. Frazee; secretary, F. H. Newcomb; C. H. Galt, Edward Ashforth and A. W. Seaman are the new trustees.

12,678 MILES IS TOTALED BY PATHFINDER WESTGARD

Completes Task of Crossing Continent Three Times in Five Months and Four Days—For Federal Government and A. A. A.

Twelve thousand six hundred and seventy-eight miles in three jumps with scarcely a breathing space between them, is, as might be remarked by a facetious motorist, "some hike." But A. L. Westgard, who made the "hike"—not on foot but in a Pathfinder "40" car—already has an established reputation as a cross-country artist of ability and prowess, and it is altogether probable that he got more pleasure than work out of his 12,000 mile jaunt. Anyway, he says he is ready to do it all over again, and it goes without saying that the car is ready, too. In order to roll up that astonishing total mileage in the time he did it—just five months and four days—Westgard traversed the United States from coast to coast three times in succession, to say nothing of a side trip of 1,016 miles.

Westgard's pathfinding was done in the interest of the Federal government and the American Automobile Association and commenced in New York on June 11th last with a run to Seattle over what is known as the "Northwest Trail," taking in Buffalo, Chicago, St. Paul and Minneapolis and including connections to Yellowstone National Park and Glacier Park; this part of the trip covered 4,196 miles and was completed on August 7th. Following the 1,016-mile trip down the Pacific Coast from Seattle to Portland and San Francisco, the return trip from the last named California city to New York was started over the "Overland Trail" through Salt Lake City, Cheyenne, Omaha and Chicago, New York being reached on October 3d, with 3,919 miles more to the credit of the Pathfinder. After a short stop in the Eastern metropolis, the third trip across the continent was started over the "Midland Trail" through Philadelphia, Pittsburgh, Indianapolis, St. Louis, Kansas City, Denver, Salt Lake City to Los Angeles, which was reached on November 25th, the mileage of the last leg being 3,547, or 12,678 miles in all.

Freeport Motor Club Elects Officers.

At the annual election of officers of the Freeport (Ill.) Motor Club, H. Tarbox was elected to the presidency. J. Daniels, Seth Scott and F. N. Pellett are the new vice-president, treasurer and secretary, respectively. The board of directors comprises John Lamm, Adam Marker, Roy Nelson, Henry Brockmeier, J. G. Woker.

1,020,607. Motor Truck. Charles W. Hunt, New York, N. Y.; Katharine H. Hunt, Charles Wallace Hunt, and George S. Humphrey, executors of said Charles W. Hunt, deceased. Filed Dec. 30, 1910. Serial No. 600,008. Motor on an independent frame and arranged so that its weight in full is borne by driving axle.

1,020,665. Auto-Vehicle Dump Box. Fred T. Sherman and Herman Goetz, Seattle, Wash. Filed Mar. 7, 1911. Serial No. 612,968. Doors that open when body is shifted rearwardly.

1,020,678. Wheel Rim. Frederic Rutherford Barker, Boston, Mass. Filed Mar. 21, 1911. Serial No. 615,916. Demountable wheel rim.

1,020,729. Ball Bearing. Gustavo Vincon, Turin, Italy. Filed Feb. 16, 1909. Serial No. 478,145. U-shaped channel ball retainers.

1,020,737. Friction Clutch Having Removable Wearing Surfaces. Herbert Austin, Barnt Green, near Birmingham, England. Filed June 1, 1909. Serial No. 499,430. Plates of frictional material, adapted to be replaced in sections.

1,020,766. Valve Stem and Head Therefor. Levi E. Lowe, Columbus, Ohio. Filed Oct. 8, 1910. Serial No. 585,936. Means of retaining valve spring in centered position.

1,020,768. Alarm Signal Device. Ray H. Manson, Elyria, Ohio, assignor to The Dean Electric Company, Elyria, Ohio, a Corporation of Ohio. Filed May 10, 1911. Serial No. 626,216. Method of constructing electric signal.

1,020,797. Vehicle Wheel Rim. Heinrich Bussing, Brunswick, Germany. Filed Mar. 18, 1911. Serial No. 615,400. Quick detachable bolted on rim.

1,020,799. Safety Crank for Explosion Engines. William R. Clark, Muncie, Ind. Filed Dec. 10, 1910. Serial No. 596,571. Cam action which ensures disengagement on reverse movement.

1,020,819. Explosive Engine. Anders Hanson, Butler, S. D. Filed Dec. 17, 1910. Serial No. 597,806. Parallel cylinders with double pistons.

1,020,836. Piston for Expansion Engines. Robert S. Moore, Washington, D. C., assignor to Gyro Motor Company, Washington, D. C., a Corporation of the District of Columbia. Filed Sept. 7, 1911. Serial No. 648,222. Annular groove cut in the head close to the edge.

1,020,856. Automatic Gasolene Dispenser. Richard Toennes, Boonville, Mo. Filed Feb. 3, 1911. Serial No. 606,441. Pivoted measuring container and means for operation.

1,020,879. Lifting Jack. Glen Russell Booth, Chana, Ill. Filed Apr 1, 1911. Serial No. 618,398. Rack and double pawls.

1,020,885. Wheel Hub Plate. Matthias Christman, Springfield, Mo., assignor of one-third to Harry L. Bissett and one-third of George A. McLaughlin, Springfield, Mo. Filed Oct. 31, 1911. Serial No. 657,737. Plate bedded in recess in wheel hub.

1,020,915. Float Feed Carburetter. Elden P. Lamb, Camden, Me., assignor to Camden Anchor-Rockland Machine Company, Rockland, Me., a Corporation. Original application filed Aug. 30, 1909, serial No. 515,239. Divided and this application filed June 15, 1910. Serial No. 567,042. Eccentric pin through float lever provides means of adjustment.

1,020,931. Carburetter. Clement Smith, Topeka, Kan. Filed Nov. 3, 1910. Serial No. 590,490. Fuel supply controlled by suction operated valve.

1,020,953. Internal Combustion Engine. William H. Ogden, Binghamton, N. Y. Filed June 20, 1911. Serial No. 634,385. Rotary cylinder motor with compressing piston.

1,020,967. Starting Mechanism for Hydrocarbon Engines. Fred Dettman, West Dundee, Ill. Filed Dec. 13, 1911. Serial No. 665,453. Means for preventing kick-back of the starting handle.

1,020,977. Vehicle Wheel. Luther L. Gregg, Jr., Lonejack, Mo. Filed Dec. 5, 1910. Serial No. 595,715. Helical springs between inner rigid rim and outer yieldable rim.

1,021,001. Magneto-Electric Device. Homer N. Montsinger, Pendleton, Ind., assignor to Montsinger Device Mfg. Co., Pendleton, Ind., a Corporation of Indiana. Filed Oct. 18, 1910. Serial No. 587,706. Means for causing armature movement that is constant, no matter what the speed of the motor.

1,021,030. Power Transmission Device. Dalton K. Wilson, Waterloo, Ia., assignor to William Galloway Co., Waterloo, Ia. Filed Aug. 26, 1910. Serial No. 579,061. Modified planetary gear positioned on the rear axle.

1,021,031. Igniting Mechanism for Explosive Engines. Alexander Winton and Harold B. Anderson, Cleveland, O., assignors to the Winton Motor Carriage Co., Cleveland, O. Filed Aug. 4, 1905. Serial No. 253,742. Means for causing spark in the proper cylinder for starting the motor.

1,021,036. Speedometer. Leon E. Blanchard, Boston, Mass., assignor to Reliance Speedometer Co., Boston, Mass., a Corporation of Maine. Filed Feb. 24, 1910. Serial No. 545,685. Means for transmitting motion from movable collar of centrifugal governor to the indicating needle.

1,021,039. Carburetter for Internal Combustion Engines. Gogu Constantinescu, Bloomsbury, London, Eng. Filed Aug. 21, 1911. Serial No. 645,250. Combined muffler and vaporizer for carburetting heavier hydrocarbons.

1,021,061. Motor Vehicle. Hiram P. Maxim, Hartford, Conn., assignor to the Waverley Co., Indianapolis, Ind., a Corporation of Indiana. Filed Feb. 27, 1908. Serial No. 418,056. Motor and transmission mounted on a shiftable frame.

1,021,079. Mixing Attachment for Carburetters. Alfred C. Stewart, Los Angeles, Cal. Filed Oct. 31, 1910. Serial No. 590,040. Combined trap for molecules of liquid which come from the carburetter and atomizer for vaporizing same.

1,021,171. Tread for Pneumatic Tires Frederick G. Ward, Pittsburg, Pa., assignor of one-third to Harry Davis, Pittsburg, Pa. Filed April 19, 1907. Serial No. 369,140. Tread formed by embedding helicals in the rubber.

The Atwater Kent Ignition System

DEALERS and REPAIRMAN

HERE are a few good Atwater Kent "talking points." You can make them make you money.

Its simplicity of mechanism—no vibrators, relays, or commutator—just one contact point regardless of the number of cylinders and only three moving parts, none of which are subject to excessive wear.

Its single adjustment easily and quickly made and seldom requiring attention.

Its adaptability and easy installation on any standard make of motor, new or old.

It is ideal for use in connection with lighting and starting equipment as it produces a hot dynamic spark, perfectly timed regardless of the engine speed.

While the Atwater Kent System is high in value and reputation, it is not high in price. In fact, it will cost less than half as much as a good magneto and will give superior results at a much less cost of upkeep.

There are now two types of Atwater Kent Ignition equipment—standard **Type F** and the new **Type K,** the latter having the automatic spark control and insulated primary circuit features.

PRICES OF THE TYPE F SYSTEM

	Standard Coil.	Kick Switch Coil.
1-cylinder	$17.00	
2-cylinder opposed	18.00	
2-cylinder distributor type	22.00	$24.00
3-cylinder distributor type	25.00	27.00
4-cylinder distributor type	25.00	27.00
6-cylinder distributor type	27.00	29.00

PRICES OF THE TYPE K SYSTEM

	Standard Coil.	Kick Switch Coil.
2-cylinder	$32.00	$35.00
3-cylinder	35.00	38.00
4-cylinder	35.00	38.00
6-cylinder	37.00	40.00

In substituting the Atwater Kent System for the magneto or for driving it from any horizontal shaft or gear, we furnish a special magneto gear mounting, the additional price of which is $5.00.

You will have many inquiries for ignition equipment during the coming year and should be in a position to recommend the Atwater Kent whenever the most efficient ignition is desired.

Seize the opportunity and post yourself by a visit to our exhibit No. 140 Madison Square Garden Show, New York City, or write for our booklet "D."

American American

American Axles

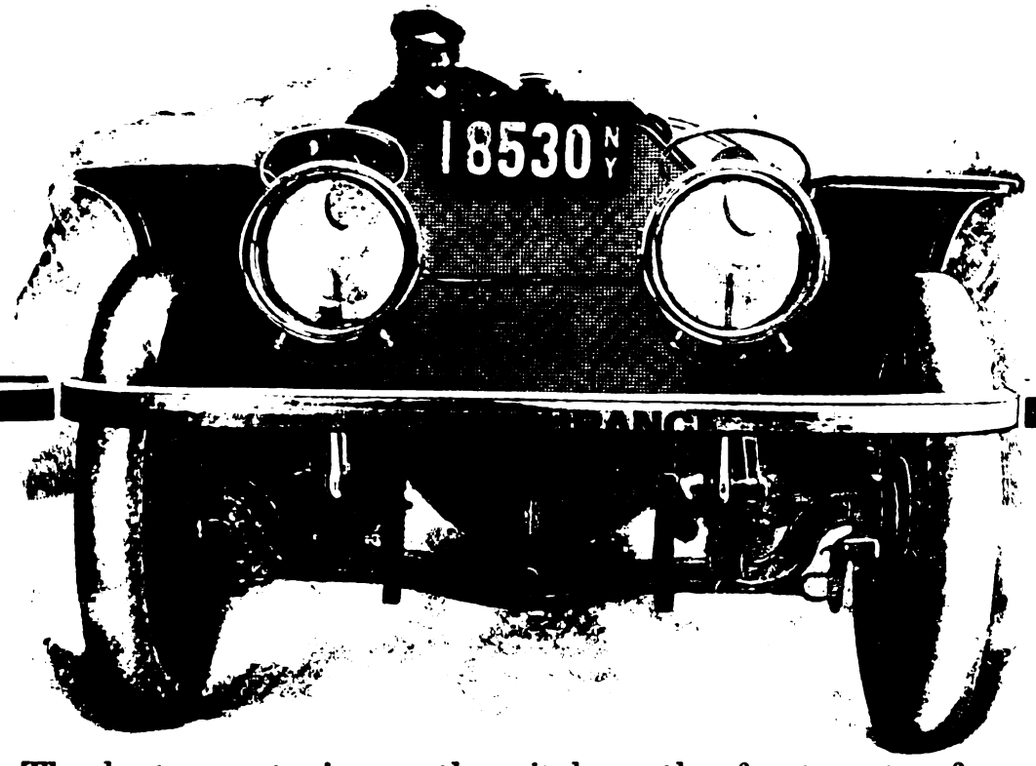
Won't Rob Your Electric's Battery

The less current demanded to turn over your axles, the more power you have for mileage.

No electric car buyer can ignore that great truth, simply stated.

American Axles have proved that they conserve and transmit the maximum of power that any power can give.

Ample evidence for you lies in the fact that *American Axles* are actually in use on eighty per cent. of the electrics in this country.



The option of Bevel Drive or Lanchester-Daimler Worm Gear can be had with American Axles only.

The best way to insure the vital, costly, front parts of your car is to prevent the damage altogether—not to collect for it after it is done.

No delay then while your car is in the repair shop; no loss in dollars outright if the appraisement of damage done falls below $25.00.

The Conover Safe-Guard protects these parts—*absolutely.*

It is a broad, massive channel-bar supported at four points by sturdy, semi-elliptical springs of finest chassis steel.

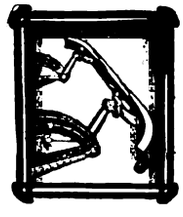
Before a lamp, fender, radiator, axle or spring can even be scratched, this powerful barrier must be broken.

The makers back the Conover Safe-Guard with an *unreserved* guarantee—a replacement free if broken any time within a period of two years.

Don't compare the Conover with the ordinary "pipe" bumper. It is a *new* protection—new in sightliness as well as in strength.

You cannot completely and satisfactorily insure your car without the Conover Safe-Guard.

Your car is worth it.



Best quality of steel heavily enameled in black, royal blue, French gray or maroon; bar 2 inches wide. **$15.00**
(Any other color of enamel $5.00 extra)

Best quality of steel, brass or nickel plated; bar 2 in. wide - - - **$17.50**

Solid bronze, finished in either brass or nickel; bar 2 in. or 2¾ in. wide **$25.00**

Shipped, express paid, anywhere in the United States, on thirty day's trial, upon receipt of the regular price. When ordering, give name and model of car. Specify size and finish desired.

An attractive booklet will be sent free upon request.

METALLURGIQUE

Will Sell in Your Community

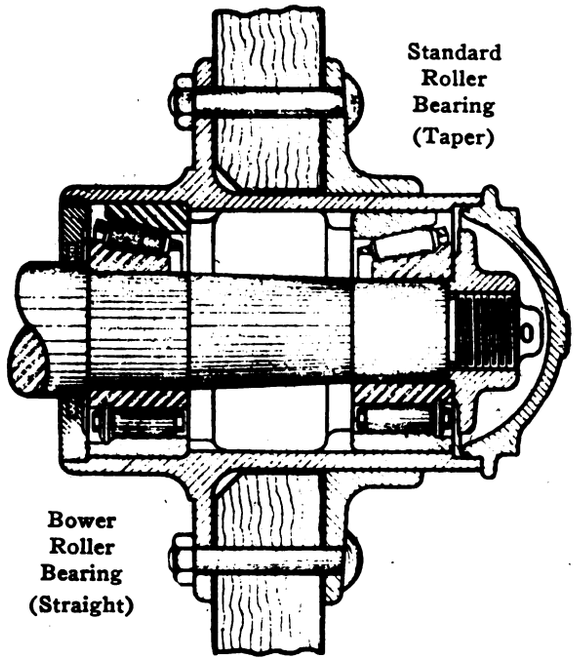
DEALERS

The European Car Idea is Growing in America — is your Ear to the Ground

Dealers who read this announcement will do well to consider the advisability of forming an agency connection with us for handling the Metallurgique—a car for the classes—a distinct and exclusive product, sensational in body design, equipment and appointment. These cars are limited in quantity—unlimited in quality.

Fro mthe radiator of unique design to the end of the rear springs—from tire to top, this powerful, unbreakable car offers value in service away beyond that of any other European or any American product. There is a selling argument in every item from steering knuckle to engine.

Luxury of appointments are regal—beauty of design and finish supreme on both sides of the water. Service unlimited.



The Metallurgique is the only logical car for men of wealth and position who desire an equipment that will make all others appear commonplace.

Let us help you find and pleas and sell to those in this class. As a preliminary, write and get the literature and terms. We can throw more light on the Metallurgique, Europe's choicest product.

SHELDON

The axles that come equipped with a choice of the finest bearings.

It's one thing to make axles equipped with one type of bearing. It's another thing to make axles of splendid mechanical construction adapted to every possible use.

The Sheldon Axle Company offers in its most complete line of excellently constructed axles for 1913, Steel Wheels, or hubs for wood wheels, with your choice of the following high class bearings:

Standard Taper Roller Bearings
Bower Straight Roller Bearings
Rhineland Double Row Annular Bearings
New Departure Double Row Annular Bearings
Hess-Bright Single Row Bearings
New Departure Single Row, Radax or Norma Ball Bearings

See Our Exhibit at Space 321, Madison Square Garden Show.

Hughie Hughes at the wheel of a ***PATHFINDER 40 ARMORED ROADSTER,*** *wire wheel equipped for Karl Fielcke, chief engineer of the Motor Car Mfg. Co.*

Are you doing your share, Mr. Dealer, toward getting wire wheels on the cars you sell? If you're not, then you're standing in your own light. For there's a glorious opportunity for progressive dealers throughout this country because of this wire wheel situation.

Wire wheels are going to be demanded and insisted upon by the consuming public just as surely as this advertisement is being published. Wise manufacturers know this and many of them are getting ready, or rather are getting in advance of the procession. And the products of those wise manufacturers will sell *first.*

If your manufacturer hasn't heard the noise yet, get out your trumpet and herald the tidings to him—the tidings of wire wheels. Tell him that you won't handle a slow moving proposition. Remember what the lack of fore doors did to a few unheeding manufacturers. The lack of wire wheels will do worse.

Digitized by Google

WIRE WHEELS

Wire wheels have come into their own purely and simply on their merits. Don't make any mistake about that. They have actually beaten down every other type of wheel by sheer superiority—nothing else. They increase tire life over any and every other type of wheel. They make the car easier riding. They make it cost less to operate. They make the car as well as the tires live longer. They are stronger in every conceivable way than any other practical type of wheel—and greatly stronger than wooden wheels of any sort.

McCue Wire Wheels are equipped with the most practical Q. D. rims ever placed upon the market. These rims are so constructed that the tire does not come in contact with the spoke nipples. They also may be used interchangeably for either clincher or straight side tires.

McCUE AXLES

McCue Axles and McCue Wire Wheels form the most advanced combination that could be placed upon any motor car. You're selling force will be greatly assisted by this combination. However, McCue Wire Wheels can be used upon any axle made. Send for "Mileage Plus."

THE McCUE COMPANY, Buffalo, N. Y.

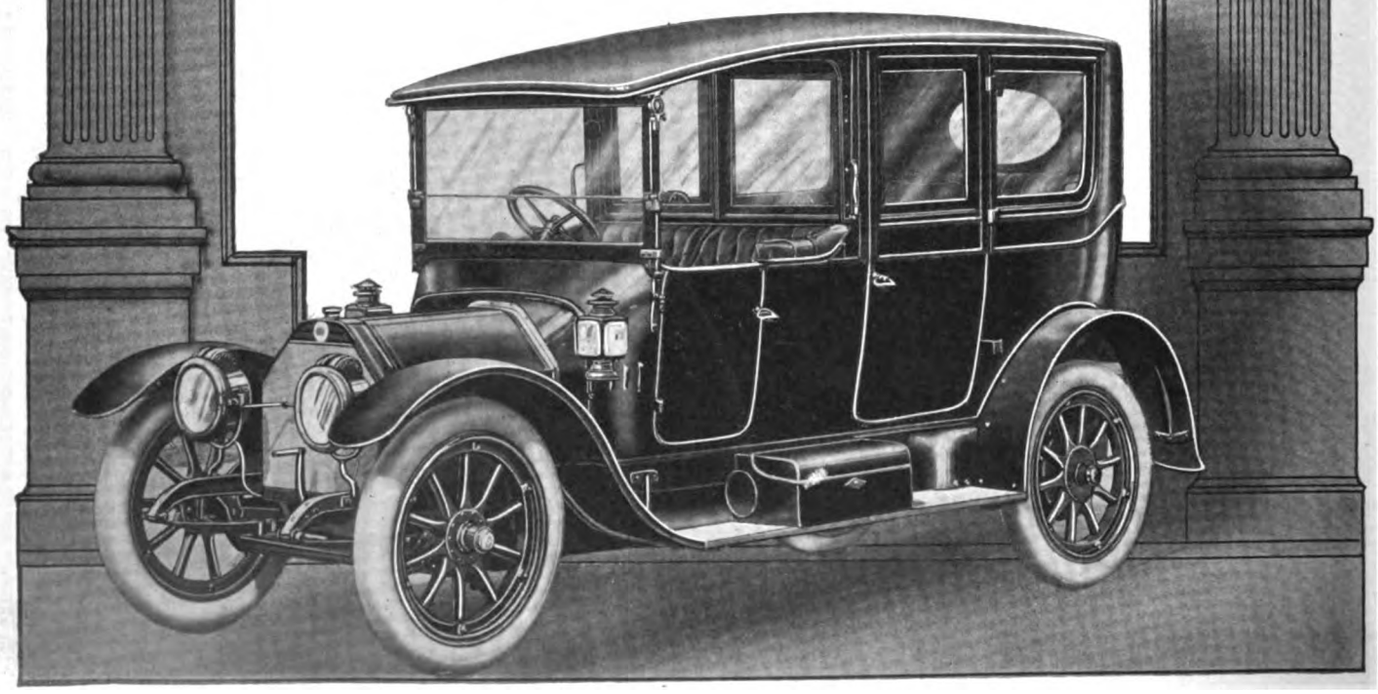
Lancia

AMERICA'S FAVORITE EUROPEAN CAR



LANCIA DEALERS KNOW

That there is a large and ever increasing buying interest developing in this country for the European car at American prices—but it is patent that the average foreign automobile is extravagantly priced on this side.

The Lancia is the one car to prove its actual European superiority over American cars of equal price—and this added value in strength, durability, silence and speed (coupled with its unusual lines) will make friends and customers for **you,** Mr. Dealer, among the elite in your territory.

We will show you, on demand, the finest selling arguments that ever surrounded a high grade car. Write and ask us to prove our contentions.

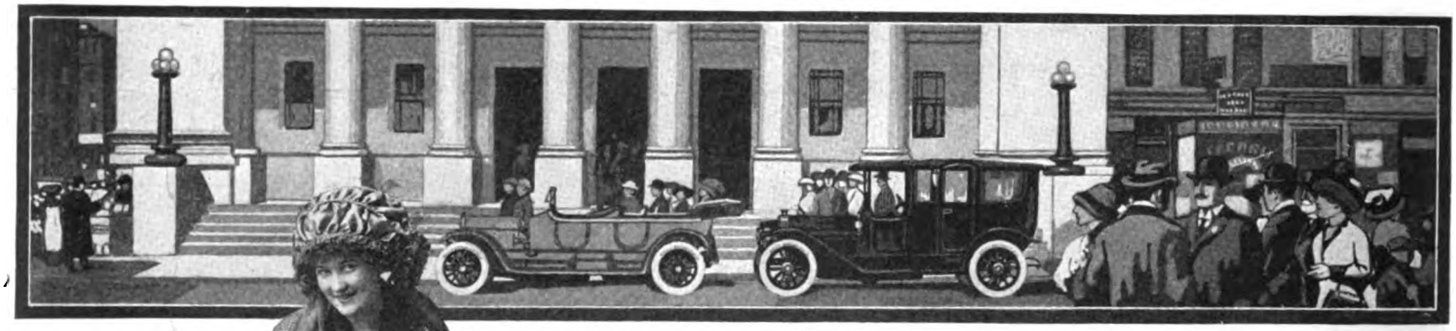
SCIENCE Supports our Claims

The WARD LEONARD SYSTEM

The Ward Leonard automatic dynamo lighting and starting system of to-day is fundamentally and scientifically correct. It is perfect both mechanically and electrically.

What the electrical engineers knew to be right and standard, we used in our systems. What they did not know, we showed them, and today the Ward Leonard Lighting and Starting System has the approval of experts, the support of science and the commendation of users.



Our lighting and starting system is automatically perfect, is simple, light in weight and *it does not go wrong.*

WARD LEONARD ELECTRIC CO.

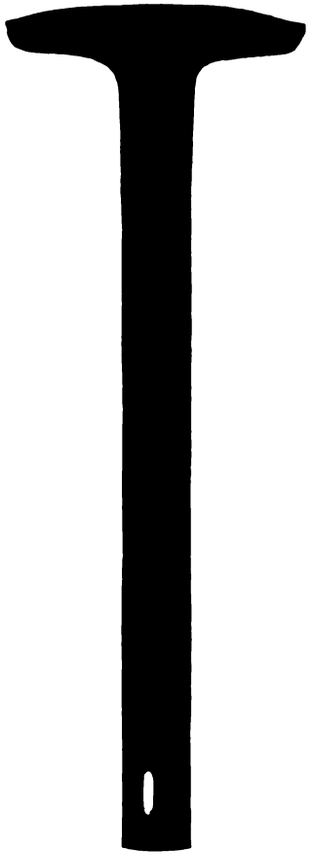
Put a poor tire on a good automobile and you get—a poor automobile.

The serviceability of a motor car is measured more than anything else by the serviceability of its tire equipment—just as a soldier's efficiency depends more on his feet than on his marksmanship.

Kelly-Springfield Automobile Tires have behind them seventeen years of rubber tire making experience. What these seventeen years stand for is shown pretty clearly in the fact that the average mileage given by Kelly-Springfield Tires exceeds by a thousand or two the average mileage given by tires of other makes.



And tire mileage means car mileage.

Kelly-Springfield
Automobile Tires

Kelly-Springfield Tire Company, 20 Vesey Street, New York

THINK THIS OVER very carefully and read it twice, if necessary.

Is there any part of an automobile engine, or any other gas engine, that is more important to its efficiency than a Valve?

Your engine leaves the factory running smoothly and sweetly—tuned up to its highest power. Perhaps the valves pit—warp—go out of shape—fail to hold compression. Then the power diminishes, and what can be more aggravating to the driver, who has known the fullness of the pulling power of his motor, than to have it grow less and less?

You cannot slight this part by putting in an inferior product—valves that will give trouble, or even break from inexperience in their manufacture—valves of unsuitable material, not suitably heat treated.

Too much is at stake, and a slight extra cost at the outset, which is the exception, may save you many times over a probable later expense.

This Company, with the experience of many years as a guarantee, will furnish you with properly made valves, of the materials best adapted to your requirements.

Not only QUALITY, but efficient SERVICE is a factor—surely there is a satisfaction in getting the kind of work you want—when you want it.

THE ELECTRIC WELDING PRODUCTS COMPANY

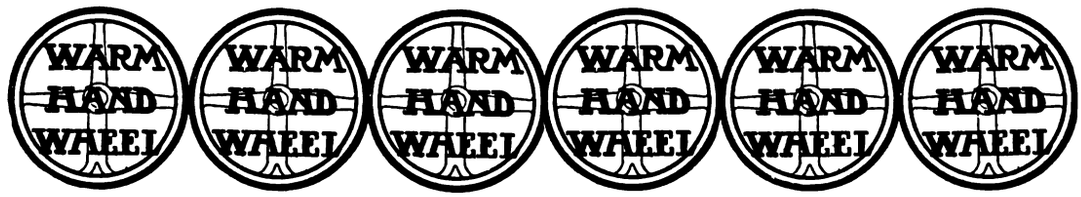
Sell just one or two Warm Hand Wheels in your locality—they'll sell dozens more for you without effort on your part.

With the refining of motor cars—as now demanded by a discriminating public that must be sold—naturally comes the question of heating the driver and the car.

With this question comes the Warm Hand Wheel as the solution of the problem of keeping the person driving the car warm and comfortable, six months of the year.



The Warm Hand Wheel is a device or steering wheel heated by the electricity supplied either by a storage battery or electric lighting or starting outfit. It can be put on any car with the greatest of ease and at the slight cost of $15 retail.

On Ford cars this Warm Hand Wheel is operated by the magneto in-built in Ford fly wheels. It operates perfectly with this source of current without affecting in any way the magneto in the performance of the functions for which it is built.

Really you can sell a raft of these Warm Hand Wheels in your territory right now. Remember they are necessary in most of the country for six months out of twelve—that is during both fall and spring as well as in the hard winter weather. Maybe your territory isn't closed yet. Write today and find out.

"In Exchange for your empty tank, accept only a genuine Prest-O-Lite Tank, filled with genuine Prest-O-Lite Gas."

This is the message that is going to Prest-O-Lite users everywhere.

In it there is a hint for the wise dealer, as well.

You know that no imitator of the Prest-O-Lite Tank has ever successfully imitated Prest-O-Lite service.

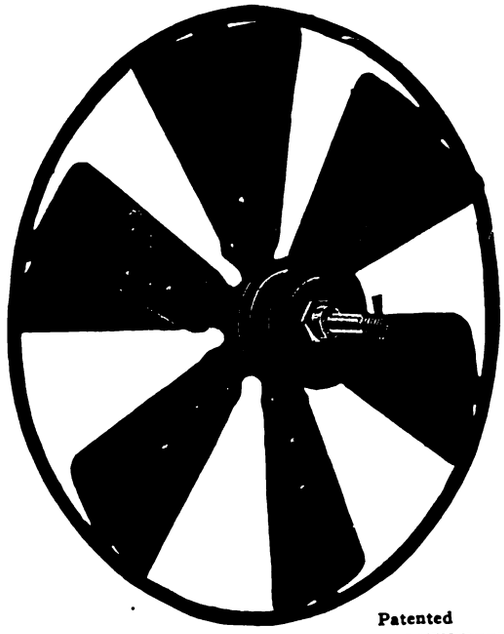
You also know that no imitator ever made good the large claim "more gas and better gas than Prest-O-Lite.

So does your customer.

Imitations are getting harder and harder to sell. There are now mighty few dealers trying it.

Most of those who yielded to the old but ever tempting claim "More Profits" have come back home.

To the dealer who is still trying to force imitations on people who won't have them, perhaps because he has money tied up in them, we can only say:



"The sooner you resume earning your good old Prest-O-Lite profit, the sooner you will make your income what it used to be."

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Sixty Years of Successful Manufacturing

TRIPLEX

A FUEL SAVER and A MONEY SAVER

Increases Power
Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets all the power all the time—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon. For further information write us.

SPECIAL METAL STAMPINGS

Standard Universal Rims

fit any style or make of tires. The side rings are reversible, they curve outward on one side to fit a straight side tire, inward on the other to accommodate a clincher. Two turns of a nut unlocks the rim for demounting, two more turns locks the rim in place. Write for catalog 607, which explains fully.

THE UNITED RIM COMPANY, Akron, Ohio

Repairing Casing

TIRE CUTS ruin casings. They admit moisture to the carcass, cause the fabric to rot and weaken, grow larger-end in blowouts.

You can repair **CASINGS** and **INNER TUBES** anywhere in 15 minutes, better than a Repair Shop can do—and for *one cent*.

Universal Auto-Vulcanizer

Patented

A practical vulcanizing outfit complete, with enough repair gum to make 40 patches. It weighs 3 pounds and can be carried in the tool box. **Simplest and most satisfactory device for eliminating tire troubles that has ever been devised.**

Absolutely automatic. Place the patch—attach the Vulcanizer—put in the gasoline—light it. No further attention required. In 15 minutes the job is done.

It *can't burn, scorch* or *injure* tube or casing. It *can't* get out of order. It *can't* fail to do its work. So simple, anyone can operate it. The Universal Auto-Vulcanizer saves its cost a *hundred times* over in trouble and expense.

Price Complete. **$4.00** Ready for Instant Use
Guaranteed Satisfactory or Money Refunded

Weed Chains

The Great Anti-Skid DEVICE

Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires

Because They Creep

An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

"Making the Good Car Better"

Any Automobile Equipped With

GRAY & DAVIS

Electric Lamps — Lighting Dynamo — Electric Starter

Must of necessity be a good car. FIRST—because these highly efficient products add to convenience, comfort, safety. SECOND—because the manufacturer who selects GRAY & DAVIS Equipment is buying the best the market affords regardless of price.

You will find either GRAY & DAVIS Electric Lamps, Lighting Dynamo, Electric Starter or all three in combination on the good cars. The very fact that an automobile has even one of these Quality products is evidence that the car builder is determined to give the purchaser up-to-date equipment.

1913 Peerless Cars Carry Full GRAY & DAVIS Equipment.

Write for Complete Information

GRAY & DAVIS, 55 Lansdowne St., Boston, Mass.

Manufacturers of Automobile Lamps, Dynamos and Electric Starters

Published Weekly by The Motor World Publishing Company, 1600 Broadway, New York

A Chain of Leading Cars Regularly Equipped with the

Truffault-Hartford SHOCK ABSORBER

Do YOU know the sales value of this Equipment on the car YOU sell?

Truffault-Hartford Shock Absorber equipment meets an insistent demand on the part of the car owner. Otherwise the automobile manufacturers would not see fit to employ it as standard factory equipment.

The car that carries this equipment is an easier car to sell. Car buyers know and appreciate what a marked difference it makes in the riding qualities of a car. They know, too, what a large saving on tires and engine repairs is effected by its use.

In view of these facts, is it any more than a logical demand that YOU, too, should insist on this essential equipment from the manufacturer whose car you sell?

Truffault-Hartford Shock Absorbers are considered by car buyers generally to be as much a part of the car's factory equipment as the lamps, the wind shield, the top, etc. And in point of benefit derived they are far more essential.

We are always ready to co-operate with the interested dealer.

Mr. Car Agent—YOU add to your Sales Arguments—

—when the car YOU sell has Truffault-Hartford Shock Absorbers as part of its equipment.

Buyers know what this equipment does for a car. Years of persistent advertising has taught them. They know how this device saves the engine and tires—how it prolongs the life of the car—what it accomplishes in cutting down up-keep expense. And knowing these things they expect the car they buy to include this equipment.

It is so much to the dealer's advantage to have the car he handles Truffault-Hartford-equipped that there are now 27 leading automobile manufacturers installing Truffault-Hartfords as part of their regular equipment.

Insist on this equipment from the manufacturer you represent. It furnishes you additional sales-arguments. It is an aid to bigger car sales—it is an acknowledged necessity for comfortable, safe and economical motoring.

The Accuracy and Quality of the Jones Speedometer

A PROVEN FACT—NOT THEORY

Winning the Gold Medal — The JONES won the highest award for **accuracy**—the Royal Automobile Club's Gold Medal. The nearest American competitor finished in 7th place.

U. S. Bureau of Standards — The tests conducted by the U. S. Government resulted in showing the unerring **accuracy** of the JONES.

Leading Universities — In the comparative signed statements of tests made by leading American Universities, the JONES unquestionably proved its **accuracy.**

Adoption by the Police — The fact that the Police Departments in all large cities not only use the JONES, but highly endorse it, is, we believe, conclusive evidence of **accuracy.**

Centrifugal Force — Is the principle of the JONES—impervious to heat, electrical influence or temperature changes—as unalterable as the law of gravitation—hence, the JONES **must** be **accurate.**

Army & Navy Journal Says: "Magnetic speedometers, used by automobiles to register speed, are so inaccurate as to make them practically useless, is demonstrated by an investigation just completed by the Bureau of Standards." Therefore, unquestionable **accuracy** is to be had in the JONES—the Centrifugal instrument.

Model 40

The JONES is the Pioneer—the inspiration of the Speedometer industry. It is Geared-To-The-Truth, gives efficient, reliable service.

Your Car can't be fully equipped without the

Truffault-Hartford SHOCK ABSORBER

THAT'S the unanimous expert opinion of the greatest car builders of America and Europe. And they express their opinion in the strongest possible terms by equipping with Truffault-Hartford Shock Absorbers these internationally-famous cars:—

Packard	Thomas	Corbitt
Alco	Benz	McFarland Six
Marmon	Fiat Six	Columbia
Stevens-Duryea	Hudson Six	Metallurgique
Simplex	Premier	Brush
Mercer	Stoddard-Dayton	American 50
Oldsmobile	Chadwick	

THE opinion of these builders reflects the demands of motoring thousands—who want the greatest possible comfort from their cars.

These motorists have learned—by their own and the experiences of others—that a car MUST BE TRUFFAULT-HARTFORD-equipped to give the utmost in easy-riding comfort—to eliminate shocks and strains of engine and mechanism—to insure the very lowest wear and tear on tires.

While there are many devices which may save you exertion once or twice each trip—or annoyance once in a thousand miles or so—TRUFFAULT-HARTFORD SHOCK ABSORBERS are giving their service on your car all the time, saving you from thousands of jolts and jars, saving you from hours of uncomfortable riding, and saving you hundreds of dollars in repair and tire bills.

You may appreciate other accessories **occasionally** but you NEED Truffault-Hartfords all the time—they make every road a boulevard.

Four Sizes, $15 to $60 *Write four our "Good Roads" Booklet*

DISCO DISCO DISCO DISCO DISCO DISCO

It's DISCO Everywhere

On good cars at all prices you find the Disco Starter this year.

The manufacturer who looks ahead—the dealer who is progressive—the owner who wants the best—they all must have the

"DISCO"

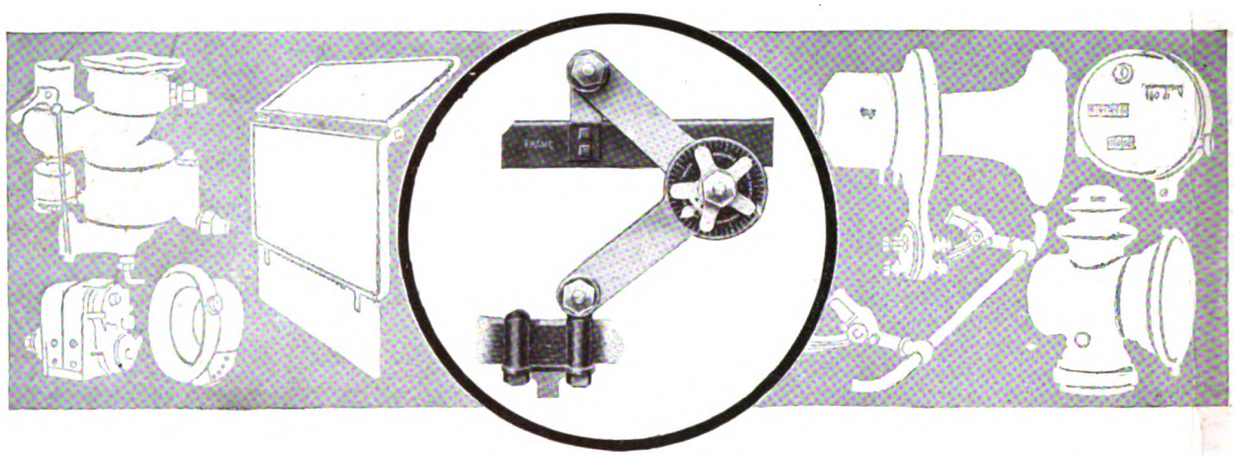
REG. U.S. PAT. OFFICE

Here are some straws to show which way the wind blows. You'll find the DISCO on the following cars for 1913:

PACKARD	AMERICAN	BUICK	JACKSON
LOCOMOBILE	MARION	SELDEN	PILOT
PIERCE-ARROW	HENDERSON	DAVIS	McLAUGHLIN
STEVENS-DURYEA	SIMPLEX	REPUBLIC	HAVERS

The New Model 16 Disco Better Than Ever

Although nearly 100,000 of our first model DISCO are in use today, and giving satisfaction, it was our own engineers who found some room for improvement. The price is lower—the efficiency higher. It sells for $30 for a 4-cylinder motor, $35 for a 6.



Get our little booklets on the Disco Starter and Disco Lighter.

IGNITION STARTER CO., 715 Dodge Bldg., Detroit, Mich.

COLD WEATHER TIP. Agents and Dealers will make big money this winter on the Disco, the ideal cold weather starter. Works at 20 below zero as well as at 105 in the shade. Write for terms.

Accessories Sell The Cars

Car values today are so relatively equal that **equipment** is the biggest factor in closing most sales.

Glance over this year's car advertising. Note well the prominent featuring of accessory equipment. Next year, equipment will play even a larger part in every car dealer's profits, and as usual you'll find the

Truffault-Hartford
SHOCK ABSORBER

The Most Widely Demanded Accessory on Any Car

In fact—Its popularity and usefulness have taken it out of the **accessory** class and make it a **necessity** to motoring comfort.

Leading motor car builders of America and Europe have decided that no car can be **fully equipped without Truffault-Hartfords.** So now you find **TRUFFAULT-HARTFORD SHOCK ABSORBERS** as regular equipment on these internationally-prominent cars:

PACKARD	SIMPLEX	BENZ	STODDARD-DAYTON	COLUMBIA
ALCO	MERCER	FIAT SIX	CHADWICK	METALLURGIQUE
MARMON	OLDSMOBILE	HUDSON SIX	CORBITT	BRUSH
STEVENS-DURYEA	THOMAS	PREMIER	McFARLAN SIX	AMERICAN 50

A man **buys** a car for **comfort**—or he **doesn't** buy on account of **big upkeep cost.** You can actually show every prospect how TRUFFAULT-HARTFORD SHOCK ABSORBERS on YOUR cars give him the **utmost in car comfort** with the **minimum** of **upkeep expense.**

If your builder uses Truffault-Hartfords as standard equipment—he has your "easy sales" interests at heart. If he doesn't—then write us today for further details—and then write him for Truffault-Hartford "sales makers" on your allotment of cars.

FOUR SIZES **ANY CAR** **EVERY ROAD**

Automobile History Repeats Itself

In 1912 the car without electric lights is a back number car. Four years ago GRAY & DAVIS introduced the **first** practicable electric lighting system.

The remarkable efficiency of the GRAY & DAVIS Dynamo led to the almost universal adoption of electric lights.

Today, the Electric Starter is **the thing.** The good cars are equipped with Electric Starters.

The unusual power, positive operation and economy of the GRAY & DAVIS 6 volt Electric Starter has led to its adoption by—

The Leading Car Builders of America

GRAY & DAVIS products not only represent the big improvements in automobile equipment, but they are pre-eminently the best. With the Starter, as with the Dynamo—**"History Repeats Itself."**

Truffault-Hartford
SHOCK ABSORBER

is distinctively a dealer's proposition. We've spent a fortune in compiling blue prints of every make, year, model of automobile manufactured since the motor car industry began. These prints show how to Truffault-Hartford-equip with a minimum of trouble and expense. The printed instructions, also provided, further simplify attachment.

Any dealer, anywhere, can sell Truffault-Hartford Shock Absorbers and put them on a car, if the purchaser does not want to do it himself.

Every car owner is a live, prospective buyer, for there is a model for every car from modest roadster to pretentious limousine and they list from

$15 to $60 a Set of Four

No accessory better or more widely advertised. Favorably known wherever autos "chug." Giving absolute satisfaction on more than 200,000 cars. Indispensable for comfortable motoring. A reducer of upkeep cost.

A dealer's proposition, pure and simple.

Write for full particulars with details of our co-operative dealers' advertising.

The

Truffault-Hartford
SHOCK ABSORBER

is giving *solid comfort* to 200,000 car owners.

This comfort is more than the *physical comfort* which an easy-riding car imparts; it's a *mental comfort* as well, for it is cheering to the mind to know that tires are being saved from excessive wear and tear, springs from breakage, car from rapid deterioration—and these are the very results that attend the use of the Truffault-Hartford.

Scientific spring control accomplishes these wonders and the Truffault-Hartford is the only shock absorber that exercises such control. This it does through *frictional absorption, a proved and patented principle.* Every jolt and jar is neutralized; spring and absorber working in perfect harmony, assimilate both so effectively that real auto comfort is realized and *"Every Road's a Boulevard."*

Your factory can take care of you. If you insist, your car will come from it, Truffault-Hartford-equipped. If it doesn't, we have a blueprint which facilitates equipment in your own or dealer's garage.

A note or postal with mention of make, year and model will bring you full particulars.

Mirror-Like Brilliancy Compels Attention

BEAUTY of finish is an important selling help. It is the external evidence of quality—the "first impression" that starts the sale right.

Cars finished with Berry Brothers' Automobile Varnishes and Baking Japans have that deep, rich, mirror-like brilliancy that compels attention, and makes the finish a real, vital selling help.

Any car, of any type, at any price, can have this selling help by the right use of our special finishes.

BERRY BROTHERS' VARNISHES

BERRY BROTHERS, Limited

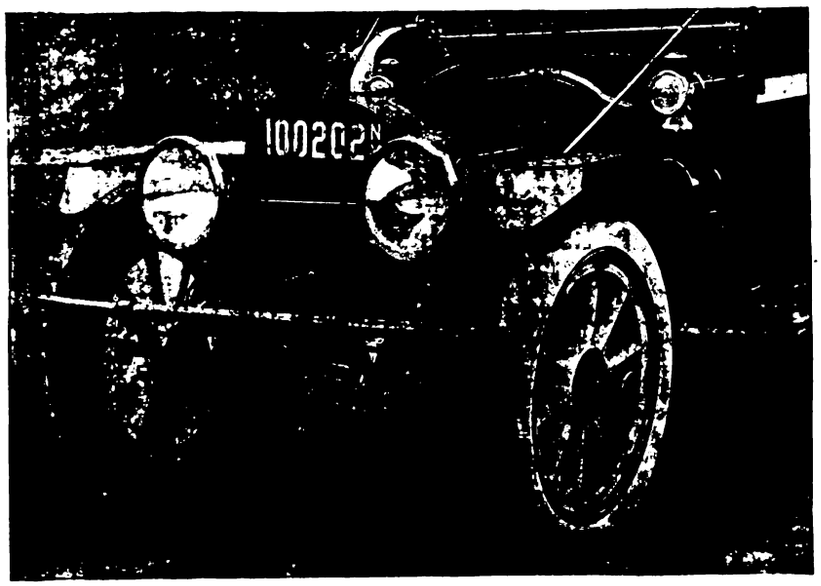
ANNOUNCEMENT EXTRAORDINARY

Here Is Something Different—Something Better

The Hartford FOUR LEAF FRICTION SPRING Bumper



The real car guard has arrived—one that **protects lamps, radiator, mudguards, springs,** and at the same time gives a car "a dressed look" which **adds at least 25 per cent to the beauty of its appearance.**

Thousands of **minor accidents occur daily** to unprotected cars, accidents in which the front parts suffer damage that is costly to repair. They emphasize the necessity of an effective **guard** for the front of a car. This is what the Hartford is.

Attaches to the Car Frame Without Drilling Holes—The extreme simplicity of the Hartford is one of its strongest recommendations. It can be put on any car without drilling any holes or making any alterations, for it clamps to the top of the side members of the frame. Readily attached by any one with a monkey wrench. When once applied, cannot work loose or rattle and virtually becomes a part of the frame and directs the force of collision to that part of the car which is best suited to withstand it.

The Best Ever—The Hartford Friction Spring Bumper anticipates every requirement of an effective car guard. Every car needs it and every car owner will recognize its superiority.

Protects and Beautifies the Car

Car Owners—You can save the price of a Hartford Friction Spring Bumper many times over in repair bills. You can add much to the appearance of **your** car. There's a model for your car. Ask about it.

Dealers—Here is a profitable proposition of **unlimited possibilities.** We've a **special proposition for you.** Ask about it.

Car Builders—The Hartford Friction Spring Bumper affords the finishing touch that emphasizes the beauty of a car—adding at least 25 per cent to the appearance of any car. It will be widely advertised. The car buyer will want it. There's a **factory equipment proposition** for you. Ask about it.

Ready to Go on Any Make of Car

There are four models of the Hartford Friction Spring Bumper:

Large	For cars weighing over 3000 pounds.....	**$20.00**
Medium	For cars weighing from 1500 to 3000 pounds....	**$16.00**
Small	For cars weighing up to 1500 pounds.....	**$12.00**
Special Type for Ford Cars		**$12.00**

To attach any one of these models is simplicity itself.

DISCO DISCO DISCO DISCO DISCO DISCO

It's DISCO Everywhere

On good cars at all prices you find the Disco Starter this year.

The manufacturer who looks ahead—the dealer who is progressive—the owner who wants the best—they all must have the

"DISCO"

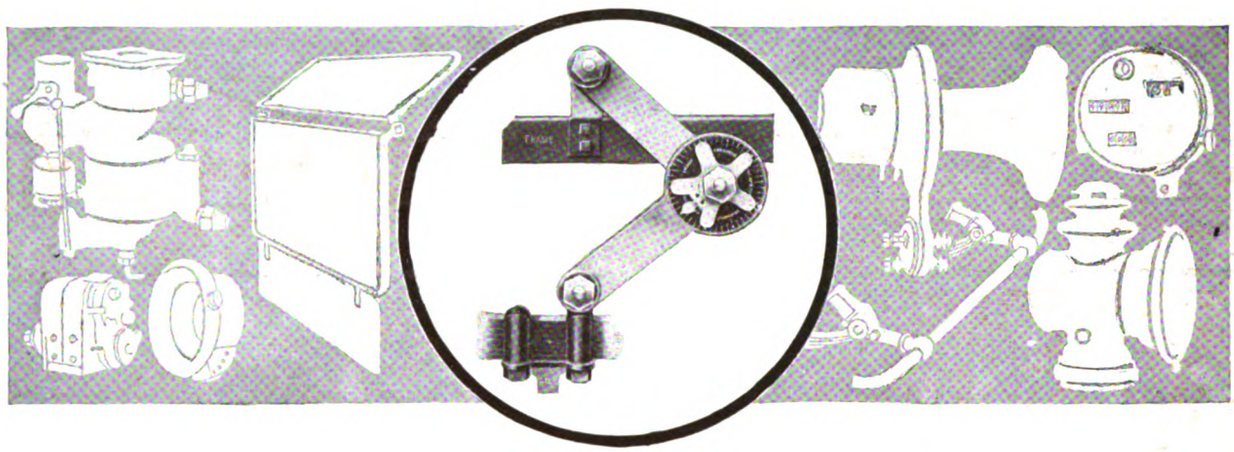
REG. U.S. PAT. OFFICE

Here are some straws to show which way the wind blows. You'll find the DISCO on the following cars for 1913:

PACKARD	AMERICAN	BUICK	JACKSON
LOCOMOBILE	MARION	SELDEN	PILOT
PIERCE-ARROW	HENDERSON	DAVIS	McLAUGHLIN
STEVENS-DURYEA	SIMPLEX	REPUBLIC	HAVERS

The New Model 16 Disco Better Than Ever

Although nearly 100,000 of our first model DISCO are in use today, and giving satisfaction, it was our own engineers who found some room for improvement. The price is lower—the efficiency higher. It sells for $30 for a 4-cylinder motor, $35 for a 6.



Get our little booklets on the Disco Starter and Disco Lighter.

IGNITION STARTER CO., 715 Dodge Bldg., Detroit, Mich.

COLD WEATHER TIP. Agents and Dealers will make big money this winter on the Disco, the ideal cold weather starter. Works at 20 below zero as well as 105 in the shade. Write for terms.

Accessories Sell The Cars

Car values today are so relatively equal that **equipment** is the biggest factor in closing most sales.

Glance over this year's car advertising. Note well the prominent featuring of accessory equipment. Next year equipment will play even a larger part in every car dealer's profits, and as usual you'll find the

Truffault-Hartford SHOCK ABSORBER

The Most Widely Demanded Accessory on Any Car

In fact—Its popularity and usefulness have taken it out of the **accessory** class and make it a **necessity** to motoring comfort.

Leading motor car builders of America and Europe have decided that no car can be **fully equipped without Truffault-Hartfords. So now you find TRUFFAULT-HARTFORD SHOCK ABSORBERS** as regular equipment on these internationally-prominent cars:

PACKARD	NATIONAL	BENZ	STODDARD-DAYTON	COLUMBIA
ALCO	MERCER	FIAT SIX	CHADWICK	METALLURGIQUE
MARMON	OLDSMOBILE	HUDSON SIX	CORBITT	BRUSH
STEVENS-DURYEA	THOMAS	PREMIER	McFARLAN SIX	AMERICAN 50
				NYBERG

A man **buys** a car for **comfort**—or he **doesn't** buy on account of **big upkeep cost.** you can actually show every prospect how TRUFFAULT-HARTFORD SHOCK ABSORBERS on YOUR cars give him the **utmost in car comfort** with the **minimum** of **upkeep expense.**

If your builder uses Truffault-Hartfords as standard equipment—he has your "easy sales" interests at heart. If he doesn't—then write us today for further details—and then write him for Truffault-Hartford "sales makers" on your allotment of cars.

FOUR SIZES **ANY CAR** **EVERY ROAD**

The Car Without an *Electric Starter*
Is an Incomplete Automobile

Every engineer, every manufacturer and practically every motorist realizes that the **electric starter** is the thing today. Likewise engineers, manufacturers and motorists know that

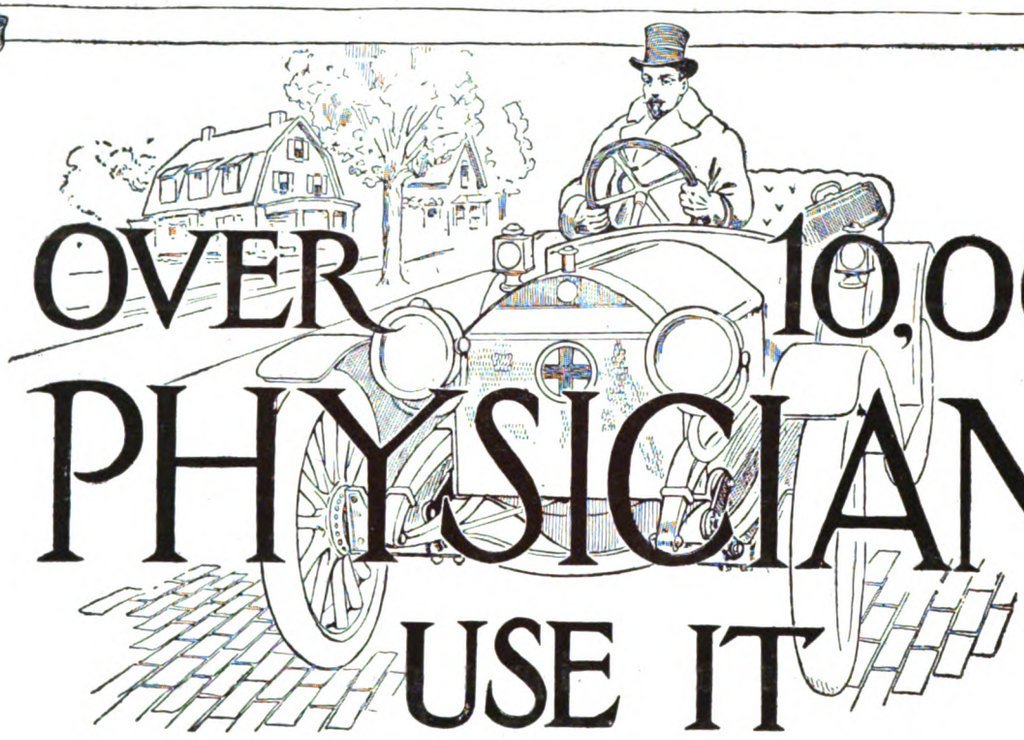
GRAY & DAVIS
6 Volt Electric Starter

is distinctly better than any other starting device. No other starter has the power, positive operation and efficiency of the GRAY & DAVIS Starter.

IF YOU'RE A MANUFACTURER—Equip with GRAY & DAVIS Starter, it is in demand. America's leading manufacturers use it.

IF YOU'RE A DEALER—Insist that the car you handle be so equipped. Such cars are easy to sell because 'most everyone wants the GRAY & DAVIS Starter.

IF YOU'RE AN OWNER—Don't accept a cheap, inefficient substitute. When you **buy** a car you're entitled to the best. Likewise remember that the **good** cars carry GRAY & DAVIS Starter, Lamps, Lighting Dynamo or all **three** in combination.



Write for Information

GRAY & DAVIS, Inc., 55 Lansdowne Street, Boston, Mass.

OVER 10,000 PHYSICIANS USE IT

The *Truffault-Hartford* SHOCK ABSORBER

is used by a very large percentage of the medical men who own and operate motor cars.

A physician's calling brings him everywhere. He must take roads as he finds them. To save time is his chief aim and many a call leads him over rut-cut suburban or country road, often at breakneck speed.

The danger attending such travel has convinced physicians of the need of something that will make their automobiles ***smooth-riding,*** irrespective of road conditions. ***They know that jolting and bouncing are dangerous to the human frame;*** have often been the cause of dislocation or strain and always promote bodily fatigue.

That ten thousand and more physicians have chosen Truffault-Hartford Shock Absorbers as a means of comfort and a protection against bodily injury, is a strong endorsement. Here is an expression of opinion by one of them;

> *"I secured a set of your Truffault-Hartford Shock Absorbers from a friend, also a physician, who purchased them for his car, an E.M.F. '30', five-passenger, but never applied them as he purchased a higher priced car already equipped with them.*
>
> *"After eight months' use of the car without them, over roads so rough as to give any car a severe test, I have applied the Truffault-Hartford Shock Absorbers and it seems that I have secured a new car with nearly double the efficiency of my E.M.F. '30' Roadster. The advantages obtained are truly remarkable. Roads are not rough any more or nearly as much so, and I believe it is almost impossible to break a spring. Prior to applying the Shock Absorbers, I broke three springs and three axles. I get a great deal out of my car both in speed and service over very bad roads here in the interior of the country (eighteen miles from the city) and can fully appreciate the comforts of the Truffault-Hartford Shock Absorbers and feel that you would appreciate my gratification in getting such a necessity to the extent of my writing you this unsolicited letter."—Edw. G. Parke, M.D., Benton, Miss., R.F.D., No. 1.*

Truffault-Hartford Shock Absorbers are included as regular factory equipment on over 25 of the largest and best selling cars.

For greater comfort, greater economy, for speed with safety, the Truffault-Hartford is indispensable. It "Makes Every Road a Boulevard."

"I INSIST ON COMFORT"

Car Buyer

THE MOST ESSENTIAL FEATURE

There are some accessories which a car absolutely needs, others which are mere incidentals, purchased more for show than usefulness. Ask anyone, who motors to any extent, what he or she deems the most desirable trait in an automobile and, nine times out of ten, the answer forthcoming is

"COMFORT"

And when it comes right down to "case notes," **comfort is everything.** The car which telegraphs the presence of every rut and bump in a roadway to its occupants, "knocks" itself every moment it is out of the garage. The next time its owner buys, the chances are that it will be another make. This very fact has influenced many makers to build comfort into their cars. These are doing it:

Packard	**American 50**	**Stoddard Dayton**	**Mercer**	**Rambler**	**Brush**
Fiat	**Oldsmobile**	**Thomas**	**Metallurgique**	**Velie**	**National**
Alco	**Premier**	**Columbia**	**Nyberg**	**McFarland**	**Pathfinder Speedster**
Benz	**Stevens-Duryea**	**Marmon**	**Hudson Six**	**Corbitt**	

for they put the

Truffault-Hartford SHOCK ABSORBER

on at the factory. The Truffault-Hartford actually "makes every road a boulevard," and with it there's **comfort, less tire wear, less car tear.**

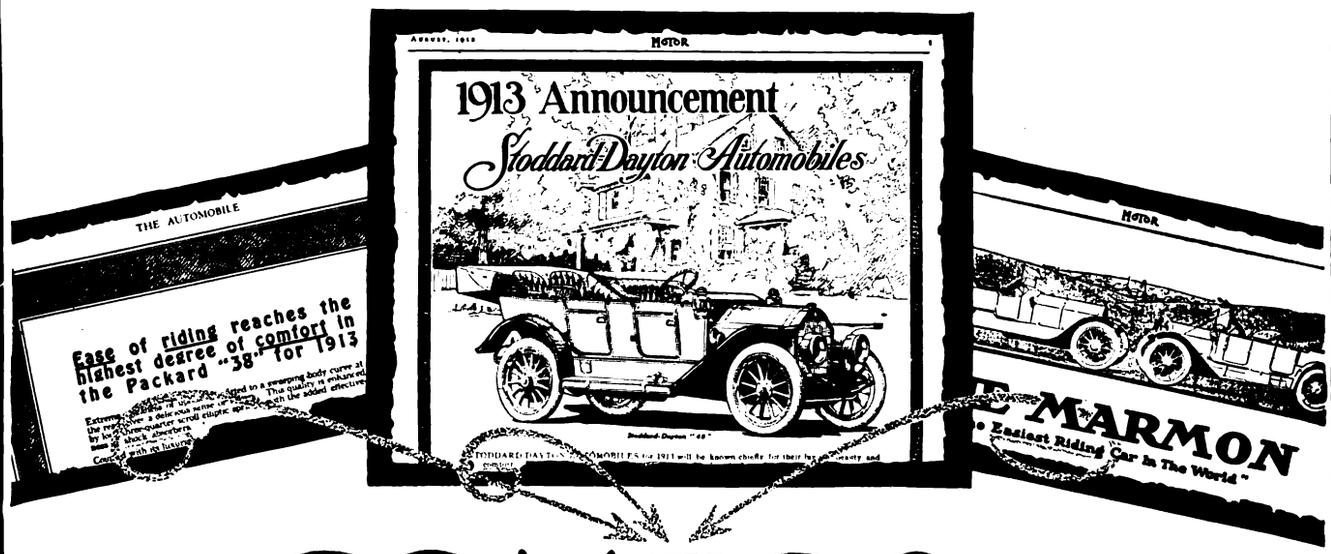
FIRST IMPRESSIONS

THE trade-mark of the varnish determines the finish on the car, and the finish determines the first impressions.

Cars finished with Berry Brothers Automobile Varnishes and Baking Enamels have a permanent deep, rich, mirror-like brilliancy that starts the sale right and keeps the car sold.



First impressions are lasting impressions when our special finishes are properly used, on any car of any type at any price.

BERRY BROTHERS VARNISHES

BERRY BROTHERS, Limited

Largest Manufacturers of Varnishes, Shellacs, Air Drying and Baking Japans, Lacquers, Stains, Fillers and Dryers.
FACTORIES—Detroit, Mich., and Walkerville, Ont.
BRANCHES—New York, Boston, Philadelphia, Baltimore, Chicago, Cincinnati, St. Louis, San Francisco.

Published Weekly by The Motor World Publishing Company, 1600 Broadway, New York

COMFORT
The Main Thing

The car that rides hard is shunned by the prospective buyer who knows that the *easy-riding* car is not only *comfortable* but *economical* as well. Many builders of famous cars are giving the buyer what he wants by putting on the

Truffault-Hartford
SHOCK ABSORBER

as standard equipment and are able to claim with all honesty that their cars are *comfortable*, that they are *easy-riding*, and, what's more, *they can prove it.* Here they are:

PACKARD	NATIONAL	BENZ	STODDARD-DAYTON	COLUMBIA
ALCO	MERCER	FIAT SIX	CHADWICK	METALLURGIQUE
MARMON	OLDSMOBILE	HUDSON SIX	CORBITT	BRUSH
STEVENS-DURYEA	THOMAS	PREMIER	McFARLAN SIX	AMERICAN
				NYBERG

The Truffault-Hartford Shock Absorber is now used on over 200,000 cars.

Where factory has failed to equip, the owner can provide for the omission. The equipping is simple, rendered so by blue prints of every known make, year and model of car.

Enjoy real, solid comfort! Truffault-Hartford-equip. Save your car from the racking of rough road travel. Save your tires. Make "every road a boulevard."

Write mentioning make, year, model of your car and we will tell you which of these four models is best adapted for it.

Four Models—$15.00 to $60.00. A new model will be added after January 1st.

A DEALER'S PROPOSITION

Truffault-Hartford
SHOCK ABSORBER

is distinctively a dealer's proposition. We've spent a fortune in compiling blue prints of every make, year, model of automobile manufactured since the motor car industry began. These prints show how to Truffault-Hartford-equip with a minimum of trouble and expense. The printed instructions, also provided, further simplify attachment.

Any dealer, anywhere, can sell Truffault-Hartford Shock Absorbers and put them on a car, if the purchaser does not want to do it himself.

Every car owner is a live, prospective buyer, for there is a model for every car from modest roadster to pretentious limousine and they list from

$15 to $60 a Set of Four

A new Model after Jan. 1st

No accessory better or more widely advertised. Favorably known wherever autos "chug." Giving absolute satisfaction on more than 200,000 cars. Indispensable for comfortable motoring. A reducer of upkeep cost.

A dealer's proposition, pure and simple.

Write for full particulars with details of our co-operative dealers' advertising.

Level-Headed

AS REGULAR EQUIPMENT

Check this list of cars equipping with our warning signals:

A. E. C.	Flanders	Orson
Alco	King	Pope Hartford
Armleder	Knickerbocker	Pierce-Arrow
Autocar	Knox	Pratt
Babcock Electric Roadster	Lozier	Simplex
H. H. Babcock	Marmon	Staver
Bailey	Matheson	Stearns
Benz	Metallurgique	Sternberg
Borland Electric	Michigan Electric	Stevens-Duryea
Broc Electric	Multiplex	Stoddard-Dayton
Columbia	Nance	Stover
Chicago Electric	National	Guy Vaughn
Davis	Oakland	Ward
F.I.A.T.	Oldsmobile	White

AS SPECIAL EQUIPMENT: **Cole** **Hudson** **Packard**

See how it practically includes every high priced car—conclusive proof that level-headed makers today know that their cars must be complete—with all accessories that make for comfort and safety.

And furthermore: that only those accessories everywhere recognized as *Standard*—irrespective of cost—will be accepted by the motorist.

All high grade cars—with but very few exceptions—are today Klaxon-equipped. Partly because the bulb horn is commonly known to be thoroughly inadequate; principally because the Klaxon is *Standard* and because the mere mention of its name means to the car buyer: "the best signal it is possible to buy."

Only one or two makers of high priced cars today are saying: "We will consider the Klaxon for 1914" or "We won't equip until our customers make us."

Studebaker

Some Studebaker Specialties That Simplify Selling

Here are a couple of hundred words that will give you in a nutshell the Studebaker argument—you can pass them along to a possible customer with very good results. Maybe you know the whole story now—but it won't hurt to refresh your mind. And any Studebaker story is refreshing.

Consider the new Studebaker "35" for instance.

1st. Studebaker new cars mean real newness. Not some little insignificant change but actual, valuable improvements. That's the Studebaker way which means money for them and for you.

2nd. Studebaker motors give full horsepower. Rating is more than a figure—it's an actual measure of the power each motor gives. That's the Studebaker way which means money for them and for you.

3rd. Studebaker endurance means that every bolt, nut, rod and casting is built to give lasting, enduring service. How do we know this? We make every part ourselves. That again is the Studebaker way which means money for them and for you.

4th. Studebaker simplicity, luxury, convenience, looks, comfort—every big or little detail is decided with the same unchanging determination to make the Studebaker way mean money for them and for you.

5th. Studebaker advertising is just as much stronger and braver and "selling-er" as Studebaker cars are. It runs all the year round in the best magazines, weeklies and newspapers the country over. And it helps—it's written to sell cars from your depot and it does. That once more is the Studebaker way which means money for them and for you.

"20" Delivery Car	$800	"30" Touring Car	$1190	"Six" Touring Car	$1550
"20" Roadster	835	"35" Touring Car	1290	"Six" Roadster	1550
"25" Touring Car	885	"35" Sedan Type	2050	"Six" Limousine	2500
		"35" Coupe	1850
